Secretary U.S. Nuclear Regulatory Commission Rulemakings and Adjudications Staff Washington,
DC 20555-0001

ATTN: Secretary Rulemakings and Adjudications Staff,

My list of radioactive waste neutralization methods includes the electrino fusion power reactor, Hawkings' generator of cold electricity, collective ion accelerator, dematerialization using highest powered positive ions ever, photo-deactivation using gamma rays, implosion machine which duplicates ball lightning, Radha Roy's transmutation process, Barker's method, Gillembarado's method, Keller catalytic process, transmutation of low-level nuclear waste into glassy substance with super high voltage, Brown's gas, combining Brown's gas with bucking magnetic fields inside a plasma ball, Bearden's method, Russian process using liquid lead bismuth to trigger transforming in the form of neutrons, accelerator-driven transmutation of waste, Brown's gas-metal matrix process, photoremediation, ZIPP fusion process, RIPPLE fission process, low-energy nuclear transmutation electrolytic cells, plasma induced/injected transmutation, Kervran reactions, Monti process, higher group symmetry electrostatics, plasma gasification melting, low-energy nuclear remediation with ultra-low momentum neutron generator, flame-free incineration in a catalyzer, John Hutchison's raygun, and fusion-fission hybrid reactor. More information on many of these methods is available at www.padrak.com/vesperman.

The Department Of Energy refuses to neutralize radioactive waste because of its insane policy of preserving its supply of bomb-grade uranium and plutonium for manufacturing nuclear weapons.

The Nuclear Regulatory Commission would better serve the nuclear power industry by vigorously developing methods of neutralizing radioactive waste.

Thank you for your consideration.

Respectfully,

Mr. Gary Vesperman
