11545 Rockville, Maryland 20852-2738

Ref: Docket No. 40-2259, Source Material License No. SUA-672

Dear Mr. Persinko,

Enclosed please find two copies of the semi-annual ground water monitoring report (covering the first and second quarters of 2013) as required by condition 60B of the referenced license. Please let me know if there are any questions regarding the report.

Sincerely,

R. Mark Owens
General Manager

1.0 Introduction and Summary of Results

This semi-annual report presents the results of ground-water monitoring for the first half of 2013 for the Lucky Mc tailings area. This report covers the requirement of NRC License SUA-672, License Condition 60B.

The following table lists the site standards that are in effect at Lucky Mc tailings POC well T1-12. The tabulation also lists the measured April 2013 concentrations for POC well T1-12. All of the present concentrations in POC well T1-12 are significantly below the site standards.

GROUND-WATER PROTECTION STANDARDS FOR POINT-OF-COMPLIANCE WELL T1-12 AND APRIL 2013 POC CONCENTRATION

POC STANDARD & CONCENTRATION	CONSTITUENT								
	Arsenic	Beryllium	Cadmium	Chromium	Nickel	RA-226+Ra-228	Selenium	Thorium-230	Uranium
SITE STANDARD	0.05	0.07	0.02	0.05	0.85	7.6	1.1	13.2	1.7
T1-12, APRIL 2013	0.003	<0.001	<0.001	0.01	0.26	3.7	0.213	0.04	0.409

NOTE: All concentrations in mg/l except for radium and thorium in pCi/l.

Figure 1.3-2 in the Lucky Mc ACL report shows the base of the Lucky Mc aquifer which shows that a narrow outlet exists on the east side of the No. 1 and No. 2 Tailings connecting them to the Wind River Channel. The No. 1 and the No. 2 Tailings should not be presently contributing any seepage to the Wind River Channel and the Fraser Draw alluvium because the water levels in these tailings are below the base of the aquifer. Figures 1.3-4 (see channel close to the B side of the cross section) and 1.3-5 (see the ridge near well OBS-2) in the Lucky Mc ACL report show that the outlets to the No. 2 and No. 1 Tailings were dry or essentially dry in 2000. Therefore these tailings should not be contributing any additional source to the Lucky Mc aquifer with time. Stable concentrations in POC well T1-12 support this conclusion.

Modeling of key parameters, uranium, selenium and radium-226 + 228 are presented in the Lucky Mc ACL report. The following table presents a comparison between the model predictions and the 2013 observed concentrations for POC well T1-12 and wells AL-1 and AL-6. These comparisons show that the present concentrations agree fairly well with the model predictions for 2013. Concentrations at the POC well are not expected to ever exceed the site standards based on the present levels and the model predictions.

COMPARISON OF MODEL PREDICTION AND 2013 CONCENTRATIONS

CONSTITUENT	URANIUM			SELENIUM			RA-226 + RA-228		
WELL	T1-12	AL-1	AL-6	T1-12	AL-1	AL-6	T1-12	AL-1	AL-6
MODEL PREDICTIONS	0.6	1.1	1.1	0.2	0.4	0.3	7	1	1
2013 CONCENTRATIONS	0.4	1.3	0.9	0.2	0.2	0.1	3.7	1.5	6

NOTE: All concentrations in mg/l except for radium in pCi/l.

2.0 Piezometric Data

The water-level data collected during the second quarter of 2013 are presented in Table 1 along with the 2010 through 2013 water-level data. Figure 1 presents the piezometric surface of the Lucky Mc aquifer from the POC well through the Fraser Draw alluvium, while Figure 2 presents plots of the water-level elevations versus time for wells AL-6, T1-6, T1-12, AL-1 and AL-7. The corresponding water-level elevation or constituent concentration is posted adjacent to the well location on the plan view figures of the area (such as Figure 1). Water-level elevations in the first and second quarters of 2013 were steady or very gradually rising in these wells.

3.0 Water-Quality Data

License Condition 60B requires monitoring of water from the POC and POE wells and other selected wells for the constituents presented in Table 1. An analysis of the selenium, uranium, combined radium-226 plus radium-228, sulfate, chloride and TDS concentrations is required.

Figure 3 presents the April 2013 chloride concentrations for the Lucky Mc aquifer. The chloride concentrations are highest in the Fraser Draw alluvial well AL-1 and Wind River Channel at POC well T1-12 and decrease significantly to levels similar to background levels at well AL-7. The chloride concentration in well AL-1 is higher showing the concentration gradient from the east to the west. Shift of the concentration gradient near AL-1 had caused the chloride concentration to increase in this well but a gradual decline from this increase has been observed in the last year. Figure 4 presents the plots of chloride concentration versus time for the five monitored wells. Chloride concentrations in POC well T1-12 overall have been fairly steady in 2011 through 2013 while a gradual increase was observed in POE well AL-6 and well AL-7. A larger increase was observed in the last half of 2010 and 2011 in well AL-1. The 2013 chloride concentrations in well AL-1 have continued on a gradual decline.

Figure 5 presents the TDS concentrations for April 2013 water samples from the Lucky Mc aquifer. The TDS concentrations are greater than 5000 mg/l at POC well T1-12, slightly less in Fraser Draw alluvial well AL-1 and are less than 4000 mg/l in the western portion of the Fraser Draw alluvium at wells AL-6 and AL-7. Figure 6 presents the plots of TDS concentrations versus time and illustrates that the 2013 TDS concentrations are similar to the average value for the previous few years for well T1-12. A decrease in concentrations in 2013 was observed in well AL-1 after an increase in concentrations had been observed in 2010 and 2011. A gradual increase in TDS had been observed in well AL-7 and AL-6 in recent years while the 2013 values show a small decrease. This change is likely due to the concentration gradient shifting.

The measured sulfate concentrations for the Lucky Mc aquifer during April of 2013 are presented in Figure 7 and show that the sulfate concentrations in the western portion of the Fraser Draw alluvium are greater than 2000 mg/l near well AL-1 while concentrations are less than 2000 mg/l in the eastern half. The sulfate concentration versus time plots in Figure 8 show that sulfate concentrations in POC well T1-12 have overall been steady for the last six years but slightly larger than values observed prior to 2007. The increase in sulfate in the 2nd half of 2010 and 2011 in well AL-1 shows the affect of the shift in concentrations to the east. A decline in sulfate concentrations has been observed in well AL-1 in 2013.

Uranium concentrations for the Lucky Mc aquifer during April of 2013 are presented in Figure 9, and this figure shows the highest observed uranium concentrations at well AL-1. Figure 10

shows that the uranium concentration in the POE well has overall gradually increased in 2013. A larger increase had been observed in well AL-1 with the 2013 values showing a steady decline in uranium concentrations. The uranium concentrations have been relatively steady in POC well T1-12 for the last few years.

Figure 11 presents the selenium concentrations for April 2013 for the Lucky Mc aquifer. Selenium concentrations are greatest at POC well T1-12 and have overall gradually declined for the last few years (see Figure 12). The selenium concentration in well AL-1 increased in May of 2010 which could be due to alluvial water shifting to the east in this area but have gradually decreased the last year.

Figure 13 presents the radium-226 plus radium-228 activity for April 2013 in the Lucky Mc aquifer in pCi/l. The activity at POC well T1-12 is well below the radium-226 plus radium-228 site standard of 7.5 pCi/l. Measured radium activities generally exhibit more variability than other constituents, and little significance is given to occasional outliers. Figure 14 shows plots of the radium-226 plus radium-228 activity versus time for the monitored wells. These plots show significant variability in measured activity, which is thought to be due to variability in the laboratory analysis. The last eight values for well AL-6 have been near 6pCi/l.

Concentrations of the remainder of the constituents at the site are gradually decreasing or are not significant at POC well T1-12.
