Subject: Palo Verde, Unit 2 - Fall 2015 Steam Generator Inspection

Good Morning Tom,

The U.S. Nuclear Regulatory Commission (NRC) staff participates in conference calls with a handful of licensees performing steam generator (SG) inspections every outage season. The PVNGS, Unit 2, refueling outage is scheduled for Fall 2015. NRC staff **has not selected PVNGS, Unit 2**, for such a call during its upcoming refueling outage; however, the NRC staff wants to be notified in a timely manner if one (or more) of the following circumstances is identified during the outage:

1. If a degradation mechanism (other than wear from loose parts or minor wear at tube support structures) is observed that has not been observed in the past in these steam generators.
2. If degradation of steam generator secondary side internals is observed that has not been observed in the past in these steam generators.
3. If a flaw is more severe than expected, or if the number of flaws identified are more than expected.
4. If an in situ pressure test is performed.

Also, if Arizona Public Service Company is not planning to perform SG tube inspections during PVNGS, Unit 2, refueling outage, please let me know.

Thank you,

Maggie Watford
