THE IMPACT OF STADIUM ANNOUNCEMENTS ON RESIDENTIAL PROPERTY VALUES: EVIDENCE FROM A NATURAL EXPERIMENT IN DALLAS-FORT WORTH

CAROLYN A. DEHRING, CRAIG A. DEPKEN and MICHAEL R. WARD*

We investigate the impact of a potential new sports venue on residential property values, focusing on the National Football League's Dallas Cowboys' search for a new host city in the Dallas-Fort Worth area. We find that residential property values in the city of Dallas increased following the announcement of a possible new stadium in the city. At the same time, property values fell throughout the rest of Dallas County, which would have paid for the proposed stadium. These patterns reversed when the Dallas stadium proposal was abandoned. Subsequently, a series of announcements regarding a new publicly subsidized stadium in nearby Arlington, Texas, reduced residential property values in Arlington. In aggregate, average property values declined approximately 1.5% relative to the surrounding area before stadium construction commenced. This decline was almost equal to the anticipated household sales tax burden, suggesting that the average expected amenity effect of hosting the Cowboys in Arlington was not significantly different from zero. (JEL L83, R53, H73)

I. INTRODUCTION

Public expenditures on a project, and the requisite public taxation, may be economically justified if the benefits from the project outweigh the costs. Most public projects, such as parks, roads, and police, have public good or external benefits that are difficult to quantify, making the evaluation of individual projects difficult. Eventually, however, the net benefits of the accumulated projects are represented in the cost of admission to the community in the form of housing prices or rents. Positive net benefit

projects raise house prices in aggregate, while negative net benefit projects lower house prices in aggregate. We measure the net benefits from the public consideration of a large discrete project, a professional sports stadium funded by a local sales tax increase.

The public expenditure on sports stadiums has long been controversial, and there is an extensive empirical literature investigating the impacts of new stadiums on local economies. The overwhelming majority of studies found either no net benefits or net benefits that are considerably smaller than the costs of either a new stadium or hosting a professional sports franchise (see Siegfried and Zimbalist [2000] and Rappaport and Wilkerson [2001] for thorough reviews). These empirical results contradict the arguments proposed by advocates of stadium studies: that a new stadium will provide the catalyst for an improvement in the community's

attributes. Nevertheless, new stadiums continue to be built with public funds.¹

We contribute to a small but growing literature focusing on the impact of professional sports venues on residential property values. Specifically, we investigate two sets of stadium announcements concerning the National Football League's (NFL) Dallas Cowboys' search for a host city in the Dallas-Fort Worth Metroplex. These announcements provide a quasi-natural experiment to test whether the announcement that a stadium might be built in a particular area has any immediate impact on the sale prices of residential properties. Because a stadium is costly to relocate, we treat the announcements of potential stadium relocation as changing the probability of a large discrete event and test for accumulated and differential impacts of stadium announcements on contemporaneous residential property values.

We find that property values increased in the city of Dallas after the announcement that the Cowboys might move from the city of Irving to a new stadium in downtown Dallas, which would have replaced the aging Cotton Bowl. However, in Dallas County, which would have paid for the stadium with new taxes, residential property values decreased after the announcement of the Fair Park stadium proposal. Consistent with these results, when the Fair Park stadium proposal was abandoned, properties in the city of Dallas declined in value, while the property values in Dallas County rebounded. In the end, the accumulated net effect of the stadium announcements for both Dallas City and Dallas County was zero, consistent with a return to the status quo ante. When analyzing three announcements concerning a potential new stadium in Arlington, we find that the accumulated impacts of the stadium announcements reflected between 1.3 and 1.5 percent reduction in residential property sales prices in Arlington, *ceteris paribus*. In other words, at each point in which it became more certain that Arlington would contribute local tax dollars to a new stadium for the Cowboys,

1. During the 1990s and through the early 2000s, cities across the United States have engaged in what could be termed a venue building spree. A little more than 50% of the 122 teams in the four major professional leagues in the United States have moved into a new or substantially renovated venue since 1990. In aggregate, these new venues cost an estimated \$13.45 billion in current (\$16 billion in 2005 CPI adjusted) dollars. Public dollars have contributed \$10.27 billion, or two-thirds, to the construction and maintenance of new sports venues.

property values in Arlington fell. While the reduction in property values reflects the combination of an expected localized amenity effect and an expected tax effect, we cannot reject the null hypothesis that the expected amenity effect was equal to zero before stadium construction commenced.²

II. A NEW DALLAS COWBOYS STADIUM: WHERE AND WHEN?

In April 2001, the Dallas Cowboys announced that they were interested in obtaining a new publicly subsidized stadium to replace the aging Texas Stadium. Built in 1972, Texas Stadium lacks many of the modern revenue generating aspects of new stadiums, particularly modern luxury suites and a closed or retractable roof. During the spring and summer 2001, team owner Jerry Jones entertained initial proposals from a number of cities in the Dallas-Fort Worth Metroplex, including current home Irving, Grapevine, Arlington, Grand Prairie, and Dallas. These preliminary discussions were tabled after the September 11, 2001, attacks in New York City and did not come back to public light until late 2003.

At that time, the Cowboys once again publicly mentioned their desire for a new stadium and suggested that the stadium could be built in Irving, near Texas Stadium. The response to this proposal by the city of Irving was not encouraging. Because of Irving's relatively small tax base (population of 130,000 in 2000) and its inability to raise the sales tax rate beyond the state-mandated cap, the city of Irving alone was unlikely to be able to finance its contribution to the anticipated \$1 billion project.³ This, in turn, caused the Cowboys to look beyond Irving for a new home.

In the early months of 2004, a number of cities indicated their desire to contend for the new stadium, but it was equally apparent that these cities suffered the same problems as Irving—too small of a tax base and/or little room under

2. The Dallas Cowboys did not relocate to another metropolitan area, therefore any metro area-wide amenity effect was unaffected by the selected stadium site.

3. The State of Texas has no state income tax. The state levies a 6.25% sales tax to fund the state government. Cities are allowed to add up to an additional 2% sales tax to fund local government and special projects such as road maintenance and stadiums. As of 2004, the city of Irving had a 1% sales tax for local government and a 1% sales tax to contribute to the Dallas Metro Transit system. Therefore, the city of Irving had no room under the existing state-mandated sales tax cap of 8.25%.

the state sales tax limit. In March 2004, it was suggested that Fair Park in downtown Dallas, home of the 72-yr-old Cotton Bowl, could be possible site for a new Cowboys stadium. The possibility that the Cotton Bowl would be replaced by a new retractable roof stadium generated considerable excitement in the Dallas community. A new stadium in Fair Park would move the Dallas Cowboys back to their original home town (rather than playing in a suburb of Dallas) and would ensure both the annual University of Texas and the University of Oklahoma football game and the annual Cotton Bowl would remain in Dallas. Moreover, a new stadium would allow Dallas to contend to host any number of events, including a National Collegiate Athletic Association (NCAA) championship football game, a Super Bowl, or an NCAA Final Four. Fair Park also has the advantage of an existing infrastructure able to handle large events.⁴

The Fair Park proposal called for the County of Dallas to increase its sales tax rate by one-half of 1% to pay for the stadium. A countywide sales tax increase was proposed to expand the tax base enough to cover the anticipated construction costs. However, notwithstanding the excitement generated by the stadium proposal, one considerable problem became apparent. The city of Dallas was contractually obligated to retire the public debt it incurred to build the \$410 million American Airlines Arena (home of the National Hockey League's Dallas Stars and the National Basketball Association's Dallas Mavericks) before spending any additional tax dollars on a new professional sports venue of any kind. This contractual obligation removed the city of Dallas, but not the rest of Dallas County, from the tax jurisdiction for a new football stadium.⁵ When it became clear that the city of Dallas would not be contributing any tax proceeds toward a new stadium, the remaining Dallas County population and city officials cooled to the idea of building a new stadium in Fair Park. The Fair Park proposal was officially abandoned in the public media on June 6, 2004. Thereafter, the Dallas Cowboys publicly renewed their search for a new host city.

4. Fair Park is home of the annual Texas State Fair, the largest state fair in the United States.

5. The city of Dallas passed the referendum to build a new basketball/hockey arena in 1998 and does not anticipate retiring the debt for that stadium until well after 2020.

On July 17, 2004, the mayor of Arlington announced that he had been in negotiations with the team about the potential of building a new stadium in Arlington. In many ways, Arlington is also a good place to locate a new stadium. Arlington is located between Fort Worth and Dallas, has access to multiple interstates and highways, and the city already hosts the Texas Rangers Major League Baseball club and a Six Flags amusement park. Arlington is also the third largest city in the Dallas-Fort Worth Metroplex (after Fort Worth and Dallas), and its approximate \$4 billion annual economy and 360,000 people provide a sufficiently large tax base to subsidize a stadium. Arlington built the Rangers baseball stadium in 1994, following a public referendum in 1991, and the city paid off the last of the baseball stadium bonds in early 2001. Afterward, in accordance with state law, the city of Arlington *reduced* its local sales tax rate by the one-half of 1% that would have been dedicated to servicing the baseball stadium debt. Therefore, in early 2004, the city of Arlington was unique among area cities in that it had a large tax base and room under the state-mandated sales tax cap.⁶

On August 17, 2004, the Arlington city council approved a ballot initiative to be decided during the November 3, 2004, general election. The ballot initiative was announced to include two elements. The first would approve up to \$325 million in public money to contribute to land acquisition and construction costs for a new retractable roof football stadium for the Dallas Cowboys. The second part authorized the city to increase the local sales tax by a half cent, increase local hotel taxes by 2 percentage points, and increase Arlington-based car rental taxes by 5 percentage points to finance the city's contribution to the stadium. The ballot initiative was approved by the voters of Arlington on November 3, 2004, with 55% voting in favor and 45% voting against. The precise stadium location was determined in early 2005, and in April 2005, the city of Arlington began collecting the additional taxes. The new stadium is scheduled to open for the 2009 football season.

During the stadium campaign, pro-stadium activists solicited an economic impact study and produced television, radio, mass mailings, and newspaper advertising that touted the

6. At the time the stadium proposal was announced, the prevailing local sales tax rate in Arlington was 7.5%.

economic impact figures generated in their study. Ultimately, they out-spent antisubsidy activists \$6 million to \$43,000. The Cowboys were large contributors to the pro-stadium proponents, had players post yard signs, and the famous team cheerleaders attended campaign events to encourage passage.⁷ Proponents predicted that the new stadium would bolster Arlington's entertainment-focused industry and that the two-stadium complex would be an attractive area in which people would want to live. This, in turn, led some to claim that the new stadium would not only contribute to the quality of life in the city of Arlington but also cause an increase in property values.

III. THE POTENTIAL IMPACTS OF A NEW STADIUM ON PROPERTY VALUES

Land use externalities are costs or benefits generated by land uses that flow outside market transactions. Because externalities have been shown to be capitalized into house prices, they provide the justification for municipal zoning. In the absence of zoning, the market will over-allocate land to negative externality-producing "lower" uses. Externalities can influence prices in two ways: scale effects and boundary effects. Scale effects relate to the absolute amount of the externality-producing use, while boundary effects relate to the proximity to the externality-producing use.⁸

Two articles have investigated the impact of a professional sports franchise or sports venue on house prices. Carlino and Coulson (2004) discussed the public good facet of professional sports teams, what they term nonexcludable beneficiaries. The perceived benefits that might accrue to those who will never attend a game relate to an enhanced sense of "civic pride," which should cause an increased willingness to pay for local housing, among other

7. This lobbying is consistent with Depken (2006) who found that much of the public cost of a new professional baseball stadium is capitalized in the value of the franchise.

8. There is a large literature investigating land use externalities. A small sample includes estimating the effect of water amenities on house prices (Brown and Pollakowski, 1977; Cassel and Mendelsohn, 1985; Darling, 1973; Knetsch, 1964; Lansford and Jones, 1995) and the effect of public open-space externalities on house prices (Correll, Lillydahl, and Singell, 1978; Dehring and Dunse, 2006; Espey and Owusu-Edusei, 2001; Irwin, 2002; Weicher and Zerbst, 1973). The effects of potentially negative externalities such as transmission towers, power lines, group homes, airports, and landfills on residential property values have also been examined.

things. In their examination of monthly rents in 60 metropolitan statistical areas in 1993 and 1999, Carlino and Coulson found rental premiums in both the central business district and the surrounding suburbs of cities that host NFL franchises.⁹

Tu (2005) examined the impact of FedEx field, the home of the NFL's Washington Redskins, on surrounding house prices pre- and post-stadium construction in Landover, Maryland. Tu compared prices within 3 miles of the FedEx field site across three time periods: predevelopment, development, and postdevelopment, where the development period starts from when the Landover site was first revealed as a possible site of the stadium. Predevelopment, he found that properties closer to the proposed stadium site had lower value relative to those located further away from the proposed site. However, this gradient became less pronounced following the stadium's development, suggesting that a positive externality was generated by the new stadium for properties located closer to the stadium. Tu estimated an aggregate increase in property values of approximately \$42 million generated by the new stadium.

In the case where a new stadium is funded with a local sales tax, any capitalization in local residential property prices identified with the stadium project is the sum of three possible effects: a negative tax effect, a (potentially) positive incremental "civic pride" effect common to the city residents from hosting the team,¹⁰ and an ambiguous externality effect.¹¹ Any positive externalities created by a stadium could be discrete or related to proximity, such as income-earning opportunities, for example, selling parking space, or access to other amenities such as nicer restaurants or hotels. Potential negative externalities would include diminished view, traffic congestion, noise, loss of privacy, and crime. Accordingly, the impact of a new stadium on house values is ambiguous ex ante and is therefore a question to be resolved empirically.

Our analysis is closest to that by Tu, but we differ in that we focus on announcements that

9. Coates, Humphreys, and Zimbalist (2006) suggested that Carlino and Coulson's estimation results are based on relatively few observations and are therefore not as robust as claimed. In a rejoinder, Carlino and Coulson (2006) suggested that this argument is incorrect.

10. Hakes and Hutmaker (2006) found that fans nearest the stadium value the team the most.

11. See Oates (1969), Bloom and Yinger (1983), and Man and Bell (1996).

a stadium might/will be built in a particular area, all of which are predevelopment, rather than pre- and post-stadium construction. We implicitly assume that housing markets exhibit informational efficiency, such that any expected net externality effects are capitalized in house prices well in advance of the actual project completion. Our article also differs from that of Tu in that we investigate the immediate impact of stadium announcements on property values. Tu found that FedEx field enhanced proximate property values by approximately \$42 million in aggregate, which reflects a pure amenity effect. In contrast to the Cowboys stadium, FedEx field was essentially privately funded, implying no local tax effect generated by the stadium.

Our use of announcement dates rather than project completion dates is not without precedent. For example, Colwell, Dehring, and Lash (2000) used announcement dates to test the effect of group homes on neighborhood house prices. They measured the announcement date as the day the public was first made aware that a group home was to be opened in the area. Similarly, Dehring (2006) used ordinance dates, rather than the effective dates of regulation, to investigate the effect of coastal construction code changes on vacant land development in Florida. Using announcement dates avoids potential specification bias when the purpose of the empirical analysis is to identify the impact of policy changes on property values. To the degree that property markets incorporate new information in a timely fashion, property value adjustments might have already occurred by the time the policy changes actually take effect.

IV. DATA AND METHODOLOGY

Our test of the impact of stadium announcements on residential property values combines hedonic pricing models, event study methodology, and difference-in-difference estimators. Hedonic pricing reveals the implicit price of housing and location attributes, as well as any price effects from the stadium.¹² Because each announcement increases or decreases the probability that a stadium would be built in a specific location, each is allowed to have an impact on property values

(MacKinlay, 1997). We employ a difference-in-difference identification strategy to distinguish the net amenity effect before and after each announcement.

There is a large literature on hedonic pricing models of houses. These studies typically find that in large metropolitan areas, most of the variation in house prices can be explained by a house's age, size, and the quality of local public schools. Other factors include the availability of parking, whether the property includes a swimming pool, and the time of sale. Following standard practice, we include these controls as well as the variables of interest to measure stadium effects.

We investigate the impact of five separate stadium announcements, two of which concern Dallas and three of which concern Arlington. The first two announcements represent the stadium potentially coming to and then leaving the Fair Park district near downtown Dallas. The first (second) of these announcements is associated with an increased (decreased) probability that a new stadium would be built in downtown Dallas. Three additional announcements center on the proposal to build a stadium in Arlington. These announcements correspond with the dates on which the mayor of Arlington announced his previous negotiations, the city council vote to approve a ballot initiative, and the affirmative ballot initiative outcome (Table 1).

Our estimation strategy is based on each event changing the probability of different sets of houses being affected by the proposed Cowboys move. After 2003, it was increasingly likely that the Cowboys franchise would relocate somewhere within the Dallas-Fort Worth metropolitan area. At the time, there may have been six or seven viable sites, implying that each had an ex ante nontrivial positive probability of being chosen. We assume that the first Dallas announcement increased the probability that the team would locate to Fair Park and that the second announcement reduced this probability to zero. We further assume that the probability of the team relocating to Arlington increased with the next three announcements during the summer and fall 2004.

One obvious difference from standard event studies is that we cannot track daily changes in the value of a single house but must draw inferences from prices of different houses. Another is that we are not calculating the return relative to the general market as one

12. Rosen (1973) is the groundbreaking hedonic pricing study, but see Sirmans, Macpherson, and Zietz (2005) for a thorough review of hedonic pricing in real estate.

TABLE 1
Dallas Cowboys Stadium Announcements Date Description

Announcement 1	April 30, 2004	Proposal to build a stadium at Fair Park in downtown Dallas. The proposed stadium would replace the aging Cotton Bowl, and the public contribution to construction costs would be financed by a half cent sales tax throughout Dallas County. Ultimately, the city of Dallas would not contribute to this additional tax because of contractual obligations to retire its debt for the American Airlines Arena.
Announcement 2	June 9, 2004	The Fair Park proposal officially abandoned.
Announcement 3	July 17, 2004	Arlington's mayor announces that he has been in secret negotiations with the team about building a new publicly subsidized stadium near the existing baseball stadium in Arlington.
Announcement 4	August 17, 2004	Arlington's city council approves a stadium ballot initiative for the November 2004 general election. The ballot initiative asks voters to approve up to \$325 million toward land acquisition and construction costs for a new stadium located near the existing baseball stadium in Arlington. The ballot initiative also includes a one-half cent sales tax in Arlington as well as additional hotel and car rental taxes.
Announcement 5	November 3, 2004	Arlington voters approve ballot initiative on November 3, 2004, and the additional taxes are instituted on April 1, 2005.

would do when analyzing abnormal stock returns. Any price effect from a proposed stadium should be reflected in the prices of houses benefiting, or suffering, from the expected net effect at the time of the announcement. For example, the public expense of the Fair Park stadium was to have been funded by taxation within Dallas County. All else equal, we expect this tax effect to cause a reduction in Dallas County house prices after the first announcement and a commensurate increase after the second announcement.

We employ a general difference-in-difference identification strategy to calculate the effects of stadiums. For example, for the first announcement, we include a Dallas County dummy variable, an announcement date dummy variable, and the Dallas County dummy variable interacted with the postannouncement period. Since the measured effect of the interaction represents the differential impact of the stadium on houses in Dallas County relative to either general announcement effects independent of location or Dallas County effects at different times, we identify it with the expected effect of increased taxation to finance the stadium on Dallas County houses.

Our estimating equation is represented as:

$$(1) \ln(\text{PRICE}_i) = \beta \text{FEATURES}_i + \delta \text{ANNOUNCE}_i + \phi \text{TAXJURIS}_i + \gamma \text{ANNOUNCE}_i \times \text{TAXJURIS}_i + \varepsilon_i,$$

where β , δ , ϕ , and γ are vectors of parameters to be estimated and ε_i is a composite zero-mean error term that facilitates neighborhood fixed effects and spatial correlation.

The dependent variable $\ln(\text{PRICE})$ is the logarithm of the sale price of the house. The vector **FEATURES** includes both structural and location attributes including structure age, aged squared, amount of living area, area squared, the number of baths, the existence of a pool, number of parking places, and dummy variables for the public schools serving the school. The vector **ANNOUNCE** includes the appropriate dummy variables, for the sample analyzed, indicating whether the sales price was agreed upon after each of the five announcements. The variable **TAXJURIS** is a dummy variable, indicating that the home is within the jurisdiction of the proposed tax intended to fund the public share of the stadium building expense.

For the Dallas Fair Park proposal, we include two separate dummy variables: one for the city of Dallas and one for all the other cities in Dallas County. The initial Fair Park stadium proposal included a countywide sales tax to pay for the stadium. However, the city of Dallas likely would not have contributed to the football stadium until it had retired its debt for the basketball-hockey arena built in 1998. It is not clear if homeowners in the city of Dallas anticipated higher taxes or not. If the market anticipated tax burdens correctly, the announcement of the stadium coming to Dallas would have been a pure amenity effect in the

city of Dallas, similar to the effect found by Tu (2005), while property value changes in the rest of Dallas County would have been a net effect. When the Fair Park stadium proposal was abandoned, the reverse pattern would be expected.

For the Arlington stadium proposal, we define TAXJURIS as the city of Arlington. We identify each announcement in Arlington as signaling an increased likelihood that a stadium would be built in Arlington. Thus, if the proposed stadium had a net positive (negative) expected impact on the community's attributes, we anticipate each announcement to correspond with an increase (decrease) on house prices in Arlington, relative to the surrounding areas.

Three points regarding the tax jurisdiction indicators are worth mentioning. First, for both stadium proposals, the public contribution to the stadium's cost was to be financed by an increase in the local sales tax rate. Citizens of one city or county may well be taxed in proportion to their taxable purchases within the jurisdiction. However, some owners of houses in the tax jurisdiction may purchase taxable items outside the jurisdiction. The converse is true for homeowners in nearby cities. Because the land area of Dallas City, Dallas County, and Arlington is large relative to normal shopping distances, we expect the measurement error from these border regions to be small. Second, using a dummy variable, we are implicitly assuming that the tax burden is roughly proportional to the house value. This is likely to hold since both housing value and expenditures on taxable items are likely to be highly correlated with household income. Third, there may be a positive amenity effect from having one's town associated with the team, regardless of the distance to the stadium. In this case, the measurement of the tax jurisdiction effect is the net of the tax and amenity effects.

We employ a generalized least squares (GLS) estimator that takes into account possible heteroscedasticity and spatial autocorrelation. Since we cannot reject that the error term has a common component at the city level, our estimator allows the variances to differ across geographic areas. We include a fixed effect for the public elementary school that a homeowner's children would likely attend. The elementary school almost always identifies a middle and a high school as well.¹³

13. Evidence suggests that there is a high correlation between property value and the quality of the public schools (Downes and Zabel, 2002).

However, it is likely that there is also spatial correlation that influences the variance of house properties as well. We therefore use a robust GLS estimator that allows for fixed effects (mean shifters) and clustering (variance shifters) based on elementary schools. The estimator we employ uses a great deal of information as there are 745 elementary schools included in the Dallas-centered sample and 649 elementary schools included in the Arlington-centered sample.

Our data include two samples of residential property sales in the Dallas-Fort Worth Metroplex from January 2004 through March 2005. The residential property sales data were collected from the Multiple Listing Service (MLS). We subtract 30 d from the closing date, reported by the MLS, to more closely align house contract dates with the announcement effects.¹⁴ To avoid undue influence of outlier properties, we excluded observations that corresponded to houses more than 70 yr old, more than 7,000 square feet, less than 500 square feet, or with more than seven bathrooms. Both the Dallas- and Arlington-centered samples were further limited by excluding properties beyond 20 miles from the proposed stadium site. The Dallas-centered sample ultimately comprises 42,351 observations; the Arlington-centered sample comprises 32,061 observations. The descriptive statistics of the data are provided in Table 2. The first two columns report the mean and standard deviation of our dependent and independent variables for the Dallas-centered sample. The second two columns report the descriptive statistics for the Arlington-centered sample.

V. EMPIRICAL RESULTS AND DISCUSSION

We estimate the difference-in-difference model described in Equation (1) including elementary school fixed effects. We accommodate spatial correlation in property values by clustering the error terms by elementary

14. This is not always guaranteed to directly align house sale dates with announcement dates as closing times can differ. However, the average time to close is approximately 30 d, and we anticipate that any other measurement error introduced by our adjustment is not systematically related to the stadium announcements. Therefore, the adjustment would only influence the efficiency, but not the consistency, of our estimation results.

Notes: Data reflect residential property sales from January 1, 2004, through February 28, 2005, with complete data, and located within 20 miles of the Cotton Bowl for the Dallas sample and the Ballpark in Arlington for the Arlington sample. Data obtained from the Dallas-Fort Worth Metroplex MLS. January is used as the reference month. Dummy variable means do not sum to 1 because of rounding.

school. The full estimation results are detailed in Tables 3 through 5.

The primary hedonic regression results are provided in Table 3. The left column provides results pertaining to the Dallas sample, centered on the Cotton Bowl in downtown Dallas, whereas the right column provides results pertaining to Arlington, centered on the Ballpark in Arlington (the approximate site of the proposed Cowboys stadium). The hedonic regression results are consistent with

the results obtained using data from other large metropolitan areas. For instance, in both the Dallas and the Arlington samples, each additional year of age reduces the average property by approximately 1.3%, although this decline is tempered a bit by the positive coefficient on the quadratic of age. Likewise, each additional 20 square feet adds approximately 1% to the value of the house, although this increase is also tempered by the negative parameter estimate on the quadratic of square

footage. In both cities, a pool on the property adds approximately 8.5%, each bathroom adds an additional 5%, each covered parking spot adds 5%, and an additional storey, holding square footage constant, reduces the average property value by approximately 9%.

The primary empirical results of interest, those pertaining to the stadium announcements, are reported in Tables 4 and 5. For the Dallas sample, we focus on the first two announcements: the Cowboys might relocate to Fair Park (Announcement 1) and the Cowboys will not relocate to Fair Park (Announcement 2). In this case, the city of Dallas would enjoy the amenity benefits of the stadium but would not have contributed to the stadium subsidy. However, the rest of the County of Dallas would have paid for the stadium without enjoying any proximity amenities associated with the stadium. Therefore, for the Dallas sample, we control for both Dallas and Dallas County announcement effects. In the case of Arlington, we focus on the last three stadium announcements: the city was in negotiations with the team (Announcement 3), the Arlington city council approved a ballot initiative concerning the stadium (Announcement 4), and the affirmative outcome of the November 2004 ballot initiative (Announcement 5).

TABLE 4
Unconstrained Stadium Announcement Effects

	Dallas Sample (1)	Arlington Sample (2)
Announcement 1	0.008 (0.029)

The first column of Table 4 presents estimation results relating to the potential downtown Dallas site. The initial announcement that the Cowboys might relocate to Fair Park in Dallas City corresponded with an increase in property values in Dallas City. On the other hand, this first announcement reduced property values throughout the rest of Dallas County (although the parameter estimate is not distinguishable from zero). When the Cowboys announced that they were not going to relocate to Fair Park in downtown Dallas, the opposite qualitative impacts on property values in the city of Dallas and throughout Dallas County are expected. Combined, these results suggest that there were expectations of amenity effects of a Cowboys stadium in the city of Dallas but that the benefits were outweighed by the expected tax burden of the stadium.

The second column of Table 4 reports similar estimation results for the Arlington sample. In this case, only the last three announcement dates are investigated. Because Arlington was the only city in the metropolitan area that would charge additional sales tax to pay for the public contribution to the stadium, there is no need for a separate county dummy variable. The results suggest that each of the first two stadium announcements concerning Arlington correlated with a reduction in residential property values in Arlington relative to other non-Arlington properties within 20 miles of the proposed stadium site. The last announcement event, corresponding with the affirmative November vote, carries a positive parameter estimate. While none of the three parameter estimates are individually statisti-

cally significant, their sum of -0.012 is statistically less than 0 at the 8% level. This suggests that the average property in Arlington that sold after the stadium referendum might have fallen in value but rather clearly did not increase in value with the announcements leading up to the referendum.

One possible problem with the results reported in Table 4 is the assumption that each announcement has a separate and identifiable impact on residential property values.¹⁵ This approach might ask “too much” of the data. A more parsimonious approach is to restrict each stadium announcement to have an identical accumulating impact on residential property values, that is, we restrict the parameters on the different announcements to be equal. When imposing this restriction, the dummy variables for the announcement periods are summed.¹⁶ Given the results in Table 4, we expect the second announcement effect in Dallas to completely offset the first as the Cowboys ultimately did not relocate to Fair Park; this would be consistent with a return to the status quo ante. However,

15. As pointed out by a helpful referee, the use of announcement dates in a reduced form framework cannot distinguish between no capitalization effect and offsetting changes in the underlying supply and demand for housing based on the probability of a new stadium being built in a particular area.

16. The sum of the dummy variables in Dallas can take a value of 0 or 1; those with a value of 0 sold before Announcement 1, those with a value of 1 sold after Announcement 2. For properties in Arlington, the sum of the announcement dummy variables falls between 0 and 3, that is, the value will be 0 if the property sold before Announcement 3 and 3 if the property sold after Announcement 5.

in Arlington, the cumulative impact of the Arlington-specific stadium announcements is ambiguous.

In Column 2 of Table 5, the results from the Dallas sample suggest no net impact on property values from the two announcements concerning the Fair Park proposal. This suggests that the values of properties surrounding Fair Park returned to the status quo ante when the Fair Park proposal was abandoned. However, in Column 3 of Table 5, the results from the Arlington sample suggest that each of the three announcements corresponded with an average reduction in residential property values in Arlington of approximately one-half of 1%. Therefore, the aggregated impact of the announcements concerning the Arlington stadium proposal was an average reduction in Arlington property values of approximately 1.5%, a result that is statistically different from zero ($p = .023$).

Although the individual Arlington-specific announcement effects are insignificant, the significant and negative cumulative effect of the three announcements on the property values in Arlington, relative to the surrounding cities, is striking. Proponents of stadium subsidies often allude to the positive externalities the stadium will generate for the host city. If such claims were true, then the impact of an increasing probability that a stadium would be built in Arlington would be expected to increase property values in that city. In our analysis of the announcements concerning a stadium in Arlington, we find no compelling evidence of individual announcements increasing the value of properties in the city where the stadium would be built. Rather, we find a negative and strongly significant cumulative impact of the announcements on property values. Combined, these results cast suspicion on the claims that stadium subsidies are justified by pecuniary and nonpecuniary positive externalities a stadium provides host city residents.

VI. CONCLUSIONS

The aggregated impact of stadium announcements when stadiums are funded by municipal tax dollars is the combination of three distinct elements: the tax burden, which causes a reduction in property values; the overall city amenity effect, which causes an increase in property values; and the proximity

amenity effect, which has an ambiguous effect on residential property values. The results presented herein suggest that the aggregated expected city amenity effect and local sales tax burden associated with the proposal to build a publicly subsidized stadium for the Dallas Cowboys in Arlington, Texas, reduced residential property values.

What is the magnitude of the amenity effect for Arlington? A back of the envelope calculation suggests that a household of four with \$50,000 income might contribute up to \$60/yr in local sales tax dedicated to the stadium construction.¹⁷ Assuming a wage growth rate of 4.5%/yr, the 30-yr present value of the tax payments would be approximately \$2,000. During the sample period, the average residential property in the city of Arlington sold for \$120,000. The 95% confidence interval for the accumulated deleterious effect of the various stadium announcements on average property values in Arlington is ($-\$3,343$ to $-\$142$), centered on $-\$1,742$. Therefore, the average reduction in property value is not statistically different from the expected additional local sales tax burden. In other words, the general amenity effect in the city of Arlington is not distinguishable from zero.

This result differs from that of Tu (2005) who found a positive amenity effect for properties located within 3 miles of the NFL's Washington Redskins stadium built in 1995. There may be significant differences between the area of Landover, Maryland, where the Redskins built their stadium, and Arlington, Texas, where the Cowboys are building their stadium. Additionally, the tax effects associated with the Cowboys project did not plague the Redskins project and this might help explain the differences in the results.

Two questions remain unanswered. First, what is the pattern of changes in residential property values in the city of Arlington as the Cowboys stadium is constructed and what will happen to residential property values after the stadium opens? If property values in Arlington increase *after* the new stadium opens, this might simply offset the reduction in property values incurred when the stadium project was announced. Second, if the property values fell in the city of Arlington during the stadium campaign, why did the stadium

17. Based on IRS State Sales Tax Deduction tables, 2005 Instructions for Schedules A & B (Form 1040).

project win the approval of a majority of Arlington voters? Perhaps, the distribution of the net benefits of a Cowboys stadium was sufficiently distorted such that a majority of the voters approved the measure even as average property values fell. On the other hand, the transient nature of Arlington's population might have caused an information asymmetry about the expected net effects of public expenditures on stadiums. These questions provide a possible road map for future inquiry.
