Thanks. Can you please print this for me and my RES colleagues as we have to run to catch the shuttle.

I put together a flow chart of things to do. After that I saw your revised draft user need. I think both the flow chart I put together and the draft user need are consistent, although I note that there are some subtle differences to tweak on both of them to bring them into alignment. In particular, your user need has a step at the beginning to perform a bounding safety assessment. That isn't in my chart, but should be. In my chart I have a block called "do something else" which equates in your chart to phase II, although I have some included site specific safety assessment as a step before you go into the "do something else" block.
