Desc: The following statement is from an NRC letter addressed to me dated 3/31/2011 (ML110890309) "To provide some background, in 1968 the matter of the pipelines was considered during the initial licensing of IP3 (the pipelines are closer to IP3 than to IP2). On September 21, 1973, the Atomic Energy Commission (AEC) issued a safety evaluation report for IP3 which stated, "Two natural gas lines cross the Hudson River and pass about 620 feet from the Indian Point 3 containment structure. Based on previous staff reviews, failures of these gas lines will not impair the safe operation of Indian Point 3."

On December 6, 1995, the licensee submitted the Individual Plant Examination of External Events (IPEEE) report for IP3. In this report, the licensee first evaluated any susceptibility to damage to the pipelines from seismic events. Based on a hazard analysis, the licensee concluded that the probability of occurrence was low enough that the pipelines could be screened out as a seismic vulnerability. The licensee next considered pipeline failures from other causes, such as an inadvertent overpressure condition. The licensee screened this scenario out from further consideration based on the low probability of the scenario. The NRC's staff evaluation report on the IP3 IPEEE did not identify any discrepancies with this approach."

Please provide a copy of the "hazard analysis" and "previous staff reviews" discussed and above.
