Subject: RE: Other FPL power sources

Barry,

When reactor plants are taken down for maintenance, power remains supplied to the electrical grid from other operating power plants that are tied into the electrical grid system. Many electrical power sources both nuclear and non-nuclear are synchronized to the electrical grid in order to maintain adequate capacity for the many consumers. The power company monitors and operates the electrical grid load distribution system. Power companies plan their outages carefully to make sure enough power is being put on the grid to ensure the consumers receive a reliable source of electricity during high demand periods or other forecasted conditions. In addition, the power companies have the capability to also increase output from other sources as needed to compensate for their planned outages.

Subject: [External_Sender] Other FPL power sources

Do we know how and from where FPL drew power as TP 3 & 4 were off line one at a time for seven months each in 2012/2013?

Barry
