

9.2.3 Demineralized Water Distribution System

The demineralized water distribution system (DWDS) stores water in the demineralized water storage tanks and delivers it to the consumers in the power plant. For the U.S. EPR, none of the users of demineralized water depend on the system for safety-related functions or backup. Containment isolation for the DWDS is provided per Section 6.2.4.

Refer to Section 12.3.6.5.11 for demineralized water distribution system design features which demonstrate compliance with the requirements of 10 CFR 20.1406.
