Office of Nuclear Reactor Regulation
Attention: Dennis M. Crutchfield, Assistant Director
for Safety Assessment
Division of Licensing
U. S. Nuclear Regulatory Commission
Washington, D.C. 20555

Gentlemen:

Subject: Docket No. 50-206
Seismic Analyses
San Onofre Nuclear Generating Station
Unit 1

Your letter of February 15, 1985 requested that we provide original design analyses for San Onofre Unit 1 which pertain to your review of SCE's April 30, 1982 seismic reevaluation report regarding Balance of Plant Mechanical Equipment and Piping (BOPMEP). As indicated in our letter of September 9, 1979 from J. T. Head to R.H. Engelken, only six original seismic analysis documents pertaining to the San Onofre Unit 1 balance of plant were identified as being available. In a subsequent letter from H. L. Ottoson to R. H. Engelken dated January 14, 1980 it was noted that one of these analyses (Bechtel stress problem number 3246-10) was not applicable to the as-built piping configuration.

In accordance with your request we have asked our contractor, Bechtel Power Corporation, to again search their files for information regarding these original seismic analyses. Based on this effort, seismic design information was located for the following systems:

Item	Description	Calculation No.
1.	Main Steam Piping between the Turbine Stop Valves and Steam Generators	3246-1
2.	Main Feedwater Piping between the Sphere Penetration and Steam Generator E-1B	3246-3
3.	Main Feedwater Piping between the Sphere Penetration and Steam Generator E-1C	3246-14, 15, 16

Encls Rec'd 4/5/85

Aperture Card Dist Encls To: Reg Files - 1 W. Paulson - 1

8504040294

A001 1/2

4.	Main Feedwater Piping between Feedwater Pumps G-3A and G-3B and Sphere Penetrations C-3A, C-3B and C-3C	3246-10

In addition, Bechtel has prepared a comparison of the available original seismic design data for the first three systems listed above with the design data used in the April 1982 BOPMEP report. This comparison is provided for your information in Attachments 1, 2 and 3.

With respect to the original seismic design data and seismic analyses located for the four systems identified above, in no case was a complete "seismic calculation package" located. In each case, various independent pieces of information related to original seismic analyses were located. This information has been assembled in Attachments 4 through 7 for the four systems identified above. It should be noted that for Item 4 above, no original seismic analyses could be located; however, Attachment 7 includes tabulations prepared in 1973 for use in pipe break analyses of this system. These are considered to be taken from original seismic calculations based on discussions with the engineer who prepared the 1973 tabulation and the fact that a similar tabulation prepared in 1973 for the main steam piping was also located and it correlates with the stresses developed for the original plant.

Finally, Attachment 8 provides a discussion of a number of differences between the methods and criteria used for the 1982 BOPMEP seismic analyses and methods and criteria which were probably used in the original seismic analyses. The purpose of this discussion is to recognize the fact that there are a number of differences between calculations done during the two time periods. As such, conclusions regarding the original design should not be made based on the results of the 1982 analyses.

If you have any questions regarding the enclosed information, please call me.

Very truly yours,

Kenneth P Baskin

ATTACHMENT (1)

Comparison of design data used for original plant seismic calculations, circa 1964/1965, with design data used for the BOPMEP Report of April 1980 for Main Steam Piping between the Turbine Stop Valves and Steam Generators, Calculation No. 3246-1.

Item	Original Analysis	BOPMEP Analysis	Comments
1. Calc. No.	3246-1	MS-01	
	(a) Turbine Stop Valves to Steam Generators (12/21/64)	Turbine Stop Valves to Steam Generators	1. Subsequent calculations were made in 1965 since the original, 12/21/64 analysis showed high stresses. See comments for Item 5.
	(b) Turbine Stop Valves to Sphere Penetration including Relief Valve Header Piping (4/24/65)		2. Original seismic analysis Item 1(c) cannot be found. Evidence of this analysis is provided by letter as shown on Page 22 of Attachment (4).
	(c) Sphere Penetration to Steam Generators (3/5/65). This computer input/output could not be located.		
2. Method of Analysis	(a) Static Analysis	Dynamic Analysis, Closely Space Modes per Reg. Guide 1.92	
	(b) Static Analysis		
	(c) Static Analysis		

ATTACHMENT (1) (Cont'd)

Item	Original Analysis	BOPMEP Analysis	Comments
3. Response Spectra	(a) 12/21/64 X Direc. = 0.5 g Y Direc. = Not Located Z Direc. = 0.5 g	Fundamental Freq. = 8.7 cps X Direc. = 2.45 g (DBE) Y Direc. = 2.1 g (DBE) Z Direc. = 3.03 g (DBE)	
	(b) 4/24/65 X Direc. = 1.0 g Y Direc. = 0.67 g Z Direc. = 1.0 g		
	(c) 3/5/65 X Direc. = 1.0 g Y Direc. = 1.0 g Z Direc. = 1.0 g		1. See Item 1, comment 2.

ATTACHMENT (1) (Cont'd)

Item	Original Analysis	BOPMEP Analysis	Comments
4. Piping Geometry	(a) 12/21/64 - Computer Model of Piping from Turbine Stop Valve to S.G. Due to Symmetry, one half of piping system was considered. Relief header line was not included. (b) 4/24/65 Computer Model Outside Containment Due to Symmetry, one half of piping system was considered. Included relief header line. (c) 3/5/65 Computer Model Inside Containment Due to Symmetry, one half of piping system was considered.	Considered Full Model for Inside Containment and Outside Containment	1. Considering (a), (b), and (c) of original analyses, the Piping Geometry was similar for both analyses

ATTACHMENT (1) (Cont'd)

Item	Original Analysis	BOPMEP Analysis	Comments
5. No. of Supports	(a) 12/21/64 2 x-direction supports using half model 1 z-direction support using half model	9 supports with x-direction components in half model, 16 supports with z-direction components in half model	High Seismic stresses were calculated in original analysis (12/21/64). The stress problem was then divided into two parts and reruns were made with more supports (i) Turbine Stop Valves to Sphere Penetration with relief header line Outside Containment (ii) Sphere Penetration to Steam Generators Inside Containment
	(b) 4/24/65 Outside Containment		Primary Stresses were within allowable limits for the analysis of 4/24/65, outside containment, and the number, type and location of supports matched those used in the BOPMEP Analysis.
	(c) 3/5/65 Inside Containment This analysis has not been located.		A letter had been sent to Service Bureau Corporation for seismic computer analysis, on 3/5/65, for inside containment portion. Results of the analysis have not been located. However, the number of supports installed in 1965/1966 agree with the number, type and location of supports used in BOPMEP which reflected piping stresses within code allowables.

ATTACHMENT (1) (Cont'd)

Item	Original Analysis	BOPMEP Analysis	Comments
6. Primary Stresses	(a) High Stresses from 12/21/64 Analysis (b) Acceptable stresses from 4/24/65 analysis outside containment (c) Stresses not available	Acceptable Primary Stress 17,623 psi	1. Since seismic spectra was more severe for the BOPMEP analysis, which resulted in acceptable stresses, it can be concluded that for the same piping geometry, support locations and types piping stresses for the original plant design were acceptable per the original plant criteria.

ATTACHMENT (2)

Comparison of design data used for original plant seismic calculations, circa 1964/1965, with design data used for the BOPMEP Report of April 1980 for Main Feedwater Piping between the Sphere Penetration and Steam Generator E-1B, Calculation No. 3246-3.

Item	Original Analysis	BOPMEP Analysis	Comments
1. Calc. No.	3246-3	FW-02	
2. Method of Seismic Analysis	Static Analysis	Dynamic Analysis, Closely Space Modes, Reg. Guide 1.92	
3. Response Spectra	12/29/64 X Direc. = 0.5 g Z Direc. = 0.5 g Analysis for Y Direc. is not available.	Fundamental Freq. = 9.8 cps X Direc. = 2.5 g (DBE) Y Direc. = 1.35 g (DBE) Z Direc. = 1.6 g (DBE)	1. For the original analysis on 12/29/64 a peak acceleration of 0.5 g applied statically, was used. Subsequent static seismic analyses was performed using a peak or 1 g. See Item 5 comments.
4. Piping Geometry	Piping Footage - 200' Elbows - 6	Piping Footage - 200' Elbows - 6	Pipe routing is identical.

ATTACHMENT (2) (Cont'd)

Item	Original Analysis	BOPMEP Analysis	Comments
5. No. of Supports	12/29/64 Computer Model N-S (X Direc.) = 1 Rigid Vert. (Y Direc.) = 4 Rigid E-W (Z Direc.) = 2 Rigid	N-S (X Direc.) = 2 Rigid Vert. (Y Direc.) = 8 Rigid E-W (Z Direc.) = 4 Rigid 5 Skew Snubbers 2 Springs	The 1964 Analysis did not represent the final seismic model and therefore the number of supports differed with the BOPMEP Model. Subsequent seismic analysis performed in 1965 cannot be located. However, the number of supports in 1965/1966 agrees with the number, type, and location used in the BOPMEP Analysis.
6. Primary Stresses	1. High Seismic Stress from 12/29/64 Analysis	Acceptable Primary Stresses - 15,451 psi	Since seismic spectra was more severe for the BOPMEP Analysis, which resulted in acceptable stresses, it can be concluded that for the same piping geometry, support locations and types, piping stresses were acceptable based on original criteria.
	2. Stresses from 1965 Analysis are not available.

ATTACHMENT 8

The Balance of Plant Mechanical Equipment and Piping (BOPMEP) Report of April 1980 presents the results of a seismic reevaluation performed to evaluate safety related components, structures and equipment of San Onofre 1. The program was based upon the use of then current analysis methods and criteria which differed significantly from, and were more severe than, those used during the original plant design, circa 1964/1965. As a result, it would be expected that significantly higher piping stresses, support and equipment loads would be generated for the BOPMEP evaluation than would be for the original plant. A discussion of the significant differences in analytical methods and criteria between BOPMEP and the original plant follows:

Original plant piping stress analysis was performed using static versus dynamic seismic analysis, per Reg. Guide 1.92 for closely spaced modes, for the BOPMEP evaluation. Also, the original analyses were based on ground motion spectra versus amplified in-structure response spectra used in the BOPMEP evaluation. A comparison of the peak accelerations from the BOPMEP seismic spectra curves with the peak of the original plant spectra curve indicates that resulting stresses and loads could be five times higher for the BOPMEP evaluation if only static seismic analysis was used in each case.

NOTE: OBE and DBE earthquakes were not addressed as such in 1964/65. A comparison of peak accelerations from BOPMEP seismic spectra curves was made against twice the peak of the original spectra curve, as shown in Figure 9.2 of the FSA, since the BOPMEP curves were DBE curves and the Figure 9.2 curve was based on a .25g earthquake. The .25g earthquake is considered comparable to the OBE and the DBE considered comparable to twice the .25g earthquake since the FSA required component functionality for an earthquake with a ground acceleration of twice that of the .25g earthquake. (See Section 9.2.6.3 of the SONGS 1 FSA).

Increases of 1.5 in piping seismic stresses and support and equipment loads could result due to dynamic vs. static analysis, and increases of 1.4 could result using closely spaced modes. Additional increases in stresses and loads could result due to differences in state of the art computer modeling techniques for concentrated and lumped masses.

Methods of combining earthquake loads also differed between BOPMEP and original plant analyses and could account for higher BOPMEP stresses. For BOPMEP, moments resulting from the three earthquake directions, two horizontal and one vertical, were combined using the square root of the sum of the equals method (SRSS); whereas, for the original plant, only one horizontal direction, the one providing highest moments, was combined with the vertical using absolute sum.

Application of stress intensification factors can also be cited as a major reason why piping stresses could be much higher for BOPMEP than for the original plant. For the original plant analyses, stress intensification factors were required to be used only for calculations of high cyclic stresses resulting from thermal expansion. Primary stresses due to weight and seismic loads would not have been considered to be of a

high cyclic nature and therefore, it is concluded that no stress intensification factors were considered in the calculation of these stresses. Stress intensification factors of up to ten were used in the BOPMEP analysis.

Certain piping systems were not considered to be safety related during the original plant design, e.g., the Auxiliary Feedwater Piping. Seismic analysis of this piping using BOPMEP analytical methods and criteria resulted in high piping stresses which would be expected when analyzing a previously non-seismic system as seismic.

Evaluation of small bore piping, piping less than, or equal to, two inches in diameter, for BOPMEP was based on very conservative assumptions and analytical techniques, e.g., rod hangers were considered to be nonexistent, very conservative valve weights were used, an empirical method of evaluation which would conservatively envelope dynamic effects was developed, etc.

Conclusion

It can be concluded that comparisons of resulting piping stresses and support and equipment loads using BOPMEP analytical methods and criteria versus those used for the original plant design could be significantly higher for piping systems considered safety related for both evaluation periods. Increases in stresses by as much as a couple orders of magnitude could be expected to occur considering only the effects of amplified spectra due to in-structure response, effects of dynamic analysis, effects of closely spaced modes and effects of stress intensification factors. Additional increases in stresses could also be expected due to differences in state of the art modeling techniques, and methods of combining earthquake loads.

ECC NO. SAN ONOFRE MAIN STM. Z ASS.	NAME W D GROSS
DATE 12-21-64	PAGE 5 OF 21

INSTRUCTIONS

1. REFER TO DESIGN PRACTICE ________ FOR DESCRIPTION OF PROGRAM.
2. USE ONLY CAPITAL LETTERS AND ARABIC FIGURES. WRITE ALPHABETICAL LETTERS O THUS "Ø", AND I THUS "I"; FIGURES ZERO THUS "0", ONE THUS "1".
3. ENTER DATA FOR EACH ANCHOR, STRAIGHT OR CURVED MEMBER, JUNCTION, OR RESTRAINT ON A SEPARATE LINE.
4. NO ENTRY NEED BE MADE FOR ANCHOR DISPLACEMENTS, RESTRAINT DEFLECTION OR FORCE IF VALUES ARE ZERO.
5. THE O.D., THICK., & TEMP. NEED TO BE ENTERED ONLY FOR THE FIRST STRAIGHT OR CURVED MEMBER. THESE VALUES WILL BE USED FOR ALL SUCCEEDING MEMBERS UNTIL DIFFERENT VALUES ARE ENTERED. THE NEW VALUES WILL THEN BE USED UNTIL ANOTHER ENTRY IS MADE.
6. NUMBER STRAIGHT & CURVED MEMBERS CONSECUTIVELY STARTING WITH 1; DITTO FOR ANCHORS & RESTRAINTS; DITTO FOR JUNCTIONS.

COORDINATE AXES FOR MEASUREMENT OF α AND φ FOR STRAIGHT AND CURVED MEMBERS

INSTRUCTIONS

1. REFER TO DESIGN PRACTICE ________ FOR DESCRIPTION OF PROGRAM.
2. USE ONLY CAPITAL LETTERS AND ARABIC FIGURES, WRITE ALPHABETICAL LETTERS O THUS "Ø", AND I THUS "I"; FIGURES ZERO THUS "0", ONE THUS "1".
3. ENTER DATA FOR EACH ANCHOR, STRAIGHT OR CURVED MEMBER, JUNCTION, OR RESTRAINT ON A SEPARATE LINE.
4. NO ENTRY NEED BE MADE FOR ANCHOR DISPLACEMENTS. RESTRAINT DEFLECTION OR FORCE IF VALUES ARE ZERO.
5. THE O.D., THICK., & TEMP. NEED TO BE ENTERED ONLY FOR THE FIRST STRAIGHT OR CURVED MEMBER. THESE VALUES WILL BE USED FOR ALL SUCCEEDING MEMBERS UNTIL DIFFERENT VALUES ARE ENTERED. THE NEW VALUES WILL THEN BE USED UNTIL ANOTHER ENTRY IS MADE.
6. NUMBER STRAIGHT & CURVED MEMBERS CONSECUTIVELY STARTING WITH 1; DITTO FOR ANCHORS & RESTRAINTS; DITTO FOR JUNCTIONS.

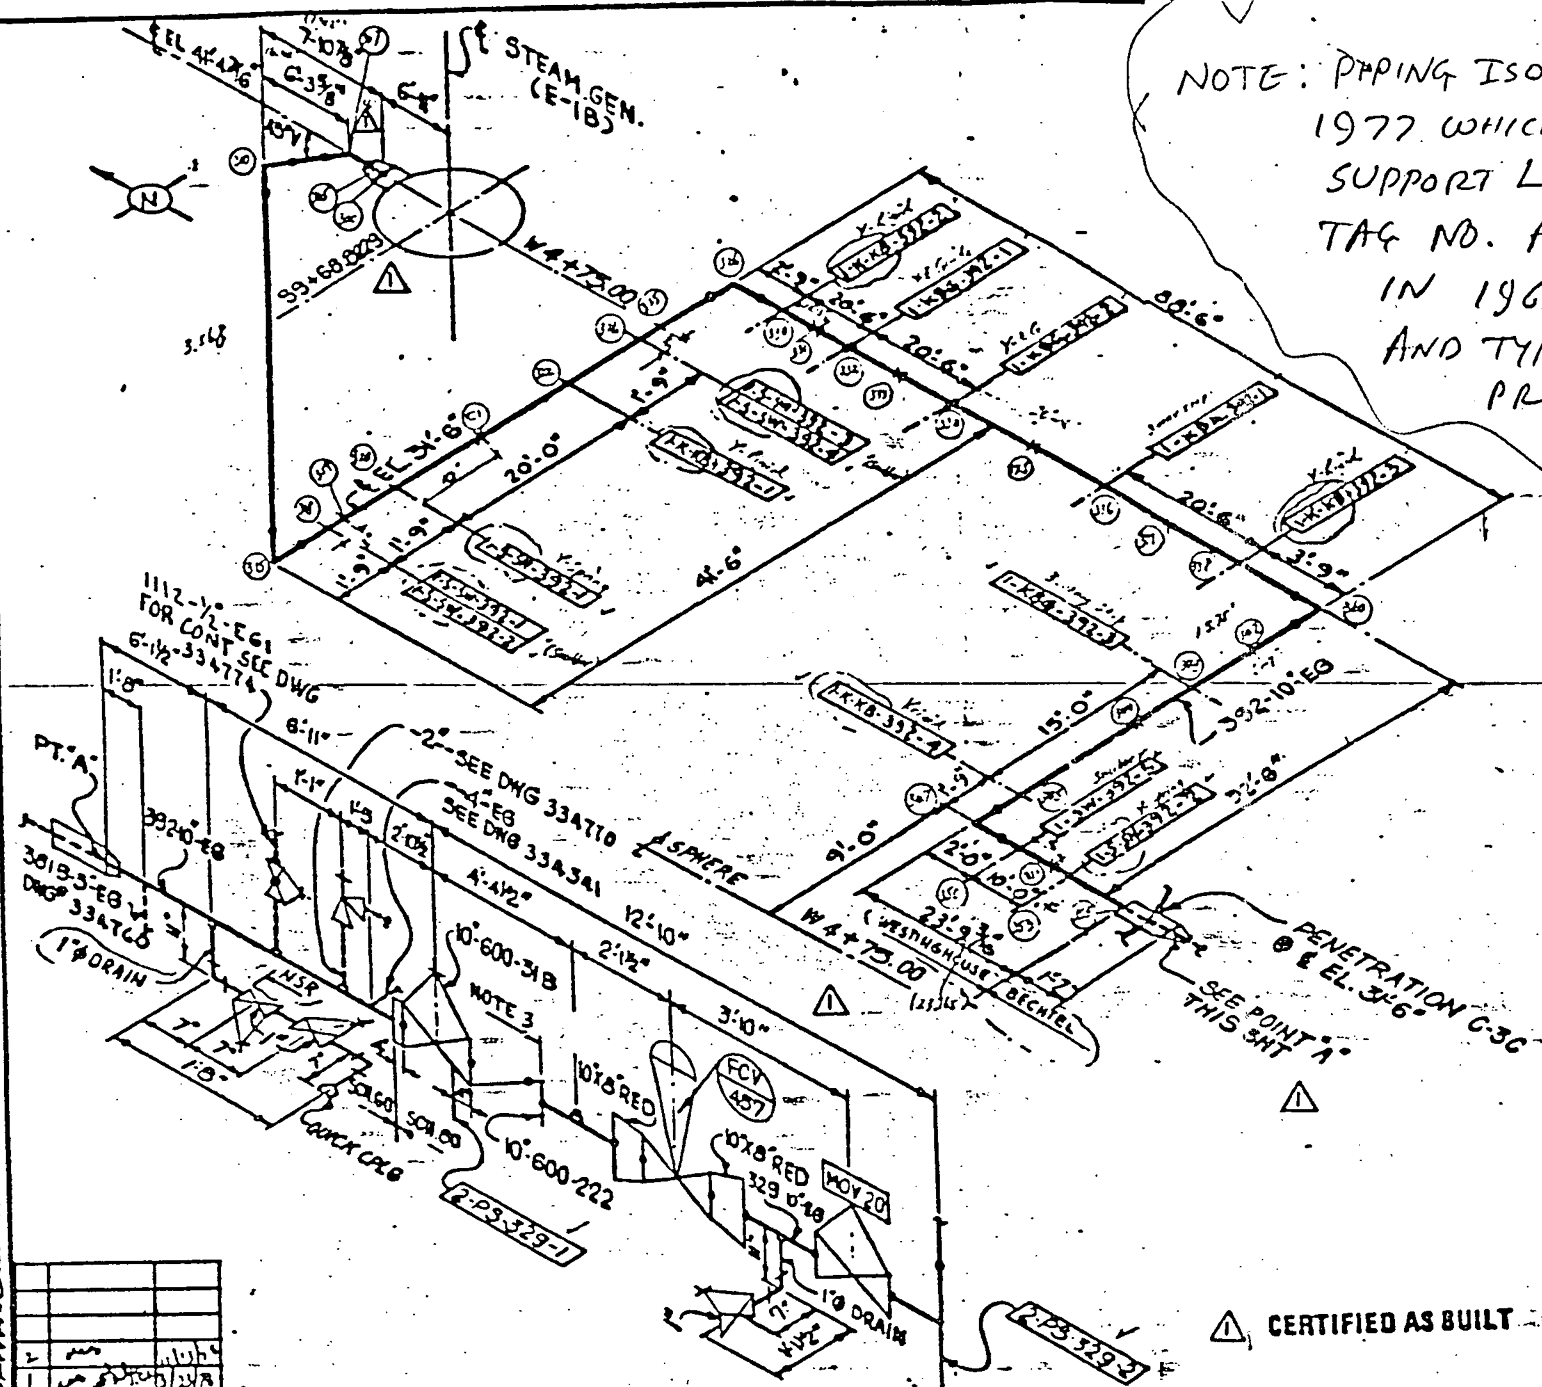
(23)



NOTE: PIPING ISOMETRIC WAS DRAWN IN 1977 WHICH REFLECTS THE PIPING SUPPORT LOCATIONS, TYPES, AND TAG NO. AS DESIGNED AND INSTALLED IN 1965/66. THESE SUPPORT LOCATIONS AND TYPES HAVE BEEN REVERIFIED IN 79-14 PROGRAM.

NOTES:

1. FOR PIPE SUPPORT AND HANGER DETAILS, SEE M-31756
2. COMPLETE LINE INSULATED UNABLE TO VERIFY FITTINGS.
3. PRESSURE BOUNDRY FOR BOP PROGRAM
4. WESTINGHOUSE / BECHTEL SCOPE OF ANALYSIS AS SHOWN.
