## General Comment

Subject: NRC-2015-0057

Changing the 10 CFR 20 regulations at this point in time is very premature. People need to be informed and better educated on how to protect themselves from a fatal cancer. Unfortunately, the majority of the medical industry does not understand how to use functional medicine yet and this is where the rubber meets the road. Without adequate safeguards in place, any additional radiation exposure exposure must be treated as if it may cause a fatal cancer in this toxic environment.

While I think that the purists petitioning the NRC may have some talking points to consider, their petitions are not worthy of merit at this time. The reason is that we live in an extremely toxic environment. This is the most toxic environment ever known to man. It is estimated that almost every one of us will be diagnosed with cancer sometime during his/her lifetime.

Instead of observing cancer rates decreasing dramatically before setting new standards, these industry workers want to reestablish the radiation protection standard baseline while cancer rates are skyrocketing. This makes little sense when we consider that cancer death rates have not changed in fifty years despite the trillions of dollars being spent on finding the cure. Instead of 1 in 20 people, 1 in 2 people are projected to be diagnosed with cancer in their lifetime. Further troubling is that the primitive treatments being used to fight cancer are deadly in and of themselves and rarely offer cure, so nobody wants to get that cancer diagnosis. The radiation protection staff must weigh all of the relevant scientific information not solely from the industries seeking to benefit and profit by this regulatory change.

It will take years, probably decades, before people are better educated in functional and holistic medicine to be able to protect themselves from cancer and from the industry giants that are truly running our government in a near oligarchy without further harming us by less restrictive radiation standards that would have worked 100 years ago when cancer was not epidemic.

I suggest people start by educating themselves on how to protect themselves from all radiation exposure and carcinogens and stop leaving that job up to the nuclear and medical community. The information we are given through corporate-sponsored television and news channels is clearly biased and uninformative. These people are clearly missing the potential for harm here.

To begin with, some of my recommended reading and listening:

Nutrition and Physical Degeneration by Weston Price is a good book that I learned important nutritional information from that is little known to the scientific community. Cancer prevention and nutrition are important. The Westonn Price Foundation is another valuable resource. There are many presentations by Sally Fallon on YouTube.

Fukushima Meltdown & Modern Radiation: Protecting Ourselves and Our Future Generations by Jonathan Apsley, MD, ND, DC is another book worthy of mentioning that I keep as a resource that is also little known to the scientific community and offers nutritional and supplemental support. Jonathan Apsley is also on YouTube.

Beating Cancer with Nutrition by Patrick Quillan is a book that outlines some more basics about general nutrition that is little known by the scientific community. He has some presentations on YouTube as well.

The Quest for the Cures by Ty Bollinger is a docu-series of interviews with medical doctors that are curing cancers. Part of this series is freely available on YouTube.
