SUBJECT: 2012 Steam Generator Tube Inspection Report

Palisades Nuclear Plant
Docket 50-255
License No. DPR-20

Dear Sir or Madam:

Entergy Nuclear Operations, Inc. is providing the enclosed 2012 steam generator tube inspection report in accordance with Technical Specifications Section 5.6.8. The specification requires that the report be submitted within 180 days after entry into mode 4 following completion of the inspection. Mode 4 was entered on May 9, 2012.

Summary of Commitments

This letter contains no new commitments and no revised commitments.

Sincerely,

A handwritten signature in black ink, appearing to read "OTTO W. GUSTAFSON".

owg/jlk

Steam Generator Tube Inspection Report for the 2012 Refueling Outage

Inspection Summary

Palisades Technical Specifications (TS) Section 5.6.8, "Steam Generator Tube Inspection Report," requires Entergy Nuclear Operations, Inc. (ENO), to submit a report to the NRC within 180 days after initial entry into mode 4 following a steam generator inspection performed in accordance with TS 5.5.8, Steam Generator (SG) Program. The report shall include:

- a. The scope of inspections performed on each SG (Table 1),
- b. Active degradation mechanisms found (Table 2),
- c. Nondestructive examination techniques utilized for each degradation mechanism (Table 3),
- d. Location, orientation (if linear), and measured sizes (if available) of service induced indications (Tables 4A, 4B and 4C),
- e. Number of tubes plugged during the inspection outage for each active degradation mechanism (Table 5),
- f. Total number and percentage of tubes plugged to date (Table 5),
- g. The results of condition monitoring, including the results of tube pulls and in-situ testing (Table 6), and
- h. The effective tube plugging percentage for all plugging in each SG (Table 5).

ENO performed an inspection of its two Combustion Engineering (CE) SGs in April 2012 during refueling outage 1R22. This inspection was the 14th in-service inspection (ISI) following SG installation in 1990 and the 1st of four scheduled inspections in the 22nd sequential inspection period. The unit initially entered mode 4 following this inspection on May 9, 2012.

The TS section 5.5.8b.1 steam generator tube integrity structural integrity performance criterion was satisfied. The TS section 5.5.8b.2 steam generator tube integrity accident induced leakage performance criterion was satisfied. Leakage did not exceed the 0.3 gallon per minute (gpm) accident induced leakage limit. Primary-to-secondary leak rate measured using condenser off-gas (Xenon-135) was measured at 0.0003 gpm for the start of operating cycle 22, finished at < 0.0001 gpm and had a decreasing trend over the cycle.

No leakage was predicted for either operating or accident conditions for the 2010 to 2012 operating cycle due to observed SG tube degradation in the 2012 refueling outage. All plugs installed were Alloy 690 in the Palisades SGs post-operation and are either Westinghouse ribbed mechanical plugs or Areva mechanically rolled plugs. The Westinghouse plugs are leak-tight for all plant conditions. The Areva roll expansion provides a leak-limiting seal between the plug and tube wall.

The Palisades SGs also contain 308 tubes plugged pre-service in SG E-50A, and 309 tubes plugged pre-service in SG E-50B. Of the tubes plugged pre-

Steam Generator Tube Inspection Report for the 2012 Refueling Outage

service, one tube in SG E-50A and four tubes in SG E-50B are plugged using welded plugs, which are leak tight. The remaining tubes plugged pre-service are plugged using CE Alloy 690 roll plugs. There have been no reported industry events related to corrosion degradation of these Alloy 690 plugs.

Thirty eight tubes were plugged in SG E-50A and eleven tubes in SG E-50B during the 2012 refueling outage. Refer to Tables 5 and 6 for details. No tubes were pulled in either SG. No tubes required in-situ pressure testing.

There were no new damage mechanisms identified in the steam generator eddy current inspection in 2012.

Service Induced Indications

Table 4A provides the location and measured sizes of service induced indications. The majority of these indications are a result of tube indications from outside diameter stress corrosion cracking (ODSCC). The remaining indications were from tube wear by support structures. There is one tube in SG E-50A Row 51 Column 150 that was removed from service preventively without a service induced indication. There are three tubes in SG E-50A that were removed from service preventively in contact with a loose part at the top of the hot leg tubesheet (TSH) in Row 130 Column 61, Row 132 Column 61, and Row 133 Column 62. These tubes had no wear indications from the loose part but were stabilized and removed from service by tube plugging to prevent issues due to wear from the loose part in the future.

Tables 4B and 4C provide listings of service induced indications with their location, orientation (if linear), and measured sizes. These two tables list all the wear indications for SG E-50A and SG E-50B identified in eddy current testing including those removed from service by tube plugging.

Tube Plugging Summary

Table 5 provides a summary of the tubes plugged during 1R22 for each active degradation mechanism in each steam generator. This table also includes the total number and percentage of tubes plugged to date along with the effective percentage for all plugging in each SG. No repairs other than plugging (e.g. sleeving) have been performed in the Palisades SGs so the effective plugging is equal to the total plugging. Table 6 provides a list of the individual tubes plugged during 1R22 with Tables 7A and 7B providing SG support and acronym information.

Tube Pulls and In-Situ Pressure Testing

No tubes required in-situ pressure testing per eddy current inspection results in the 2012 refueling outage.

* There are multiple ETSSs available for depth sizing of foreign object wear, each depending on the shape of the wear scar and the coil being used. If foreign object wear (with no part present) is reported, an appropriate +Point™ or pancake coil technique will be selected for performing CMOA. The associated NDE uncertainties and CMOA limits will be documented in the CMOA report.

** The Ghent probe will only be used if needed for clarification of the eddy current response or for additional sizing information associated with unusual or unexpected indications.

**Table 7B
Acronyms and Abbreviations**

Acronym	Definition
CMOA	Condition Monitoring and Operational Assessment
DNI	Dent or Ding with Indication
DSI	Distorted Support Indication
LP	Loose Part
MRPC	Motorized Rotating Pancake Coil (+Pt.™)
MBM	Manufacturing Burnish Mark
NDE	Non Destructive Examination
NQI	Non-Quantifiable Indication
NTE	No Tube Expansion
ODSCC	Outside Diameter Stress Corrosion Cracking
PLG	Tube Is Plugged
PLP	Possible Loose Part
PTE	Partial Tube Expansion
PVN	Permeability Variation
PWSCC	Primary Water Stress Corrosion Cracking
SAI	Single Axial Indication
SCI	Single Circumferential Indication
SVI	Single Volumetric Indication
TBP	To Be Plugged
TTS	Top of Tubesheet
<TS	Less Than Technical Specification
WAR	Wear Indication
