NOV 2 9 1981

1.0 **OBJECTIVE**

Provides instruction for plant shutdown from Hot Standby to Cold 1.1 Shutdown.

2.0 REFERENCES

- 2.1 SONGS Unit 1 Technical Specifications.
- 2.2 Westinghouse Nuclear Service Division Technical Bulletin No. NSD-TB-80-10, Subject: Reactor Cool. Bypass Valve, dated: September 25, 1980.

3.0 **PREREQUISITES**

Operating Instruction SO1-3-4, "Plant Shutdown From Full Power to 3.1 Hot Standby" is completed, if applicable.

4.0 PRECAUTIONS AND LIMITATIONS

- 4.1 The containment spray system, the refueling water storage tank, their associated valves and interlocks shall remain operable per Tech. Spec. 3.3 while above 200°F in the reactor coolant system.
- 4.2 One shutdown group of control rods must be 320 steps withdrawn wwwenever positive reactivity is being inserted by boron dilution, xenon decay or cooldown. The following two exceptions to this rule may be applied:
 - 4.2.1 The Reactor Coolant System has been borated to at least the Hot Standby, xenon free, boron concentration and is being maintained at Hot Standby conditions.
 - 4.2.2 The Reactor Coolant System has been borated to the Cold Shutdown boron concentration.
- 4.3 The pressurizer spray valves shall be operated as necessary to maintain the pressurizer boron concentration within +150 ppm to -50 ppm of the main coolant boron concentration to minimize the amount of reactivity tied up in this manner.
- The cooldown rate of the Reactor Coolant System shall not exceed 100°F/hr. The maximum allowable cooldown rate is subject to change during plant life as the observed or expected shift in design transition temperature (DTT) increases. Refer to the cooldown curve, Attachment 8.2.

4.0 PRECAUTIONS AND LIMITATIONS (Cont'd)

- 4.5 Component cooling to the reactor coolant pumps must be supplied any time a reactor coolant pump is operating and must not be terminated to an idle pump until the reactor coolant system has been cooled to the cold condition (<200°F).
- 4.6 During the solid water phase of cooldown, reactor coolant pump(s) must be run continuously. Should abnormal or unusual conditions cause securing of all reactor coolant pumps, restart is permitted only after evaluating RCS temperature gradients.
- 4.7 At the completion of cooldown, a reactor coolant pump shall be run a sufficient amount of time to insure that the reactor coolant system and steam generator metal temperatures have equalized with reactor coolant liquid temperatures.
- 4.8 Tests or maintenance activities that might affect reactor coolant system pressure shall not be performed during solid system operation.
- 4.9 During Cold Shutdown conditions, either two (2) RHR pumps and heat exchangers shall be operable or in service or one (1) RHR pump and heat exchanger shall be in service and a minimum of one (1) steam generator shall be available for decay heat removal.
- 4.10 To limit the consequences of a steam line break, establish ≥ 4 $\Delta K/K$ shutdown, Hot Standby, xenon free, all rods in, prior to removing the safety injection system from service.
- 4.11 Maintain steam generator levels at~50% on narrow range recorder during cooldown. If a steam generator(s) feedring is uncovered (<26% narrow range level), feedwater flow shall be reduced to or maintained <150 gpm to that steam generator(s) until level is >26%.
- 4.12 The manual bonnet vent valves for HV-853A and HV-853B must be closed when the main feedpumps are depressurized to preclude drainage of RWST to reheater pit sump via the feedpump seals.

5.0 CHECK-OFF LISTS

Not Applicable.

6.0 INSTRUCTION

INITIALS

6.1 If required, commence degassing the RCS and purging the volume control tank (VCT) with nitrogen as per Operating Instruction SO1-4-8, "Degassing the Reactor Coolant System."

6.0 <u>INSTRUCTION</u> (Cont'd) <u>INITIALS</u>

NOTE:

If the RCS is to be opened for maintenance, degassing must continue until the hydrogen concentration is <5cc/Kq.

- 6.2 Surveillance requirements prior to and during cooldown:
 - 6.2.1 Determine the shutdown margin required using Surveillance Instruction SO1-12.9-2, "Determination of Just Critical Rod Position and Reactor Shutdown margin." Record the equired boron concentration _____ppm, and quanity of boric acid required _____gallons.

NOTE:

The reactor shutdown will normally be $\geq 4\%$ with all rods inserted. If the RCS is to be opened, a shutdown margin of $\geq 5\%$ is required, if the head is to be removed, a shutdown margin of $\geq 10\%$ is required.

- 6.2.2 Complete S01-12.8-10, "Containment Sphere and RCS Inspection" while in Mode 3.
- 6.2.3 If the cold shutdown is expected to last longer than 48 hours, perform SO1-12.7-1, "Inservice Testing of Valves" during the cooldown. N/A if completed within the previous 92 days.
- The Watch Engineer shall review S01-0-112,
 "Operating Surveillance Requirements Unit 1",
 Exhibit A, to determine what additional surveillance requirements need be completed between Modes 3 and 6. (More specifically the 12.7,
 12.8 and 12.9 series Surveillance
 Instructions.)
- 6.2.5 Perform applicable section of SO1-12.3-18,
 "Fire System Valve Alignment and Operability
 Check," when the containment is accessible.
- 6.2.6 Complete Check-Off List 5.3 of SO1-12.3-6, "Safety Related Valve Alignment, for the Residual Heat Removal System."

NOTE: If necessary, prepare additional batches of boric acid to refill the boric acid storage tank using Operating Instruction SO1-4-14, "Boric Acid Batching and Transfer."

6.0	INST	RUCTION	(Cont'd)		INITIALS
			CAUTION	Maintain a level of >64% in the acid storage tank at all time w is in the reactor.	
	6.3		e RCS to the 2 or 6.3.3 a	required shutdown valve using s desired.	
		6.3.1	one shuto	one (1) RCP is in operation and lown group of control rods are to 320 steps.	
				A and B must be used for spray equalizing the boron concentration	ns.
			<u>></u> 8 mor	the pressure level indication is 30% of span, assign an operator to itor RCS pressure until such time DMS is in service.	
		6.3.2	Place the operation	e reactor makeup controls for auto	omatic

6.0 INSTRUCTION

(Cont'd)

INITIALS

6.4 (Cont'd)

6.4.4.2 (Cont'd)

NOTE:

The spray flow must be controlled to limit the rate of pressurizer cooldown to 195°F.

NOTE:

Use spray valve PC-430C, if RCP B

is to be used for cooldown.

6.4.4.3 Stop all RCP's, except RCP B, to reduce the heating of the RCS.

NOTE:

RCP B must be operated for spray flow. If RCP B is not available, RCP's A and C will be used.

- 6.4.5 Manually block the safety injection actuation circuit when the ALERT BLOCK AUTO INJECTION alarm is received, or when the RCS pressure is \sim 1800 psig.
- 6.4.6 As Cooldown progresses, attempt to maintain the pressurizer level at ~90% of span.

CAUTION: Do not collapse the bubble at this time.

NOTE:

An operator must be assigned to monitor the RCS pressure with the pressurizer level >80% of span.

NOTE:

The high pressurizer level promotes better cooling of the metal in the upper steam space.

6.4.7 As the letdown flow decreases, open additional letdown orifices to maintain the desired letdown flow.

NOTE: Letdown flow may be varied as required by system operating conditions.

6.4.8 Continue to cooldown by periodically resetting the steam dump controller, PC-418A.

6.0 <u>I</u> I	NST	RUCTION	(Cont'd)		INITIALS
6	. 4	(Cont'd)			
		6.4.9	below are	of the following conditions listed met, open CV-276, RCP No.1 Seal lve (Reference 2.2):	
			NOTE:	If the conditions are not met at this time, continue to monit during the remainder of the coo or until the pumps have been st	ldown
		6.4.9.1	the No. 1	e RCP pump bearing temperature or seal leakoff temperature s its alarm level.	
•			NOTE:	RCP bearing temperatures may be monitored on TRC-446, point #13(RCP C), #14 (RCP A) and #1 (RCP B). The high reactor cool water bearing temperature limit 175°F. When 175°F is reached, RC pump BEARING HI ALARM will actuate.	5 ant
			NOTE:	The seal water return high temperature limit is 205°F. When 205°F is reached, SEAL WATER RETURN HI TEMPERATURE ALARM will actuate.	
		.2	RCS pressu	ure is <1000 psig.	
		.3	RCP No. 1	seal leakoff valve is open.	
		. 4	RCP No. 1 (1) gpm.	seal leakoff flowrate is < one	
		.5	Seal injectis >6 gpm.	tion flow rate to each pump(s)	
•	-	6.4.10	psig, esta between th Operating	pressure decreases below 500 ablish two (2) positive barriers are feedwater and RCS. Refer to Instruction S01-4-17, "Safety System Operation." W.E.	Operator

5.0	INSTR	UCTION	(Cont'd)	INITIALS
	6.4	(Cont'd)		•
		6.4.11	When the RCS pressure decreases to 400 psig place the Over Pressurization Mitigation System (OMS) in operation by placing PORV CV-545 and PORV CV-546 OMS Lo Press Setpoint to the ENABLE position.	,
			NOTE: An Operator is not required to monitor RCS pressure, if the OMS is operational.	
		6.4.12	If RCS cooldown is to progress to Cold Shutdown, start to align the RHR System per SD1-4-9, "Placing the Residual Heat Removal System in Service."	
	,	6.4.13	When condenser vacuum is no longer required:	
		.1	Open the condenser vacuum breaker.	
		. 2	Stop the condenser vacuum pumps and/or secure steam to the air ejectors.	· ,
		6.4.13.3	Stop both the gland seal condenser exhauster blowers.	
		.4	When the condenser is at atmospheric pressure, secure steam to the turbine gland seal system.	
	6.5	RCS Cooldow	n to Cold Shutdown (Mode 5)	
		NOTE:	If going to Refueling conditions (Mode 6), an RCS boron concentration of >2900 ppm is required.	
		6.5.1	When RCS is at \sim 350 psig and 350 $^{\circ}$ F;	
		. 1	Place the RHR System in service per S01-4-9, "Placing the Residual Heat Removal System in Service."	
• •			CAUTION: On loss of one (1) saltwater cooling pump, immediately reduce cooldown rate while monitoring	

component cooling water temperature.

6.0 INSTRUCTION (Cont'd)

INITIALS

6.5 (Cont'd)

6.5.1.1 (continued)

CAUTION:

To provide relief paths to RV-206 and normal letdown by PCV-1105, do not close MOV-813. MOV- 814, LCV-1112, CV-202, CV-203, CV-204, MOV-834 and MOV-833.

NOTE:

At the completion of plant cooldown, the reactor coolant pump shall be run until the reactor coolant system and steam generator metal temperatures have equalized with the RCS liquid

temperatures.

- .2 Place Auto Auxiliary Feedwater System in manual depressing Auxiliary Feedwater System Mode MANUAL for Train A and B.
- 6.5.2 When the R.C.S. temperature is <200°F. close the Containment Spray Header Manual isolation valve, 6-1500-444.

NOTE:

Containment Spray is blocked to prevent spraying the containment due to an inadvertant initiation.

6.5.3 When the main steam pressure reaches approximately atmospheric:

> .1 Apply a nitrogen blanket to the main steam lines.

> > NOTE:

The above step is not required, if it is certain that personnel entry into the steam generator secondary side is to be made or upon direction of the Watch Engineer:

Close the trap free blow valves as required.

by the Watch Engineer.

12 months.

PLANT SHUTDOWN FROM HOT STANDBY TO COLD SHUTDOWN

6.0	INST	RUCTION		(Cont'd)	INITIALS			
	6.5	(Cont'd)					
		6.5.4		Start to raise the water level in the steam generators to ~120% of indicated level (narrow range).				
				NOTE: As the steam generator levels increase, measure the rate of change to calculate the time to reach ~120% level.				
		6.5.5		When the final or desired RCS temperature is reached:				
			. 1	Stop the last RCP(s).	,			
			. 2	Place Yellow Caution Tags at each RCP controswitch indicating the RCS temperature at the time the last RCP was stopped.	l e			
			. 3	Open CV-305, auxiliary spray valve.				
		,	.4	Close CV-304, charging line isolation.				
			. 5	Close CV-430C and CV-430H, pressurizer spray valves.				
		6.5.6		Continue to circulate through the auxiliary spray line until the pressurizer temperature is approximately equal to RCS temperature as indicated by TI-430A				
		6.5.7		Maintain RCS pressure as follows:				
			1	Manually adjust FC-1112 to obtain a set charging flow.				
		.•	2	Control the RCS pressure at ~350 psig with P letdown pressure controller.	C-1105,			
	6.6	Secure	equi	pment as operating conditions dictate, or as	directed			

Complete S01-12.6-1, "Fire System Valve Cycling Exercise,"
Section 1.14 for the sphere fire spray system if not completed within the previous 12 months. N/A if done within the previous
