**Subject: Marine Turtle Removal Monthly Summary  
January 2015**

Dear Meghan,

Attached, please find the monthly summary of marine turtle removals for January 2015. This month, we captured twenty-eight (28) *Caretta caretta*, fourteen (14) *Chelonia mydas* and one (1) *Lepidochelys kempii* in the intake canal of the St. Lucie power plant on Hutchinson Island. There were no mortalities or sea turtles sent for rehabilitation in January.

Throughout the month, the 5-inch barrier net experienced moderate loads of jellyfish that entered into the intake canal system, whereas algae entrainment was light. Construction of the permanent 5-inch barrier net was completed this past month. The new barrier net has been operational since mid-January and the temporary 5-inch barrier net has already been removed. Inwater Research Group biologists performed enhanced monitoring for sea turtles during the net removal process and the permanent barrier net has performed as designed; no turtles have been observed beyond the 5-inch net.

The tag numbers and morphometric data for all turtles captured during the month have been included with this report (see attachments/addendums). Also included is a spreadsheet for all captures, mortalities, injuries, and causal events delineated by species and by month for the year 2015. In addition, this spreadsheet also tracks fresh scrapes incurred on captured turtles for the current month, as well as the entire year. An additional Excel spreadsheet tracks all causal injuries and mortalities incurred by sea turtles at the St. Lucie Plant since 2002.

Please feel free to contact me with any questions.

Sincerely,

Steve
