DUKE POWER COMPANY

Power Building

422 SOUTH CHURCH STREET, CHARLOTTE, N. C. 28242

WILLIAM O. PARKER, JR.
VICE PRESIDENT
STEAM PRODUCTION

January 26, 1978

Mr. James P. O'Reilly, Director U. S. Nuclear Regulatory Commission Suite 1217 230 Peachtree Street, Northwest Atlanta, Georgia 30303

RE: Oconee Unit 1
Docket No. 50-269

Dear Mr. O'Reilly:

Pursuant to Sections 6.2 and 6.6.2 of the Oconee Nuclear Station Technical Specifications, please find attached Reportable Occurrence Report RO-269/77-31.

Very truly yours,

William O. Parker, Jr.

# DUKE POWER COMPANY OCONEE UNIT 1

Report No.: RO-269/77-31

Report Date: January 26, 1978

Occurrence Date: December 29, 1977

Facility: Oconee Unit 1, Seneca, South Carolina

Identification of Occurrence: RCS Pressure Channel Inoperable

Conditions Prior to Occirrence: 90 percent full power

## Description of Occurrence:

On December 27, 1977, unidentified Reactor Coolant System leakage of less than 1 gpm was detected. At 2131 RPS Channel A tripped on low pressure/temperature and was placed in manual bypass. At 0200 on December 28 the previously detected leak was determined to be coming from the area of Engineered Safeguard Channel 1 and RPS Channel A Pressure Transmitter. A reactor shutdown was initiated at 0209 due to high Reactor Building (RB) activity. At 0600 personnel entered the RB and determined that pressure switch 1 PS-364 was leaking and valved it out. Reactor power reduction was stopped at 39 percent full power and with the isolation of 1PS-364, RPS Channel A was returned to service.

At 2400 during PT/1&2/0600/01, it was determined that RC Loop A wide range (WR) pressure was indicating high. Further investigation determined that ES Analog Channel 1 WR pressure was indicating high and would not trip at required setpoints. ES Analog Channel 1 was placed in trip condition. Pressure transmitter 1PT-21P, which is located approximately 5 feet from and slightly below 1PS-364 was recalibrated and ES Analog Channel 1 was returned to service.

#### Apparent Cause of Occurrence:

The diaphragm of pressure switch 1PS-364 evidently failed as steam was seen blowing from the switch. This failure caused RPS Channel A to trip. The steam from the switch failure evidently impacted on and shifted the zero setting of pressure transmitter 1PT-21P. The zero shift caused the high reading on ES Analog Channel 1.

### Analysis of Occurrence:

Pressure switch 1PS-364 provides a signal to prevent valves LP-1, -2 from opening with RCS pressure greater than 400 psig. The failed diaphragm caused RPS Channel A to trip. RPS Channels B, C & D remained fully operational during the incident as required by Technical Specifications 3.5.1. Valves LP-1, -2 had been tagged shut prior to this incident.

The zero setpoint of pressure transmitter 1PT-21P shifted when it was heated by steam from the switch failure. ES Analog Channel 1 which provides a signal for LPI and HPI initiation became inoperable, however, channels 2 and 3 remained fully operational as required by Technical Specification 3.5.1. The health and safety of the public were not endangered by this incident.

### Corrective Action:

Pressure switch 1PS-364 is presently valved out and will be replaced during a future outage. Pressure transmitter 1PT-21P was recalibrated and returned to service.

0 2	On December 27 an increase in reactor coolant leakage was noted. At 2131
0 3	RPS channel A tripped on press/temp. It was determined that a pressure
0 4	switch had blown. Reactor shutdown was initiated but was terminated when
0 5	switch was valved out. On December 29 it was noted that Channel 1 WR
0 6	pressure was reading high so the channel was tripped. At 1545 recalibration
0 7	was complete so channel was returned to service. At no time was the ability
08	of the reactor to operate safely impaired.
