## 1.0 ERROR-ADJUSTED CORE OPERATING LIMITS

This Core Operating Limits Report for O1C18 has been prepared in accordance with the requirements of Technical Specification 6.9. The core operating limits within this report have been developed using NRC-approved methodology (References 1, 2, 3, and 4). The RPS protective limits and maximum allowable setpoints are documented in References 6 and 7, and validated in References 5 and 8 for O1C18. Operational limits and requirements are documented in Reference 5. The reactor coolant system design flow used in References 5 and 8 for O1C18 is 107.5 % (of 88,000 gpm per pump). The core operating limits have been developed with a radial local peaking factor ( $F_{\Delta H}^N$ ) of 1.714 and an axial peaking factor ( $F_Z^N$ ) of 1.5.

The error-adjusted core operating limits (i.e., setpoints) have been determined for O1C18, with all necessary uncertainties and margins applied. The calculations that support these setpoints are documented in Reference 5. The following cycle specific error-adjusted setpoints are included in this report:

- 1) RPS protective limits (Figures 1.1 and 2.1), and RPS maximum allowable setpoints (Figures 1.2 and 1.3),
- 2) Steady state operating band,
- 3) BWST, SFP, CBAST, and CFT boron requirements,
- 4) Quadrant power tilt operational setpoints,
- 5) RPS power-imbalance trip setpoints,
- 6) Power-imbalance operational setpoints and,
- 7) Rod index operational alarm and shutdown margin-restricted setpoints.

444 EFPD to EOC	292 ± 5	300	100	100

Oconee 1 Cycle 18

**BWST, SFP, CBAST, and CFT BORON REQUIREMENTS**

**0 EFPD to EOC**

- 1) The BWST boron concentration shall be greater than 2210 ppm<sup>1</sup> and less than 3000 ppm<sup>2</sup> (referred to by Tech Spec 3.3.4).
- 2) The Spent Fuel Pool boron concentration shall be greater than 2210 ppm<sup>1</sup> and less than 3000 ppm<sup>2</sup> (referred to by Tech Spec 3.8.15).
- 3) The equivalent of at least 1100 cubic feet of 11,000 ppm boron<sup>3</sup> shall be maintained in the CBAST (referred to by Tech Spec 3.2.2).
- 4) The boron concentration in each CFT shall be greater than 1835 ppm<sup>4</sup> (referred to by Tech Spec 3.3.3).
- 5) The refueling canal boron concentration shall be greater than 2210 ppm<sup>1</sup> (referred to by the bases to Tech Spec 3.8.4). This concentration is large enough to maintain 1%  $\Delta k/k$  shutdown margin with all control rods out of the core at temperatures down to 33 °F, and with no credit for xenon worth. There is no upper limit on the refueling canal boron concentration.

Note that in the event that the refueling boron should fall below 2210 ppm, the criticality calculations would need to be re-evaluated.

Oconee 1 Cycle 18

**ERROR-ADJUSTED QUADRANT POWER TILT OPERATIONAL SETPOINTS**

	CONDITION 1 (STEADY STATE)		CONDITION 2 (TRANSIENT)		CONDITION 3 (MAXIMUM)
	30 - 100 % FP	0 - 30 % FP	30 - 100 % FP	0 - 30 % FP	0 - 100 % FP
Full Incore Alarm *	3.50	7.57	7.07	9.36	16.51
Outcore Alarm	2.18	6.09	5.63	7.72	14.22
Backup Incore	2.20	3.87	3.63	4.82	10.08

Note that the above limits will be used in the following order of priority:

- 1) Full Incore
- 2) Outcore
- 3) Backup Incore

The **backup incore** limits will be used in the event that the Operator Aid Computer is out of service. For normal operation with a working Operator Aid Computer, the **full incore** limits will be used as long as sufficient incore detector strings are operational. In the event that sufficient incore strings are not operational, the **outcore** limits will be used.

The Steady State, Transient, and Maximum Limits tabulated above define quadrant tilt ranges that impose different restrictions on power operation, and time intervals within which specific action may be required. In brief, Condition 1 applies to all power operation above 15% power excluding physics testing. For Conditions 2 and 3, steps are taken to reduce the tilt to within Condition 1 limits or a power reduction is required. If tilt is in excess of Condition 3 limits, reactor shutdown is required. Refer to the Technical Specification Sections listed below for more detailed information.

## 2.0 CORE OPERATING LIMITS (NOT ERROR-ADJUSTED)

The following cycle-specific core operating limits are included in this report. All computations performed in setting these limits used the approved SIMULATE methodology.

- 1) RPS protective limits (Figure 2.1 and table),
- 2) Quadrant power tilt operational limits,
- 3) Power-imbalance operational limits and,
- 4) Rod index operational alarm and shutdown margin-restricted limits.

Oconee 1 Cycle 18

**QUADRANT POWER TILT OPERATIONAL LIMITS\***

**\*NOT FOR PLANT USE -- SEE PAGE 11**

STEADY STATE		TRANSIENT		MAXIMUM
30 - 100 % FP	0 - 30 % FP	30 - 100 % FP	0 - 30 % FP	0 - 100 % FP
5.19	10.00	9.44	12.00	20.00

The Steady State, Transient, and Maximum Limits tabulated above define quadrant tilt ranges that impose different restrictions on power operation, and time intervals within which specific action may be required. Refer to the Technical Specification Sections listed below for more detailed information.
