SUBJECT: UNSCHEDULED SHUTDOWN DUE TO INOPERABLE CONTAINMENT ISOLATION VALVE

The licensee determined at 2:18 p.m. (all times PST) on December 6, 1989 that pressure regulators for the backup nitrogen system on valve HV-851A were inoperable. This valve is the "A" feedwater/safety injection pump discharge valve to the reactor coolant system, and also serves as a containment isolation valve. Although the valve is not listed in the Technical Specifications as a containment isolation valve, the licensee administratively applied the Action Statement of Technical Specification 3.6.2. A plant shutdown was initiated at 8:18 p.m., and was completed at 11:49 p.m. The licensee is repairing the pressure regulator system, and anticipates unit restart when repairs are completed.

The resident inspectors are following the licensee's outage activities.

The licensee has issued a press release regarding this event.

This information is current as of 8:00 a.m. PST on December 7, 1989.
