LNP Cooling Tower Deposition Analysis

PREPARED FOR: PEF LNP Project File (Meteorology and Air Quality)
PREPARED BY: Ronald Vaughn/ATL
REVIEWED BY: George Howroyd/ATL
COPIES: Lorin Young/IDF
Mike Keating/DEN
DATE: 5/22/2008
PROJECT NUMBER: 338884

Purpose

The analysis documented here was designed to assess the potential for adverse off-site impacts to land use from the proposed cooling towers at the Levy Nuclear Plant (LNP). Because the cooling towers will use saltwater from the Cross Florida Barge Canal (CFBC) for cooling, the potential exists for salt deposition to the land surrounding the site from a small amount of the salt containing particles that may become entrained into the cooling tower exhaust as cooling tower "drift". The analysis and results documented in this Technical Memorandum are intended to provide insight into the predicted deposition of salt-containing particles to vegetation and the ground surface from the two mechanical draft cooling towers at LNP.

Dispersion Model

The American Meteorological Society/U.S. Environmental Protection Agency Regulatory Model (AERMOD), version 07026, was used to predict off-site impacts that could result from the cooling tower operation. The complete AERMOD modeling system is comprised of three parts: the AERMET pre-processor, the AERMAP pre-processor, and the AERMOD model. The AERMET pre-processor compiles the surface and upper-air meteorological data and formats the data for AERMOD input. The AERMAP pre-processor was not used in the analysis due to the generally flat terrain in the area surrounding the proposed site.

Meteorological Input Data

Five years of meteorological data were obtained from the Florida Department of Environmental Protection (FDEP) in the form of AERMOD-ready AERMET formatted files. The AERMET files consist of five years (2001 - 2005) of surface observations from Gainesville, Florida and upper air data from Jacksonville, Florida. The Profile Base Elevation of the Gainesville, Florida National Weather Station is 46 meters. While one year of on-site meteorological data was available from the on-site monitoring system, this five-year period of data was considered to be more statistically suitable for this analysis since the objective of the analysis was to calculate maximum or "worst-case" off-site deposition rates.

Receptor Grid

A polar receptor grid was utilized, with a radial spacing of 10 degrees (i.e., 10°, 20°, 30°, etc.). Modeling was performed on a receptor grid beginning at 1000 meters (m) from a point between the two cooling towers, which corresponds to the approximate distance to the nearest property boundary, due west of the cooling towers. Additional receptors were placed on each of the 36 radials at distances of 1100 m, 1200 m, 1300 m, 1400 m, 1500 m, 2000 m, 2500 m, 3000 m, 4000 m, and 5000 m.

Emissions Data and Other Modeling Considerations

The parameters for the cooling tower that were input into the AERMOD dispersion model are provided in Table 1. The drift emissions from the cooling tower were based on the manufacturer specified drift loss rate (a function of the mist eliminator efficiency), the circulating water flow rate, and the maximum expected concentration of Total Dissolved Solids (TDS) in the circulating water. The maximum TDS of the makeup water supplied to the cooling towers was conservatively assumed to be 25,000 parts per million (ppm) based on using saltwater from the CFBC. An estimate of the distribution of drift droplet sizes in the cooling tower exhaust stream is presented in Table 2.

<p>¹ Each tower will have a total of 44 cooling tower cells. However, the modeling is based on eleven cooling tower cells per cooling tower, with each modeled cell representing 4 combined cells. Therefore, it is necessary to calculate an equivalent diameter of four cooling tower cells. There will be two cooling towers on-site. The calculation is as follows: Area of Circle = (π * square of the diameter)/4. The diameter of cooling tower cell is 10.0 m. Area of one cooling tower cell = (π * square of 10.0)/4 = 78.54 sq meters. The area of four cooling tower cells = 4 * 78.54 sq. meters = 314.16 sq. meters. Equivalent diameter = square root of [(4 * 314.16)/ π] = 20 meters.</p> <p>² The circulating water flow rate of 531,100 gpm is for normal operation. The plant's main condensers are rated for a maximum flow rate of 600,000 gpm. Dispersion modeling analysis was performed on the basis of normal operation and the results should be increased by a factor of 600,000/531,100 to estimate drift deposition for maximum potential flow rates.</p> <p>³ The expected number of cycles of concentration (COC) during normal operation is 1.5, with possible short-term excursions up to 2.0. The dispersion modeling results presented in this document do not account for a COC and the results should be increased by a factor of 1.5 (normal operation) or 2.0 (short-term excursions) to account for recycling of the cooling water in the cooling tower basin.</p> <p>⁴ The PM emission rate = TDS x draft rate (%) x CWFR x density of salt water x 60 min/hr PM emission rate = (25,000/10⁶) x (0.0005/100) x 531,100 gal/min x 8.57 lb/gal x 60 min/hr = 34.14 lb/hr</p> <p>⁵ Particle size distribution is based on the paper, "Calculating Realistic PM-10 Emissions from Cooling Towers", Joel Reisman and Gordon Frisbie, 2001 (See Appendix A). PM-10 emission rate = PM emission rate x percent of total PM that is PM-10 PM-10 = 34.14 lb/hr x (1.10/100) = 0.375 lb/hr</p>

¹ Particle size distribution is based on the paper, "Calculating Realistic PM Emissions from Cooling Towers", Joel Reisman and Gordon Frisbie, 2001 (See Appendix A).

The AERMOD model contains options that determine the way in which calculations are made. The options utilized in the analysis included stack tip downwash, PRIME algorithm for sources influenced by building downwash, default wind profile exponents, default vertical potential temperature gradients, rural dispersion coefficient, and non-regulatory default option. Because the population density of Levy County, Florida is less than 750 people per square km, the urban modeling option was not selected, in accordance with USEPA guidance. Building heights and any other significant structures (i.e., the cooling tower structures themselves are the nearest significant structures) were specified for modeling purposes to facilitate the calculation of downwash and building wake effects by the model. The non-regulatory default option allowed for the selection of the dry deposition option so that impacts would be calculated in grams per square meter.

Modeling Methodology and Procedures

As previously discussed, the AERMOD dispersion model was used to predict potential off-site impacts from salt deposition from the proposed LNP cool towers. The AERMOD dispersion model can be configured to predict deposition by using the cooling tower emissions characteristics (see Table 1), particle size distribution (see Table 2), and selection of the non-regulatory default, and dry deposition options.

Results

The results obtained from running AERMOD are presented in Table 3 and show the maximum 1-month deposition rates for normal operation circulating water flow rate (531,100 gpm/tower) and 1.0 cycles of concentration. The results are shown for each of the five years of meteorological data as well as the 1st high 1-month deposition rates at distances

of 1000 m, 1500 m, 2000 m, 3000 m, and 5000 m from the center of the grid. The maximum predicted deposition (0.6353 grams/square meter-month) occurs at an on-site location, 1000 meters from the center of the grid, northeast of the cooling towers (2005). The maximum predicted off-site deposition is 0.4024 grams/square meter-month, occurring at the nearest property boundary, due west of the cooling towers (1000 m, 270 degrees, 2002 meteorological data). The maximum off-site deposition rate based on a maximum potential circulating water flow rate of 600,000 gpm and a maximum short-term cycle of concentration of 2.0 can therefore be calculated to be:

$$= 0.4024 \times (600,000/531,100) \times 2.0$$

$$= 0.9092 \text{ grams/square meter-month.}$$

Copies of computer printouts from the modeling runs are included as Appendix B.

Particulate Matter Size Fraction Distribution

Calculating Realistic PM₁₀ Emissions from Cooling Towers

Abstract No. 216 Session No. AM-1b

Joel Reisman and Gordon Frisbie

Greystone Environmental Consultants, Inc., 650 University Avenue, Suite 100, Sacramento, California 95825

ABSTRACT

Particulate matter less than 10 micrometers in diameter (PM₁₀) emissions from wet cooling towers may be calculated using the methodology presented in EPA's AP-42¹, which assumes that all total dissolved solids (TDS) emitted in "drift" particles (liquid water entrained in the air stream and carried out of the tower through the induced draft fan stack.) are PM₁₀. However, for wet cooling towers with medium to high TDS levels, this method is overly conservative, and predicts significantly higher PM₁₀ emissions than would actually occur, even for towers equipped with very high efficiency drift eliminators (e.g., 0.0006% drift rate). Such over-prediction may result in unrealistically high PM₁₀ modeled concentrations and/or the need to purchase expensive Emission Reduction Credits (ERCs) in PM₁₀ non-attainment areas. Since these towers have fairly low emission points (10 to 15 m above ground), over-predicting PM₁₀ emission rates can easily result in exceeding federal Prevention of Significant Deterioration (PSD) significance levels at a project's fence line. This paper presents a method for computing realistic PM₁₀ emissions from cooling towers with medium to high TDS levels.

INTRODUCTION

Cooling towers are heat exchangers that are used to dissipate large heat loads to the atmosphere. Wet, or evaporative, cooling towers rely on the latent heat of water evaporation to exchange heat between the process and the air passing through the cooling tower. The cooling water may be an integral part of the process or may provide cooling via heat exchangers, for example, steam condensers. Wet cooling towers provide direct contact between the cooling water and air passing through the tower, and as part of normal operation, a very small amount of the circulating water may be entrained in the air stream and be carried out of the tower as "drift" droplets. Because the drift droplets contain the same chemical impurities as the water circulating through the tower, the particulate matter constituent of the drift droplets may be classified as an emission. The magnitude of the drift loss is influenced by the number and size of droplets produced within the tower, which are determined by the tower fill design, tower design, the air and water patterns, and design of the drift eliminators.

AP-42 METHOD OF CALCULATING DRIFT PARTICULATE

EPA's AP-42¹ provides available particulate emission factors for wet cooling towers, however, these values only have an emission factor rating of "E" (the lowest level of confidence acceptable). They are also rather high, compared to typical present-day manufacturers' guaranteed drift rates, which are on the order of 0.0006%. (Drift emissions are typically

expressed as a percentage of the cooling tower water circulation rate). AP-42 states that “a *conservatively high* PM₁₀ emission factor can be obtained by (a) multiplying the total liquid drift factor by the TDS fraction in the circulating water, and (b) assuming that once the water evaporates, all remaining solid particles are within the PM₁₀ range.” (Italics per EPA).

If TDS data for the cooling tower are not available, a source-specific TDS content can be estimated by obtaining the TDS for the make-up water and multiplying it by the cooling tower cycles of concentration. [The cycles of concentration is the ratio of a measured parameter for the cooling tower water (such as conductivity, calcium, chlorides, or phosphate) to that parameter for the make-up water.]

Using AP-42 guidance, the total particulate emissions (PM) (after the pure water has evaporated) can be expressed as:

$$\text{PM} = \text{Water Circulation Rate} \times \text{Drift Rate} \times \text{TDS} \quad [1]$$

For example, for a typical power plant wet cooling tower with a water circulation rate of 146,000 gallons per minute (gpm), drift rate of 0.0006%, and TDS of 7,700 parts per million by weight (ppmw):

$$\text{PM} = 146,000 \text{ gpm} \times 8.34 \text{ lb water/gal} \times 0.0006/100 \times 7,700 \text{ lb solids}/10^6 \text{ lb water} \times 60 \text{ min/hr} = \underline{3.38 \text{ lb/hr}}$$

On an annual basis, this is equivalent to almost 15 tons per year (tpy). Even for a state-of-the-art drift eliminator system, this is not a small number, especially if assumed to all be equal to PM₁₀, a regulated criteria pollutant. However, as the following analysis demonstrates, only a very small fraction is actually PM₁₀.

COMPUTING THE PM₁₀ FRACTION

Based on a representative drift droplet size distribution and TDS in the water, the amount of solid mass in each drop size can be calculated. That is, for a given initial droplet size, assuming that the mass of dissolved solids condenses to a spherical particle after all the water evaporates, and assuming the density of the TDS is equivalent to a representative salt (e.g., sodium chloride), the diameter of the final solid particle can be calculated. Thus, using the drift droplet size distribution, the percentage of drift mass containing particles small enough to produce PM₁₀ can be calculated. This method is conservative as the final particle is assumed to be perfectly spherical; hence as small a particle as can exist.

The droplet size distribution of the drift emitted from the tower is critical to performing the analysis. Brentwood Industries, a drift eliminator manufacturer, was contacted and agreed to provide drift eliminator test data from a test conducted by Environmental Systems Corporation (ESC) at the Electric Power Research Institute (EPRI) test facility in Houston, Texas in 1988 (Aull², 1999). The data consist of water droplet size distributions for a drift eliminator that achieved a tested drift rate of 0.0003 percent. As we are using a 0.0006 percent drift rate, it is reasonable to expect that the 0.0003 percent drift rate would produce smaller droplets, therefore,

this size distribution data can be assumed to be conservative for predicting the fraction of PM₁₀ in the total cooling tower PM emissions.

In calculating PM₁₀ emissions the following assumptions were made:

- Each water droplet was assumed to evaporate shortly after being emitted into ambient air, into a single, solid, spherical particle.
- Drift water droplets have a density (ρ_w) of water; 1.0 g/cm³ or 1.0 * 10⁻⁶ $\mu\text{g} / \mu\text{m}^3$.
- The solid particles were assumed to have the same density (ρ_{TDS}) as sodium chloride, (i.e., 2.2 g/cm³).

Using the formula for the volume of a sphere, $V = 4\pi r^3 / 3$, and the density of pure water, $\rho_w = 1.0 \text{ g/cm}^3$, the following equations can be used to derive the solid particulate diameter, D_p , as a function of the TDS, the density of the solids, and the initial drift droplet diameter, D_d :

$$\text{Volume of drift droplet} = (4/3)\pi(D_d/2)^3 \quad [2]$$

$$\text{Mass of solids in drift droplet} = (\text{TDS})(\rho_w)(\text{Volume of drift droplet}) \quad [3]$$

substituting,

$$\text{Mass of solids in drift} = (\text{TDS})(\rho_w)(4/3)\pi(D_d/2)^3 \quad [4]$$

Assuming the solids remain and coalesce after the water evaporates, the mass of solids can also be expressed as:

$$\text{Mass of solids} = (\rho_{\text{TDS}})(\text{solid particle volume}) = (\rho_{\text{TDS}})(4/3)\pi(D_p/2)^3 \quad [5]$$

Equations [4] and [5] are equivalent:

$$(\rho_{\text{TDS}})(4/3)\pi(D_p/2)^3 = (\text{TDS})(\rho_w)(4/3)\pi(D_d/2)^3 \quad [6]$$

Solving for D_p :

$$D_p = D_d [(\text{TDS})(\rho_w / \rho_{\text{TDS}})]^{1/3} \quad [7]$$

Where,

TDS is in units of ppmw

D_p = diameter of solid particle, micrometers (μm)

D_d = diameter of drift droplet, μm

Using formulas [2] – [7] and the particle size distribution test data, Table 1 can be constructed for drift from a wet cooling tower having the same characteristics as our example; 7,700 ppmw TDS and a 0.0006% drift rate. The first and last columns of this table are the particle size distribution derived from test results provided by Brentwood Industries. Using straight-line interpolation for a solid particle size 10 μm in diameter, we conclude that approximately 14.9 percent of the mass emissions are equal to or smaller than PM₁₀. The balance of the solid

particulate are particulate greater than 10 μm . Hence, PM_{10} emissions from this tower would be equal to PM emissions x 0.149, or 3.38 lb/hr x 0.149 = 0.50 lb/hr. The process is repeated in Table 2, with all parameters equal except that the TDS is 11,000 ppmw. The result is that approximately 5.11 percent are smaller at 11,000 ppm. Thus, while total PM emissions are larger by virtue of a higher TDS, overall PM_{10} emissions are actually lower, because more of the solid particles are larger than 10 μm .

¹ Bracketed numbers refer to equation number in text.

The percentage of PM_{10}/PM was calculated for cooling tower TDS values from 1000 to 12000 ppmw and the results are plotted in Figure 1. Using these data, Figure 2 presents predicted PM_{10} emission rates for the 146,000 gpm example tower. As shown in this figure, the PM emission rate increases in a straight line as TDS increases, however, the PM_{10} emission rate increases to a maximum at around a TDS of 4000 ppmw, and then begins to decline. The reason is that at higher TDS, the drift droplets contain more solids and therefore, upon evaporation, result in larger solid particles for any given initial droplet size.

CONCLUSION

The emission factors and methodology given in EPA's AP-42¹ Chapter 13.4 *Wet Cooling Towers*, do not account for the droplet size distribution of the drift exiting the tower. This is a critical factor, as more than 85% of the mass of particulate in the drift from most cooling towers will result in solid particles larger than PM_{10} once the water has evaporated. Particles larger than PM_{10} are no longer a regulated air pollutant, because their impact on human health has been shown to be insignificant. Using reasonable, conservative assumptions and a realistic drift

droplet size distribution, a method is now available for calculating realistic PM₁₀ emission rates from wet mechanical draft cooling towers equipped with modern, high-efficiency drift eliminators and operating at medium to high levels of TDS in the circulating water.

Total Sum =						8.18E+00		
Percent PM10 =						1.10%		

Note:

¹ Particle size distribution is based on the paper, "Calculating Realistic PM-10 Emissions from Cooling Towers", Joel Reisman and Gordon Frisbie, 2001.

Example Calculation for 10 µm Droplet Diameter

1.0 Droplet Volume

Volume of sphere = $(4 \times \text{Pi} \times \text{cube of the radius})/3$
Volume of drift droplet = $(4 \times 3.1416 \times (10 \mu\text{m}/2)^3)/3$
Volume of drift droplet = 524 µm³

2.0 Droplet Mass

Mass of droplet = Density of water x droplet volume
Mass of droplet = 1.0 E-06 µg/µm³ x 524 µm³
Mass of droplet = 524 E-06 µg

3.0 Particle Mass

Particle mass = (Total Dissolved Solids (TDS) in the cooling water x droplet mass)/10⁶
Particle mass = 25,000 parts per million x 524 E-06 µg)/10⁶
Particle mass = 1.31 E-05 µg

4.0 Solid Particle Volume

Solid particle volume = Particle Mass/Density of particles (NaCl)
The solid particle are assumed to have the same density as sodium chloride (NaCl), 2.2 E-06 µg/µm³
Solid particle volume = 1.31 E-05 µg/2.20 E-06 µg/µm³
Solid particle volume = 5.95 µm³

5.0 Solid Particle Diameter

Solid particle diameter = 2 x cube root of $(3 \times \text{Pi}/4 \times \text{solid particle volume})$
Solid particle diameter = 2 x $(3 \times 3.1416/4 \times 5.95 \mu\text{m}^3)^{1/3}$
Solid particle diameter = 2.248 µm

MODELOPTS: DDEP TOXICS ELEV * MODEL SETUP OPTIONS SUMMARY ***
CONC DRYDPL WETDPL

**Model Is Setup For Calculation of Average Concentration Values.
**Model Is Setup For Calculation of Dry Deposition Values.

-- DEPOSITION LOGIC --
**Model Uses DRY DEPLETION. DDPLETE = I
**Model Uses WET DEPLETION. WDPLETE = I
**NO GAS DRY DEPOSITION Data Provided.

**Model Uses RURAL Dispersion Only.

**Model Uses User-Specified Options:
1. Stack-tip Downwash.
2. Model Accounts for ELEVated Terrain Effects.

**Other Options Specified:
TOXICS - Allows use of TOXICS option enhancements.

**Model Assumes No FLAGPOLE Receptor Heights.

**Model Calculates 1 Short Term Average(s) of: MONTH
and Calculates ANNUAL Averages

**This Run Includes: 22 Source(s); 1 Source Group(s); and 396 Receptor(s)

**The Model Assumes A Pollutant Type of: PM

**Model Set To Continue RUNNING After the Setup Testing.

**Output Options Selected:
Model Outputs Tables of ANNUAL Averages by Receptor
Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE Keyword)
Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for Calm Hours
m for Missing Hours
b for Both Calm and Missing Hours
Base Elev. for Pot. Temp. Profile (m MSL) = 46.00 ; Decay Coef. = 0.000 ; Rot. Angle = 0.0
Emission Units = GRAMS/SEC ; Emission Rate Unit Factor = 0.10000E+07
Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 1.3 MB of RAM.

**Input Runstream File: LEVY3_2001_PM.DTA

**Output Print File:

LEVY3_2001_PM.LST

MODELOPTS: DDEP TOXICS ELEV * MODEL SETUP OPTIONS SUMMARY ***
CONC DRYDPL WETDPL

**Model Is Setup For Calculation of Average Concentration Values.
**Model Is Setup For Calculation of Dry Deposition Values.

-- DEPOSITION LOGIC --
**Model Uses DRY DEPLETION. DDPLETE = I
**Model Uses WET DEPLETION. WDPLETE = I
**NO GAS DRY DEPOSITION Data Provided.

**Model Uses RURAL Dispersion Only.

**Model Uses User-Specified Options:
1. Stack-tip Downwash.
2. Model Accounts for ELEVated Terrain Effects.

**Other Options Specified:
TOXICS - Allows use of TOXICS option enhancements.

**Model Assumes No FLAGPOLE Receptor Heights.

**Model Calculates 1 Short Term Average(s) of: MONTH
and Calculates ANNUAL Averages

**This Run Includes: 22 Source(s); 1 Source Group(s); and 396 Receptor(s)

**The Model Assumes A Pollutant Type of: PM

**Model Set To Continue RUNNING After the Setup Testing.

**Output Options Selected:
Model Outputs Tables of ANNUAL Averages by Receptor
Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE Keyword)
Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for Calm Hours
m for Missing Hours
b for Both Calm and Missing Hours
Base Elev. for Pot. Temp. Profile (m MSL) = 46.00 ; Decay Coef. = 0.000 ; Rot. Angle = 0.0
Emission Units = GRAMS/SEC ; Emission Rate Unit Factor = 0.10000E+07
Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 1.3 MB of RAM.

**Input Runstream File: LEVY3_2002_PM.DTA

**Output Print File:

LEVY3_2002_PM.LST

CONC

*** MODEL SETUP OPTIONS SUMMARY ***

**Model Is Setup For Calculation of Average Concentration Values.
**Model Is Setup For Calculation of Dry Deposition Values.

-- DEPOSITION LOGIC --
**Model Uses DRY DEPLETION. DDPLETE = I
**Model Uses WET DEPLETION. WDPLETE = I
**NO GAS DRY DEPOSITION Data Provided.

**Model Uses RURAL Dispersion Only.
**Model Uses User-Specified Options:
1. Stack-tip Downwash.
2. Model Accounts for ELEVated Terrain Effects.

**Other Options Specified:
TOXICS - Allows use of TOXICS option enhancements.

**Model Assumes No FLAGPOLE Receptor Heights.

**Model Calculates 1 Short Term Average(s) of: MONTH
and Calculates ANNUAL Averages

**This Run Includes: 22 Source(s); 1 Source Group(s); and 396 Receptor(s)

**The Model Assumes A Pollutant Type of: PM

**Model Set To Continue RUNNING After the Setup Testing.

**Output Options Selected:
Model Outputs Tables of ANNUAL Averages by Receptor
Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE Keyword)
Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for Calm Hours
m for Missing Hours
b for Both Calm and Missing Hours

**Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) = 46.00 ; Decay Coef. = 0.000 ; Rot. Angle = 0.0
Emission Units = GRAMS/SEC ; Emission Rate Unit Factor = 0.10000E+07
Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 1.3 MB of RAM.

**Input Runstream File: LEVY3_2003_PM.DTA

**Output Print File:

LEVY3_2003_PM.LST

MODELOPTS: DDEP TOXICS ELEV * MODEL SETUP OPTIONS SUMMARY ***
CONC DRYDPL WETDPL

**Model Is Setup For Calculation of Average Concentration Values.
**Model Is Setup For Calculation of Dry Deposition Values.

-- DEPOSITION LOGIC --
**Model Uses DRY DEPLETION. DDPLETE = I
**Model Uses WET DEPLETION. WDPLETE = I
**NO GAS DRY DEPOSITION Data Provided.

**Model Uses RURAL Dispersion Only.

**Model Uses User-Specified Options:
1. Stack-tip Downwash.
2. Model Accounts for ELEVated Terrain Effects.

**Other Options Specified:
TOXICS - Allows use of TOXICS option enhancements.

**Model Assumes No FLAGPOLE Receptor Heights.

**Model Calculates 1 Short Term Average(s) of: MONTH
and Calculates ANNUAL Averages

**This Run Includes: 22 Source(s); 1 Source Group(s); and 396 Receptor(s)

**The Model Assumes A Pollutant Type of: PM

**Model Set To Continue RUNNING After the Setup Testing.

**Output Options Selected:
Model Outputs Tables of ANNUAL Averages by Receptor
Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE Keyword)
Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for Calm Hours
m for Missing Hours
b for Both Calm and Missing Hours

**Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) = 46.00 ; Decay Coef. = 0.000 ; Rot. Angle = 0.0
Emission Units = GRAMS/SEC ; Emission Rate Unit Factor = 0.10000E+07
Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 1.3 MB of RAM.

**Input Runstream File: LEVY3_2004_PM.DTA

**Output Print File:

LEVY3_2004_PM.LST

MODELOPTS: DDEP TOXICS ELEV * MODEL SETUP OPTIONS SUMMARY ***
CONC DRYDPL WETDPL

**Model Is Setup For Calculation of Average Concentration Values.
**Model Is Setup For Calculation of Dry Deposition Values.

-- DEPOSITION LOGIC --
**Model Uses DRY DEPLETION. DDPLETE = I
**Model Uses WET DEPLETION. WDPLETE = I
**NO GAS DRY DEPOSITION Data Provided.

**Model Uses RURAL Dispersion Only.

**Model Uses User-Specified Options:
1. Stack-tip Downwash.
2. Model Accounts for ELEVated Terrain Effects.

**Other Options Specified:
TOXICS - Allows use of TOXICS option enhancements.

**Model Assumes No FLAGPOLE Receptor Heights.

**Model Calculates 1 Short Term Average(s) of: MONTH
and Calculates ANNUAL Averages

**This Run Includes: 22 Source(s); 1 Source Group(s); and 396 Receptor(s)

**The Model Assumes A Pollutant Type of: PM

**Model Set To Continue RUNNING After the Setup Testing.

**Output Options Selected:
Model Outputs Tables of ANNUAL Averages by Receptor
Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE Keyword)
Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for Calm Hours
m for Missing Hours
b for Both Calm and Missing Hours

**Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) = 46.00 ; Decay Coef. = 0.000 ; Rot. Angle = 0.0
Emission Units = GRAMS/SEC ; Emission Rate Unit Factor = 0.10000E+07
Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 1.3 MB of RAM.

**Input Runstream File: LEVY3_2005_PM.DTA

**Output Print File:

LEVY3_2005_PM.LST
