## 1.0 INTRODUCTION

Groundwater monitoring wells were installed at the Luminant, Inc. (Luminant) Comanche Peak Nuclear Power Plant (CPNPP) to support determination of groundwater elevation and hydraulic gradients for the Units 3 and 4 Combined Operating License (COL) Application. A total of 47 single and clustered groundwater monitoring wells at 20 locations were installed in October 2006 in support of the COL Application groundwater investigation.

Monitoring wells were designated as follows, where XX denotes the well or cluster number with wells installed in one or more of three subsurface zones specified by letter:

- *Regolith Wells (A-zone wells)*: Regolith or undifferentiated fill monitoring wells (MW-12XXa) were installed if greater than 10 ft of saturated soil was encountered above hollow-stem auger refusal.
- *Shallow Bedrock Wells (B-zone wells)*: Shallow bedrock monitoring wells (MW-12XXb) were generally completed in the upper 40 to 65 ft of bedrock in an apparent zone of alternating stratigraphy; i.e., claystone, mudstone, limestone, and shale sequences.
- *Bedrock Wells (C-zone wells)*: Bedrock monitoring wells (MW-12XXc) were generally completed in deeper bedrock zones consisting of alternating stratigraphy and competent bedrock.

Groundwater monitoring well locations are shown in Figure 1 with installation details presented in Table 1.

Following installation, development, and surveying of the groundwater monitoring wells, the groundwater monitoring wells were gauged monthly from November 29, 2006 through November 15, 2007, to determine depth to groundwater. Due to apparent non-equilibrium conditions in some of the monitoring wells, the wells were gauged for an additional 5 months between January 23, 2008 and May 28, 2008. Based on subsequent requests from the US Nuclear Regulatory Commission (NRC) staff for additional groundwater elevation data, the wells were again gauged for an additional 5 months between August 17, 2012 and December 5, 2012.

To determine trends in the elevation of Squaw Creek Reservoir (SCR), historic data was obtained from the US Geological Survey (USGS) for Gauge Station 08091730 at Squaw Creek Reservoir, Texas (USGS 2012b).

No operable precipitation gauges with a significant recorded history are installed within the Squaw Creek Watershed above SCR. To allow for evaluation of precipitation effects on the groundwater and surface water elevations, rainfall data was obtained from several rainfall gauges surrounding the CPNPP site for selected historic extreme weather events.

This Project Report was Independently Reviewed to ensure that;

- a. Water level gauging field data has been accurately translated into the Project Report.
- b. Mathematical calculations to obtain Project Report water elevations are accurate.
- c. Approach: For Steps a and b, data shall be verified by reviewing an initial 10% sample of the data, and if errors are identified, then the verification shall be expanded to a 25%

sample. If significant errors are discovered in the 25% sample, then all data is reviewed for accuracy.

- d. Result: For Steps a and b, no errors were identified for the 10% sample.
- e. Data processing methods and references are reasonable and appropriate.
- f. Results are reasonable and consistent with input data.

## **2.0 GROUNDWATER GAUGING ACTIVITIES**

### **2.1 Manual Monthly Groundwater Gauging**

For the August 17, 2012 through December 5, 2012 gauging events, the depth to water measurements in each groundwater well monitored was measured with a groundwater interface probe to the nearest 100<sup>th</sup> foot. Prior to use, markings on the groundwater interface probe were compared to a steel tape as an accuracy check. Prior to each gauging event, a daily operation check was performed to ensure the interface probe was operational. Measurements for depth to water were then obtained from a surveyed location on each well casing, denoted by a pre-cut notch on the top of each groundwater well PVC casing.

Copies of the field data sheets from the August 17, 2012 through December 5, 2012 monthly gauging events are included as Appendix A.

### **2.2 Data Processing**

#### **2.2.1 Groundwater Data**

Depth to water measurements obtained between November 29, 2006 and November 15, 2007 are presented in the CPNPP Units 3 and 4 Final Safety Analysis Report (FSAR), Revision 3, Table 2.4.12-209 (Luminant 2012a). Depth to water measurements obtained between January 23, 2008 and May 28, 2008 were presented in the response to NRC Request for Information (RFI) HYD-20 (Enercon 2009). Depth to water and groundwater elevation information from these historical events are included for comparative analysis in Tables 2 through 4. FSAR Table 2.4.12 and the RFI HYD-12 response are included as Appendix F.

Groundwater measurements were processed in an Excel spreadsheet by subtracting the depth to water from the surveyed reference elevation to obtain the groundwater elevation above mean sea level (msl). Monthly groundwater elevations for the August 2012 to December 2012 gauging events are presented in Table 5.

Groundwater elevation vs. time graphs for each well or well cluster (MW-1200 through MW-1219) are presented as Figures 2a through 21a. Due to the interval without data collection between the May 2008 gauging event and the August 2012 gauging event, the graphs are further divided between the historic (pre-2012) gauging events (Figures 2b through 21b) and the current 2012 gauging events (Figures 2c through 21c) for clarity.

#### **2.2.2 Precipitation Data**

No operable precipitation gauging station is located at the CPNPP site; therefore, rainfall data were obtained from the National Oceanic and Atmospheric Administration (NOAA) station at Opossum Hollow (Glen Rose), Texas (WU 2012), approximately 5 miles to the south (Figure 23). Daily rainfall totals from November 29, 2006 to May 28, 2008 and from August 17, 2012 to

 <b>ENERCON SERVICES, INC.</b>	<b>PROJECT REPORT</b>	No. TXUT-001-PR-019
		REV. 0
		PAGE NO. 7 of 98

December 5, 2012 are included on the groundwater elevation vs. time graphs (Figures 2b, c through 21b, c). A copy of the Opossum Hollow, Texas, precipitation records from May 6, 2006 to December 5, 2012 are included as Appendix B.

### **2.2.3 Squaw Creek Reservoir Data**

In order to compare groundwater elevations to local surface water elevations, SCR elevation data was obtained online from the USGS for Gauge Station 08091730 at Squaw Creek Reservoir, Texas (USGS 2012b). The daily SCR elevation from November 29, 2006 to May 28, 2008 and from August 17, 2012 to December 5, 2012 is presented on Figures 22a and 22b with a comparison to daily rainfall for the same period of record (described in Section 3.2 of this report).

## **2.3 Groundwater Elevation Assessment**

Changes in groundwater elevations within the monitoring wells are presented in Table 6. The change between the last month of monitoring in 2008 (April 25, 2008 to May 28, 2008) is included to show the relative magnitude of change prior to the hiatus in monitoring. The change in water levels between May 28, 2008 and August 17, 2012, as well as the monthly change between the August 2012 measurement and December 5, 2012 are also presented and assessed in the following subsections.

### **2.3.1 Regolith Wells**

During the November 2006 to May 2008 groundwater gauging activities, all 12 regolith monitoring wells (MW-12XXa and MW-1211b) showed signs of equilibrium groundwater conditions (fluctuations in elevation without consistent rise or fall) over the monitoring period. Groundwater elevations remained relatively consistent between May 2008 and August 2012. Both MW-1211a and MW-1211b are completed in the eastern existing fill swale with overlapping screen intervals and maintained water levels at the approximate elevation of SCR, indicating that they are in hydraulic communication with SCR through the existing fill (Figure 13b).

During the most recent monitoring period (August to December 2012), groundwater elevations in the regolith wells (excepting MW-1211a and MW-1211b) showed a general declining trend, most likely due to the severe extended drought (approximately 2 years) conditions currently in experienced throughout the north Texas area.

### **2.3.2 Shallow Bedrock Wells**

During the November 2006 to May 2008 groundwater gauging activities, seven of the shallow bedrock (B-Zone) monitoring wells (MW-1201b, MW-1203b, MW-1207b, MW-1209b, MW-1212b, MW-1215b, and MW-1217b) consistently exhibited equilibrium water levels (Figures 3b, 5b, 9b, 11b, 14b, 17b, and 19b). MW-1209b maintained water levels at the approximate elevation of SCR, indicating the well is in hydraulic communication with SCR (Figure 11b).

Between May 2008 and August 2012, the above-mentioned shallow bedrock wells showed little variation in water levels with only minor fluctuations observed in 2012, indicating the wells remain at equilibrium conditions (Figures 3c, 5c, 9c, 11c, 14c, 17c, and 19c). Water levels in 3 additional wells (MW-1200b, MW-1202b, and MW-1210b, Figures 2c, 4c, and 12c) showed a slight to significant water level rise between 2008 and 2012 (2.41 to 31.30 ft change) and now show equilibrium indications (declining or fluctuating water levels since August 2012). MW-1216b exhibited a rapid rise between November 2006 and May 2008 (average 16.07 ft/yr rise, Figure 18b), a significant reduction in the rate of rise between 2008 and 2012 (average 0.91 ft/yr

 <b>ENERCON SERVICES, INC.</b>	<b>PROJECT REPORT</b>	No. TXUT-001-PR-019
		REV. 0
		PAGE NO. 8 of 98

rise), and then a rapid rise between August and December 2012 (Figure 18c). While still exhibiting a general increase in water level, it is expected MW-1216b is most likely at equilibrium conditions.

The four remaining shallow bedrock wells (MW-1204b, MW-1205b, MW-1206b, and MW-1213b) showed a slight to moderate water level rise between 2008 and 2012 (6.70 to 21.23 ft change) (Figures 6b, 7b, 8b, and 15b). Water levels within these four wells have continued to exhibit a slow, steady rise in water level between August and December 2012 (Figures 6c, 7c, 8c, and 15c); however, all four wells show a slowing trend in the average groundwater rate of rise (calculated in average ft per year) from the historic (pre-2012) gauging events to the current monitoring period (Table 7). Although still rising, the slowing trend in water level rise shows these wells are nearing equilibrium conditions.

The average rate of rise in the wells exhibiting non-equilibrium conditions for the historic (pre-2012), May 2008 to August 2012 monitoring hiatus, and the August to December 2012 monitoring period is presented in Table 7.

### **2.3.3 Bedrock Wells**

During the November 2006 to May 2008 groundwater gauging activities, one bedrock (C-Zone) monitoring well (MW-1205c) remained dry for the entire monitoring period (Figure 6). The remaining 14 bedrock monitoring wells exhibited steady increases in water levels with no indications of equilibrium conditions within the well.

MW-1205c remained dry during the May 2008 to August 2012 monitoring hiatus and for the 2012 gauging period. Between May 2008 and August 2012, all other bedrock wells showed a slight to significant water level rise (2.70 to 28.60 ft change); however, water levels in 2 wells (MW-1207c, and MW-1209c; Figures 9c and 11c) have shown declining or fluctuating water levels since August 2012 and indicate equilibrium conditions. In particular, MW-1209c has equalized to the water level in MW-1209b and SCR, noting a hydraulic connection between the near-shore weathered bedrock and SCR in this vicinity.

Water levels within the remaining 12 bedrock wells have continued to exhibit a slow, steady rise in water level between August and December 2012 with no indications of equilibrium conditions.

None of the bedrock monitoring wells shows a correlation between precipitation events and change in the rate of increases in water level within the well.

### **2.3.4 General Vertical Gradients**

Hydraulic heads observed at the site primarily decrease downwards, indicating downward vertical gradients in the subsurface materials underlying the site. Figures 2a through 21a present the water levels for each well, with the position of each well screen and approximate elevations of the various stratigraphic units intersected by the well. Gradients are downward from the regolith into the Engineering "A" bedrock at all but one location (Section 2.3.2). Gradients are also downward from the Engineering "A" bedrock unit into the Engineering "B" bedrock unit. Similarly, hydraulic gradients from the shallow bedrock of Engineering "A" and "B" units to the deeper bedrock within the Glen Rose (identified as Engineering "C-F") are consistently downward.

### 3.0 SQUAW CREEK RESERVOIR ELEVATION ASSESSMENT

SCR is directly adjacent to the CPNPP Units 3 and 4 site and forms a downgradient hydraulic boundary for groundwater flow. Normal pool elevation is approximately 775 ft msl with a minimum operating level for CPNPP Units 1 and 2 of 770 ft msl (Luminant 2012b); however, a maximum reported elevation of 779.14 ft msl occurred on December 19, 1991 during an extreme rainfall event (NOAA 2012b).

In order to determine a conservative downgradient boundary elevation for the groundwater pathway and maximum groundwater elevation evaluation, SCR elevations and precipitation data were used to assess the relationship between extreme rainfall events and SCR elevations as well as the duration of elevated SCR water levels.

#### 3.1 Squaw Creek Reservoir Elevation Data

Construction for Squaw Creek Dam began on November 17, 1974, and was completed on June 16, 1977. Squaw Creek Dam and appurtenant structures consist of a 4360 ft long earthfill embankment with a maximum height of 159 ft and a crest elevation of 796 ft. The service spillway is an uncontrolled concrete ogee type located between the right (southwest) end of the embankment and abutment. The crest of the main spillway is at elevation 775 ft msl with an emergency spillway crest elevation of 783 ft msl. The service outlet structure consists of a concrete tower housing three gate-controlled outlets with invert elevations of 764 ft, 715 ft and 666.5 ft. The 30-in diameter low-flow outlet has an invert elevation of 653 ft. All discharges from the outlet tower pass through a six-foot diameter concrete-encased conduit, released downstream of the embankment (Luminant 2012a, Section 2.4.1.2.3.4).

Deliberate impoundment began in February 1977. Normal full pool elevation (first measured instance above 775 ft msl) was reached on May 3, 1979 (USGS 2012b). A summary of SCR construction and dam data are presented in Table 8.

The USGS maintains an elevation gauging station (USGS Gauge 08091730) on the downstream side of the dam outlet tower (USGS 2012b). Daily data on SCR pool elevation for this evaluation was obtained from two sources:

- Data after October 1, 1994 were obtained from the USGS via the online National Water Information System (NWIS) Web Interface (USGS 2012a). Daily elevation data were retrieved for the period from October 1, 1994 to December 5, 2012 (final date of groundwater elevation measurements). The maximum recorded daily data from the downloaded records were used in this assessment. Data downloaded from the USGS NWIS Web Interface are included as Appendix C.
- Data prior to October 1, 1994 were provided by the USGS via email (USGS 2012b) in the form of tabulated daily storage volume observations for each water year from 1977 to 1994 (October 1 to September 30). Capacity tables were also included, which correlated reservoir storage volume to SCR pool elevation. These capacity tables have been summarized and extrapolated in Table 9 to approximate the change in SCR elevation for each 100 acre-ft of storage change from 773 ft msl to above the maximum recorded elevation of 779.14 ft msl. Data received from the USGS are included as Appendix D.

 <b>ENERCON SERVICES, INC.</b>	<b>PROJECT REPORT</b>	No. TXUT-001-PR-019
		REV. 0
		PAGE NO. 10 of 98

The data retrieved from both sources described above provides a record of daily SCR elevations from the start of impoundment to December 5, 2012. For the period between May 3, 1979 (date of first elevation above 775 ft msl) and December 5, 2012, there have been 12,270 total days. During that time frame, only 79 data points were noted as missing from the records, resulting in only a 0.64% loss in data.

### 3.2 SCR Elevation Trends

To determine the normal operating history of SCR, the daily elevation data (USGS 2012a, USGS 2012b) were reviewed to assess the number of days and duration above normal pool elevation. This assessment only considers the data following the initial full pool date (May 3, 1979; date SCR elevation first exceeded 775 ft msl) to the last groundwater gauging event on December 5, 2012. These results are summarized in Table 8 and discussed below:

- Since the initial full pool date, there has been no recorded SCR elevation below 772 ft msl.
- SCR elevation was reported below 773 ft msl a total of 546 days, or 4.48% of the recorded data days.
- SCR elevation was reported below 774 ft msl a total of 3493 days, or 28.7% of the recorded data days.
- SCR elevation was reported below 775 ft msl a total of 7333 days, or 60.2% of the recorded data days; only 39.8% of the time has SCR elevation been above 775 ft msl.
- SCR elevation was reported below 775.5 ft msl a total of 11,557 days, or 94.8% of the recorded data days. Therefore, the normal operating level of SCR is usually below 775.50 ft msl with a significant amount of time below 775 ft msl.
- SCR elevation was reported above 775.5 ft msl a total of 634 days, or 5.2% of the recorded data days. The longest recorded duration above 775.5 ft msl was 28 days between January 9, 2012 and February 5, 2012.
- SCR elevation was reported above 776 ft msl a total of 129 days, or 1.06% of the recorded data days. The longest recorded duration above 776 ft msl was 12 days between April 26, 1990 and May 7, 1990.
- SCR elevation was reported above 777 ft msl a total of 20 days, or 0.16% of the recorded data days. The longest recorded duration above 777 ft msl was 5 days between June 26, 2006 and June 30, 2006.
- SCR elevation was reported above 778 ft msl only one day, or 0.01% of the recorded data days. This occurred on December 19, 1991 during an extreme rainfall event across north central Texas. This event also produced the maximum recorded SCR elevation of 779.14 ft msl at 11 am on December 19, 1991. The water level was above 779 for less than a day and quickly receded below 778 ft msl.

The above assessment shows that SCR elevations are normally below 775.5 ft msl with occasional and short-lived excursions above 775.5 ft msl. This elevation is below the

 ENERCON SERVICES, INC.	<b>PROJECT REPORT</b>	No. TXUT-001-PR-019
		REV. 0
		PAGE NO. 11 of 98

groundwater elevations observed in the regolith wells (with the exception of MW-1211a and MW-1211b, completed in the existing fill of the eastern swale). MW-1209b (shallow bedrock well) has equalized at the approximate elevation of SCR and appear to be influenced by SCR water levels. MW-1209 is located approximately 150 feet from the SCR shoreline. Other shallow bedrock wells near the SCR shoreline (MW-1206b and MW-1212b) typically have water levels approximately 8 to 17 ft higher than SCR elevations.

### 3.3 Precipitation Data

As discussed in Subsection 2.2.2, there is no operable precipitation gauging station at the CPNPP site. The previously discussed Opossum Hollow precipitation station provides historic data to May 2006 only; therefore, additional data were requested from the NOAA National Climate Data Center (NCDC).

There are no precipitation gauging stations with a significant recorded history located in the Squaw Creek Watershed (Figure 23); therefore, data were obtained from six NOAA weather stations surrounding the Squaw Creek Watershed and CPNPP (NOAA 2012). Data from these six stations are presented in Appendix E.

Intense storms in North Central Texas tend to be concentrated in small area storm cells and rainfall amounts can vary widely within a short distance; therefore, with the lack of a gauge within the watershed, assessing the data from areas surrounding the site may give a general insight as to the rainfall and storm events in the vicinity of the site which may possibly influence water levels within SCR.

### 3.4 Precipitation-SCR Elevation Assessment

To determine if extreme rainfall events have a significant effect on SCR elevation, rainfall data from the six NOAA weather stations were reviewed to find the most extreme precipitation events recorded at these stations. Rainfall and SCR elevations were compared for 21 days surrounding the main rainfall event to assess both SCR response prior to, during, and after the event. Five extreme rainfall events, which represent the five highest rainfall events since the initial full pool date, were chosen for this assessment. These five events are discussed below and shown in Figures 24 through 28:

#### ***September 1986 (Table 10, Figure 24)***

Very little rainfall (less than 0.20 inches) was recorded by the surrounding gauges prior to the main storm event starting on September 3, 1986. The Glen Rose station recorded a one-day rainfall total of 6.90 inches. Surrounding gauges recorded between 1.53 and 5.25 inches. SCR elevation was below 774 ft msl prior to the storm event and rose to a maximum of 775.19 ft msl by September 8, 1986 before receding.

#### ***May 1989 (Table 11, Figure 25)***

Occasional light to moderate rainfall was recorded prior to the main storm event starting on May 18, 1989. The Glen Rose station recorded a one-day rainfall total of 5.92 inches. Surrounding gauges recorded between 0.15 and 5.63 inches. The Rainbow station recorded a daily rainfall total of 5.75 inches on May 20, 1989 with no recorded precipitation at any other station. SCR elevation was 775.38 ft msl prior to the storm event and rose to a maximum of 777.73 ft msl during the event before receding to below 776 ft msl by May 22, 1989.

 ENERCON SERVICES, INC.	<b>PROJECT REPORT</b>	No. TXUT-001-PR-019
		REV. 0
		PAGE NO. 12 of 98

***December 1991 (Table 12, Figure 26)***

Known as the 1991 Christmas Floods, occasional light to moderate rainfall was recorded several days prior to the main storm event starting on December 18, 1991. The Glen Rose station recorded a one-day rainfall total of 7.14 inches. Surrounding gauges recorded up to 4.80 inches over the next two days. SCR elevation was 775.22 ft msl prior to the storm event and rose to a maximum of 779.14 ft msl at 11 am on December 19, 1991 (historic maximum recorded SCR elevation), then subsequently receded to below 776 ft msl by December 27, 1991.

***July-August 1995 (Table 13, Figure 27)***

Occasional light rainfall was recorded prior to the main storm event starting on July 31, 1995. The Glen Rose station recorded a one-day rainfall total of 8.48 inches (maximum one day precipitation total). Surrounding gauges recorded between 0.32 and 7.55 inches with rainfall totals up to 6.90 inches over the next two days. SCR elevation was 775.09 ft msl prior to the storm event and rose to a maximum of 776.93 ft msl on August 2, 1995 and then receded to below 776 ft msl by August 6, 1995.

***October 2011 (Table 14, Figure 28)***

Occasional light rainfall was recorded several days prior to the main storm event starting on October 8 to 9, 2011. The Glen Rose station recorded a one-day rainfall total of 3.31 inches with surrounding gauges recording up to 6.10 inches the following day. SCR elevation was 775.45 ft msl prior to the storm event and only rose to a maximum of 775.59 ft msl before receding.

Based on the above assessments, it appears extreme storm events do have an effect on SCR elevations during the storm event; however, the rise in SCR level is relatively short-lived and water elevation returns to approximately normal operating levels within a few days, depending on the storm conditions (Figures 24 through 28).

**4.0 CONCLUSIONS**

The additional groundwater gauging activities in 2012 show that most of the intermediate (shallow bedrock or 'b' series) wells are at equilibrium. Many of the deep bedrock wells ('C-Zone) exhibit only very slow rises (in the tenths to hundredths of a foot per month) in water level, indicating that these wells are likely approaching equilibrium conditions. With the exception of one well pair (MW-1216a and MW-1216b), ground water levels at CPNPP Units 3 and 4 continue to show a downward hydraulic gradient based on lower groundwater elevations in deeper wells of each clustered well group.

Based on the results of this assessment, further short-term (monthly) groundwater gauging is not warranted. It is concluded that additional measurements of the pre-construction monitoring well groundwater levels will not result in additional, significant data.

The assessment of SCR water levels provides a basis for the conservative operating level for SCR to be used in the groundwater modeling calculations. Based on the review of the historical elevation data and extreme rainfall event comparison, normal SCR elevations tend to be below 775 ft msl with occasional and short-lived excursions above 775.5 ft msl due to rainfall events. The data further indicate that water levels in SCR do not affect groundwater elevations within the shallow bedrock except in the close proximity, near shore weathered zones and the existing swale fill below the elevation of SCR.

Roger,

Much appreciate the help. Yes, I would like copies of the mean daily for anything available. Even just reports such as the 2011 report with the tabular data will be sufficient if that is all that is available.

I didn't think you had precipitation at this station, nor do I believe you have anything upstream along Squaw Creek. That's okay, I can make some general assumptions using the Glen Rose gage for the major events. Currently, the main two events I have in mind are the December 1991 floods and the October 1981 Hurricane Norma flooding.

Have a good trip and I look forward to hearing from you when you get back.

According to the 2011 water year manuscript for Squaw Creek Reservoir, we published daily mean contents from Feb. 1977 to Sept. 2002. For the period prior to Oct. 1, 1994, we would most likely only have daily mean contents and yearly maximum and minimum elevations. I'm in San Antonio this week, but will check our hard copy manuscripts when I get back to Fort Worth for this period before data was being stored digitally to be sure. Let me know if you would like copies of this data. Our station history documentation indicates there never was a raingage at this station.

I am conducting some research on groundwater in the area and need to know duration of the higher water levels in the reservoir and how it may affect groundwater elevations. The only other thing that may help would be precipitation at this station, as the nearest gauges are Granbury and Glen Rose, either of which may or may not tell the whole story at areas surrounding Squaw Creek Reservoir or the drainage basin, in addition to the timing of the rise in reservoir level to the major storm event.

Thank you for the reply. I look forward to the information.

Randall Lantz:

By copy of this reply, Mr. Roger Trader or Mr. Keith Snider of the USGS North Texas Program Offices will investigate availability of (maximum daily and (or) hourly) reservoir elevation data from 1977 to 1994 (and particularly December 1991) (and that are not available online) at USGS station 08091730 (Squaw Creek near Glen Rose, TX).

Can you provide more background information about why you are interested in obtaining these data? It would likely help us discuss the need for more inclusive monitoring when we review our monitoring programs with Federal, state and local partners. Thank you for any insight you can provide.

Thank you for your inquiry and interest in USGS data.

We are able to retrieve online information regarding reservoir elevation back to 1994.  
We are interested in obtaining elevation data (minimum daily, preferred hourly) back to the dam closure in 1977, in particular the two months surrounding the maximum extreme recorded in December 1991.

Please let me know the availability of this information.

Thank you,

Roger,

Do you have the file for water year 1994? The data you provided stops in October, 1993, and the online data starts in October, 1994, so I have approximately 1 year of data missing from the analysis.

Again, thank you for the information.

Roger,

Much appreciate the help. Yes, I would like copies of the mean daily for anything available. Even just reports such as the 2011 report with the tabular data will be sufficient if that is all that is available.

I didn't think you had precipitation at this station, nor do I believe you have anything upstream along Squaw Creek. That's okay, I can make some general assumptions using the Glen Rose gage for the major events. Currently, the main two events I have in mind are the December 1991 floods and the October 1981 Hurricane Norma flooding.

Have a good trip and I look forward to hearing from you when you get back.

Randall

According to the 2011 water year manuscript for Squaw Creek Reservoir, we published daily mean contents from Feb. 1977 to Sept. 2002. For the period prior to Oct. 1, 1994, we would most likely only have daily mean contents and yearly maximum and minimum elevations. I'm in San Antonio this week, but will check our hard copy manuscripts when I get back to Fort Worth for this period before data was being stored digitally to be sure. Let me know if you would like copies of this data. Our station history documentation indicates there never was a raingage at this station.

I am conducting some research on groundwater in the area and need to know duration of the higher water levels in the reservoir and how it may affect groundwater elevations. The only other thing that may help would be precipitation at this station, as the nearest gauges are Granbury and Glen Rose, either of which may or may not tell the whole story at areas surrounding Squaw Creek Reservoir or the drainage basin, in addition to the timing of the rise in reservoir level to the major storm event.

Thank you for the reply. I look forward to the information.

Randall Lantz:

By copy of this reply, Mr. Roger Trader or Mr. Keith Snider of the USGS North Texas Program Offices will investigate availability of (maximum daily and (or) hourly) reservoir elevation data from 1977 to 1994 (and particularly December 1991) (and that are not available online) at USGS station 08091730 (Squaw Creek near Glen Rose, TX).

Can you you provide more background information about why you are interested in obtaining these data? It would likely help us discuss the need for more inclusive monitoring when we review our monitoring programs with Federal, state and local partners. Thank you for any insight you can provide.

Thank you for your inquiry and interest in USGS data.

We are able to retrieve online information regarding reservoir elevation back to 1994. We are interested in obtaining elevation data (minimum daily, preferred hourly) back to the dam closure in 1977, in particular the two months surrounding the maximum extreme recorded in December 1991.

Please let me know the availability of this information.

Thank you,

BRAZOS RIVER BASIN

08091730 SQUAW CREEK RESERVOIR NEAR GLEN ROSE, TX

LOCATION.--Lat 32°17'28", long 97°45'49", Somervell County, Hydrologic Unit 12060202, on downstream side of outlet tower at dam, 3.9 mi (6.3 km) north of Glen Rose, and 4.3 mi (6.9 km) upstream from mouth.

DRAINAGE AREA.--64.0 mi<sup>2</sup> (166 km<sup>2</sup>).

PERIOD OF RECORD.--February to September 1977.

GAGE.--Water-stage recorder. Datum of gage is at mean sea level.

REMARKS.--The reservoir is formed by a rolled earthfilled dam 4,360 ft (1,330 m) long. Deliberate impoundment began in February 1977, and the dam was completed in June 1977. The flood-control outlet works consist of an ungated 100-foot-long (30 m) concrete ogee spillway located at right end of dam. The low-flow outlet works consist of a concrete outlet tower with three slide gates, each 4 by 6 ft (1 by 2 m), and a 6- by 6-foot (2 by 2 m) slide gate, which feed into a 6-foot (2 m) inside diameter concrete conduit that extends through the dam. Figures given herein represent total contents. Data regarding the dam and reservoir are given in the following table:

WATER-DISCHARGE RECORDS

PERIOD OF RECORD.--February 1977 to current year.

GAGE.--Water-stage recorder. Datum of gage is National Geodetic Vertical Datum of 1929.

REMARKS.--The reservoir is formed by a rolled earthfill dam 4,360 ft long. Deliberate impoundment began in February 1977, and the dam was completed in June 1977. The flood-control outlet works consist of an ungated 100-foot-long concrete ogee spillway located at right end of dam. The low-flow outlet works consist of a concrete outlet tower with three 4- by 6-foot slide gates and a 6- by 6-foot slide gate, which feed into a 6-foot inside diameter concrete conduit that extends through the dam. During year, water was diverted by pipeline from Lake Granbury into this reservoir. Figures given herein represent total contents. Data regarding the dam and reservoir are given in the following tables:

LOCATION.--Lat 32°18'00", long 97°47'12", Somervell County, Hydrologic Unit 12060202, on upstream side of intake structure near power house, 1.8 mi upstream from dam, 3.9 mi north of Glen Rose, and 6.1 mi upstream from mouth.

DRAINAGE AREA.--64.0 mi<sup>2</sup>.

PERIOD OF RECORD.--February 1977 to current year.

GAGE.--Water-stage recorder. Datum of gage is National Geodetic Vertical Datum of 1929.

REMARKS.--The reservoir is formed by a rolled earthfill dam 4,360 long. Deliberate impoundment began in February 1977, and the dam was completed in June 1977.
