Subject: Docket No. 50-206  
Voluntary Report  
Licensee Event Report No. 89-010  
San Onofre Nuclear Generating Station, Unit 1

Enclosed is a voluntary Licensee Event Report (LER) for an occurrence involving core power distribution monitoring. This voluntary report is provided consistent with a commitment made in our March 17, 1989 submittal to the NRC regarding technical issues impacting the San Onofre Unit 1 restart from the Cycle X refueling outage. The March 17 submittal provided a discussion of this subject with an assessment which concluded that this condition was not safety significant. This voluntary report provides a more detailed discussion of this issue which results from our continued follow-up investigation and review process. This process resulted in circumstances which prolonged the preparation and submittal of this report. SCE endeavors to avoid such circumstances, and will continue to do so in the future.

This occurrence had no effect on the health and safety of either plant personnel or the public.

If you require any additional information, please so advise.

Sincerely,

Enclosure: LER No. 89-010
