who can be affected by Indian point. I have two small children, I'm originally from Tokyo, Japan, currently living in NY Metro area.

Since 3/11 Fukushima nuclear accident, I researched about the danger of nuclear, and in few days, I realised that I didn't know anything, but with time people like me were beginning to realize the danger of nuclear plants, even without accidents, the routine release of radiation, leakage & nuclear waste.

The distance between Indian Point & Manhattan is 30miles. Tokyo & Fukushima is 150 miles. There are hotspots in Tokyo and surrounding prefectures. Food has been contaminated and it's been circulated throughout the country.
This is why I cannot take my children to Tokyo to see their grand parents without fear.

I have a friend who runs a kindergarten in Fukushima, at the playground, there's a monitoring post to measure radiation, the children have radiation dosimeters and cannot play outside without fearing the exposure to radiation. They have to take thyroid exams. Mothers are struggling to find non-contaminated foods, some are trying to decontaminate the streets, the path that children take to school organic farmers had to give up their precious land.
I don't want to see this happen here & I don't want to live with the fear

(Let's prevent the accident from happening)

When this accident happened, the Japane goverment said it was "beyond expectation". If Indian point becomes the target of terrorism, is hit by an earthquake/hurricane human errors or multiple system failure happens, are you going to say it was "beyond expectation"? I am not only talking about the reactor, but the high level radioactive waste storage as well.

Enough is enough. We must learn from Fukushima.

Once the nuclear accident happens, we cannot undo the contamination.

This matters to me, because this affects our children & their future,
