Gentlemen:

Subject:

Docket No. 50-206

MOV Testing Program (Generic Letter 89-10)

San Onofre Nuclear Generating Station (SONGS), Unit 1

Reference: NRC Letter from R. P. Zimmerman to H. B. Ray dated April 4, 1992

Inspection Report No. 92-02 (reference) requested we inform the NRC of any changes in the scope or schedule to the Motor Operated Valve (MOV) Generic Letter (GL) 89-10 program. We are re-evaluating our program due to the shutdown of SONGS 1 and are not currently planning to conduct any further valve testing under the program. We are in the process of completing an evaluation to implement this change and are providing the current status at the request of the NRC Project Manager.

The GL 89-10 testing program was intended to verify that motor operated valves would actuate properly under design basis events. We had planned to test the MOVs following Cycle 11, and the program was scheduled to be completed in June 1994. However, SONGS 1 has been permanently shutdown and will be defueled, reducing the safety concerns associated with the remaining MOVs.

Of the safety related valves in the program, only four valves will remain in use after SONGS 1 is defueled. Two of these are the component cooling water isolation valves (MOV-720A&B) which may be used to isolate the system for maintenance or testing. These valves may also be operated manually without any reduction in safety.

The other two valves (CVS-MOV-1254A&B -- ventilation system valves for the wide range gas monitor) are not within the scope of GL 89-10.

9301220192 930113 PDR ADOCK 05000206 P PDR A069

We consider this issue closed for SONGS 1, and we expect to revise the program to delete the SONGS 1 valve testing requirements. However, we will inform you should we find a need to continue the program. If you have any questions, please contact me.

Very truly yours,

RM Beerth
