Duke Energy Carolinas, LLC (Duke Energy)

Oconee Nuclear Station, Units 1, 2, and 3  
Docket Numbers 50-269, 50-270, and 50-287  
Renewed Operating License Nos. DPR-38, DPR-47, and DPR-55

Subject: Response to Request for Additional Information Regarding the License Amendment Request (LAR) to Change the Oconee Nuclear Station (ONS) Emergency Plan to Upgrade ONS Emergency Action Levels Based on NEI 99-01, Revision 6

License Amendment Request No. 2015-04

By letter dated June 23, 2015 (Agencywide Documents Access and Management System (ADAMS) Accession No. ML 15183A060), Duke Energy requested approval of a proposed change to the Emergency Action Levels (EALs) used at Oconee Nuclear Station (ONS). Duke Energy proposes to revise their current ONS EAL scheme to one based upon Nuclear Energy Institute (NEI) document NEI 99-01, "Development of Emergency Action Levels for Non-Passive Reactors," Revision 6 (ADAMS Accession No. ML 12326A805).

The NRC staff reviewed the request and determined that additional information is needed to complete their review. A letter requesting additional information was sent on December 15, 2015 (ADAMS Accession No. ML 15345A398). Enclosure 1 to this letter provides the ONS response to the request for additional information. Enclosure 2 provides the ONS Emergency Action Level Technical Bases Document, Revision 0, that incorporates changes in response to the request for additional information and additional changes deemed necessary, as described in Enclosure 1.

This letter makes no new commitments or changes to any existing commitments. Should you have any questions regarding this request, please contact Chris Wasik, Regulatory Affairs Manager, at (864) 873-5789.

**ENCLOSURE 1**

RESPONSE TO REQUEST FOR ADDITIONAL INFORMATION

LICENSE AMENDMENT REQUEST NO. 2015-04

OCONEE NUCLEAR POWER STATION, UNIT 1, 2, AND 3

DOCKET NOS 50-269, 50-270, and 50-287

RENEWED LICENSE NOS. DPR-38, DPR-47, and DPR-55

By letter dated June 23, 2015 (Agencywide Documents Access and Management System (ADAMS) Accession No. ML15183A060), Duke Energy requested approval of a proposed change to the Emergency Action Levels (EALs) used at Oconee Nuclear Station (ONS) which would revise the current ONS EAL scheme to one based upon Nuclear Energy Institute (NEI) document NEI 99-01, "Development of Emergency Action Levels for Non-Passive Reactors," Revision 6 (ADAMS Accession No. ML12326A805). The NRC staff reviewed the request and determined that additional information is needed to complete their review. A letter requesting additional information was sent on December 15, 2015 (ADAMS Accession No. ML15345A398).

Duke Energy provides the following response to the request for additional information (RAI) regarding the License Amendment Request to revise the ONS EAL Scheme to one based on NEI 99-01, Revision 6. Changes to the ONS Technical Bases Document as a result of this RAI are identified within the ONS RAI Response in the table below. Changes were also made to the ONS Technical Bases Document that were not the result of an RAI. These additional changes are described in a table below the RAI response, with an explanation of why each change was deemed necessary. The revised ONS EAL Technical Bases Document is provided in Enclosure 2 with revision bars indicating changes from the original submittal.

RAI-ONS-#	Question	ONS Response
01	<p>Section 4.3, "Instrumentation Used for EALs," to NEI 99-01, Revision 6, states, in part, that: <i>"Scheme developers should ensure that specific values used as EAL setpoints are within the calibrated range of the referenced instrumentation."</i> Please confirm that all setpoints and indications used in the proposed EAL scheme are within the calibrated range(s) of the stated instrumentation and that the resolution of the instrumentation is appropriate for the setpoint/indication.</p>	<p>ONS has confirmed that setpoints and indications used in the proposed EAL scheme are within the calibrated range(s) of the stated instrumentation and that the resolution of the instrumentation is appropriate for the setpoint/indication.</p>
02	<p>Section 2.5, "Technical Bases Information," of Duke's LAR states, in part, that: "A Plant-specific basis section that provides ONS-relevant information concerning the EAL. This is followed by a Generic basis section that provides a description of the rationale for the EAL as provided in NEI 99-01 Rev. 6." Due to the high probability that EAL decision-makers may be confused between these two sections when the information appears to be inconsistent, please justify the rationale for two sections when it is acceptable to just have one basis section that is specific to the plant, or revise accordingly to eliminate potential confusion by user.</p>	<p>The ONS site specific and NEI 99-01 generic bases sections have been combined into a single bases section for each EAL. Section 2.5 "Technical Bases Information" has been revised accordingly.</p> <p>Redundant bases, where applicable, have been deleted.</p>

RAI-ONS-#	Question	ONS Response
03	<p>In Section 5.0, "Definitions," of Duke's LAR, the definition for Site Area Emergency is not consistent with the definition in the NRC-endorsed guidance. Please revise accordingly, or provide further justification for inconsistency with the NRC-endorsed guidance.</p>	<p>Site Area Emergency was verified consistent with the NEI 99-01, Revision 6 definition.</p> <p>Also, after further review, determined that the following definitions should be included in Section 5.0 to be consistent with NEI 99-01 Revision 6:</p> <ul style="list-style-type: none"> <li>• Emergency Action Level (EAL),</li> <li>• Emergency Classification Level (ECL),</li> <li>• Fission Product Barrier Threshold, and</li> <li>• Initiating Condition</li> </ul>
04	<p>For the following EALs, please explain why the listed NOTES were included, or revise accordingly.</p> <ul style="list-style-type: none"> <li>• RA1.2 – NOTE-3</li> <li>• RS1.2 – NOTE-3</li> <li>• RG1.2 – NOTE-3</li> </ul>	<p>Deleted Note 3 from EALs RA1.2, RS1.2 and RG1.2</p>

RAI-ONS-#	Question	ONS Response
05	For EALs RU1, RA1, RS1 and RG1, please explain why the values and thresholds developed for these EALs are inconsistent with what has already been approved for ONS, or revise accordingly.	<p>The proposed ONS RG1.1, RS1.1 and RA1.1 EAL threshold values are based on NEI 99-01 Rev 6 and utilize the site specific URI/RASCAL dose assessment model (v2.0.0.1) for their development.</p> <p>The proposed ONS RU1.1 EAL threshold value is based on NEI 99-01 Rev 6 and utilizes 2 times the ODCM limit for its development.</p> <p>The current ONS RG1.1 and RS1.1 EALs are based on NUMARC/NESP-007 Rev 2.</p> <p>The current ONS RA1.1 EAL threshold value is based on NUMARC/NESP-007 Rev 2 and utilizes 200 times the ODCM limit for its development.</p> <p>The current ONS RU1.1 EAL threshold value is based on NUMARC/NESP-007 Rev 2 and utilizes 2 times the ODCM limit for its development.</p> <p>The table below provides a comparison between the current and proposed ONS gaseous effluent EAL thresholds for the GE, SAE, Alert and Unusual Event emergency classification levels:</p>

Monitor	GE	SAE	Alert	Unusual Event
RAI-46 (cpm)	NEI: 3.00E+5 NUMARC: 2.09E+6	NEI: 3.00E+4 NUMARC: 2.09E+5	NEI: 3.00E+3 NUMARC: 2.09E+4	N/A
RAI-45 (cpm)	N/A	N/A	N/A	NEI: 1.41E+5 NUMARC: 9.35E+5

RAI-ONS-#	Question	ONS Response
05, continued		<p><u>RG1.1 Differences</u></p> <p>The NEI 99-01 Rev 6 ONS RG1.1 EAL threshold value utilizes the RASCAL based dose assessment model assuming a reactor accident source term and meteorology reflective of conditions consistent with a design basis accident and definition of the General Emergency classification level. The NUMARC/NESP-007 Rev 2 ONS RG1.1 EAL threshold value utilizes an annual average X/Q in accordance with the NRC endorsed "Methodology for Development of Emergency Action Levels NUMARC/NESP-007_Revision 2 Questions and Answers," dated June 1993. The X/Q input alone accounts for a difference of more than one order of magnitude. Differences in assumed source term mix also contribute to the difference in threshold values. The basis and development methodologies for RG1.1 are completely different between NUMARC/NESP-007 Rev 2 and NEI 99-01 Rev 6.</p> <p><u>RS1.1 Differences</u></p> <p>Both NEI 99-01 Rev 6 and the NUMARC/NESP-007 Rev 2 RS1.1 EAL threshold values are established as 1/10 the RG1.1 threshold values. Thus, the differences described above for RG1.1 are the same for RS1.1.</p> <p><u>RA1.1 Differences</u></p> <p>NEI 99-01 Rev 6 established the basis for RA1.1 as 1/10 the RS1.1 threshold value. NUMARC/NESP-007 Rev 2 established the basis for RA1.1 as 200 times the ODCM limit. The basis and development methodologies for RA1.1 are completely different between NUMARC/NESP-007 Rev 2 and NEI 99-01 Rev 6.</p>

RAI-ONS-#	Question	ONS Response
05, continued		<p><u>RU1.1 Differences</u></p> <p>Both the NEI 99-01 Rev 6 and the NUMARC/NESP-007 Rev 2 ONS RU1.1 EAL threshold values are derived from the same the ODCM equation:</p> $SP_{\text{total body}} \text{ (cpm)} = \left( \frac{500}{472 \times f \times \frac{\lambda}{Q} \times \sum_i (S_i \times K_i) \times \frac{CF_{Xe-133}}{Eq_i}} \right) + bkg$ <p><u>RU1.1 Differences, continued</u></p> <p>Both the NEI 99-01 Rev 6 and the NUMARC/NESP-007 Rev 2 ONS RU1.1 EAL threshold values use the same input values with the exception of source term.</p> <ul style="list-style-type: none"> <li>• The NUMARC/NESP-007 Rev 2 ONS RU1.1 EAL threshold value is based on Xe-133.</li> <li>• The NEI 99-01 Rev 6 ONS RU1.1 EAL threshold value is based on NUREG-1940 Table 1-2 normal RCS Noble Gas term source mix.</li> </ul> <p>Neither NUMARC/NESP-007 Rev 2 nor NEI 99-01 Rev 6 provides source term guidance for the RU1.1 EAL threshold value. NUREG-1940 is used for the ONS RA1.1, RS1.1 and RG1.1 radiological effluent EAL threshold source term basis. NUREG-1940 was selected as the source term basis for the RU1.1 radiological effluent EAL threshold to maintain consistency of guidance document bases across the emergency classification thresholds.</p>
06	For EAL RA2.2, the information in the NEI 99-01 Basis section does not contain all of the actual information from NEI 99-01 germane to this particular EAL. Please explain why this information was omitted, or revise accordingly.	<p>Re-instated the following text to the RA2.2 bases:</p> <p>"This EAL applies to irradiated fuel that is licensed for dry storage up to the point that the loaded storage cask is sealed. Once sealed, damage to a loaded cask causing loss of the CONFINEMENT BOUNDARY is classified in accordance with EAL EU1.1."</p>

RAI-ONS-#	Question	ONS Response
07	For EAL RG2.1, the level value in the EAL, -23 feet, is inconsistent with the stated level in the ONS Basis, -23.5 feet. Please correct the discrepancy and ensure the correct ONS Level 3 value is used in this EAL, or provide justification for this difference.	Corrected RG2.1 to read, "Spent fuel pool level cannot be restored to at least -23.5 ft. for $\geq$ 60 min. (Note 1)."
08	For EALs RA3.2 and HA5.1, both of these EALs are applicable to the same areas; therefore, it is not required to have two separate tables (Table R-2 for EAL RA3.2, and Table H-2 for EAL HA5.1). In addition, the listed areas are too all-encompassing and should be refined to just those specific areas where access is required as described in the NRC endorsed guidance. Please revise the areas, or provide further justification.	ONS will maintain two tables, R-2 and H-2 for end-user usability. NRC-endorsed guidance indicates that the site-specific list of plant rooms or areas with entry-related mode applicability should include those rooms or areas that contain equipment which require a manual/local action as specified in operating procedures used for normal plant operation, cooldown and shutdown. EAL Technical Bases Document, Attachment 3, Safe Operation & Shutdown Rooms/Areas Tables R-3 & H-2 Bases, provides analysis for the areas listed. The Oconee plant is constructed with essentially a common Turbine Building and a common Auxiliary Building for all three units. Very little separation is provided for key areas joined by common hallways. For this reason, the areas provided in Table R-2/H-2 are necessarily all-encompassing.
09	For the description of Category E-Independent Spent Fuel Storage Installation (ISFSI), please add wording related to how security events at the ISFSI are declared.	Revised the ISFSI category introduction: "The ONS ISFSI is contained wholly within the plant Protected Area. Therefore a security event related to the ISFSI would be applicable to EALs HU1.1, HA1.1 and HS1.1."

RAI-ONS-#	Question	ONS Response
10	<p>For EALs CU2.1 and SA1.1, please confirm that the listed alternating current (AC) power sources are timely and reliable (i.e., will they be available when needed?), and If not, please remove them from the list.</p>	<p>The CU2.1 and SA1.1 listed AC Power Sources include:</p> <p>Offsite:</p> <ul style="list-style-type: none"> <li>• Unit Normal Transformer (backcharged)</li> <li>• Unit Startup Transformer (SWYD)</li> <li>• Another Unit Startup Transformer (aligned) (SWYD)</li> <li>• CT5 (Central/energizing Standby Bus)</li> </ul> <p>Emergency:</p> <ul style="list-style-type: none"> <li>• Unit Startup Transformer (Keowee)</li> <li>• Another Unit Startup Transformer (aligned) (Keowee)</li> <li>• CT4</li> <li>• CT5 (dedicated line/energizing Standby Bus)</li> </ul> <p>The timeliness of the listed AC power sources is dependent upon the required alignment as indicated by the parenthetical following the source. For example, Unit Normal Transformer (backcharged) is only credited as a viable offsite source while it is aligned and the associated unit is on backcharge such that it is capable of powering the essential busses within 15 minutes, whether or not the buses are currently powered from it.</p> <p>Routine maintenance and surveillance programs are in place to ensure the reliability of the offsite and emergency power paths. The important functions of these systems are monitored under the 10 CFR 50.65 Maintenance Rule program. In addition, Operations performs routine rounds to verify these paths are operable and/or available. While the Central switchyard is outside the scope of the Maintenance Rule, it is subject to the North American Electric Reliability Corporation (NERC) reliability standards.</p>

RAI-ONS-#	Question	ONS Response
11	<p>The intent of EALs CA2.1, SS1.1, SG1.1 and SG1.2 is to make the appropriate emergency classification upon a loss of ALL power sources. However, the list as developed eliminates the possibility of alternative AC power sources energizing an essential bus, thus negating the need for declaring the applicable EAL. Please remove the table of AC power sources, or provide further justification.</p>	<p>Removed table references from CA2.1, SS1.1,-SG1.1, and SG1.2 as suggested.</p>
12	<p>For EALs CU3.1 and CA3.1, the guidance in the ONS basis related to the process to follow when core exit thermocouples (CETCs) are unavailable/unreliable should be carried over as a NOTE for this EAL to ensure this information is presented to EAL decision-makers (i.e., on the EAL wallboard).</p>	<p>Added new Note 10 to CU3.1 and CA3.1:  <i>"Note 10: In the absence of reliable RCS temperature indication caused by the loss of decay heat removal capability, classification should be based on time to boil data."</i></p>
13	<p>For EALs CU5.1 and SU7.1, both of these EALs are applicable to the same areas; therefore, it is not required to have two separate tables (Table C-5 for EAL CU5.1, and Table S-4 for EAL SU7.1). Please provide basis for listing separate tables, or revise accordingly. In addition, please explain the following, and if necessary, revise these EALs accordingly:</p> <ul style="list-style-type: none"> <li>• How the EOF phone system can suffice for onsite communications?</li> <li>• Are dedicated satellite phones available for onsite, offsite, and NRC communications?</li> <li>• How many dedicated satellite phones are there, as it may be likely that the NRC phone will need to be dedicated for NRC communications?</li> </ul>	<p>The two separate tables are provided for end-user usability.</p> <p>EOF Phones are not available for Onsite communications. Removed EOF Phone System from Onsite column.</p> <p>Dedicated satellite phones are available for Offsite communications only. Removed Satellite phones from Onsite and NRC columns.</p> <p>There are two dedicated satellite phones. One is in the EOF Offsite Agency Communicator Area and one is in the Offsite Monitoring Area.</p>

RAI-ONS-#	Question	ONS Response
14	<p>For EAL HU2.1, please explain why the use of the abbreviation DBE (design basis earthquake) and OBE (operating basis earthquake) are inconsistently used. While the guidance eventually states that these two terms are the same for ONS, please revise to be consistent with the guidance or consistent with the ONS use of the equivalent term(s), or provide further justification. Also, please explain the need for the detailed information related to the Strong Motion Accelerometer and Tendon Gallery Peak Acceleration Recorders, as it could be implied that, pending approval, the staff agrees that these recorders will suffice for determining this EAL, or revise accordingly.</p>	<p>Revised HU2 IC and EAL to use "OBE" vs. "DBE."          Removed the detailed information related to the Strong Motion Accelerometer and Tendon Gallery Peak Acceleration Recorders, as they cannot be used to classify an emergency (&gt;15 minute indication).__</p>
15	<p>For EAL HU3.2, please explain why EAL SA9.1 is not also listed, along with EAL CA6.1, to ensure that the escalation path for all operating modes are addressed, or revise accordingly.</p>	<p>Added escalation pathway of EAL SA9.1 to EAL HU3.2 bases.          During review of the escalation pathways on the Wallboards, it was noted that HA2, HA3, and HA4 incorrectly referenced HA6.1 instead of CA6.1. This has been corrected in the Wallboards.</p>
16	<p>For EAL HU3.5, please explain, in greater detail, what this EAL is intended for and how it meets the definition of an Unusual Event. In particular, please explain what Condition B is, and how it related to the site radiological emergency plan</p>	<p>The Jocassee Dam is located upstream of the Oconee Nuclear Station. Historically, Condition B associated with the failure of the Jocassee Dam was included in the Emergency Plan because it could cause the turbine building basement to flood, disabling important equipment (e.g., main and emergency feedwater pumps). Escalation of the event to a higher category was based on the ability to maintain core cooling or shutdown functions. With the migration to NEI 99-01, Rev 6 guidance, symptom-based effects from flooding on the radiological emergency plan would be addressed through the loss of power EALs and the Natural/Technical Hazard EALs, based on actual losses of power or safety-related equipment. FERC Emergency Planning maintains evacuation protocols for the public based on dam failures; therefore, HU3.5 was removed.</p>

RAI-ONS-#	Question	ONS Response
17	<p>For EAL HS3.1, please explain, in greater detail, what this EAL is intended to do and why it is at the Site Area Emergency classification level. Has there been an NRC commitment made related to ONS dam failures?</p>	<p>In the ONS submittal to adopt the NUMARC/NESP-007, Rev. 2, Classification Scheme, dated May 5, 1994, Duke Energy identified the concerns associated with the failure of the Keowee Hydro Dam and characterized this failure as a Site Area Emergency. A failure of Keowee Hydro would result in loss of the emergency AC power supply and the potential to lose the ultimate heat sink source. Some flooding of the site may result. Evaluation of the plant status following failure of the dam would determine the need to escalate emergency classifications. More recently, in a January 15, 2010 letter to the NRC, Duke Energy communicated measures in place to address postulated external flood threat issues. Within that letter, Duke Energy referred to the Jocassee EAP, which identifies two conditions related to the status of the dam: Condition A - Failure is Imminent or Has Occurred; Condition B- Potentially Hazardous Situation is Developing. Condition A initiates a call tree that notifies offsite agencies to implement specific actions to protect/warn the public as well as notifications to the ONS Unit 2 Control Room. The letter further communicated that once notification has been received at ONS, the ONS Emergency Plan and associated response procedures are implemented. Existing plant procedures included guidance to trip each of the ONS units and bring the units to a safe shutdown condition.</p> <p>Although no specific commitments related to ONS dam failures were identified, previous versions of the ONS Emergency Plan and ongoing flood hazard discussions have included existing actions within the Site and Hydro Emergency Plans. NRC approval of this submittal would supersede previous Emergency Plans. Symptom-based affects from flooding on the radiological emergency plan would be addressed through the loss of power EALs and the Natural/Technical Hazard EALs, based on actual losses of power or safety-related equipment. The Federal Energy Regulatory Commission (FERC), as regulator for both Jocassee and Keowee dams, has Emergency Planning requirements and oversight for evacuation protocols for the public safety based on dam failures. Therefore, HS3.1 has been removed.</p>

RAI-ONS-#	Question	ONS Response
18	For EALs HU4.1 and HU4.2, the areas listed in Table H-1 seem to be vague or too all-encompassing. Please explain if the listed areas are all the areas that contain equipment needed for safe operation, safe shutdown and safe cool-down, and if these areas can be fine-tuned to limit consideration for these EALs.	<p>Table H-1 Fire Areas are based on the ONS Fire Protection design basis specification. Table H-1 Fire Areas include those structures containing functions and systems required for safe operation, shutdown and cooldown of the plant (SAFETY SYSTEMS).</p> <p>A balance must be established between defining major plant structures containing safe shutdown equipment as fire areas versus a detailed list of areas for every safety system component location. The Table H-1 list of fire areas achieves that balance in support of timely and accurate emergency classification for the end-user.</p>
19	For EALs HU4.3 and HU4.4, please confirm that the Independent Spent Fuel Storage Installation (ISFSI) would be an area applicable to these EALs, or revise accordingly.	The ONS ISFSI is contained wholly within the plant Protected Area. Therefore the ISFSI would be applicable to EALs HU4.3 and HU4.4 for fires within the plant Protected Area
20	For EAL HS6.1, please consider adding operating mode specificity to the key safety functions listed in the EAL.	<p>Revised HS6.1 mode applicability from ALL to Modes 1 – 6.</p> <p>Revised HS6.1 based upon an assessment of applicable modes for each of the listed safety function as follows:</p> <p>“An event has resulted in plant control being transferred from the Control Room to the Auxiliary Shutdown Panels or Standby Shutdown Facility (SSF)</p> <p style="text-align: center;">AND</p> <p>Control of any of the following key safety functions is not reestablished within 15 min. (Note 1):</p> <ul style="list-style-type: none"> <li>• Reactivity (Modes 1, 2 and 3 only)</li> <li>• Core Cooling</li> <li>• RCS heat removal”</li> </ul>

RAI-ONS-#	Question	ONS Response
21	<p>For EALs SU3.1 and SA3.1, please confirm that ONS evaluated the unique design aspects of the digital instrumentation used, and the applicability of these EALs to the applicable failure modes. In addition, please confirm that additional EALs are not warranted based upon digital instrumentation and control.</p>	<p>A conference call between ONS and NRC personnel was conducted on 1/19/2016 to gain further understanding of this question. As a result of this call, it was determined that the question specifically pertains to the digital Reactor Protective System (RPS) at Oconee and whether the design of this digital system introduced failure modes which affect applicability of EALs or warrant additional EALs.</p> <p>As part of the RPS and Engineered Safeguards Protective System (ESPS) replacement project, a Failure Modes and Effects Analysis (FMEA) was performed. The FMEA, reviewed by NRC staff as part of the licensing submittal for the RPS/ESPS replacement [ML100220016, Ref 72], consisted of a systematic qualitative analysis of the RPS and ESPS design with the primary objectives of identifying all credible failure modes, evaluating the consequence and effects of failures, and verifying that the design satisfies single-failure criterion applicable to the replacement RPS/ESPS.</p> <p>While the design of the Oconee RPS is now digital, the functions remain the same. Credible failures within the system have been analyzed. These failures cause the system to fail in a predefined safe state, as was true for the original analog RPS system. Based on an assessment of the FMEA analysis there is no impact on the scope of SU3.1 or SA3.1. The EALs for Oconee that the RPS is applicable to still apply as written, and no new initiating criteria are deemed to be warranted.</p>

RAI-ONS-#	Question	ONS Response
22	For Table F-2 in the Fission Barrier Matrix, please provide the information related to how this table was developed.	<p>The values presented in Table F-2 were derived from Table 2 of the Oconee Core Damage Assessment Guidelines (OSC-5283) as follows:</p> <p><b>FC Loss</b></p> <p>Column FC Loss represents the expected Containment High Range Radiation Monitor (RIA-57 &amp; RIA-58) response based on a LOCA for various periods of time after S/D with 4% clad damage. The values in Table F-2 in this column were calculated first by multiplying the 100% clad damage values in Table 2 of OSC-5283 by .04 and then rounded to account for variation in monitor readings due to decay.</p> <p><b>CMT Potential Loss</b></p> <p>Column CMT Potential Loss represents the expected Containment High Range Radiation Monitor (RIA-57 &amp; RIA-58) response based on a LOCA for various periods of time after S/D with 20% clad damage. The values in Table F-2 in this column were calculated first by multiplying the 100% clad damage values in Table 2 of OSC-5283 by 0.2 and then rounded to account for variation in monitor readings due to decay.</p>
23	Under the Fission Product Barrier (FPB) Matrix, the cited NEI 99-01 Basis sections for several of the FPB criteria are not from NRC-endorsed guidance (NEI 99-01, Revision 6). Please either revise to what has actually been endorsed, or (depending on respond to RAI-02) consider unifying the basis sections into one.	As per response to RAI-ONS-02, the ONS site specific and NEI 99-01 Revision 6 bases have been unified.

**Summary of EAL Changes Not Associated with RAI Response**

The table below summarizes the changes that have been incorporated into the EAL Technical Bases Document contained in Enclosure 2 that are not involved in the NRC RAI response.

EAL #	Description
HU1.1	Separated HU1.1 into HU1.1, HU1.2 and HU1.3 to remove the "OR" qualifier in the NEI 99-01, Revision 6 template, as follows:  "HU1.1 A SECURITY CONDITION that does not involve a HOSTILE ACTION as reported by the Site Security Supervision"  "HU1.2 Notification of a credible security threat directed at the site"  "HU1.3 A validated notification from the NRC providing information of an aircraft threat"
HA1.1	Separated HA1.1 into HA1.1 and HA1.2 to remove the "OR" qualifier in the NEI 99-01, Revision 6 template, as follows:  "HA1.1 A HOSTILE ACTION is occurring or has occurred within the OWNER CONTROLLED AREA as reported by the Security Shift Supervision"  "HA1.2 A validated notification from NRC of an aircraft threat within 30 min. of the site"
RA1.4	Administrative change to correct the definition for Site Boundary by changing "DPC" to "Duke Energy".
RG1.3	Administrative change to update ONS Basis Reference 1 to be AD-EP-ALL-0203 which has superseded SH/0/B/2005/002.
SA1.1	Administrative change to correct the Mode Applicability to read "4-Hot Shutdown" instead of "3-Hot Shutdown".
SA6.1/SS6.1	Administrative change to correct the Subcategory to read "6 - RPS Failure" instead of "2 - RPS Failure".
HA7.1/HS7.1/ HG7.1	Administrative change to update the Operations Shift Manager acronym to be "SM" instead of "OSM".

## 1.0 PURPOSE

This document provides an explanation and rationale for each Emergency Action Level (EAL) included in the EAL Upgrade Project for Oconee Nuclear Station (ONS). It should be used to facilitate review of the ONS EALs and provide historical documentation for future reference. Decision-makers responsible for implementation of RP/0/A/1000/001, Emergency Classification, may use this document as a technical reference in support of EAL interpretation. This information may assist the Emergency Coordinator in making classifications, particularly those involving judgment or multiple events. The basis information may also be useful in training and for explaining event classifications to off-site officials.

The expectation is that emergency classifications are to be made as soon as conditions are present and recognizable for the classification, but within 15 minutes or less in all cases of conditions present. Use of this document for assistance is not intended to delay the emergency classification.

Because the information in a basis document can affect emergency classification decision-making (e.g., the Emergency Coordinator refers to it during an event), the NRC staff expects that changes to the basis document will be evaluated in accordance with the provisions of 10 CFR 50.54(q).

## 2.0 DISCUSSION

### 2.1 Background

EALs are the plant-specific indications, conditions or instrument readings that are utilized to classify emergency conditions defined in the ONS Emergency Plan.

In 1992, the NRC endorsed NUMARC/NESP-007 "Methodology for Development of Emergency Action Levels" as an alternative to NUREG-0654 EAL guidance.

NEI 99-01 (NUMARC/NESP-007) Revisions 4 and 5 were subsequently issued for industry implementation. Enhancements over earlier revisions included:

- Consolidating the system malfunction initiating conditions and example emergency action levels which address conditions that may be postulated to occur during plant shutdown conditions.
- Initiating conditions and example emergency action levels that fully address conditions that may be postulated to occur at permanently Defueled Stations and Independent Spent Fuel Storage Installations (ISFSIs).
- Simplifying the fission product barrier EAL threshold for a Site Area Emergency.

Subsequently, Revision 6 of NEI 99-01 has been issued which incorporates resolutions to numerous implementation issues including the NRC EAL Frequently Asked Questions (FAQs). Using NEI 99-01 Revision 6, "Methodology for the Development of Emergency Action Levels for Non-Passive Reactors," November 2012 (ADAMS Accession Number ML12326A805) (ref. 4.1.1), ONS conducted an EAL implementation upgrade project that produced the EALs discussed herein.

## 2.2 Fission Product Barriers

Fission product barrier thresholds represent threats to the defense in depth design concept that precludes the release of radioactive fission products to the environment. This concept relies on multiple physical barriers, any one of which, if maintained intact, precludes the release of significant amounts of radioactive fission products to the environment.

Many of the EALs derived from the NEI methodology are fission product barrier threshold based. That is, the conditions that define the EALs are based upon thresholds that represent the loss or potential loss of one or more of the three fission product barriers. "Loss" and "Potential Loss" signify the relative damage and threat of damage to the barrier. A "Loss" threshold means the barrier no longer assures containment of radioactive materials. A "Potential Loss" threshold implies an increased probability of barrier loss and decreased certainty of maintaining the barrier.

The primary fission product barriers are:

- A. Fuel Clad (FC): The Fuel Clad Barrier consists of the cladding material that contains the fuel pellets.
- B. Reactor Coolant System (RCS): The RCS Barrier includes the RCS primary side and its connections up to and including the pressurizer safety and relief valves, and other connections up to and including the primary isolation valves.
- C. Containment (CMT): The Containment (Reactor Building) Barrier includes the Reactor Building and connections up to and including the outermost containment isolation valves. This barrier also includes the main steam, feedwater, and blowdown line extensions outside the Reactor Building up to and including the outermost secondary side isolation valve. Containment Barrier thresholds are used as criteria for escalation of the Emergency Classification Level (ECL) from Alert to a Site Area Emergency or a General Emergency.

## 2.3 Fission Product Barrier Classification Criteria

The following criteria are the bases for event classification related to fission product barrier loss or potential loss:

Alert:

*Any loss or any potential loss of either Fuel Clad or RCS Barrier*

Site Area Emergency:

*Loss or potential loss of any two barriers*

General Emergency:

*Loss of any two barriers and loss or potential loss of the third barrier*

## 2.4 EAL Organization

The ONS EAL scheme includes the following features:

- Division of the EAL set into three broad groups:
  - EALs applicable under any plant operating modes – This group would be reviewed by the EAL-user any time emergency classification is considered.
  - EALs applicable only under hot operating modes – This group would only be reviewed by the EAL-user when the plant is in Hot Shutdown, Hot Standby, Startup, or Power Operation mode.
  - EALs applicable only under cold operating modes – This group would only be reviewed by the EAL-user when the plant is in Cold Shutdown, Refueling mode or No Mode.

The purpose of the groups is to avoid review of hot condition EALs when the plant is in a cold condition and avoid review of cold condition EALs when the plant is in a hot condition. This approach significantly minimizes the total number of EALs that must be reviewed by the EAL-user for a given plant condition, reduces EAL-user reading burden and, thereby, speeds identification of the EAL that applies to the emergency.

- Within each group, assignment of EALs to categories and subcategories:

Category and subcategory titles are selected to represent conditions that are operationally significant to the EAL-user. The ONS EAL categories are aligned to and represent the NEI 99-01 "Recognition Categories." Subcategories are used in the ONS scheme as necessary to further divide the EALs of a category into logical sets of possible emergency classification thresholds. The ONS EAL categories and subcategories are listed below.

## EAL Groups, Categories and Subcategories

EAL Group/Category	EAL Subcategory
<b><u>Any Operating Mode:</u></b>	
R – Abnormal Rad Levels / Rad Effluent	1 – Radiological Effluent 2 – Irradiated Fuel Event 3 – Area Radiation Levels
H – Hazards and Other Conditions Affecting Plant Safety	1 – Security 2 – Seismic Event 3 – Natural or Technological Hazard 4 – Fire 5 – Hazardous Gas 6 – Control Room Evacuation 7 – Emergency Coordinator Judgment
E – Independent Spent Fuel Storage Installation (ISFSI)	1 – Confinement Boundary
<b><u>Hot Conditions:</u></b>	
S – System Malfunction	1 – Loss of Essential AC Power 2 – Loss of Vital DC Power 3 – Loss of Control Room Indications 4 – RCS Activity 5 – RCS Leakage 6 – RPS Failure 7 – Loss of Communications 8 – Containment Failure 9 – Hazardous Event Affecting Safety Systems
F – Fission Product Barrier Degradation	None
<b><u>Cold Conditions:</u></b>	
C – Cold Shutdown / Refueling System Malfunction	1 – RCS Level 2 – Loss of Essential AC Power 3 – RCS Temperature 4 – Loss of Vital DC Power 5 – Loss of Communications 6 – Hazardous Event Affecting Safety Systems

The primary tool for determining the emergency classification level is the EAL Classification Matrix. The user of the EAL Classification Matrix may (but is not required to) consult the EAL Technical Bases in order to obtain additional information concerning the EALs under classification consideration. The user should consult Section 3.0 and Attachments 1 & 2 of this document for such information.

## 2.5 Technical Bases Information

EAL technical bases are provided in Attachment 1 for each EAL according to EAL group (Any, Hot, Cold), EAL category (R, C, H, S, E and F) and EAL subcategory. A summary explanation of each category and subcategory is given at the beginning of the technical bases discussions of the EALs included in the category. For each EAL, the following information is provided:

### Category Letter & Title

### Subcategory Number & Title

### Initiating Condition (IC)

Site-specific description of the generic IC given in NEI 99-01 Rev. 6.

### EAL Identifier (enclosed in rectangle)

Each EAL is assigned a unique identifier to support accurate communication of the emergency classification to onsite and offsite personnel. Four characters define each EAL identifier:

1. First character (letter): Corresponds to the EAL category as described above (R, C, H, S, E or F)
2. Second character (letter): The emergency classification (G, S, A or U)
  - G = General Emergency
  - S = Site Area Emergency
  - A = Alert
  - U = Unusual Event
3. Third character (number): Subcategory number within the given category. Subcategories are sequentially numbered beginning with the number one (1). If a category does not have a subcategory, this character is assigned the number one (1).
4. Fourth character (number): The numerical sequence of the EAL within the EAL subcategory. If the subcategory has only one EAL, it is given the number one (1).

### Classification (enclosed in rectangle):

Unusual Event (U), Alert (A), Site Area Emergency (S) or General Emergency (G)

### EAL (enclosed in rectangle)

Exact wording of the EAL as it appears in the EAL Classification Matrix

### Mode Applicability

One or more of the following plant operating conditions comprise the mode to which each EAL is applicable: 1 - Power Operation, 2 - Startup, 3 – Hot Standby, 4 - Hot Shutdown, 5 - Cold Shutdown, 6 - Refueling, NM – No Mode, or Any. (See Section 2.6 for operating mode definitions)

### Definitions:

If the EAL wording contains a defined term, the definition of the term is included in this section. These definitions can also be found in Section 5.1.

Basis:

A basis section that provides ONS-relevant information concerning the EAL as well as a description of the rationale for the EAL as provided in NEI 99-01 Rev. 6.

ONS Basis Reference(s):

Site-specific source documentation from which the EAL is derived

2.6 Operating Mode Applicability (ref. 4.1.6)

1 Power Operation

$K_{eff} \geq 0.99$  and reactor thermal power > 5%

2 Startup

$K_{eff} \geq 0.99$  and reactor thermal power  $\leq$  5%

3 Hot Standby

$K_{eff} < 0.99$  and average coolant temperature  $\geq$  250°F

4 Hot Shutdown

$K_{eff} < 0.99$  and average coolant temperature 250°F >  $T_{avg}$  > 200°F and all reactor vessel head closure bolts fully tensioned

5 Cold Shutdown

$K_{eff} < 0.99$  and average coolant temperature  $\leq$  200°F and all reactor vessel head closure bolts fully tensioned

6 Refueling

One or more reactor vessel head closure bolts less than fully tensioned

NM No Mode

Reactor vessel contains no irradiated fuel

The plant operating mode that exists at the time that the event occurs (prior to any protective system or operator action being initiated in response to the condition) should be compared to the mode applicability of the EALs. If a lower or higher plant operating mode is reached before the emergency classification is made, the declaration shall be based on the mode that existed at the time the event occurred.

### **3.0 GUIDANCE ON MAKING EMERGENCY CLASSIFICATIONS**

#### **3.1 General Considerations**

When making an emergency classification, the Emergency Coordinator must consider all information having a bearing on the proper assessment of an Initiating Condition (IC). This includes the Emergency Action Level (EAL) plus the associated Operating Mode Applicability, Notes, and the informing basis information. In the Recognition Category F matrices, EALs are based on loss or potential loss of Fission Product Barrier Thresholds.

##### **3.1.1 Classification Timeliness**

NRC regulations require the licensee to establish and maintain the capability to assess, classify, and declare an emergency condition within 15 minutes after the availability of indications to plant operators that an emergency action level has been exceeded and to promptly declare the emergency condition as soon as possible following identification of the appropriate emergency classification level. The NRC staff has provided guidance on implementing this requirement in NSIR/DPR-ISG-01, "Interim Staff Guidance, Emergency Planning for Nuclear Power Plants" (ref. 4.1.9).

##### **3.1.2 Valid Indications**

All emergency classification assessments shall be based upon valid indications, reports or conditions. A valid indication, report, or condition, is one that has been verified through appropriate means such that there is no doubt regarding the indicator's operability, the condition's existence, or the report's accuracy.

An indication, report, or condition is considered to be valid when it is verified by (1) an instrument channel check, or (2) indications on related or redundant indicators, or (3) by direct observation by plant personnel, such that doubt related to the indicator's operability, the condition's existence, or the report's accuracy is removed. Implicit in this definition is the need for timely assessment.

##### **3.1.3 Imminent Conditions**

For ICs and EALs that have a stipulated time duration (e.g., 15 minutes, 30 minutes, etc.), the Emergency Coordinator should not wait until the applicable time has elapsed, but should declare the event as soon as it is determined that the condition has exceeded, or will likely exceed, the applicable time. If an ongoing radiological release is detected and the release start time is unknown, it should be assumed that the release duration specified in the IC/EAL has been exceeded, absent data to the contrary.

##### **3.1.4 Planned vs. Unplanned Events**

A planned work activity that results in an expected event or condition which meets or exceeds an EAL does not warrant an emergency declaration provided that: 1) the activity proceeds as planned, and 2) the plant remains within the limits imposed by the operating license. Such activities include planned work to test, manipulate, repair, maintain or modify a system or component. In these cases, the controls associated with the planning, preparation and execution of the work will ensure that compliance is maintained with all aspects of the operating license provided that the activity proceeds and concludes as expected. Events or conditions of this type may be subject to the reporting requirements of 10 § CFR 50.72 (ref. 4.1.4).

### 3.1.5 Classification Based on Analysis

The assessment of some EALs is based on the results of analyses that are necessary to ascertain whether a specific EAL threshold has been exceeded (e.g., dose assessments, chemistry sampling, RCS leak rate calculation, etc.). For these EALs, the EAL wording or the associated basis discussion will identify the necessary analysis. In these cases, the 15-minute declaration period starts with the availability of the analysis results that show the threshold to be exceeded (i.e., this is the time that the EAL information is first available). The NRC expects licensees to establish the capability to initiate and complete EAL-related analyses within a reasonable period of time (e.g., maintain the necessary expertise on-shift).

### 3.1.6 Emergency Coordinator Judgment

While the EALs have been developed to address a full spectrum of possible events and conditions which may warrant emergency classification, a provision for classification based on operator/management experience and judgment is still necessary. The NEI 99-01 EAL scheme provides the Emergency Coordinator with the ability to classify events and conditions based upon judgment using EALs that are consistent with the ECL definitions (refer to Category H). The Emergency Coordinator will need to determine if the effects or consequences of the event or condition reasonably meet or exceed a particular ECL definition. A similar provision is incorporated in the Fission Product Barrier Tables; judgment may be used to determine the status of a fission product barrier.

## 3.2 Classification Methodology

To make an emergency classification, the user will compare an event or condition (i.e., the relevant plant indications and reports) to an EAL(s) and determine if the EAL has been met or exceeded. The evaluation of an EAL must be consistent with the related Operating Mode Applicability and Notes. If an EAL has been met or exceeded, the associated IC is likewise met, the emergency classification process “clock” starts, and the ECL must be declared in accordance with plant procedures no later than fifteen minutes after the process “clock” started.

When assessing an EAL that specifies a time duration for the off-normal condition, the “clock” for the EAL time duration runs concurrently with the emergency classification process “clock.” For a full discussion of this timing requirement, refer to NSIR/DPR-ISG-01 (ref. 4.1.9).

### 3.2.1 Classification of Multiple Events and Conditions

When multiple emergency events or conditions are present, the user will identify all met or exceeded EALs. The highest applicable ECL identified during this review is declared. For example:

- If an Alert EAL and a Site Area Emergency EAL are met, whether at one unit or at two different units, a Site Area Emergency should be declared.

There is no “additive” effect from multiple EALs meeting the same ECL. For example:

- If two Alert EALs are met, whether at one unit or at two different units, an Alert should be declared.

Related guidance concerning classification of rapidly escalating events or conditions is provided in Regulatory Issue Summary (RIS) 2007-02, *Clarification of NRC Guidance for Emergency Notifications During Quickly Changing Events* (ref. 4.1.2).

### 3.2.2 Consideration of Mode Changes During Classification

The mode in effect at the time that an event or condition occurred, and prior to any plant or operator response, is the mode that determines whether or not an IC is applicable. If an event or condition occurs, and results in a mode change before the emergency is declared, the emergency classification level is still based on the mode that existed at the time that the event or condition was initiated (and not when it was declared). Once a different mode is reached, any new event or condition, not related to the original event or condition, requiring emergency classification should be evaluated against the ICs and EALs applicable to the operating mode at the time of the new event or condition.

For events that occur in Cold Shutdown or Refueling, escalation is via EALs that are applicable in the Cold Shutdown or Refueling modes, even if Hot Shutdown (or a higher mode) is entered during the subsequent plant response. In particular, the fission product barrier EALs are applicable only to events that initiate in the Hot Shutdown mode or higher.

### 3.2.3 Classification of Imminent Conditions

Although EALs provide specific thresholds, the Emergency Coordinator must remain alert to events or conditions that could lead to meeting or exceeding an EAL within a relatively short period of time (i.e., a change in the ECL is IMMIDENT). If, in the judgment of the Emergency Coordinator, meeting an EAL is IMMIDENT, the emergency classification should be made as if the EAL has been met. While applicable to all emergency classification levels, this approach is particularly important at the higher emergency classification levels since it provides additional time for implementation of protective measures.

### 3.2.4 Emergency Classification Level Upgrading and Downgrading

An ECL may be downgraded when the event or condition that meets the highest IC and EAL no longer exists, and other site-specific downgrading requirements are met. If downgrading the ECL is deemed appropriate, the new ECL would then be based on a lower applicable IC(s) and EAL(s). The ECL may also simply be terminated.

As noted above, guidance concerning classification of rapidly escalating events or conditions is provided in RIS 2007-02 (ref. 4.1.2).

### 3.2.5 Classification of Short-Lived Events

Event-based ICs and EALs define a variety of specific occurrences that have potential or actual safety significance. By their nature, some of these events may be short-lived and, thus, over before the emergency classification assessment can be completed. If an event occurs that meets or exceeds an EAL, the associated ECL must be declared regardless of its continued presence at the time of declaration. Examples of such events include an earthquake or a failure of the reactor protection system to automatically trip the reactor followed by a successful manual trip.

### 3.2.6 Classification of Transient Conditions

Many of the ICs and/or EALs employ time-based criteria. These criteria will require that the IC/EAL conditions be present for a defined period of time before an emergency declaration is warranted. In cases where no time-based criterion is specified, it is recognized that some transient conditions may cause an EAL to be met for a brief period of time (e.g., a few seconds to a few minutes). The following guidance should be applied to the classification of these conditions.

EAL momentarily met during expected plant response - In instances where an EAL is briefly met during an expected (normal) plant response, an emergency declaration is not warranted provided that associated systems and components are operating as expected, and operator actions are performed in accordance with procedures.

EAL momentarily met but the condition is corrected prior to an emergency declaration – If an operator takes prompt manual action to address a condition, and the action is successful in correcting the condition prior to the emergency declaration, then the applicable EAL is not considered met and the associated emergency declaration is not required. For illustrative purposes, consider the following example:

An ATWS occurs and the high pressure ECCS systems fail to automatically start. Reactor vessel level rapidly decreases and the plant enters an inadequate core cooling condition (a potential loss of both the Fuel Clad and RCS Barriers). If an operator manually starts a high pressure ECCS system in accordance with an EOP step and clears the inadequate core cooling condition prior to an emergency declaration, then the classification should be based on the ATWS only.

It is important to stress that the 15-minute emergency classification assessment period (process clock) is not a “grace period” during which a classification may be delayed to allow the performance of a corrective action that would obviate the need to classify the event. Emergency classification assessments must be deliberate and timely, with no undue delays. The provision discussed above addresses only those rapidly evolving situations when an operator is able to take a successful corrective action prior to the Emergency Coordinator completing the review and steps necessary to make the emergency declaration. This provision is included to ensure that any public protective actions resulting from the emergency classification are truly warranted by the plant conditions.

### 3.2.7 After-the-Fact Discovery of an Emergency Event or Condition

In some cases, an EAL may be met but the emergency classification was not made at the time of the event or condition. This situation can occur when personnel discover that an event or condition existed which met an EAL, but no emergency was declared, and the event or condition no longer exists at the time of discovery. This may be due to the event or condition not being recognized at the time or an error that was made in the emergency classification process.

In these cases, no emergency declaration is warranted; however, the guidance contained in NUREG-1022 (ref. 4.1.3) is applicable. Specifically, the event should be reported to the NRC in accordance with 10 CFR § 50.72 (ref. 4.1.4) within one hour of the discovery of the undeclared event or condition. The licensee should also notify appropriate State and local agencies in accordance with the agreed upon arrangements.

### 3.2.8 Retraction of an Emergency Declaration

Guidance on the retraction of an emergency declaration reported to the NRC is discussed in NUREG-1022 (ref. 4.1.3).

## 5.0 DEFINITIONS, ACRONYMS & ABBREVIATIONS

### 5.1 Definitions (ref. 4.1.1 except as noted)

Selected terms used in Initiating Condition and Emergency Action Level statements are set in all capital letters (e.g., ALL CAPS). These words are defined terms that have specific meanings as used in this document. The definitions of these terms are provided below.

#### **Alert**

Events are in progress, or have occurred, which involve an actual or potential substantial degradation of the level of safety of the plant or a security event that involves probable life threatening risk to site personnel or damage to site equipment because of hostile action. Any releases are expected to be small fractions of the EPA Protective Action Guideline exposure levels.

#### **Confinement Barrier**

The barrier(s) between spent fuel and the environment once the spent fuel is processed for dry storage. As related to the ONS ISFSI, Confinement Boundary is comprised of the DSC (dry shielded canister) shell, inner bottom cover plate, inner top cover plate, siphon & vent block, siphon & vent port cover plate, and the welds that join them together.

#### **Containment Closure**

The action to secure containment and its associated structures, systems, and components as a functional barrier to fission product release under all plant conditions up to and including a loss of decay heat removal or fuel handling accident inside containment (ref. 4.1.11).

As applied to ONS, Containment Closure is established when the requirements of OP/1,2,3/A/1502/000, Containment Closure Control, are met (ref. 4.1.7).

#### **Emergency Action Level (EAL)**

A pre-determined, site-specific, observable threshold for an Initiating Condition that, when met or exceeded, places the plant in a given emergency classification level.

#### **Emergency Classification Level (ECL)**

One of a set of names or titles established by the US Nuclear Regulatory Commission (NRC) for grouping off-normal events or conditions according to (1) potential or actual effects or consequences, and (2) resulting onsite and offsite response actions. The emergency classification levels, in ascending order of severity, are:

- Unusual Event (UE)
- Alert
- Site Area Emergency (SAE)
- General Emergency (GE)

#### **EPA PAGs**

Environment Protection Agency Protective Action Guidelines. The EPA PAGs are expressed in terms of dose commitment: 1 Rem TEDE or 5 Rem CDE Thyroid. Actual or projected offsite exposures in excess of the EPA PAGs requires ONS to recommend protective actions for the general public to offsite planning agencies.

**Explosion**

A rapid, violent and catastrophic failure of a piece of equipment due to combustion, chemical reaction or overpressurization. A release of steam (from high energy lines or components) or an electrical component failure (caused by short circuits, grounding, arcing, etc.) should not automatically be considered an explosion. Such events require a post-event inspection to determine if the attributes of an explosion are present.

**Faulted**

The term applied to a steam generator that has a steam leak on the secondary side of sufficient size to cause an uncontrolled drop in steam generator pressure or the steam generator to become completely depressurized.

**Fire**

Combustion characterized by heat and light. Sources of smoke such as slipping drive belts or overheated electrical equipment do not constitute fires. Observation of flame is preferred but is NOT required if large quantities of smoke and heat are observed.

**Fission Product Barrier Threshold**

A pre-determined, site-specific, observable threshold indicating the loss or potential loss of a fission product barrier.

**Flooding**

A condition where water is entering a room or area faster than installed equipment is capable of removal, resulting in a rise of water level within the room or area.

**General Emergency**

Events are in progress or have occurred which involve actual or imminent substantial core degradation or melting with potential for loss of containment integrity or hostile actions that result in an actual loss of physical control of the facility. Releases can be reasonably expected to exceed EPA Protective Action Guideline exposure levels offsite for more than the immediate site area.

**Hostage**

A person(s) held as leverage against the station to ensure that demands will be met by the station.

**Hostile Action**

An act toward ONS or its personnel that includes the use of violent force to destroy equipment, take hostages, and/or intimidate the licensee to achieve an end. This includes attack by air, land, or water using guns, explosives, projectiles, vehicles, or other devices used to deliver destructive force. Other acts that satisfy the overall intent may be included. Hostile action should not be construed to include acts of civil disobedience or felonious acts that are not part of a concerted attack on ONS. Non-terrorism-based EALs should be used to address such activities (i.e., this may include violent acts between individuals in the owner controlled area).

**Hostile Force**

One or more individuals who are engaged in a determined assault, overtly or by stealth and deception, equipped with suitable weapons capable of killing, maiming, or causing destruction.

**Imminent**

The trajectory of events or conditions is such that an EAL will be met within a relatively short period of time regardless of mitigation or corrective actions.

**Independent Spent Fuel Storage Installation (ISFSI)**

A complex that is designed and constructed for the interim storage of spent nuclear fuel and other radioactive materials associated with spent fuel storage.

**Impede(d)**

Personnel access to a room or area is hindered to an extent that extraordinary measures are necessary to facilitate entry of personnel into the affected room/area (e.g., requiring use of protective equipment, such as SCBAs, that is not routinely employed).

**Initiating Condition (IC)**

An event or condition that aligns with the definition of one of the four emergency classification levels by virtue of the potential or actual effects or consequences.

**Intrusion**

The act of entering without authorization. Discovery of a bomb in a specified area is indication of intrusion into that area by a hostile force.

**Maintain**

Take appropriate action to hold the value of an identified parameter within specified limits.

**Normal Levels**

As applied to radiological IC/EALs, the highest reading in the past twenty-four hours excluding the current peak value.

**Owner Controlled Area**

Area outside the PROTECTED AREA fence that immediately surrounds the plant. Access to this area is generally restricted to those entering on official business.

**Projectile**

An object directed toward a Nuclear Power Plant that could cause concern for its continued operability, reliability, or personnel safety.

**Protected Area**

That part of the nuclear station property consisting of the Reactor, Auxiliary, Turbine, and Service Building and grounds, contained within the owner controlled security fence (ref. 4.1.10).

**RCS Intact**

The RCS should be considered intact when the RCS pressure boundary is in its normal condition for the cold shutdown mode of operation (e.g., no freeze seals or nozzle dams, pressurizer manway and safeties installed).

**Reduced Inventory**

Condition with fuel in the reactor vessel and the level lower than approximately three feet below the reactor vessel flange (RCS level < 50" on LT-5) (ref. 4.1.11).

**Refueling Pathway**

The spent fuel pool and/or fuel transfer canal comprise the refueling pathway.

**Restore**

Take the appropriate action required to return the value of an identified parameter to the applicable limits.

**Ruptured**

The condition of a steam generator in which primary-to-secondary leakage is of sufficient magnitude to require a safety injection.

**Safety System**

A system required for safe plant operation, cooling down the plant and/or placing it in the cold shutdown condition, including the ECCS. These are typically systems classified as safety-related (as defined in 10CFR50.2):

Those structures, systems and components that are relied upon to remain functional during and following design basis events to assure:

- (1) The integrity of the reactor coolant pressure boundary;
- (2) The capability to shut down the reactor and maintain it in a safe shutdown condition;
- (3) The capability to prevent or mitigate the consequences of accidents which could result in potential offsite exposures.

**Security Condition**

Any security event as listed in the approved security contingency plan that constitutes a threat/compromise to site security, threat/risk to site personnel, or a potential degradation to the level of safety of the plant. A security condition does not involve a hostile action.

**Site Area Emergency**

Events are in progress or have occurred which involve actual or likely major failures of plant functions needed for protection of the public or hostile actions that result in intentional damage or malicious acts; (1) toward site personnel or equipment that could lead to the likely failure of or; (2) that prevent effective access to equipment needed for the protection of the public. Any releases are not expected to result in exposure levels which exceed EPA Protective Action Guidelines exposure levels beyond the site boundary.

**Site Boundary**

That area, including the PROTECTED AREA, in which Duke Energy has the authority to control all activities including exclusion or removal of personnel and property (1 mile radius) from the center of Unit 2. (ref. 4.1.10).

**Unisolable**

An open or breached system line that cannot be isolated, remotely or locally.

**Unplanned**

A parameter change or an event that is not 1) the result of an intended evolution or 2) an expected plant response to a transient. The cause of the parameter change or event may be known or unknown.

**Unusual Event**

Events are in progress or have occurred which indicate a potential degradation in the level of safety of the plant or indicate a security threat to facility protection has been initiated. No releases of radioactive material requiring offsite response or monitoring are expected unless further degradation of safety systems occurs.

**Valid**

An indication, report, or condition, is considered to be valid when it is verified by (1) an instrument channel check, or (2) indications on related or redundant indicators, or (3) by direct observation by plant personnel, such that doubt related to the indicator's operability, the condition's existence, or the report's accuracy is removed. Implicit in this definition is the need for timely assessment.

**Visible Damage**

Damage to a component or structure that is readily observable without measurements, testing, or analysis. The visual impact of the damage is sufficient to cause concern regarding the operability or reliability of the affected component or structure.

## 5.2 Acronyms and Abbreviations

°F	Degrees Fahrenheit
°	Degrees
AC	Alternating Current
AP	Abnormal Operating Procedure
ATWS	Anticipated Transient Without Scram
BWST	Borated Water Storage Tank
CETC	Core Exit Thermocouple
CDE	Committed Dose Equivalent
CFR	Code of Federal Regulations
CMT	Containment
DBA	Design Basis Accident
DBE	Design Basis Earthquake
DC	Direct Current
DSC	Dry Shielded Canister
EAL	Emergency Action Level
ECCS	Emergency Core Cooling System

## 7.0 ATTACHMENTS

7.1 Attachment 1, Emergency Action Level Technical Bases

7.2 Attachment 2, Fission Product Barrier Matrix and Basis

7.3 Attachment 3, Safe Operation & Shutdown Areas Tables R-2 & H-2 Bases

ATTACHMENT 1  
EAL Bases

**Category R – Abnormal Rad Release / Rad Effluent**

EAL Group: ANY (EALs in this category are applicable to any plant condition, hot or cold.)

Many EALs are based on actual or potential degradation of fission product barriers because of the elevated potential for offsite radioactivity release. Degradation of fission product barriers though is not always apparent via non-radiological symptoms. Therefore, direct indication of elevated radiological effluents or area radiation levels are appropriate symptoms for emergency classification.

At lower levels, abnormal radioactivity releases may be indicative of a failure of containment systems or precursors to more significant releases. At higher release rates, offsite radiological conditions may result which require offsite protective actions. Elevated area radiation levels in the plant may also be indicative of the failure of containment systems or preclude access to plant vital equipment necessary to ensure plant safety.

Events of this category pertain to the following subcategories:

**1. Radiological Effluent**

Direct indication of effluent radiation monitoring systems provides a rapid assessment mechanism to determine releases in excess of classifiable limits. Projected offsite doses, actual offsite field measurements or measured release rates via sampling indicate doses or dose rates above classifiable limits.

**2. Irradiated Fuel Event**

Conditions indicative of a loss of adequate shielding or damage to irradiated fuel may preclude access to vital plant areas or result in radiological releases that warrant emergency classification.

**3. Area Radiation Levels**

Sustained general area radiation levels which may preclude access to areas requiring continuous occupancy also warrant emergency classification.

ATTACHMENT 1  
EAL Bases

**Category:** R – Abnormal Rad Levels / Rad Effluent  
**Subcategory:** 1 – Radiological Effluent  
**Initiating Condition:** Release of gaseous or liquid radioactivity greater than 2 times the SLC/TS limits for 60 minutes or longer

**EAL:**

**RU1.1 Unusual Event**

Reading on **any** Table R-1 effluent radiation monitor > column "UE" for ≥ 60 min.  
(Notes 1, 2, 3)

- Note 1: The Emergency Coordinator should declare the event promptly upon determining that time limit has been exceeded, or will likely be exceeded.
- Note 2: If an ongoing release is detected and the release start time is unknown, assume that the release duration has exceeded the specified time limit.
- Note 3: If the effluent flow past an effluent monitor is known to have stopped, indicating that the release path is isolated, the effluent monitor reading is no longer VALID for classification purposes.

Table R-1 Effluent Monitor Classification Thresholds						
Release Point		Monitor	GE	SAE	Alert	UE
Gaseous	Unit 1/2/3 Plant Vent	RIA-45	---	---	---	1.41E+5 cpm
	Unit 1/2/3 Plant Vent	RIA-46	3.00E+5 cpm	3.00E+4 cpm	3.00E+3 cpm	---
Liquid	Liquid Radwaste Discharge	RIA-33	---	---	---	4.79E+5 cpm

**Mode Applicability:**

All

**Definition(s):**

None

**Basis:**

The column "UE" release values in Table R-1 represent two times the appropriate SLC and Technical Specification release rate and concentration limits associated with the specified monitors (ref. 1, 2, 3, 4, 5, 6).

Gaseous Releases

Instrumentation that may be used to assess this EAL: (ref. 1):

- Unit 1/2/3 Plant Vent Noble Gas Low Monitor – RIA-45(L)

ATTACHMENT 1  
EAL Bases

Liquid Releases

Instrumentation that may be used to assess this EAL: (ref. 1):

- Liquid Radwaste Discharge Monitor – RIA-33 (batch release)

This IC addresses a potential decrease in the level of safety of the plant as indicated by a low-level radiological release that exceeds regulatory commitments for an extended period of time (e.g., an uncontrolled release). It includes any gaseous or liquid radiological release, monitored or un-monitored, including those for which a radioactivity discharge permit is normally prepared.

Nuclear power plants incorporate design features intended to control the release of radioactive effluents to the environment. Further, there are administrative controls established to prevent unintentional releases, and to control and monitor intentional releases. The occurrence of an extended, uncontrolled radioactive release to the environment is indicative of degradation in these features and/or controls.

Radiological effluent EALs are also included to provide a basis for classifying events and conditions that cannot be readily or appropriately classified on the basis of plant conditions alone. The inclusion of both plant condition and radiological effluent EALs more fully addresses the spectrum of possible accident events and conditions.

Classification based on effluent monitor readings assumes that a release path to the environment is established. If the effluent flow past an effluent monitor is known to have stopped due to actions to isolate the release path, then the effluent monitor reading is no longer valid for classification purposes.

Releases should not be prorated or averaged. For example, a release exceeding 4 times release limits for 30 minutes does not meet the EAL.

This EAL addresses normally occurring continuous radioactivity releases from monitored gaseous or liquid effluent pathways.

Escalation of the emergency classification level would be via IC RA1.

**Subcategory:** 1 – Radiological Effluent  
**Initiating Condition:** Release of gaseous or liquid radioactivity greater than 2 times the SLC/TS limits for 60 minutes or longer.

**EAL:**

**RU1.2 Unusual Event**

Sample analysis for a gaseous or liquid release indicates a concentration or release rate > 2 x SLC/TS limits for ≥ 60 min. (Notes 1, 2)

Note 1: The Emergency Coordinator should declare the event promptly upon determining that time limit has been exceeded, or will likely be exceeded.

Note 2: If an ongoing release is detected and the release start time is unknown, assume that the release duration has exceeded the specified time limit.

**Mode Applicability:**

All

**Definition(s):**

None

**Basis:**

This IC addresses a potential decrease in the level of safety of the plant as indicated by a low-level radiological release that exceeds regulatory commitments for an extended period of time (e.g., an uncontrolled release). It includes any gaseous or liquid radiological release, monitored or un-monitored, including those for which a radioactivity discharge permit is normally prepared.

Nuclear power plants incorporate design features intended to control the release of radioactive effluents to the environment. Further, there are administrative controls established to prevent unintentional releases, and to control and monitor intentional releases. The occurrence of an extended, uncontrolled radioactive release to the environment is indicative of degradation in these features and/or controls.

Radiological effluent EALs are also included to provide a basis for classifying events and conditions that cannot be readily or appropriately classified on the basis of plant conditions alone. The inclusion of both plant condition and radiological effluent EALs more fully addresses the spectrum of possible accident events and conditions.

Releases should not be prorated or averaged. For example, a release exceeding 4 times release limits for 30 minutes does not meet the EAL.

This EAL addresses uncontrolled gaseous or liquid releases that are detected by sample analyses or environmental surveys, particularly on unmonitored pathways (e.g., spills of radioactive liquids into storm drains, heat exchanger leakage in river water systems, etc.).

Escalation of the emergency classification level would be via IC RA1.

**Initiating Condition:** Release of gaseous or liquid radioactivity resulting in offsite dose greater than 10 mrem TEDE or 50 mrem thyroid CDE

**EAL:**

**RA1.1 Alert**  
 Reading on **any** Table R-1 effluent radiation monitor > column "ALERT" for ≥ 15 min.  
 (Notes 1, 2, 3, 4)

- Note 1: The Emergency Coordinator should declare the event promptly upon determining that time limit has been exceeded, or will likely be exceeded.
- Note 2: If an ongoing release is detected and the release start time is unknown, assume that the release duration has exceeded the specified time limit.
- Note 3: If the effluent flow past an effluent monitor is known to have stopped, indicating that the release path is isolated, the effluent monitor reading is no longer VALID for classification purposes.
- Note 4: The pre-calculated effluent monitor values presented in EALs RA1.1, RS1.1 and RG1.1 should be used for emergency classification assessments until the results from a dose assessment using actual meteorology are available.

Table R-1 Effluent Monitor Classification Thresholds						
Release Point		Monitor	GE	SAE	Alert	UE
Gaseous	Unit 1/2/3 Plant Vent	RIA-45	----	----	----	1.41E+5 cpm
	Unit 1/2/3 Plant Vent	RIA-46	3.00E+5 cpm	3.00E+4 cpm	3.00E+3 cpm	----
Liquid	Liquid Radwaste Discharge	RIA-33	----	----	----	4.79E+5 cpm

**Mode Applicability:**

All

**Definition(s):**

None

**Basis:**

This EAL addresses gaseous radioactivity releases, that for whatever reason, cause effluent radiation monitor readings corresponding to site boundary doses that exceed either:

- 10 mRem TEDE
- 50 mRem CDE Thyroid

ATTACHMENT 1  
EAL Bases

The column "ALERT" gaseous effluent release values in Table R-1 correspond to calculated doses of 1% (10% of the SAE thresholds) of the EPA Protective Action Guidelines (TEDE or CDE Thyroid) (ref. 1, 2, 3, 4).

Instrumentation that may be used to assess this EAL: (ref. 1):

- Unit 1/2/3 Plant Vent Noble Gas Medium Monitor – RIA-46(M)

This IC addresses a release of gaseous or liquid radioactivity that results in projected or actual offsite doses greater than or equal to 1% of the EPA Protective Action Guides (PAGs). It includes both monitored and un-monitored releases. Releases of this magnitude represent an actual or potential substantial degradation of the level of safety of the plant as indicated by a radiological release that significantly exceeds regulatory limits (e.g., a significant uncontrolled release).

Radiological effluent EALs are also included to provide a basis for classifying events and conditions that cannot be readily or appropriately classified on the basis of plant conditions alone. The inclusion of both plant condition and radiological effluent EALs more fully addresses the spectrum of possible accident events and conditions.

The TEDE dose is set at 1% of the EPA PAG of 1,000 mrem while the 50 mrem thyroid CDE was established in consideration of the 1:5 ratio of the EPA PAG for TEDE and thyroid CDE.

Classification based on effluent monitor readings assumes that a release path to the environment is established. If the effluent flow past an effluent monitor is known to have stopped due to actions to isolate the release path, then the effluent monitor reading is no longer valid for classification purposes.

Escalation of the emergency classification level would be via IC RS1.

**EAL:**

**RA1.2 Alert**

Dose assessment using actual meteorology indicates doses > 10 mrem TEDE or 50 mrem thyroid CDE at or beyond the SITE BOUNDARY (Note 4)

Note 4: The pre-calculated effluent monitor values presented in EALs RA1.1, RS1.1 and RG1.1 should be used for emergency classification assessments until the results from a dose assessment using actual meteorology are available.

**Mode Applicability:**

All

**Definition(s):**

*SITE BOUNDARY* - That area, including the PROTECTED AREA, in which Duke Energy has the authority to control all activities including exclusion or removal of personnel and property (1 mile radius) from the center of Unit 2.

**Basis:**

Dose assessments are performed by computer-based methods (ref. 1, 2).

This IC addresses a release of gaseous or liquid radioactivity that results in projected or actual offsite doses greater than or equal to 1% of the EPA Protective Action Guides (PAGs). It includes both monitored and un-monitored releases. Releases of this magnitude represent an actual or potential substantial degradation of the level of safety of the plant as indicated by a radiological release that significantly exceeds regulatory limits (e.g., a significant uncontrolled release).

Radiological effluent EALs are also included to provide a basis for classifying events and conditions that cannot be readily or appropriately classified on the basis of plant conditions alone. **EAL:**

**RA1.3 Alert**

Analysis of a liquid effluent sample indicates a concentration or release rate that would result in doses > 10 mrem TEDE or 50 mrem thyroid CDE at or beyond the SITE BOUNDARY for 60 min. of exposure (Notes 1, 2)

- Note 1: The Emergency Coordinator should declare the event promptly upon determining that time limit has been exceeded, or will likely be exceeded.
- Note 2: If an ongoing release is detected and the release start time is unknown, assume that the release duration has exceeded the specified time limit.

**Mode Applicability:**

All

**Definition(s):**

*SITE BOUNDARY* - That area, including the PROTECTED AREA, in which Duke Energy has the authority to control all activities including exclusion or removal of personnel and property (1 mile radius) from the center of Unit 2.

**Basis:**

Dose assessments based on liquid releases are performed per Offsite Dose Calculation Manual (ref. 1).

This IC addresses a release of gaseous or liquid radioactivity that results in projected or actual offsite doses greater than or equal to 1% of the EPA Protective Action Guides (PAGs). It includes both monitored and un-monitored releases. Releases of this magnitude represent an actual or potential substantial degradation of the level of safety of the plant as indicated by a radiological release that significantly exceeds regulatory limits (e.g., a significant uncontrolled release).

Radiological effluent EALs are also included to provide a basis for classifying events and conditions that cannot be readily or appropriately classified on the basis of plant conditions alone. The inclusion of both plant condition and radiological effluent EALs more fully addresses the spectrum of possible accident events and conditions.

The TEDE dose is set at 1% of the EPA PAG of 1,000 mrem while the 50 mrem thyroid CDE was established in consideration of the 1:5 ratio of the EPA PAG for TEDE and thyroid CDE.

Classification based on effluent monitor readings assumes that a release path to the environment is established. If the effluent flow past an effluent monitor is known to have stopped due to actions to isolate the release path, then the effluent monitor reading is no longer valid for classification purposes.

**EAL:**

**RA1.4 Alert**

Field survey results indicate **EITHER** of the following at or beyond the SITE BOUNDARY:

- Closed window dose rates > 10 mR/hr expected to continue for ≥ 60 min.
- Analyses of field survey samples indicate thyroid CDE > 50 mrem for 60 min. of inhalation.

(Notes 1, 2)

Note 1: The Emergency Coordinator should declare the event promptly upon determining that time limit has been exceeded, or will likely be exceeded.

Note 2: If an ongoing release is detected and the release start time is unknown, assume that the release duration has exceeded the specified time limit.

**Mode Applicability:**

All

**Definition(s):**

**SITE BOUNDARY** - That area, including the PROTECTED AREA, in which Duke Energy has the authority to control all activities including exclusion or removal of personnel and property (1 mile radius) from the center of Unit 2.

**Basis:**

AD-EP-ALL-0203 Protocol for the Field Monitoring Coordinator During Emergency Conditions provides guidance for emergency or post-accident radiological environmental monitoring (ref. 1).

This IC addresses a release of gaseous or liquid radioactivity that results in projected or actual offsite doses greater than or equal to 1% of the EPA Protective Action Guides (PAGs). It includes both monitored and un-monitored releases. Releases of this magnitude represent an actual or potential substantial degradation of the level of safety of the plant as indicated by a radiological release that significantly exceeds regulatory limits (e.g., a significant uncontrolled release).

Radiological effluent EALs are also included to provide a basis for classifying events and conditions that cannot be readily or appropriately classified on the basis of plant conditions alone. The inclusion of both plant condition and radiological effluent EALs more fully addresses the spectrum of possible accident events and conditions.

The TEDE dose is set at 1% of the EPA PAG of 1,000 mrem while the 50 mrem thyroid CDE was established in consideration of the 1:5 ratio of the EPA PAG for TEDE and thyroid CDE.

ATTACHMENT 1

ATTACHMENT 1  
EAL Bases

**Category:** R – Abnormal Rad Levels / Rad Effluent

**Subcategory:** 1 – Radiological Effluent

**Initiating Condition:** Release of gaseous radioactivity resulting in offsite dose greater than 100 mrem TEDE or 500 mrem thyroid CDE

**EAL:**

**RS1.1 Site Area Emergency**

Reading on **any** Table R-1 effluent radiation monitor > column "SAE" for  $\geq 15$  min.  
(Notes 1, 2, 3, 4)

- Note 1: The Emergency Coordinator should declare the event promptly upon determining that time limit has been exceeded, or will likely be exceeded.
- Note 2: If an ongoing release is detected and the release start time is unknown, assume that the release duration has exceeded the specified time limit.
- Note 3: If the effluent flow past an effluent monitor is known to have stopped, indicating that the release path is isolated, the effluent monitor reading is no longer VALID for classification purposes.
- Note 4: The pre-calculated effluent monitor values presented in EALs RA1.1, RS1.1 and RG1.1 should be used for emergency classification assessments until the results from a dose assessment using actual meteorology are available.

Table R-1 Effluent Monitor Classification Thresholds						
Release Point		Monitor	GE	SAE	Alert	UE
Gaseous	Unit 1/2/3 Plant Vent	RIA-45	----	----	----	1.41E+5 cpm
	Unit 1/2/3 Plant Vent	RIA-46	3.00E+5 cpm	3.00E+4 cpm	3.00E+3 cpm	----
Liquid	Liquid Radwaste Discharge	RIA-33	----	----	----	4.79E+5 cpm

**Mode Applicability:**

All

**Definition(s):**

None

ATTACHMENT 1  
EAL Bases

**Basis:**

This EAL addresses gaseous radioactivity releases, that for whatever reason, cause effluent radiation monitor readings corresponding to site boundary doses that exceed either:

- 100 mRem TEDE
- 500 mRem CDE Thyroid

The column "SAE" gaseous effluent release value in Table R-1 corresponds to calculated doses of 10% of the EPA Protective Action Guidelines (TEDE or CDE Thyroid) (ref. 1, 3).

Instrumentation that may be used to assess this EAL: (ref. 2):

- Unit 1/2/3 Plant Vent Noble Gas Medium Monitor – RIA-46(M)

This IC addresses a release of gaseous radioactivity that results in projected or actual offsite doses greater than or equal to 10% of the EPA Protective Action Guides (PAGs). It includes both monitored and un-monitored releases. Releases of this magnitude are associated with the failure of plant systems needed for the protection of the public.

Radiological effluent EALs are also included to provide a basis for classifying events and conditions that cannot be readily or appropriately classified on the basis of plant conditions alone. The inclusion of both plant condition and radiological effluent EALs more fully addresses the spectrum of possible accident events and conditions.

The TEDE dose is set at 10% of the EPA PAG of 1,000 mrem while the 500 mrem thyroid CDE was established in consideration of the 1:5 ratio of the EPA PAG for TEDE and thyroid CDE.

Classification based on effluent monitor readings assumes that a release path to the environment is established. If the effluent flow past an effluent monitor is known to have stopped due to actions to isolate the release path, then the effluent monitor reading is no longer valid for classification purposes.

Escalation of the emergency classification level would be via IC RG1.

ATTACHMENT 1  
EAL Bases

**Category:** R – Abnormal Rad Levels / Rad Effluent  
**Subcategory:** 2 – Irradiated Fuel Event  
**Initiating Condition:** UNPLANNED loss of water level above irradiated fuel  
**EAL:**

**RU2.1 Unusual Event**

UNPLANNED water level drop in the REFUELING PATHWAY as indicated by low water level alarm or indication

**AND**

UNPLANNED rise in corresponding area radiation levels as indicated by **any** of the following radiation monitors:

- RIA-3 RB Refueling Deck Shield Wall
- RIA-6 Spent Fuel Building Wall
- Portable area monitors on the main bridge or SFP bridge

**Mode Applicability:**

All

**Definition(s):**

*UNPLANNED* - A parameter change or an event that is not 1) the result of an intended evolution or 2) an expected plant response to a transient. The cause of the parameter change or event may be known or unknown.

*REFUELING PATHWAY*- The spent fuel pool and/or fuel transfer canal comprise the refueling pathway.

**Basis:**

The spent fuel pool low water level alarm setpoint is actuated at -1.8 ft. below normal level (ref. 1). Water level restoration instructions are performed in accordance with Abnormal Operating Procedures (APs) (ref. 2).

The specified radiation monitors are those expected to see increase area radiation levels as a result of a loss of REFUELING PATHWAY inventory (ref. 3). Increasing radiation indications on these monitors in the absence of indications of decreasing water level are not classifiable under this EAL. Radiation levels in the Reactor Building refueling area are monitored by RIA-3. Radiation levels in the Spent Fuel Pool area are monitored RIA-6. When a fuel bridge is being used to handle fuel, radiation levels are monitored by a portable area monitor mounted on the bridge. (ref. 3, 4)

When the spent fuel pool and reactor cavity are connected, there could exist the possibility of uncovering irradiated fuel. Therefore, this EAL is applicable for conditions in which irradiated fuel is being transferred to and from the reactor vessel and spent fuel pool.

ATTACHMENT 1  
EAL Bases

This IC addresses a decrease in water level above irradiated fuel sufficient to cause elevated radiation levels. This condition could be a precursor to a more serious event and is also indicative of a minor loss in the ability to control radiation levels within the plant. It is therefore a potential degradation in the level of safety of the plant.

A water level decrease will be primarily determined by indications from available level instrumentation. Other sources of level indications may include reports from plant personnel (e.g., from a refueling crew) or video camera observations (if available). A significant drop in the water level may also cause an increase in the radiation levels of adjacent areas that can be detected by monitors in those locations.

The effects of planned evolutions should be considered. For example, a refueling bridge area radiation monitor reading may increase due to planned evolutions such as lifting of the reactor vessel head or movement of a fuel assembly. Note that this EAL is applicable only in cases where the elevated reading is due to an unplanned loss of water level.

A drop in water level above irradiated fuel within the reactor vessel may be classified in accordance Recognition Category C during the Cold Shutdown and Refueling modes.

Escalation of the emergency classification level would be via IC RA2.

ATTACHMENT 1  
EAL Bases

**Category:** R – Abnormal Rad Levels / Rad Effluent

**Subcategory:** 2 – Irradiated Fuel Event

**Initiating Condition:** Significant lowering of water level above, or damage to, irradiated fuel

**EAL:**

**RA2.1 Alert**

Uncovery of irradiated fuel in the REFUELING PATHWAY

**Mode Applicability:**

All

**Definition(s):**

*REFUELING PATHWAY*- The spent fuel pool and/or fuel transfer canal comprise the refueling pathway.

**Basis:**

This IC addresses events that have caused imminent or actual damage to an irradiated fuel assembly, or a significant lowering of water level within the spent fuel pool. These events present radiological safety challenges to plant personnel and are precursors to a release of radioactivity to the environment. As such, they represent an actual or potential substantial degradation of the level of safety of the plant.

This EAL escalates from RU2.1 in that the loss of level, in the affected portion of the REFUELING PATHWAY, is of sufficient magnitude to have resulted in uncovery of irradiated fuel. Indications of irradiated fuel uncovery may include direct or indirect visual observation (e.g., reports from personnel or camera images), as well as significant changes in water and radiation levels, or other plant parameters. Computational aids may also be used (e.g., a boil-off curve). Classification of an event using this EAL should be based on the totality of available indications, reports and observations.

While an area radiation monitor could detect an increase in a dose rate due to a lowering of water level in some portion of the REFUELING PATHWAY, the reading may not be a reliable indication of whether or not the fuel is actually uncovered. To the degree possible, readings should be considered in combination with other available indications of inventory loss.

A drop in water level above irradiated fuel within the reactor vessel may be classified in accordance Recognition Category C during the Cold Shutdown and Refueling modes.

Escalation of the emergency classification level would be via IC RS1.

**ONS Basis Reference(s):**

1. AP/1-2,3/A/1700/035 Loss of SPF Cooling and/or Level
2. NEI 99-01 AA2

ATTACHMENT 1  
EAL Bases

**Category:** R – Abnormal Rad Levels / Rad Effluent

**Subcategory:** 2 – Irradiated Fuel Event

**Initiating Condition:** Significant lowering of water level above, or damage to, irradiated fuel

**EAL:**

**RA2.2 Alert**

Damage to irradiated fuel resulting in a release of radioactivity

**AND**

HIGH alarm on **any** of the following radiation monitors:

- RIA-3 RB Refueling Deck Shield Wall
- RIA-6 Spent Fuel Building Wall
- RIA-41 Spent Fuel Pool Gas
- RIA-49 RB Gas
- Portable area monitors on the main bridge or SFP bridge

**Mode Applicability:**

All

**Definition(s):**

None

**Basis:**

The specified radiation monitors are those expected to see increase area radiation levels as a result of damage to irradiated fuel. Radiation levels in the Reactor Building refueling area are monitored by RIA-3. Radiation levels in the Spent Fuel Pool area are monitored RIA-6. When a fuel bridge is being used to handle fuel, radiation levels are monitored by a portable area monitor mounted on the bridge. (ref. 1, 2, 3)

The HIGH alarm for RIA-3 (containment area monitor) and RIA-49 (RB gaseous process monitor) corresponds to the setpoints established to assure that 10 CFR 20 limits are not exceeded.

The HIGH alarm setpoint for RIA-6 (SFP bridge area monitor) is designed to make operators aware of increased readings above 10 CFR 20 limits. The HIGH alarm setpoint for RIA-41 (Spent Fuel Pool gaseous atmosphere) is set to alarm if 4 times the limits of 10 CFR 20 are exceeded based upon Xe-133. RIA-49 monitors the reactor building gas. Portable monitors are established during refueling outages and are located on the main bridge, and the spent fuel pool bridge.

ATTACHMENT 1  
EAL Bases

This IC addresses events that have caused imminent or actual damage to an irradiated fuel assembly, or a significant lowering of water level within the spent fuel pool. These events present radiological safety challenges to plant personnel and are precursors to a release of radioactivity to the environment. As such, they represent an actual or potential substantial degradation of the level of safety of the plant.

This EAL applies to irradiated fuel that is licensed for dry storage up to the point that the loaded storage cask is sealed. Once sealed, damage to a loaded cask causing loss of the CONFINEMENT BOUNDARY is classified in accordance with EAL EU1.1.

Escalation of the emergency would be based on either Recognition Category R or C ICs.

This EAL addresses a release of radioactive material caused by mechanical damage to irradiated fuel. Damaging events may include the dropping, bumping or binding of an assembly, or dropping a heavy load onto an assembly. A rise in readings on radiation monitors should be considered in conjunction with in-plant reports or observations of a potential fuel damaging event (e.g., a fuel handling accident).

Escalation of the emergency classification level would be via IC RS1.

4. NEI 99-01 AA2

ATTACHMENT 1  
EAL Bases

**Category:** R – Abnormal Rad Levels / Rad Effluent

**Subcategory:** 2 – Irradiated Fuel Event

**Initiating Condition:** Significant lowering of water level above, or damage to, irradiated fuel

**EAL:**

**RA2.3 Alert**

Lowering of spent fuel pool level to -13.5 ft.

**Mode Applicability:**

All

**Definition(s):**

None

**Basis:**

This EAL is applicable once the post-Fukushima level instrumentation becomes operational on its associated unit.

Post-Fukushima order EA-12-051 required the installation of reliable SFP level indication capable of identifying normal level (Level 1), SFP level 10 ft. above the top of the fuel racks (Level 2) and SFP level at the top of the fuel racks (Level 3).

SFP level instruments 1/2/3SFP0010 (primary) and 011 (backup) measure SFP level relative to normal water level (El. 840 ft.) from + 1 ft. to -23.5 ft. (El. 816.4 ft).

For ONS Level 2 corresponds to an indicated water level of -13.5 ft. (El. 826.5 ft.) (ref. 1).

This IC addresses events that have caused imminent or actual damage to an irradiated fuel assembly, or a significant lowering of water level within the spent fuel pool. These events present radiological safety challenges to plant personnel and are precursors to a release of radioactivity to the environment. As such, they represent an actual or potential substantial degradation of the level of safety of the plant.

Escalation of the emergency would be based on either Recognition Category R or C ICs.

Spent fuel pool water level at this value is within the lower end of the level range necessary to prevent significant dose consequences from direct gamma radiation to personnel performing operations in the vicinity of the spent fuel pool. This condition reflects a significant loss of spent fuel pool water inventory and thus it is also a precursor to a loss of the ability to adequately cool the irradiated fuel assemblies stored in the pool.

Escalation of the emergency classification level would be via IC RS1.

**Subcategory:** 2 – Irradiated Fuel Event  
**Initiating Condition:** Spent fuel pool level at the top of the fuel racks  
**EAL:**

<b>RS2.1 Site Area Emergency</b>
----------------------------------

Lowering of spent fuel pool level to -23.5 ft.
--

**Mode Applicability:**

All

**Definition(s):**

None

**Basis:**

This EAL is applicable once the post-Fukushima level instrumentation becomes operational on its associated unit.

Post-Fukushima order EA-12-051 required the installation of reliable SFP level indication capable of identifying normal level (Level 1), SFP level 10 ft. above the top of the fuel racks (Level 2) and SFP level at the top of the fuel racks (Level 3).

SFP level instruments 1/2/3SFP0010 (primary) and 011 (backup) measure SFP level relative to normal water level (El. 840 ft.) from + 1 ft. to -23.5 ft. (El. 816.4 ft).

For ONS Level 3 corresponds to an indicated water level of -23.5 ft. (El. 816.5 ft.) (ref. 1).

This EAL addresses a significant loss of spent fuel pool inventory control and makeup capability leading to IMMEDIATE fuel damage. This condition entails major failures of plant functions needed for protection of the public and thus warrant a Site Area Emergency declaration.

It is recognized that this IC would likely not be met until well after another Site Area Emergency IC was met; however, it is included to provide classification diversity.

Escalation of the emergency classification level would be via IC AG1 or RG2.

SFP level instruments 1/2/3SFP0010 (primary) and 011 (backup) measure SFP level relative to normal water level (El. 840 ft.) from + 1 ft. to -23.5 ft. (El. 816.4 ft).

For ONS Level 3 corresponds to an indicated water level of -23.5 ft. (El. 816.5 ft.) (ref. 1).

This EAL addresses a significant loss of spent fuel pool inventory control and makeup capability leading to a prolonged uncover of spent fuel. This condition will lead to fuel damage and a radiological release to the environment.

It is recognized that this IC would likely not be met until well after another General Emergency IC was met; however, it is included to provide classification diversity.

ATTACHMENT 1  
EAL Bases

**Category:** R – Abnormal Rad Levels / Rad Effluent  
**Subcategory:** 3 – Area Radiation Levels  
**Initiating Condition:** Radiation levels that IMPEDE access to equipment necessary for normal plant operations, cooldown or shutdown

**EAL:**

**RA3.1 Alert**

Dose rates > 15 mR/hr in **EITHER** of the following areas:

- Control Room (RIA-1)
- Central Alarm Station (by survey)

**Mode Applicability:**

All

**Definition(s):**

*IMPEDE(D)* - Personnel access to a room or area is hindered to an extent that extraordinary measures are necessary to facilitate entry of personnel into the affected room/area (e.g., requiring use of protective equipment, such as SCBAs, that is not routinely employed).

**Basis:**

Areas that meet this threshold include the Control Room (CR) and the Central Alarm Station (CAS). RIA-1 monitors the Control room for area radiation (ref. 1). The CAS is included in this EAL because of its importance to permitting access to areas required to assure safe plant operations.

There are no permanently installed area radiation monitors in the CAS that may be used to assess this EAL threshold. Therefore, this threshold is evaluated using local radiation survey for this area (ref. 1).

This IC addresses elevated radiation levels in certain plant rooms/areas sufficient to preclude or impede personnel from performing actions necessary to maintain normal plant operation, or to perform a normal plant cooldown and shutdown. As such, it represents an actual or potential substantial degradation of the level of safety of the plant. The Emergency Coordinator should consider the cause of the increased radiation levels and determine if another IC may be applicable.

Escalation of the emergency classification level would be via Recognition Category R, C or F ICs.

**Subcategory:** 3 – Area Radiation Levels  
**Initiating Condition:** Radiation levels that IMPEDE access to equipment necessary for normal plant operations, cooldown or shutdown

**EAL:**

**RA3.2 Alert**  
 An UNPLANNED event results in radiation levels that prohibit or IMPEDE access to **any** Table R-2 rooms or areas (Note 5)

Note 5: If the equipment in the listed room or area was already inoperable or out-of-service before the event occurred, then no emergency classification is warranted.

<b>Table R-2 Safe Operation &amp; Shutdown Rooms/Areas</b>	
Room/Area	Mode Applicability
Turbine Building	1, 2, 3
Equipment and Cable Rooms	1, 2, 3
Auxiliary Building	1, 2, 3, 4, 5
Reactor Buildings	3, 4, 5

**Mode Applicability:**

All

**Definition(s):**

*IMPEDE(D)* - Personnel access to a room or area is hindered to an extent that extraordinary measures are necessary to facilitate entry of personnel into the affected room/area (e.g., requiring use of protective equipment, such as SCBAs, that is not routinely employed).

*UNPLANNED* - A parameter change or an event that is not 1) the result of an intended evolution or 2) an expected plant response to a transient. The cause of the parameter change or event may be known or unknown.

**Basis:**

If the equipment in the listed room or area was already inoperable, or out-of-service, before the event occurred, then no emergency should be declared since the event will have no adverse impact beyond that already allowed by Technical Specifications at the time of the event.

The list of plant rooms or areas with entry-related mode applicability identified specify those rooms or areas that contain equipment which require a manual/local action as specified in operating procedures used for normal plant operation, cooldown and shutdown. Rooms or areas in which actions of a contingent or emergency nature would be performed (e.g., an action to address an off-normal or emergency condition such as emergency repairs, corrective measures or emergency operations) are not included. In addition, the list specifies the plant mode(s) during which entry would be required for each room or area (ref. 1).

ATTACHMENT 1  
EAL Bases

This IC addresses elevated radiation levels in certain plant rooms/areas sufficient to preclude or impede personnel from performing actions necessary to maintain normal plant operation, or to perform a normal plant cooldown and shutdown. As such, it represents an actual or potential substantial degradation of the level of safety of the plant. The Emergency Coordinator should consider the cause of the increased radiation levels and determine if another IC may be applicable.

For RA3.2, an Alert declaration is warranted if entry into the affected room/area is, or may be, procedurally required during the plant operating mode in effect at the time of the elevated radiation levels. The emergency classification is not contingent upon whether entry is actually necessary at the time of the increased radiation levels. Access should be considered as impeded if extraordinary measures are necessary to facilitate entry of personnel into the affected room/area (e.g., installing temporary shielding, requiring use of non-routine protective equipment, requesting an extension in dose limits beyond normal administrative limits).

An emergency declaration is not warranted if any of the following conditions apply:

- The plant is in an operating mode different than the mode specified for the affected room/area (i.e., entry is not required during the operating mode in effect at the time of the elevated radiation levels). For example, the plant is in Mode 1 when the radiation increase occurs, and the procedures used for normal operation, cooldown and shutdown do not require entry into the affected room until Mode 4.
- The increased radiation levels are a result of a planned activity that includes compensatory measures which address the temporary inaccessibility of a room or area (e.g., radiography, spent filter or resin transfer, etc.).
- The action for which room/area entry is required is of an administrative or record keeping nature (e.g., normal rounds or routine inspections).
- The access control measures are of a conservative or precautionary nature, and would not actually prevent or impede a required action.
- If the equipment in the listed room or area was already inoperable, or out-of-service, before the event occurred, then no emergency should be declared since the event will have no adverse impact beyond that already allowed by Technical Specifications at the time of the event.

Escalation of the emergency classification level would be via Recognition Category R, C or F ICs.

ATTACHMENT 1  
EAL Bases

**Category E – Independent Spent Fuel Storage Installation (ISFSI)**

EAL Group: ANY (EALs in this category are applicable to any plant condition, hot or cold.)

An independent spent fuel storage installation (ISFSI) is a complex that is designed and constructed for the interim storage of spent nuclear fuel and other radioactive materials associated with spent fuel storage. A significant amount of the radioactive material contained within a canister must escape its packaging and enter the biosphere for there to be a significant environmental effect resulting from an accident involving the dry storage of spent nuclear fuel.

A Notification of Unusual Event is declared on the basis of the occurrence of an event of sufficient magnitude that a loaded cask confinement boundary is damaged or violated.

The ONS ISFSI is contained wholly within the plant Protected Area. Therefore a security event related to the ISFSI would be applicable to EALs HU1.1, HA1.1 and HS1.1

ATTACHMENT 1  
EAL Bases

**Category:** ISFSI  
**Subcategory:** Confinement Boundary  
**Initiating Condition:** Damage to a loaded cask CONFINEMENT BOUNDARY  
**EAL:**

**EU1.1 Unusual Event**  
 Damage to a loaded canister CONFINEMENT BOUNDARY as indicated by an on-contact radiation reading on the surface of a loaded spent fuel cask > any Table E-1 ISFSI dose limit

Table E-1 ISFSI Dose Limits			
Location	24PHB	37PTH	69BTH
HSM front bird screen	1,050 mrem/hr	1,050 mrem/hr	500 mrem/hr
Outside HSM door	40 mrem/hr	4 mrem/hr	4 mrem/hr
End shield wall exterior	550 mrem/hr	8 mrem/hr	8 mrem/hr

**Mode Applicability:**

All

**Definition(s):**

*CONFINEMENT BOUNDARY* - The barrier(s) between spent fuel and the environment once the spent fuel is processed for dry storage. As related to the ONS ISFSI, Confinement Boundary is comprised of the DSC (dry shielded canister) shell, inner bottom cover plate, inner top cover plate, siphon & vent block, siphon & vent port cover plate, and the welds that join them together.

*INDEPENDENT SPENT FUEL STORAGE INSTALLATION (ISFSI)* - A complex that is designed and constructed for the interim storage of spent nuclear fuel and other radioactive materials associated with spent fuel storage.

**Basis:**

The ONS ISFSI utilizes the NUHOMS System dry spent fuel storage system for dry spent fuel storage.

The Standardized NUHOMS® System is a horizontal canister system composed of a steel dry shielded canister (DSC), a reinforced concrete horizontal storage module (HSM), and a transfer cask (TC). The welded DSC provides confinement and criticality control for the storage and transfer of irradiated fuel. The concrete module provides radiation shielding while allowing cooling of the DSC and fuel by natural convection during storage (ref. 1, 2). The ONS ISFSI utilizes the 24PHB, 37PTH and 69BTH DSC designs.

ATTACHMENT 1  
EAL Bases

Confinement boundary is defined as the barrier(s) between areas containing radioactive substances and the environment. Therefore, damage to a confinement boundary must be a confirmed physical breach between the spent fuel and the environment for the TSC.

The Table E-1 values shown are 2 times the limits specified in the ISFSI Certificate of Compliance Technical Specifications for radiation external to the applicable loaded DSC (ref. 1, 2).

This IC addresses an event that results in damage to the CONFINEMENT BOUNDARY of a storage cask containing spent fuel. It applies to irradiated fuel that is licensed for dry storage beginning at the point that the loaded storage cask is sealed. The issues of concern are the creation of a potential or actual release path to the environment, degradation of one or more fuel assemblies due to environmental factors, and configuration changes which could cause challenges in removing the cask or fuel from storage.

The existence of "damage" is determined by radiological survey. The technical specification multiple of "2 times", which is also used in Recognition Category R IC RU1, is used here to distinguish between non-emergency and emergency conditions. The emphasis for this classification is the degradation in the level of safety of the spent fuel cask and not the magnitude of the associated dose or dose rate. It is recognized that in the case of extreme damage to a loaded cask, the fact that the "on-contact" dose rate limit is exceeded may be determined based on measurement of a dose rate at some distance from the cask.

Security-related events for ISFSIs are covered under ICs HU1 and HA1.

ATTACHMENT 1  
EAL Bases

**Category C – Cold Shutdown / Refueling System Malfunction**

EAL Group: Cold Conditions (RCS temperature  $\leq 200^{\circ}\text{F}$ ); EALs in this category are applicable only in one or more cold operating modes.

Category C EALs are directly associated with cold shutdown or refueling system safety functions. Given the variability of plant configurations (e.g., systems out-of-service for maintenance, containment open, reduced AC power redundancy, time since shutdown) during these periods, the consequences of any given initiating event can vary greatly. For example, a loss of decay heat removal capability that occurs at the end of an extended outage has less significance than a similar loss occurring during the first week after shutdown. Compounding these events is the likelihood that instrumentation necessary for assessment may also be inoperable. The cold shutdown and refueling system malfunction EALs are based on performance capability to the extent possible with consideration given to RCS integrity, containment closure, and fuel clad integrity for the applicable operating modes (5 - Cold Shutdown, 6 - Refueling, NM – No Mode).

The events of this category pertain to the following subcategories:

1. RCS Level

RCS water level is directly related to the status of adequate core cooling and, therefore, fuel clad integrity.

2. Loss of Essential AC Power

Loss of essential plant electrical power can compromise plant safety system operability including decay heat removal and emergency core cooling systems which may be necessary to ensure fission product barrier integrity. This category includes loss of onsite and offsite power sources for 4160V AC essential buses.

3. RCS Temperature

Uncontrolled or inadvertent temperature or pressure increases are indicative of a potential loss of safety functions.

4. Loss of Vital DC Power

Loss of emergency plant electrical power can compromise plant safety system operability including decay heat removal and emergency core cooling systems which may be necessary to ensure fission product barrier integrity. This category includes loss of power to or degraded voltage on the 125V DC vital buses.

5. Loss of Communications

Certain events that degrade plant operator ability to effectively communicate with essential personnel within or external to the plant warrant emergency classification.

6. Hazardous Event Affecting Safety Systems

Certain hazardous natural and technological events may result in visible damage to or degraded performance of safety systems warranting classification.

ATTACHMENT 1  
EAL Bases

**Category:** C – Cold Shutdown / Refueling System Malfunction  
**Subcategory:** 1 – RCS Level  
**Initiating Condition:** UNPLANNED loss of RCS inventory for 15 minutes or longer  
**EAL:**

**CU1.1 Unusual Event**

UNPLANNED loss of reactor coolant results in RCS water level less than a required lower limit for  $\geq 15$  min. (Note 1)

Note 1: The Emergency Coordinator should declare the event promptly upon determining that time limit has been exceeded, or will likely be exceeded.

**Mode Applicability:**

5 - Cold Shutdown, 6 - Refueling

**Definition(s):**

*UNPLANNED* - A parameter change or an event that is not 1) the result of an intended evolution or 2) an expected plant response to a transient. The cause of the parameter change or event may be known or unknown.

**Basis:**

RCS water level less than a required lower limit is meant to be less than the lower end of the level control band being procedurally maintained for the current condition or evolution.

RCS water level instrumentation requirements to begin an RCS inventory reduction with fuel in the core to below 80" (lowered inventory) or 50" (reduced inventory) are the following (ref. 1):

- Both channels of LT-5 prior to reducing RCS inventory below 80".
- Both channels of LT-5 and both hot leg and cold leg ultrasonic monitors prior to reducing RCS inventory below 50".

This IC addresses the inability to restore and maintain water level to a required minimum level (or the lower limit of a level band), or a loss of the ability to monitor RCS level concurrent with indications of coolant leakage. Either of these conditions is considered to be a potential degradation of the level of safety of the plant.

Refueling evolutions that decrease RCS water inventory are carefully planned and controlled. An UNPLANNED event that results in water level decreasing below a procedurally required limit warrants the declaration of an Unusual Event due to the reduced water inventory that is available to keep the core covered.

This EAL recognizes that the minimum required RCS level can change several times during the course of a refueling outage as different plant configurations and system lineups are implemented. This EAL is met if the minimum level, specified for the current plant conditions, cannot be maintained for 15 minutes or longer. The minimum level is typically specified in the applicable operating procedure but may be specified in another controlling document.

ATTACHMENT 1  
EAL Bases

The 15-minute threshold duration allows sufficient time for prompt operator actions to restore and maintain the expected water level. This criterion excludes transient conditions causing a brief lowering of water level.

Continued loss of RCS inventory may result in escalation to the Alert emergency classification level via either IC CA1 or CA3.

2. NEI 99-01 CU1

ATTACHMENT 1  
EAL Bases

**Category:** C – Cold Shutdown / Refueling System Malfunction  
**Subcategory:** 1 – RCS Level  
**Initiating Condition:** UNPLANNED loss of RCS inventory for 15 minutes or longer  
**EAL:**

**CU1.2 Unusual Event**

RCS level **cannot** be monitored

**AND EITHER**

- UNPLANNED increase in **any** Table C-1 sump/tank level due to loss of RCS inventory
- Visual observation of UNISOLABLE RCS leakage

**Table C-1 Sumps / Tanks**

- RB Normal Sumps
- RB Emergency Sumps
- Core Flood Tank
- Quench Tank
- Low Activity Waste Tank
- High Activity Waste Tank
- Miscellaneous Waste Holdup Tank
- LPI Room Sumps

**Mode Applicability:**

5 - Cold Shutdown, 6 – Refueling

**Definition(s):**

*UNISOLABLE* - An open or breached system line that cannot be isolated, remotely or locally.

*UNPLANNED* - A parameter change or an event that is not 1) the result of an intended evolution or 2) an expected plant response to a transient. The cause of the parameter change or event may be known or unknown.

**Basis:**

A RCS leak should be considered UNISOLABLE if the leak cannot be isolated within 15 min.

In Cold Shutdown mode, the RCS will normally be intact and standard RCS level monitoring means are available.

In the Refuel mode, the RCS is not intact and reactor vessel level may be monitored by different means, including the ability to monitor level visually.

In this EAL, all water level indication is unavailable and the RCS inventory loss must be detected by indirect leakage indications (Table C-1). Level increases must be evaluated

ATTACHMENT 1  
EAL Bases

against other potential sources of leakage such as cooling water sources inside the containment to ensure they are indicative of RCS leakage. If the make-up rate to the RCS unexplainably rises above the pre-established rate, a loss of RCS inventory may be occurring even if the source of the leakage cannot be immediately identified. Visual observation of significant leakage from systems connected to the RCS that cannot be isolated could also be indicative of a loss of RCS inventory (ref. 1, 2).

This IC addresses the inability to restore and maintain water level to a required minimum level (or the lower limit of a level band), or a loss of the ability to monitor RCS level concurrent with indications of coolant leakage. Either of these conditions is considered to be a potential degradation of the level of safety of the plant.

Refueling evolutions that decrease RCS water inventory are carefully planned and controlled. An UNPLANNED event that results in water level decreasing below a procedurally required limit warrants the declaration of an Unusual Event due to the reduced water inventory that is available to keep the core covered.

This EAL addresses a condition where all means to determine level have been lost. In this condition, operators may determine that an inventory loss is occurring by observing changes in sump and/or tank levels (Table C-1). Sump and/or tank level changes must be evaluated against other potential sources of water flow to ensure they are indicative of leakage from the RCS.

Continued loss of RCS inventory may result in escalation to the Alert emergency classification level via either IC CA1 or CA3.

ATTACHMENT 1  
EAL Bases

**Category:** C – Cold Shutdown / Refueling System Malfunction

**Subcategory:** 1 – RCS Level

**Initiating Condition:** Loss of RCS inventory

**EAL:**

<b>CA1.1</b> <b>Alert</b>
---------------------------

Loss of RCS inventory as indicated by RCS level < 10" (LT-5)
--

**Mode Applicability:**

5 - Cold Shutdown, 6 – Refueling

**Definition(s):**

None

**Basis:**

RCS water level of 10" as indicated on LT-5 is the lowest level for continued operation of LPI pumps for decay heat removal (ref. 1). Two LPI pumps and two coolers normally perform the decay heat removal function for each unit (ref. 2).

The threshold was chosen because a loss of suction to decay heat removal systems may occur. The inability to restore and maintain level after reaching this setpoint infers a failure of the RCS Barrier.

This IC addresses conditions that are precursors to a loss of the ability to adequately cool irradiated fuel (i.e., a precursor to a challenge to the fuel clad barrier). This condition represents a potential substantial reduction in the level of plant safety.

For this EAL, a lowering of RCS water level below 10 in. indicates that operator actions have not been successful in restoring and maintaining RCS water level. The heat-up rate of the coolant will increase as the available water inventory is reduced. A continuing decrease in water level will lead to core uncover.

Although related, this EAL is concerned with the loss of RCS inventory and not the potential concurrent effects on systems needed for decay heat removal (e.g., loss of a Decay Heat Removal suction point). An increase in RCS temperature caused by a loss of decay heat removal capability is evaluated under IC CA3.

If RCS water level continues to lower, then escalation to Site Area Emergency would be via IC CS1.

**ONS Basis Reference(s):**

**EAL:**

**CA1.2 Alert**

RCS level **cannot** be monitored for  $\geq 15$  min. (Note 1)

**AND EITHER**

- UNPLANNED increase in **any** Table C-1 Sump / Tank level due to a loss of RCS inventory
- Visual observation of UNISOLABLE RCS leakage

Note 1: The Emergency Coordinator should declare the event promptly upon determining that time limit has been exceeded, or will likely be exceeded.

Table C-1 Sumps / Tanks
<ul style="list-style-type: none"><li>• RB Normal Sumps</li><li>• RB Emergency Sumps</li><li>• Core Flood Tank</li><li>• Quench Tank</li><li>• Low Activity Waste Tank</li><li>• High Activity Waste Tank</li><li>• Miscellaneous Waste Holdup Tank</li><li>• LPI Room Sumps</li></ul>

**Mode Applicability:**

5 - Cold Shutdown, 6 – Refueling

**Definition(s):**

*UNISOLABLE* - An open or breached system line that cannot be isolated, remotely or locally.

*UNPLANNED* - A parameter change or an event that is not 1) the result of an intended evolution or 2) an expected plant response to a transient. The cause of the parameter change or event may be known or unknown.

**Basis:**

A RCS leak should be considered UNISOLABLE if the leak cannot be isolated within 15 minutes.

In Cold Shutdown mode, the RCS will normally be intact and standard RCS level monitoring means are available.

ATTACHMENT 1  
EAL Bases

In the Refuel mode, the RCS is not intact and RCS level may be monitored by different means, including the ability to monitor level visually.

In this EAL, all RCS water level indication would be unavailable for greater than 15 minutes, and the RCS inventory loss must be detected by indirect leakage indications (Table C-1). Level increases must be evaluated against other potential sources of leakage such as cooling water sources inside the containment to ensure they are indicative of RCS leakage. If the make-up rate to the RCS unexplainably rises above the pre-established rate, a loss of RCS inventory may be occurring even if the source of the leakage cannot be immediately identified. Visual observation of significant leakage from systems connected to the RCS that cannot be isolated could also be indicative of a loss of RCS inventory (ref. 1, 2).

This IC addresses conditions that are precursors to a loss of the ability to adequately cool irradiated fuel (i.e., a precursor to a challenge to the fuel clad barrier). This condition represents a potential substantial reduction in the level of plant safety.

For this EAL, the inability to monitor RCS level may be caused by instrumentation and/or power failures, or water level dropping below the range of available instrumentation. If water level cannot be monitored, operators may determine that an inventory loss is occurring by observing changes in sump and/or tank levels. Sump and/or tank level changes must be evaluated against other potential sources of water flow to ensure they are indicative of leakage from the RCS.

The 15-minute duration for the loss of level indication was chosen because it is half of the EAL duration specified in IC CS1.

If the RCS inventory level continues to lower, then escalation to Site Area Emergency would be via IC CS1.

**ONS Basis Reference(s):**

Core uncover is indicated by **any** of the following:

- UNPLANNED increase in **any** Table C-1 sump/tank level
- Visual observation of UNISOLABLE RCS leakage
- High alarm on RIA-3 RB Refueling Deck Shield Wall
- Erratic Source Range Monitor Indication

Note 1: The Emergency Coordinator should declare the event promptly upon determining that time limit has been exceeded, or will likely be exceeded.

Table C-1 Sumps / Tanks
<ul style="list-style-type: none"><li>• RB Normal Sumps</li><li>• RB Emergency Sumps</li><li>• Core Flood Tank</li><li>• Quench Tank</li><li>• Low Activity Waste Tank</li><li>• High Activity Waste Tank</li><li>• Miscellaneous Waste Holdup Tank</li><li>• LPI Room Sumps</li></ul>

**Mode Applicability:**

5 – Cold Shutdown, 6 – Refueling

**Definition(s):**

*UNISOLABLE* - An open or breached system line that cannot be isolated, remotely or locally.

*UNPLANNED* - A parameter change or an event that is not 1) the result of an intended evolution or 2) an expected plant response to a transient. The cause of the parameter change or event may be known or unknown.

**Basis:**

A RCS leak should be considered UNISOLABLE if the leak cannot be isolated within 15 minutes.

ATTACHMENT 1  
EAL Bases

In Cold Shutdown mode, the RCS will normally be intact and standard RCS level monitoring means are available.

In the Refueling mode, the RCS is not intact and RCS level may be monitored by different means, including the ability to monitor level visually.

In this EAL, all RCS water level indication would be unavailable for greater than 30 minutes, and the RCS inventory loss must be detected by indirect leakage indications (Table C-1). Level increases must be evaluated against other potential sources of leakage such as cooling water sources inside the containment to ensure they are indicative of RCS leakage. If the make-up rate to the RCS unexplainably rises above the pre-established rate, a loss of RCS inventory may be occurring even if the source of the leakage cannot be immediately identified. Visual observation of significant leakage from systems connected to the RCS that cannot be isolated could also be indicative of a loss of RCS inventory (ref. 1, 2).

Sump or tank level increases should be of a magnitude that correlates to a volume sufficient to indicate fuel has been uncovered or uncover is imminent.

The Reactor Vessel inventory loss may be detected by a reduction in water shielding that causes a high alarm on the Refueling Deck Shield Wall area radiation monitor (ref. 3).

Post-TMI accident studies indicated that the installed PWR nuclear instrumentation will operate erratically when the core is uncovered and that this should be used as a tool for making such determinations (ref. 4, 5, 6).

This IC addresses a significant and prolonged loss of reactor vessel/RCS inventory control and makeup capability leading to IMMEDIATE fuel damage. The lost inventory may be due to a RCS component failure, a loss of configuration control or prolonged boiling of reactor coolant. These conditions entail major failures of plant functions needed for protection of the public and thus warrant a Site Area Emergency declaration.

Following an extended loss of core decay heat removal and inventory makeup, decay heat will cause reactor coolant boiling and a further reduction in reactor vessel level. If RCS level cannot be restored, fuel damage is probable.

The 30-minute criterion is tied to a readily recognizable event start time (i.e., the total loss of ability to monitor level), and allows sufficient time to monitor, assess and correlate reactor and plant conditions to determine if core uncover has actually occurred (i.e., to account for various accident progression and instrumentation uncertainties). It also allows sufficient time for performance of actions to terminate leakage, recover inventory control/makeup equipment and/or restore level monitoring.

The inability to monitor RCS level may be caused by instrumentation and/or power failures, or water level dropping below the range of available instrumentation. If water level cannot be monitored, operators may determine that an inventory loss is occurring by observing changes in sump and/or tank levels. Sump and/or tank level changes must be evaluated against other potential sources of water flow to ensure they are indicative of leakage from the RCS.

This EAL addresses concerns raised by Generic Letter 88-17, Loss of Decay Heat Removal; SECY 91-283, Evaluation of Shutdown and Low Power Risk Issues; NUREG-1449, Shutdown and Low-Power Operation at Commercial Nuclear Power Plants in the United States; and NUMARC 91-06, Guidelines for Industry Actions to Assess Shutdown Management.

**Table C-2 Containment Challenge Indications**

- CONTAINMENT CLOSURE not established (Note 6)
- Containment hydrogen concentration  $\geq 4\%$
- Unplanned rise in containment pressure

**Mode Applicability:**

5 - Cold Shutdown, 6 – Refueling

**Definition(s):**

*CONTAINMENT CLOSURE* - The action to secure containment and its associated structures, systems, and components as a functional barrier to fission product release under all plant conditions up to and including a loss of decay heat removal or fuel handling accident inside containment.

As applied to ONS, Containment Closure is established when the requirements of OP/1,2,3/A/1502/009, Containment Closure Control, are met.

*UNISOLABLE* - An open or breached system line that cannot be isolated, remotely or locally.

*UNPLANNED* - A parameter change or an event that is not 1) the result of an intended evolution or 2) an expected plant response to a transient. The cause of the parameter change or event may be known or unknown.

**Basis:**

A RCS leak should be considered UNISOLABLE if the leak cannot be isolated within 15 minutes.

In Cold Shutdown mode, the RCS will normally be intact and standard RCS level monitoring means are available.

In the Refueling mode, the RCS is not intact and RCS level may be monitored by different means, including the ability to monitor level visually.

In this EAL, all RCS water level indication would be unavailable for greater than 30 minutes, and the RCS inventory loss must be detected by indirect leakage indications (Table C-1). Level increases must be evaluated against other potential sources of leakage such as cooling water sources inside the containment to ensure they are indicative of RCS leakage. If the make-up rate to the RCS unexplainably rises above the pre-established rate, a loss of RCS inventory may be occurring even if the source of the leakage cannot be immediately identified. Visual observation of significant leakage from systems connected to the RCS that cannot be isolated could also be indicative of a loss of RCS inventory (ref. 1, 2).

ATTACHMENT 1  
EAL Bases

Sump or tank level increases should be of a magnitude that correlates to a volume sufficient to indicate fuel has been uncovered or uncovering is imminent.

The Reactor Vessel inventory loss may be detected by a reduction in water shielding that causes a high alarm on the Refueling Deck Shield Wall area radiation monitor (ref. 3).

Post-TMI accident studies indicated that the installed PWR nuclear instrumentation will operate erratically when the core is uncovered and that this should be used as a tool for making such determinations (ref. 4, 5, 6).

Three conditions are associated with a challenge to Containment integrity:

1. CONTAINMENT CLOSURE not established - The status of containment closure is tracked if plant conditions change that could raise the risk of a fission product release as a result of a loss of decay heat removal (ref. 7). If containment closure is re-established prior to exceeding the 30 minute core uncovering time limit then escalation to GE would not occur.
2. Containment hydrogen  $\geq 4\%$  - The 4% hydrogen concentration threshold is generally considered the lower limit for hydrogen combustion. ONS is equipped with a Containment Hydrogen Monitoring System (CHMS) that provides continuous indication of hydrogen concentration in the containment atmosphere. The measurement capability is provided over the range of 0% to 10%. A continuous indication of the hydrogen concentration is not required in the control room at all times during normal operation. If continuous indication of the hydrogen concentration is not available at all times, continuous indication and recording shall be functioning within 90 minutes of the initiation of the safety injection. (ref. 8, 9)
3. UNPLANNED rise in containment pressure - An unplanned pressure rise in containment while in cold shutdown or refueling modes can threaten Containment Closure capability and thus containment potentially cannot be relied upon as a barrier to fission product release.

This IC addresses the inability to restore and maintain reactor vessel level above the top of active fuel with containment challenged. This condition represents actual or IMMEDIATE substantial core degradation or melting with potential for loss of containment integrity. Releases can be reasonably expected to exceed EPA PAG exposure levels offsite for more than the immediate site area.

Following an extended loss of core decay heat removal and inventory makeup, decay heat will cause reactor coolant boiling and a further reduction in reactor vessel level. If RCS level cannot be restored, fuel damage is probable.

With CONTAINMENT CLOSURE not established, there is a high potential for a direct and unmonitored release of radioactivity to the environment. If CONTAINMENT CLOSURE is re-established prior to exceeding the 30-minute time limit, then declaration of a General Emergency is not required.

The existence of an explosive mixture means, at a minimum, that the containment atmospheric hydrogen concentration is sufficient to support a hydrogen burn (i.e., at the lower deflagration limit). A hydrogen burn will raise containment pressure and could result in collateral equipment damage leading to a loss of containment integrity. It therefore represents a challenge to Containment integrity.

ATTACHMENT 1  
EAL Bases

In the early stages of a core uncover event, it is unlikely that hydrogen buildup due to a core uncover could result in an explosive gas mixture in containment. If all installed hydrogen gas monitors are out-of-service during an event leading to fuel cladding damage, it may not be possible to obtain a containment hydrogen gas concentration reading as ambient conditions within the containment will preclude personnel access. During periods when installed containment hydrogen gas monitors are out-of-service, operators may use the other listed indications to assess whether or not containment is challenged.

The 30-minute criterion is tied to a readily recognizable event start time (i.e., the total loss of ability to monitor level), and allows sufficient time to monitor, assess and correlate reactor and plant conditions to determine if core uncover has actually occurred (i.e., to account for various accident progression and instrumentation uncertainties). It also allows sufficient time for performance of actions to terminate leakage, recover inventory control/makeup equipment and/or restore level monitoring.

The inability to monitor RCS level may be caused by instrumentation and/or power failures, or water level dropping below the range of available instrumentation. If water level cannot be monitored, operators may determine that an inventory loss is occurring by observing changes in sump and/or tank levels. Sump and/or tank level changes must be evaluated against other potential sources of water flow to ensure they are indicative of leakage from the RCS.

This EAL addresses concerns raised by Generic Letter 88-17, *Loss of Decay Heat Removal*; SECY 91-283, *Evaluation of Shutdown and Low Power Risk Issues*; NUREG-1449, *Shutdown and Low-Power Operation at Commercial Nuclear Power Plants in the United States*; and NUMARC 91-06, *Guidelines for Industry Actions to Assess Shutdown Management*.

ATTACHMENT 1  
EAL Bases

**Category:** C – Cold Shutdown / Refueling System Malfunction  
**Subcategory:** 2 – Loss of Essential AC Power  
**Initiating Condition:** Loss of all but one AC power source to essential buses for 15 minutes or longer

**EAL:**

**CU2.1 Unusual Event**

AC power capability, Table C-3, to essential 4160 V buses MFB-1 and MFB-2 reduced to a single power source for  $\geq 15$  min. (Note 1)

**AND**

**Any** additional single power source failure will result in loss of **all** AC power to SAFETY SYSTEMS

Note 1: The Emergency Coordinator should declare the event promptly upon determining that time limit has been exceeded, or will likely be exceeded.

**Table C-3 AC Power Sources**

**Offsite:**

- Unit Normal Transformer (backcharged)
- Unit Startup Transformer (SWYD)
- Another Unit Startup Transformer (aligned) (SWYD)
- CT5 (Central/energizing Standby Bus)

**Emergency:**

- Unit Startup Transformer (Keowee)
- Another Unit Startup Transformer (aligned) (Keowee)
- CT4
- CT5 (dedicated line/energizing Standby Bus)

**Mode Applicability:**

5 - Cold Shutdown, 6 – Refueling, NM – No Mode

**Definition(s):**

**SAFETY SYSTEM** - A system required for safe plant operation, cooling down the plant and/or placing it in the cold shutdown condition, including the ECCS. These are typically systems classified as safety-related (as defined in 10CFR50.2):

Those structures, systems and components that are relied upon to remain functional during and following design basis events to assure:

- (1) The integrity of the reactor coolant pressure boundary;
- (2) The capability to shut down the reactor and maintain it in a safe shutdown condition;

ATTACHMENT 1  
EAL Bases

- (3) The capability to prevent or mitigate the consequences of accidents which could result in potential offsite exposures.

**Basis:**

For emergency classification purposes, "capability" means that an AC power source is available to and capable of powering the emergency bus(es) within 15 min, whether or not the buses are currently powered from it.

The condition indicated by this EAL is the degradation of the offsite and onsite power sources such that any additional single failure would result in a loss of all AC power to the emergency buses. 4160 V buses MFB-1 and MFB-2 are the essential buses (ref. 1).

Each unit is provided with two physically independent circuits from the switching station. One is the circuit from the 230 kV switching station through the startup transformer, which is designed to be available within a few seconds following a loss of coolant accident. The second circuit is the path from the switchyard through the main step-up transformer, the main generator bus and the unit auxiliary transformer with the generator disconnected from the main bus. The second circuit is currently used during refueling as an additional power feed for the shutdown unit(s) from the 230 kV switchyard. Whenever there is inadequate power from the generating units, the 230 kV switching station and the hydro units, power is available to the standby power buses either directly from the 100 kV Central Tie Substation or from Lee Steam Station via a Transformer CT5 (ref. 2).

Upon loss of power from the Oconee generating unit and 230 kV switchyard, power is supplied from both Keowee Hydro Station units through two separate and independent routes. One route is an underground feeder to Transformer CT4 which supplies the two redundant Main Feeder Buses (MFB-1 and MFB-2). The other route is an overhead feeder to the 230 KV switching station which supplies each unit startup transformer (ref. 3).

The Standby Shutdown Facility (SSF) consists of standby systems for use in an extreme emergency and is equipped with a manually started diesel generator that can supply power necessary to maintain hot shutdown of the reactors of each unit in the event of loss of power. However, the SSF cannot supply power to the essential buses and therefore not credited in this EAL (ref. 3).

This cold condition EAL is equivalent to the hot condition EAL SA1.1.

This IC describes a significant degradation of offsite and onsite AC power sources such that any additional single failure would result in a loss of all AC power to SAFETY SYSTEMS. In this condition, the sole AC power source may be powering one, or more than one, train of safety-related equipment.

When in the cold shutdown, refueling, or no mode, this condition is not classified as an Alert because of the increased time available to restore another power source to service. Additional time is available due to the reduced core decay heat load, and the lower temperatures and pressures in various plant systems. Thus, when in these modes, this condition is considered to be a potential degradation of the level of safety of the plant.

An "AC power source" is a source recognized in APs and EOPs, and capable of supplying required power to an essential bus. Some examples of this condition are presented below.

- A loss of all offsite power with a concurrent failure of all but one essential power source

ATTACHMENT 1  
EAL Bases

(e.g., CT4, CT5, CT1 (Keowee)).

- A loss of essential power sources (e.g., CT4, CT5, CT1, 2, 3 (Keowee)) with a single train of essential buses being back-fed from an offsite power source.

Fifteen minutes was selected as a threshold to exclude transient or momentary losses of power.

The subsequent loss of the remaining single power source would escalate the event to an Alert in accordance with IC CA2.

ATTACHMENT 1  
EAL Bases

**Category:** C – Cold Shutdown / Refueling System Malfunction  
**Subcategory:** 2 – Loss of Essential AC Power  
**Initiating Condition:** Loss of all offsite and all emergency AC power to essential buses for 15 minutes or longer

**EAL:**

**CA2.1 Alert**

Loss of all offsite and all emergency AC power capability to essential 4160 V buses MFB-1 and MFB-2 for  $\geq 15$  min. (Note 1)

Note 1: The Emergency Coordinator should declare the event promptly upon determining that time limit has been exceeded, or will likely be exceeded.

**Mode Applicability:**

5 - Cold Shutdown, 6 - Refueling, NM – No Mode

**Basis:**

For emergency classification purposes, “capability” means that an AC power source is available to and capable of powering the emergency bus(es) within 15 min, whether or not the buses are currently powered from it.

The condition indicated by this EAL is the degradation of the offsite and onsite power sources resulting in a loss of all AC power to the emergency buses. 4160 V buses MFB-1 and MFB-2 are the essential buses (ref. 1).

Each unit is provided with two physically independent circuits from the switching station. One is the circuit from the 230 kV switching station through the startup transformer, which is designed to be available within a few seconds following a loss of coolant accident. The second circuit is the path from the switchyard through the main step-up transformer, the main generator bus and the unit auxiliary transformer with the generator disconnected from the main bus. The second circuit is currently used during refueling as an additional power feed for the shutdown unit(s) from the 230 kV switchyard. Whenever there is inadequate power from the generating units, the 230 kV switching station and the hydro units, power is available to the standby power buses either directly from the 100 kV Central Tie Substation or from Lee Steam Station via a Transformer CT5. (ref. 2)

Upon loss of power from the Oconee generating unit and 230 kV switchyard, power is supplied from both Keowee Hydro Station units through two separate and independent routes. One route is an underground feeder to Transformer CT4 which supplies the two redundant Main Feeder Buses (MFB-1 and MFB-2). The other route is an overhead feeder to the 230 KV switching station which supplies each unit startup transformer. (ref. 3)

The Standby Shutdown Facility (SSF) consists of standby systems for use in an extreme emergency and is equipped with a manually started diesel generator that can supply power necessary to maintain hot shutdown of the reactors of each unit in the event of loss of power. However, the SSF cannot supply power to the essential buses and therefore not credited in this EAL (ref. 3).

ATTACHMENT 1  
EAL Bases

This cold condition EAL is equivalent to the hot condition loss of all offsite AC power EAL SS1.1.

This IC addresses a total loss of AC power that compromises the performance of all SAFETY SYSTEMS requiring electric power including those necessary for emergency core cooling, containment heat removal/pressure control, spent fuel heat removal and the ultimate heat sink.

When in the cold shutdown, refueling, or no mode, this condition is not classified as a Site Area Emergency because of the increased time available to restore an emergency bus to service. Additional time is available due to the reduced core decay heat load, and the lower temperatures and pressures in various plant systems. Thus, when in these modes, this condition represents an actual or potential substantial degradation of the level of safety of the plant.

Fifteen minutes was selected as a threshold to exclude transient or momentary power losses.

Escalation of the emergency classification level would be via IC CS1 or RS1.

ATTACHMENT 1  
EAL Bases

**Category:** C – Cold Shutdown / Refueling System Malfunction

**Subcategory:** 3 – RCS Temperature

**Initiating Condition:** UNPLANNED increase in RCS temperature

**EAL:**

**CU3.1 Unusual Event**

UNPLANNED increase in RCS temperature to > 200°F due to loss of decay heat removal capability (Note 10)

Note 10: In the absence of reliable RCS temperature indication caused by the loss of decay heat removal capability, classification should be based on time to boil data.

**Mode Applicability:**

5 - Cold Shutdown, 6 - Refueling

**Definition(s):**

*UNPLANNED* - A parameter change or an event that is not 1) the result of an intended evolution or 2) an expected plant response to a transient. The cause of the parameter change or event may be known or unknown.

**Basis:**

Several instruments are capable of providing indication of RCS temperature with respect to the Technical Specification cold shutdown temperature limit (200°F, ref. 1). These include cold leg ( $T_c$ ) temperature indications, hot leg ( $T_h$ ) temperature indications with RCPs running, CETCs and LPI cooler outlet temperature indications (ref. 2).

However, if Low Pressure Injection (LPI) flow is lost, the normal temperature elements used to monitor RCS temperature are not accurate indicators of RCS temperature. The CETCs are the design instruments for these conditions. For some periods of time the CETCs may not be available. The current practices concerning determining time to boil can be used in the evaluation of these EALs. Without CETC indication and with a loss of LPI flow the following guidance should be used (ref. 2):

- Use the predetermined "time to boil" data for evaluating these EALs. This approach reflects the relatively small numerical difference between the typical Technical Specification cold shutdown temperature limit of 200°F and the boiling temperature of RCS water with the plant in Mode 5 or 6.
- Alternately, the Control Room staff may use a procedure or user aid to determine when RCS temperature will likely exceed 200°F given the actual plant conditions (e.g., using a heat-up curve).

This IC addresses an UNPLANNED increase in RCS temperature above the Technical Specification cold shutdown temperature limit and represents a potential degradation of the level of safety of the plant. If the RCS is not intact and CONTAINMENT CLOSURE is not established during this event, the Emergency Coordinator should also refer to IC CA3.

A momentary UNPLANNED excursion above the Technical Specification cold shutdown temperature limit when the heat removal function is available does not warrant a classification.

ATTACHMENT 1  
EAL Bases

This EAL involves a loss of decay heat removal capability, or an addition of heat to the RCS in excess of that which can currently be removed, such that reactor coolant temperature cannot be maintained below the cold shutdown temperature limit specified in Technical Specifications. During this condition, there is no immediate threat of fuel damage because the core decay heat load has been reduced since the cessation of power operation.

During an outage, the level in the reactor vessel will normally be maintained at or above the reactor vessel flange. Refueling evolutions that lower water level below the reactor vessel flange are carefully planned and controlled. A loss of forced decay heat removal at reduced inventory may result in a rapid increase in reactor coolant temperature depending on the time after shutdown.

Escalation to Alert would be via IC CA1 based on an inventory loss or IC CA3 based on exceeding plant configuration-specific time criteria.

EAL Bases

**Category:** C – Cold Shutdown / Refueling System Malfunction

**Subcategory:** 3 – RCS Temperature

**Initiating Condition:** UNPLANNED increase in RCS temperature

**EAL:**

**CU3.2 Unusual Event**

Loss of all RCS temperature and RCS level indication for  $\geq 15$  min. (Note 1)

Note 1: The Emergency Coordinator should declare the event promptly upon determining that time limit has been exceeded, or will likely be exceeded.

**Mode Applicability:**

5 - Cold Shutdown, 6- Refueling

**Definition(s):**

None

**Basis:**

Several instruments are capable of providing indication of RCS temperature with respect to the Technical Specification cold shutdown temperature limit (200°F, ref. 1). These include cold leg ( $T_c$ ) temperature indications, hot leg ( $T_h$ ) temperature indications with RCPs running, CETCs and LPI cooler outlet temperature indications (ref. 2).

Several instruments are capable of providing indication of RCS level including pressurizer level, RVLIS, LT-5 and local monitor (ref. 3).

This EAL addresses the inability to determine RCS temperature and level, and represents a potential degradation of the level of safety of the plant. If the RCS is not intact and CONTAINMENT CLOSURE is not established during this event, the Emergency Coordinator should also refer to IC CA3.

This EAL reflects a condition where there has been a significant loss of instrumentation capability necessary to monitor RCS conditions and operators would be unable to monitor key parameters necessary to assure core decay heat removal. During this condition, there is no immediate threat of fuel damage because the core decay heat load has been reduced since the cessation of power operation.

Fifteen minutes was selected as a threshold to exclude transient or momentary losses of indication.

Escalation to Alert would be via IC CA1 based on an inventory loss or IC CA3 based on exceeding plant configuration-specific time criteria.

UNPLANNED increase in RCS temperature to > 200°F for > Table C-4 duration  
(Notes 1, 10)

**OR**

UNPLANNED RCS pressure increase > 10 psig due to a loss of RCS cooling (this EAL does not apply during water-solid plant conditions)

Note 1: The Emergency Coordinator should declare the event promptly upon determining that the applicable time has been exceeded, or will likely be exceeded.

Note 10: In the absence of reliable RCS temperature indication caused by the loss of decay heat removal capability, classification should be based on time to boil data.

<b>Table C-4: RCS Heat-up Duration Thresholds</b>		
<b>RCS Status</b>	<b>CONTAINMENT CLOSURE Status</b>	<b>Heat-up Duration</b>
Intact (but <b>not</b> REDUCED INVENTORY)	N/A	60 min.*
<b>Not intact</b> <b>OR</b> REDUCED INVENTORY	established	20 min.*
	<b>not</b> established	0 min.
* If an RCS heat removal system is in operation within this time frame and RCS temperature is being reduced, the EAL is <b>not</b> applicable.		

**Mode Applicability:**

5 - Cold Shutdown, 6 – Refueling

**Definition(s):**

**CONTAINMENT CLOSURE** - The action to secure containment and its associated structures, systems, and components as a functional barrier to fission product release under all plant conditions up to and including a loss of decay heat removal or fuel handling accident inside containment.

As applied to ONS, Containment Closure is established when the requirements of OP/1,2,3/A/1502/009, Containment Closure Control, are met.

**UNPLANNED** - A parameter change or an event that is not 1) the result of an intended evolution or 2) an expected plant response to a transient. The cause of the parameter change or event may be known or unknown.

ATTACHMENT 1  
EAL Bases

**REDUCED INVENTORY** - Condition with fuel in the reactor vessel and the level lower than three feet below the reactor vessel flange (RCS level < 50" on LT-5)

**Basis:**

Several instruments are capable of providing indication of RCS temperature with respect to the Technical Specification cold shutdown temperature limit (200°F, ref. 1). These include cold leg ( $T_c$ ) temperature indications, hot leg ( $T_h$ ) temperature indications with RCPs running, CETCs and LPI cooler outlet temperature indications (ref. 2).

However, if Low Pressure Injection (LPI) flow is lost, the normal temperature elements used to monitor RCS temperature are not accurate indicators of RCS temperature. The CETCs are the design instruments for these conditions. For some periods of time the CETCs may not be available. The current practices concerning determining time to boil can be used in the evaluation of these EALs. Without CETC indication and with a loss of LPI flow the following guidance should be used (ref. 2):

- Use the predetermined "time to boil" data for evaluating these EALs. This approach reflects the relatively small numerical difference between the typical Technical Specification cold shutdown temperature limit of 200°F and the boiling temperature of RCS water with the plant in Mode 5 or 6.
- Alternately, the Control Room staff may use a procedure or user aid to determine when RCS temperature will likely exceed 200°F given the actual plant conditions (e.g., using a heat-up curve).

Numerous RCS pressure instruments are capable of measuring pressure to less than 10 psia including RCS low range cooldown pressure indicators RC-P-0086A/B (ref. 3).

This IC addresses conditions involving a loss of decay heat removal capability or an addition of heat to the RCS in excess of that which can currently be removed. Either condition represents an actual or potential substantial degradation of the level of safety of the plant.

A momentary UNPLANNED excursion above the Technical Specification cold shutdown temperature limit when the heat removal function is available does not warrant a classification.

The RCS Heat-up Duration Thresholds table addresses an increase in RCS temperature when CONTAINMENT CLOSURE is established but the RCS is not intact, or RCS inventory is reduced (e.g., mid-loop operation). The 20-minute criterion was included to allow time for operator action to address the temperature increase.

The RCS Heat-up Duration Thresholds table also addresses an increase in RCS temperature with the RCS intact. The status of CONTAINMENT CLOSURE is not crucial in this condition since the intact RCS is providing a high pressure barrier to a fission product release. The 60-minute time frame should allow sufficient time to address the temperature increase without a substantial degradation in plant safety.

Finally, in the case where there is an increase in RCS temperature, the RCS is not intact or is at reduced inventory, and CONTAINMENT CLOSURE is not established, no heat-up duration is allowed (i.e., 0 minutes). This is because 1) the evaporated reactor coolant may be released directly into the containment atmosphere and subsequently to the environment, and 2) there is reduced reactor coolant inventory above the top of irradiated fuel.

ATTACHMENT 1  
EAL Bases

The RCS pressure increase threshold provides a pressure-based indication of RCS heat-up in the absence of RCS temperature monitoring capability.

Escalation of the emergency classification level would be via IC CS1 or RS1.

ATTACHMENT 1  
EAL Bases

**Category:** C – Cold Shutdown / Refueling System Malfunction

**Subcategory:** 4 – Loss of Vital DC Power

**Initiating Condition:** Loss of Vital DC power for 15 minutes or longer

**EAL:**

**CU4.1 Unusual Event**

Indicated voltage is < 105VDC on vital DC buses **required** by Technical Specifications for ≥ 15 min. (Note 1)

Note 1: The Emergency Coordinator should declare the event promptly upon determining that time limit has been exceeded, or will likely be exceeded.

**Mode Applicability:**

5 - Cold Shutdown, 6 - Refueling

**Definition(s):**

None

**Basis:**

The purpose of this EAL is to recognize a loss of DC power compromising the ability to monitor and control the removal of decay heat during cold shutdown or refueling operations. This EAL is intended to be anticipatory in as much as the operating crew may not have necessary indication and control of equipment needed to respond to the loss. The fifteen minute interval is intended to exclude transient or momentary power losses.

For each unit, two independent and physically separated 125 volt DC batteries and DC buses are provided for the vital instrumentation and control power system. (ref. 1, 2). Minimum DC bus voltage is 110 VDC (ref. 3).

This EAL is the cold condition equivalent of the hot condition loss of DC power EAL SS2.1.

This IC addresses a loss of vital DC power which compromises the ability to monitor and control operable SAFETY SYSTEMS when the plant is in the cold shutdown or refueling mode. In these modes, the core decay heat load has been significantly reduced, and coolant system temperatures and pressures are lower; these conditions increase the time available to restore a vital DC bus to service. Thus, this condition is considered to be a potential degradation of the level of safety of the plant.

As used in this EAL, "required" means the vital DC buses necessary to support operation of the in-service, or operable, train or trains of SAFETY SYSTEM equipment. For example, if Train A is out-of-service (inoperable) for scheduled outage maintenance work and Train B is in-service (operable), then a loss of Vital DC power affecting Train B would require the declaration of an Unusual Event. A loss of Vital DC power to Train A would not warrant an emergency classification.

Fifteen minutes was selected as a threshold to exclude transient or momentary power losses.

Depending upon the event, escalation of the emergency classification level would be via IC CA1 or CA3, or an IC in Recognition Category R.

Onsite, offsite and NRC communications include one or more of the systems listed in Table C-5 (ref. 1).

1. Commercial phone service

The Commercial phone service does not go through the site telephone system.

2. ONS site phone system

The site phone system is generator and battery backed with:

- Fiber-Optic to Charlotte GO (65 lines)
- Telephone line to Easley (6 circuits)
- Anderson (4 lines)
- Six Mile (4 lines)
- Site Telephone System: Inward and outward direct dial available from the Control Room, TSC, and OSC

3. EOF phone system

The emergency communications systems at the Charlotte EOF are designed to ensure the reliable, timely flow of information between all parties having an emergency response role.

4. Public Address (Paging) system

The paging system provides paging and party line communications between stations located throughout the plant. Inside and outside type wall and desk-mounted stations are used to communicate between roaming personnel and fixed work locations. Plant-wide instructions are issued using the paging feature.

5. Onsite radio system

The onsite radio system receives emergency backup power from Keowee Hydro Units supporting communications with: Control Room 1&2, 3, Fire Brigade, Chemistry, Safety, Radiation Protection, Maintenance, Medical Emergency Response Team, and Hazardous Materials Response Team.

6. DEMNET

DEMNET is the primary means of offsite communication. This circuit allows intercommunication among the EOF, TSC, control room, counties, and states. DEMNET operates as an internet based (VoIP) communications system with a satellite back-up. Should the internet transfer rate become slow or unavailable, the DEMNET will automatically transfer to satellite mode.

7. Offsite radio system

The offsite radio system is battery backed supporting communications with: Control Room Units 1&2, TSC, Field Monitoring Teams, EOF, counties and State of South Carolina.

ATTACHMENT 1  
EAL Bases

8. NRC Emergency Telephone System (ETS)

The NRC uses a Duke Energy dedicated telephone line which allows direct telephone communications from the plant to NRC regional and national offices. The Duke Energy communications line provides a link independent of the local public telephone network. Telephones connected to this network are located in the Oconee Control Rooms, Technical Support Center, and Emergency Operations Facility and can be used to establish NRC Emergency Notification System (ENS) and Health Physics Network (HPN) capability.

9. Satellite Phone

Satellite Phones can be used for external communications

This EAL is the cold condition equivalent of the hot condition EAL SU7.1.

This IC addresses a significant loss of on-site or offsite communications capabilities. While not a direct challenge to plant or personnel safety, this event warrants prompt notifications to OROs and the NRC.

This IC should be assessed only when extraordinary means are being utilized to make communications possible (e.g., use of non-plant, privately owned equipment, relaying of on-site information via individuals or multiple radio transmission points, individuals being sent to offsite locations, etc.).

The first EAL condition addresses a total loss of the communications methods used in support of routine plant operations.

The second EAL condition addresses a total loss of the communications methods used to notify all OROs of an emergency declaration. The OROs referred to here are the State EOC and FEO, Pickens County LEC and EOC, and Oconee County LEC and EOC.

The third EAL addresses a total loss of the communications methods used to notify the NRC of an emergency declaration.

2. NEI 99-01 CU5

ATTACHMENT 1  
EAL Bases

**Category:** C – Cold Shutdown / Refueling System Malfunction  
**Subcategory:** 6 – Hazardous Event Affecting Safety Systems  
**Initiating Condition:** Hazardous event affecting a SAFETY SYSTEM needed for the current operating mode

**EAL:**

**CA6.1 Alert**

The occurrence of any Table C-6 hazardous event

**AND EITHER:**

- Event damage has caused indications of degraded performance in at least one train of a SAFETY SYSTEM needed for the current operating mode
- The event has caused VISIBLE DAMAGE to a SAFETY SYSTEM component or structure needed for the current operating mode

Table C-6 Hazardous Events
<ul style="list-style-type: none"><li>● Seismic event (earthquake)</li><li>● Internal or external FLOODING event</li><li>● High winds or tornado strike</li><li>● FIRE</li><li>● EXPLOSION</li><li>● Other events with similar hazard characteristics as determined by the Shift Manager</li></ul>

**Mode Applicability:**

5 - Cold Shutdown, 6 - Refueling

**Definition(s):**

*EXPLOSION* - A rapid, violent and catastrophic failure of a piece of equipment due to combustion, chemical reaction or overpressurization. A release of steam (from high energy lines or components) or an electrical component failure (caused by short circuits, grounding, arcing, etc.) should not automatically be considered an explosion. Such events require a post-event inspection to determine if the attributes of an explosion are present.

*FIRE* - Combustion characterized by heat and light. Sources of smoke such as slipping drive belts or overheated electrical equipment do not constitute fires. Observation of flame is preferred but is NOT required if large quantities of smoke and heat are observed.

*FLOODING* - A condition where water is entering a room or area faster than installed equipment is capable of removal, resulting in a rise of water level within the room or area.

ATTACHMENT 1  
EAL Bases

**SAFETY SYSTEM** - A system required for safe plant operation, cooling down the plant and/or placing it in the cold shutdown condition, including the ECCS. These are typically systems classified as safety-related (as defined in 10CFR50.2):

Those structures, systems and components that are relied upon to remain functional during and following design basis events to assure:

- (1) The integrity of the reactor coolant pressure boundary;
- (2) The capability to shut down the reactor and maintain it in a safe shutdown condition;
- (3) The capability to prevent or mitigate the consequences of accidents which could result in potential offsite exposures.

**VISIBLE DAMAGE** - Damage to a component or structure that is readily observable without measurements, testing, or analysis. The visual impact of the damage is sufficient to cause concern regarding the operability or reliability of the affected component or structure.

**Basis:**

- The significance of seismic events are discussed under EAL HU2.1 (ref. 1).
- Internal FLOODING may be caused by events such as component failures, equipment misalignment, or outage activity mishaps.
- External flooding at ONS is highly unlikely since the probable maximum flood (PMF) would be contained by the Keowee Reservoir. Plant grade elevation is 796.0 ft MSL. The minimum external access elevation for the Auxiliary, Turbine, and Service Buildings is 796.5 ft MSL which provides a 6 inch water sill. (ref. 2)
- High winds in excess of design (95 mph) or tornado strikes can cause significant structural damage (ref. 3).
- Areas containing functions and systems required for safe shutdown of the plant are identified by fire area (ref. 4, 5).
- An explosion that degrades the performance of a SAFETY SYSTEM train or visibly damages a SAFETY SYSTEM component or structure would be classified under this EAL.

This IC addresses a hazardous event that causes damage to a SAFETY SYSTEM, or a structure containing SAFETY SYSTEM components, needed for the current operating mode. This condition significantly reduces the margin to a loss or potential loss of a fission product barrier, and therefore represents an actual or potential substantial degradation of the level of safety of the plant.

The first conditional addresses damage to a SAFETY SYSTEM train that is in service/operation since indications for it will be readily available. The indications of degraded performance should be significant enough to cause concern regarding the operability or reliability of the SAFETY SYSTEM train.

The second conditional addresses damage to a SAFETY SYSTEM component that is not in service/operation or readily apparent through indications alone, or to a structure containing SAFETY SYSTEM components. Operators will make this determination based on the totality of available event and damage report information. This is intended to be a brief assessment not requiring lengthy analysis or quantification of the damage.

ATTACHMENT 1  
EAL Bases

Escalation of the emergency classification level would be via IC CS1 or RS1.

ATTACHMENT 1  
EAL Bases

**Category H – Hazards and Other Conditions Affecting Plant Safety**

EAL Group: ANY (EALs in this category are applicable to any plant condition, hot or cold.)

Hazards are non-plant, system-related events that can directly or indirectly affect plant operation, reactor plant safety or personnel safety.

1. Security

Unauthorized entry attempts into the PROTECTED AREA, bomb threats, sabotage attempts, and actual security compromises threatening loss of physical control of the plant.

2. Seismic Event

Natural events such as earthquakes have potential to cause plant structure or equipment damage of sufficient magnitude to threaten personnel or plant safety.

3. Natural or Technology Hazard

Other natural and non-naturally occurring events that can cause damage to plant facilities include tornados, FLOODING, hazardous material releases and events restricting site access warranting classification.

4. Fire

Fires can pose significant hazards to personnel and reactor safety. Appropriate for classification are fires within the Plant PROTECTED AREA or which may affect operability of equipment needed for safe shutdown

5. Hazardous Gas

Toxic, corrosive, asphyxiant or flammable gas leaks can affect normal plant operations or preclude access to plant areas required to safely shutdown the plant.

6. Control Room Evacuation

Events that are indicative of loss of Control Room habitability. If the Control Room must be evacuated, additional support for monitoring and controlling plant functions is necessary through the emergency response facilities.

7. Emergency Coordinator Judgment

The EALs defined in other categories specify the predetermined symptoms or events that are indicative of emergency or potential emergency conditions and thus warrant classification. While these EALs have been developed to address the full spectrum of possible emergency conditions which may warrant classification and subsequent implementation of the Emergency Plan, a provision for classification of emergencies based on operator/management experience and judgment is still necessary. The EALs of this category provide the Emergency Coordinator the latitude to classify emergency conditions consistent with the established classification criteria based upon Emergency Coordinator judgment.

ATTACHMENT 1  
EAL Bases

**Category:** H – Hazards  
**Subcategory:** 1 – Security  
**Initiating Condition:** Confirmed SECURITY CONDITION or threat  
**EAL:**

**HU1.1 Unusual Event**

A SECURITY CONDITION that does **not** involve a HOSTILE ACTION as reported by the Security Shift Supervision

**Mode Applicability:**

All

**Definition(s):**

*SECURITY CONDITION* - Any security event as listed in the approved security contingency plan that constitutes a threat/compromise to site security, threat/risk to site personnel, or a potential degradation to the level of safety of the plant. A security condition does not involve a hostile action.

*HOSTILE ACTION* - An act toward ONS or its personnel that includes the use of violent force to destroy equipment, take hostages, and/or intimidate the licensee to achieve an end. This includes attack by air, land, or water using guns, explosives, projectiles, vehicles, or other devices used to deliver destructive force. Other acts that satisfy the overall intent may be included. Hostile action should not be construed to include acts of civil disobedience or felonious acts that are not part of a concerted attack on ONS. Non-terrorism-based EALs should be used to address such activities (i.e., this may include violent acts between individuals in the owner controlled area).

**Basis:**

This EAL is based on the Duke Energy Physical Security Plan for ONS (ref. 1).

This IC addresses events that pose a threat to plant personnel or SAFETY SYSTEM equipment, and thus represent a potential degradation in the level of plant safety. Security events which do not meet one of these EALs are adequately addressed by the requirements of 10 CFR § 73.71 or 10 CFR § 50.72. Security events assessed as HOSTILE ACTIONS are classifiable under ICs HA1, HS1 and HG1.

Timely and accurate communications between Security Shift Supervision and the Control Room is essential for proper classification of a security-related event. Classification of these events will initiate appropriate threat-related notifications to plant personnel and Offsite Response Organizations.

Security plans and terminology are based on the guidance provided by NEI 03-12, *Template for the Security Plan, Training and Qualification Plan, Safeguards Contingency Plan [and Independent Spent Fuel Storage Installation Security Program]*.

This EAL references the Security Shift Supervision because these are the individuals trained to confirm that a security event is occurring or has occurred. Training on security event confirmation and classification is controlled due to the nature of Safeguards and 10 CFR §

ATTACHMENT 1  
EAL Bases

2.39 information.

Emergency plans and implementing procedures are public documents; therefore, EALs should not incorporate Security-sensitive information. This includes information that may be advantageous to a potential adversary, such as the particulars concerning a specific threat or threat location. Security-sensitive information should be contained in non-public documents such as the Duke Energy Physical Security Plan for ONS (ref. 1).

Escalation of the emergency classification level would be via IC HA1.

ATTACHMENT 1  
EAL Bases

**Category:** H – Hazards  
**Subcategory:** 1 – Security  
**Initiating Condition:** Confirmed SECURITY CONDITION or threat

**EAL:**

**HU1.2 Unusual Event**

Notification of a credible security threat directed at the site

**Mode Applicability:**

All

**Definition(s):**

*SECURITY CONDITION* - Any security event as listed in the approved security contingency plan that constitutes a threat/compromise to site security, threat/risk to site personnel, or a potential degradation to the level of safety of the plant. A security condition does not involve a hostile action.

**Basis:**

This EAL is based on the Duke Energy Physical Security Plan for ONS (ref. 1).

This IC addresses events that pose a threat to plant personnel or SAFETY SYSTEM equipment, and thus represent a potential degradation in the level of plant safety. Security events which do not meet one of these EALs are adequately addressed by the requirements of 10 CFR § 73.71 or 10 CFR § 50.72. Security events assessed as HOSTILE ACTIONS are classifiable under ICs HA1, HS1 and HG1.

Timely and accurate communications between Security Shift Supervision and the Control Room is essential for proper classification of a security-related event. Classification of these events will initiate appropriate threat-related notifications to plant personnel and Offsite Response Organizations.

Security plans and terminology are based on the guidance provided by NEI 03-12, *Template for the Security Plan, Training and Qualification Plan, Safeguards Contingency Plan [and Independent Spent Fuel Storage Installation Security Program]*.

This EAL addresses the receipt of a credible security threat. The credibility of the threat is assessed in accordance with the Duke Energy Physical Security Plan for ONS.

Emergency plans and implementing procedures are public documents; therefore, EALs should not incorporate Security-sensitive information. This includes information that may be advantageous to a potential adversary, such as the particulars concerning a specific threat or threat location. Security-sensitive information should be contained in non-public documents such as the Duke Energy Physical Security Plan for ONS (ref. 1).

Escalation of the emergency classification level would be via IC HA1.

**EAL:**

<b>HU1.3 Unusual Event</b>
----------------------------

A validated notification from the NRC providing information of an aircraft threat
---

**Mode Applicability:**

All

**Definition(s):**

*SECURITY CONDITION* - Any security event as listed in the approved security contingency plan that constitutes a threat/compromise to site security, threat/risk to site personnel, or a potential degradation to the level of safety of the plant. A security condition does not involve a hostile action.

**Basis:**

This EAL is based on the Duke Energy Physical Security Plan for ONS (ref. 1).

This IC addresses events that pose a threat to plant personnel or SAFETY SYSTEM equipment, and thus represent a potential degradation in the level of plant safety. Security events which do not meet one of these EALs are adequately addressed by the requirements of 10 CFR § 73.71 or 10 CFR § 50.72. Security events assessed as HOSTILE ACTIONS are classifiable under ICs HA1, HS1 and HG1.

Timely and accurate communications between Security Shift Supervision and the Control Room is essential for proper classification of a security-related event. Classification of these events will initiate appropriate threat-related notifications to plant personnel and Offsite Response Organizations.

Security plans and terminology are based on the guidance provided by NEI 03-12, *Template for the Security Plan, Training and Qualification Plan, Safeguards Contingency Plan [and Independent Spent Fuel Storage Installation Security Program]*.

This EAL addresses the threat from the impact of an aircraft on the plant. The NRC Headquarters Operations Officer (HOO) will communicate to the licensee if the threat involves an aircraft. The status and size of the plane may also be provided by NORAD through the NRC. Validation of the threat is performed in accordance with AP/0/A/1700/045 Site Security Threats (ref. 2).

Emergency plans and implementing procedures are public documents; therefore, EALs should not incorporate Security-sensitive information. This includes information that may be advantageous to a potential adversary, such as the particulars concerning a specific threat or threat location. Security-sensitive information should be contained in non-public documents such as the Duke Energy Physical Security Plan for ONS (ref. 1).

Escalation of the emergency classification level would be via IC HA1.

ATTACHMENT 1  
EAL Bases

**Category:** H – Hazards  
**Subcategory:** 1 – Security  
**Initiating Condition:** HOSTILE ACTION within the OWNER CONTROLLED AREA or airborne attack threat within 30 minutes

**EAL:**

**HA1.1 Alert**

A HOSTILE ACTION is occurring or has occurred within the OWNER CONTROLLED AREA as reported by the Security Shift Supervision

**Mode Applicability:**

All

**Definition(s):**

*HOSTILE ACTION* - An act toward ONS or its personnel that includes the use of violent force to destroy equipment, take hostages, and/or intimidate the licensee to achieve an end. This includes attack by air, land, or water using guns, explosives, projectiles, vehicles, or other devices used to deliver destructive force. Other acts that satisfy the overall intent may be included. Hostile action should not be construed to include acts of civil disobedience or felonious acts that are not part of a concerted attack on ONS. Non-terrorism-based EALs should be used to address such activities (i.e., this may include violent acts between individuals in the owner controlled area).

*OWNER CONTROLLED AREA* - Area outside the PROTECTED AREA fence that immediately surrounds the plant. Access to this area is generally restricted to those entering on official business.

**Basis:**

This IC addresses the occurrence of a HOSTILE ACTION within the OWNER CONTROLLED AREA or notification of an aircraft attack threat. This event will require rapid response and assistance due to the possibility of the attack progressing to the PROTECTED AREA, or the need to prepare the plant and staff for a potential aircraft impact.

Timely and accurate communications between Security Shift Supervision and the Control Room is essential for proper classification of a security-related event.

Security plans and terminology are based on the guidance provided by NEI 03-12, *Template for the Security Plan, Training and Qualification Plan, Safeguards Contingency Plan [and Independent Spent Fuel Storage Installation Security Program]*.

As time and conditions allow, these events require a heightened state of readiness by the plant staff and implementation of onsite protective measures (e.g., evacuation, dispersal or sheltering). The Alert declaration will also heighten the awareness of Offsite Response Organizations (OROs), allowing them to be better prepared should it be necessary to consider further actions.

This IC does not apply to incidents that are accidental events, acts of civil disobedience, or otherwise are not a HOSTILE ACTION perpetrated by a HOSTILE FORCE. Examples include

ATTACHMENT 1  
EAL Bases

the crash of a small aircraft, shots from hunters, physical disputes between employees, etc. Reporting of these types of events is adequately addressed by other EALs, or the requirements of 10 CFR § 73.71 or 10 CFR § 50.72.

This EAL is applicable for any HOSTILE ACTION occurring, or that has occurred, in the OWNER CONTROLLED AREA. This includes any action directed against an ISFSI that is located outside the plant PROTECTED AREA.

Emergency plans and implementing procedures are public documents; therefore, EALs should not incorporate Security-sensitive information. This includes information that may be advantageous to a potential adversary, such as the particulars concerning a specific threat or threat location. Security-sensitive information should be contained in non-public documents such as the Duke Energy Physical Security Plan for ONS (ref. 1).

Escalation of the emergency classification level would be via IC HS1.

**ONS Basis Reference(s):**

**Subcategory:** 1 – Security  
**Initiating Condition:** HOSTILE ACTION within the OWNER CONTROLLED AREA or airborne attack threat within 30 minutes

**EAL:**

**HA1.2 Alert**

A validated notification from NRC of an aircraft attack threat within 30 min. of the site

**Mode Applicability:**

All

**Definition(s):**

*HOSTILE ACTION* - An act toward ONS or its personnel that includes the use of violent force to destroy equipment, take hostages, and/or intimidate the licensee to achieve an end. This includes attack by air, land, or water using guns, explosives, projectiles, vehicles, or other devices used to deliver destructive force. Other acts that satisfy the overall intent may be included. Hostile action should not be construed to include acts of civil disobedience or felonious acts that are not part of a concerted attack on ONS. Non-terrorism-based EALs should be used to address such activities (i.e., this may include violent acts between individuals in the owner controlled area).

**Basis:**

This IC addresses the occurrence of a HOSTILE ACTION within the OWNER CONTROLLED AREA or notification of an aircraft attack threat. This event will require rapid response and assistance due to the possibility of the attack progressing to the PROTECTED AREA, or the need to prepare the plant and staff for a potential aircraft impact.

Timely and accurate communications between Security Shift Supervision and the Control Room is essential for proper classification of a security-related event.

Security plans and terminology are based on the guidance provided by NEI 03-12, *Template for the Security Plan, Training and Qualification Plan, Safeguards Contingency Plan [and Independent Spent Fuel Storage Installation Security Program]*.

As time and conditions allow, these events require a heightened state of readiness by the plant staff and implementation of onsite protective measures (e.g., evacuation, dispersal or sheltering). The Alert declaration will also heighten the awareness of Offsite Response Organizations (OROs), allowing them to be better prepared should it be necessary to consider further actions.

This IC does not apply to incidents that are accidental events, acts of civil disobedience, or otherwise are not a HOSTILE ACTION perpetrated by a HOSTILE FORCE. Examples include the crash of a small aircraft, shots from hunters, physical disputes between employees, etc. Reporting of these types of events is adequately addressed by other EALs, or the requirements of 10 CFR § 73.71 or 10 CFR § 50.72.

ATTACHMENT 1  
EAL Bases

This EAL addresses the threat from the impact of an aircraft on the plant, and the anticipated arrival time is within 30 minutes. The intent of this EAL is to ensure that threat-related notifications are made in a timely manner so that plant personnel and OROs are in a heightened state of readiness. This EAL is met when the threat-related information has been validated in accordance with AP/0/A/1700/045 Site Security Threats (ref. 2).

The NRC Headquarters Operations Officer (HOO) will communicate to the licensee if the threat involves an aircraft. The status and size of the plane may be provided by NORAD through the NRC.

In some cases, it may not be readily apparent if an aircraft impact within the OWNER CONTROLLED AREA was intentional (i.e., a HOSTILE ACTION). It is expected, although not certain, that notification by an appropriate Federal agency to the site would clarify this point. In this case, the appropriate federal agency is intended to be NORAD, FBI, FAA or NRC. The emergency declaration, including one based on other ICs/EALs, should not be unduly delayed while awaiting notification by a Federal agency.

Emergency plans and implementing procedures are public documents; therefore, EALs should not incorporate Security-sensitive information. This includes information that may be advantageous to a potential adversary, such as the particulars concerning a specific threat or threat location. Security-sensitive information should be contained in non-public documents such as the Duke Energy Physical Security Plan for ONS (ref. 1).

Escalation of the emergency classification level would be via IC HS1.

**ONS Basis Reference(s):**

1. Duke Energy Physical Security Plan for ONS
2. AP/0/A/1700/045 Site Security Threats
3. NEI 99-01 HA1

ATTACHMENT 1  
EAL Bases

**Category:** H – Hazards

**Subcategory:** 1 – Security

**Initiating Condition:** HOSTILE ACTION within the PROTECTED AREA

**EAL:**

**HS1.1 Site Area Emergency**

A HOSTILE ACTION is occurring or has occurred within the PROTECTED AREA as reported by the Security Shift Supervision

**Mode Applicability:**

All

**Definition(s):**

*HOSTILE ACTION* - An act toward ONS or its personnel that includes the use of violent force to destroy equipment, take hostages, and/or intimidate the licensee to achieve an end. This includes attack by air, land, or water using guns, explosives, projectiles, vehicles, or other devices used to deliver destructive force. Other acts that satisfy the overall intent may be included. Hostile action should not be construed to include acts of civil disobedience or felonious acts that are not part of a concerted attack on ONS. Non-terrorism-based EALs should be used to address such activities (i.e., this may include violent acts between individuals in the owner controlled area).

*PROTECTED AREA* - That part of the nuclear station property consisting of the Reactor, Auxiliary, Turbine, and Service Building and grounds, contained within the owner controlled security fence.

**Basis:**

The Security Shift Supervision are the designated on-site personnel qualified and trained to confirm that a security event is occurring or has occurred. Training on security event classification confirmation is closely controlled due to the strict secrecy controls placed on the Duke Energy Physical Security Contingency Plan for ONS (Safeguards) information. (ref. 1)

This IC addresses the occurrence of a HOSTILE ACTION within the PROTECTED AREA. This event will require rapid response and assistance due to the possibility for damage to plant equipment.

Timely and accurate communications between Security Shift Supervision and the Control Room is essential for proper classification of a security-related event (ref. 1, 2).

Security plans and terminology are based on the guidance provided by NEI 03-12, *Template for the Security Plan, Training and Qualification Plan, Safeguards Contingency Plan [and Independent Spent Fuel Storage Installation Security Program]*.

As time and conditions allow, these events require a heightened state of readiness by the plant staff and implementation of onsite protective measures (e.g., evacuation, dispersal or sheltering). The Site Area Emergency declaration will mobilize Offsite Response Organization (ORO) resources and have them available to develop and implement public protective actions in the unlikely event that the attack is successful in impairing multiple safety functions.

ATTACHMENT 1  
EAL Bases

This IC does not apply to a HOSTILE ACTION directed at an ISFSI PROTECTED AREA located outside the PROTECTED AREA; such an attack should be assessed using IC HA1. It also does not apply to incidents that are accidental events, acts of civil disobedience, or otherwise are not a HOSTILE ACTION perpetrated by a HOSTILE FORCE. Examples include the crash of a small aircraft, shots from hunters, physical disputes between employees, etc. Reporting of these types of events is adequately addressed by other EALs, or the requirements of 10 CFR § 73.71 or 10 CFR § 50.72.

Emergency plans and implementing procedures are public documents; therefore, EALs should not incorporate Security-sensitive information. This includes information that may be advantageous to a potential adversary, such as the particulars concerning a specific threat or threat location. Security-sensitive information should be contained in non-public documents such as the Duke Energy Physical Security Plan for ONS (ref. 1).

Escalation of the emergency classification level would be via IC HG1.

**ONS Basis Reference(s):**

2. AP/0/A/1700/045 Site Security Threats
3. NEI 99-01 HS1

ATTACHMENT 1  
EAL Bases

**Category:** H – Hazards

**Subcategory:** 1 – Security

**Initiating Condition:** HOSTILE ACTION resulting in loss of physical control of the facility

**EAL:**

**HG1.1 General Emergency**

A HOSTILE ACTION is occurring or has occurred within the PROTECTED AREA as reported by the Security Shift Supervision

**AND EITHER** of the following has occurred:

**Any** of the following safety functions cannot be controlled or maintained

- Reactivity
- Core cooling
- RCS heat removal

**OR**

Damage to spent fuel has occurred or is IMMINENT

**Mode Applicability:**

All

**Definition(s):**

*HOSTILE ACTION* - An act toward ONS or its personnel that includes the use of violent force to destroy equipment, take hostages, and/or intimidate the licensee to achieve an end. This includes attack by air, land, or water using guns, explosives, projectiles, vehicles, or other devices used to deliver destructive force. Other acts that satisfy the overall intent may be included. Hostile action should not be construed to include acts of civil disobedience or felonious acts that are not part of a concerted attack on ONS. Non-terrorism-based EALs should be used to address such activities (i.e., this may include violent acts between individuals in the owner controlled area).

*IMMINENT* - The trajectory of events or conditions is such that an EAL will be met within a relatively short period of time regardless of mitigation or corrective actions

*PROTECTED AREA* - That part of the nuclear station property consisting of the Reactor, Auxiliary, Turbine, and Service Building and grounds, contained within the owner controlled security fence.

**Basis:**

Indications of damaged spent fuel are provided in AP/1,2,3/A/1700/009 Spent Fuel Damage (ref. 4).

This IC addresses an event in which a HOSTILE FORCE has taken physical control of the facility to the extent that the plant staff can no longer operate equipment necessary to maintain key safety functions. It also addresses a HOSTILE ACTION leading to a loss of physical control that results in actual or IMMINENT damage to spent fuel due to 1) damage to a spent

ATTACHMENT 1  
EAL Bases

fuel pool cooling system (e.g., pumps, heat exchangers, controls, etc.) or, 2) loss of spent fuel pool integrity such that sufficient water level cannot be maintained.

Timely and accurate communications between the Security Shift Supervision and the Control Room is essential for proper classification of a security-related event (ref. 2, 3).

Security plans and terminology are based on the guidance provided by NEI 03-12, *Template for the Security Plan, Training and Qualification Plan, Safeguards Contingency Plan [and Independent Spent Fuel Storage Installation Security Program]*.

Emergency plans and implementing procedures are public documents; therefore, EALs should not incorporate Security-sensitive information. This includes information that may be advantageous to a potential adversary, such as the particulars concerning a specific threat or threat location. Security-sensitive information should be contained in non-public documents such as the Duke Energy Physical Security Plan for ONS (ref.1).

5. NEI 99-01 HG1

ATTACHMENT 1  
EAL Bases

**Category:** H – Hazards and Other Conditions Affecting Plant Safety

**Subcategory:** 2 – Seismic Event

**Initiating Condition:** Seismic event greater than OBE levels

**EAL:**

**HU2.1 Unusual Event**

Seismic event > OBE as indicated by **EITHER** of the following:

- 1SA-9/E-1 (SEISMIC TRIGGER) alarm
- 3SA-9/E-1 (SEISMIC TRIGGER) alarm

**Mode Applicability:**

All

**Definition(s):**

None

**Basis:**

This EAL is based on a VALID receipt of either of the specified seismic trigger alarms.

For ONS, the Operating Basis Earthquake (OBE) is equivalent to the Design Basis Earthquake (DBE). The design basis earthquake ground acceleration at the site is 0.05g. The maximum hypothetical earthquake ground acceleration is 0.10g and 0.15g for Class 1 structures founded on bedrock and overburden respectively. For ONS, the Operating Basis Earthquake (OBE) is equivalent to the Design Basis Earthquake (DBE). (ref. 1)

If an earthquake of  $\geq 0.05$  g has occurred on site, all units are required to be shut down to Mode 5 once a plant damage assessment is complete along with the completion of any needed repairs to support the units ability to achieve safe shutdown. (ref. 2)

Earthquake instrumentation is the SMA-3 system consisting of a central recording system, control panel, one TS-3 triaxial seismic trigger package, and two force-balance triaxial accelerometer packages. The seismic trigger and one accelerometer of the SMA-3 system are located in the Unit 1 Tendon Gallery. Also, a second accelerometer is located directly above at elevation 797' +6" in the Oconee 1 Reactor Building. The recorder for the system is located in the Unit 1 Cable Room. Also, a seismic trigger/switch is located in the Unit 1 tendon gallery. The TS-3 has a preset acceleration threshold of 0.05g which activates the statalarm in Units 1 and 3 control rooms, when design conditions occur. (ref. 3)

To avoid inappropriate emergency classification resulting from spurious actuation of the seismic instrumentation or felt motion not attributable to seismic activity, an offsite agency (USGS, National Earthquake Information Center (NEIC)) can confirm that an earthquake has occurred in the area of the plant. Such confirmation should not, however, preclude a timely emergency declaration based on receipt of the OBE alarm. The NEIC can be contacted by calling (303) 273-8500 (ref. 2). Select **option #1** and inform the analyst you wish to confirm recent seismic activity in the vicinity of ONS. If requested, provide the analyst with the

ATTACHMENT 1  
EAL Bases

following ONS coordinates: **34° 47' 38.2" north latitude, 82° 53' 55.4" west longitude** (ref. 4). Alternatively, near real-time seismic activity can be accessed via the NEIC website:

*<http://earthquake.usgs.gov/eqcenter/>*

This IC addresses a seismic event that results in accelerations at the plant site greater than those specified for an Operating Basis Earthquake (OBE). An earthquake greater than an OBE but less than a Safe Shutdown Earthquake (SSE) should have no significant impact on safety-related systems, structures and components; however, some time may be required for the plant staff to ascertain the actual post-event condition of the plant (e.g., performs walk-downs and post-event inspections). Given the time necessary to perform walk-downs and inspections, and fully understand any impacts, this event represents a potential degradation of the level of safety of the plant.

Event verification with external sources should not be necessary during or following an OBE. Earthquakes of this magnitude should be readily felt by on-site personnel and recognized as a seismic event (e.g., lateral accelerations in excess of 0.05g). The Shift Manager or Emergency Coordinator may seek external verification if deemed appropriate (e.g., a call to the USGS, check internet news sources, etc.); however, the verification action must not preclude a timely emergency declaration.

Depending upon the plant mode at the time of the event, escalation of the emergency classification level would be via IC CA6 or SA9.

ATTACHMENT 1  
EAL Bases

**Category:** H – Hazards and Other Conditions Affecting Plant Safety

**Subcategory:** 3 – Natural or Technological Hazard

**Initiating Condition:** Hazardous event

**EAL:**

**HU3.1 Unusual Event**

A tornado strike within the PROTECTED AREA

**Mode Applicability:**

All

**Definition(s):**

*PROTECTED AREA* - That part of the nuclear station property consisting of the Reactor, Auxiliary, Turbine, and Service Building and grounds, contained within the owner controlled security fence.

**Basis:**

Response actions associated with a tornado onsite is provided in AP/0/A/1700/006, Natural Disaster (ref. 1).

If damage is confirmed visually or by other in-plant indications, the event may be escalated to an Alert under EAL CA6.1 or SA9.1.

A tornado striking (touching down) within the PROTECTED AREA warrants declaration of an Unusual Event regardless of the measured wind speed at the meteorological tower. A tornado is defined as a violently rotating column of air in contact with the ground and extending from the base of a thunderstorm.

This IC addresses hazardous events that are considered to represent a potential degradation of the level of safety of the plant.

EAL HU3.1 addresses a tornado striking (touching down) within the PROTECTED AREA.

Escalation of the emergency classification level would be based on ICs in Recognition Categories R, F, S or C.

**ONS Basis Reference(s):**

1. AP/0/A/1700/006 Natural Disaster
2. NEI 99-01 HU3

ATTACHMENT 1  
EAL Bases

**Category:** H – Hazards and Other Conditions Affecting Plant Safety

**Subcategory:** 3 – Natural or Technological Hazard

**Initiating Condition:** Hazardous event

**EAL:**

**HU3.2 Unusual Event**

Internal room or area FLOODING of a magnitude sufficient to require manual or automatic electrical isolation of a SAFETY SYSTEM component needed for the current operating mode

**Mode Applicability:**

All

**Definition(s):**

*FLOODING* - A condition where water is entering a room or area faster than installed equipment is capable of removal, resulting in a rise of water level within the room or area.

*SAFETY SYSTEM* - A system required for safe plant operation, cooling down the plant and/or placing it in the cold shutdown condition, including the ECCS. These are typically systems classified as safety-related (as defined in 10CFR50.2):

Those structures, systems and components that are relied upon to remain functional during and following design basis events to assure:

- (1) The integrity of the reactor coolant pressure boundary;
- (2) The capability to shut down the reactor and *maintain* it in a safe shutdown condition;
- (3) The capability to prevent or mitigate the consequences of accidents which could result in potential offsite exposures.

**Basis:**

Areas susceptible to internal flooding are the Turbine Building and Auxiliary Building (ref.1, 2). Refer to EAL CA6.1 or SA9.1 for internal flooding affecting one or more SAFETY SYSTEM trains.

This IC addresses hazardous events that are considered to represent a potential degradation of the level of safety of the plant.

This EAL addresses FLOODING of a building room or area that results in operators isolating power to a SAFETY SYSTEM component due to water level or other wetting concerns. Classification is also required if the water level or related wetting causes an automatic isolation of a SAFETY SYSTEM component from its power source (e.g., a breaker or relay trip). To warrant classification, operability of the affected component must be required by Technical Specifications for the current operating mode.

Escalation of the emergency classification level would be based on ICs in Recognition Categories R, F, S or C.

**Subcategory:** 3 – Natural or Technological Hazard

**Initiating Condition:** Hazardous event

**EAL:**

**HU3.3 Unusual Event**

Movement of personnel within the PROTECTED AREA is IMPEDED due to an offsite event involving hazardous materials (e.g., an offsite chemical spill or toxic gas release)

**Mode Applicability:**

All

**Definition(s):**

*IMPEDE(D)* - Personnel access to a room or area is hindered to an extent that extraordinary measures are necessary to facilitate entry of personnel into the affected room/area (e.g., requiring use of protective equipment, such as SCBAs, that is not routinely employed).

*PROTECTED AREA* - That part of the nuclear station property consisting of the Reactor, Auxiliary, Turbine, and Service Building and grounds, contained within the owner controlled security fence.

**Basis:**

As used here, the term "offsite" is meant to be areas external to the ONS PROTECTED AREA.

This IC addresses hazardous events that are considered to represent a potential degradation of the level of safety of the plant.

This EAL addresses a hazardous materials event originating at an offsite location and of sufficient magnitude to impede the movement of personnel within the PROTECTED AREA.

Escalation of the emergency classification level would be based on ICs in Recognition Categories R, F, S or C.

**ONS Basis Reference(s):**

1. NEI 99-01 HU3

ATTACHMENT 1  
EAL Bases

**Category:** H – Hazards and Other Conditions Affecting Plant Safety

**Subcategory:** 3 – Natural or Technological Hazard

**Initiating Condition:** Hazardous event

**EAL:**

**HU3.4 Unusual Event**

A hazardous event that results in on-site conditions sufficient to prohibit the plant staff from accessing the site via personal vehicles (Note 7)

Note 7: This EAL does **not** apply to routine traffic impediments such as fog, snow, ice, or vehicle breakdowns or accidents.

**Mode Applicability:**

All

**Definition(s):**

None

**Basis:**

This IC addresses hazardous events that are considered to represent a potential degradation of the level of safety of the plant.

This EAL addresses a hazardous event that causes an on-site impediment to vehicle movement and significant enough to prohibit the plant staff from accessing the site using personal vehicles. Examples of such an event include site FLOODING caused by a hurricane, heavy rains, up-river water releases, dam failure, etc., or an on-site train derailment blocking the access road.

This EAL is not intended apply to routine impediments such as fog, snow, ice, or vehicle breakdowns or accidents, but rather to more significant conditions such as the Hurricane Andrew strike on Turkey Point in 1992, the flooding around the Cooper Station during the Midwest floods of 1993, or the flooding around Ft. Calhoun Station in 2011.

Escalation of the emergency classification level would be based on ICs in Recognition Categories R, F, S or C.

**ONS Basis Reference(s):**

ATTACHMENT 1  
EAL Bases

**Category:** H – Hazards and Other Conditions Affecting Plant Safety

**Subcategory:** 4 – Fire

**Initiating Condition:** FIRE potentially degrading the level of safety of the plant

**EAL:**

**HU4.1 Unusual Event**

A FIRE is **not** extinguished within 15 min. of **any** of the following FIRE detection indications (Note 1):

- Report from the field (i.e., visual observation)
- Receipt of multiple (more than 1) fire alarms or indications
- Field verification of a single fire alarm

**AND**

The FIRE is located within **any** Table H-1 area

Note 1: The Emergency Coordinator should declare the event promptly upon determining that time limit has been exceeded, or will likely be exceeded.

Table H-1 Fire Areas
<ul style="list-style-type: none"><li>• Reactor Building</li><li>• Auxiliary Building</li><li>• Turbine Building</li><li>• Standby Shutdown Facility</li><li>• Intake Structure</li><li>• Electrical Blockhouse</li><li>• Keowee Hydro &amp; associated transformers</li><li>• Transformer Yard</li><li>• Protected Service Water Building</li><li>• Essential Siphon Vacuum Building</li></ul>

**Mode Applicability:**

All

**Definition(s):**

*FIRE* - Combustion characterized by heat and light. Sources of smoke such as slipping drive belts or overheated electrical equipment do not constitute fires. Observation of flame is preferred but is NOT required if large quantities of smoke and heat are observed.

**Basis:**

The 15 minute requirement begins with a credible notification that a fire is occurring, or receipt of multiple valid fire detection system alarms or field validation of a single fire alarm. The alarm is to be validated using available Control Room indications or alarms to prove that it is not spurious, or by reports from the field.

ATTACHMENT 1  
EAL Bases

Table H-1 Fire Areas are those areas that contain equipment necessary for safe operation and shutdown of the plant (ref. 1, 2).

This IC addresses the magnitude and extent of FIRES that may be indicative of a potential degradation of the level of safety of the plant.

For EAL HU4.1 the intent of the 15-minute duration is to size the FIRE and to discriminate against small FIRES that are readily extinguished (e.g., smoldering waste paper basket). In addition to alarms, other indications of a FIRE could be a drop in fire main pressure, automatic activation of a suppression system, etc.

Upon receipt, operators will take prompt actions to confirm the validity of an initial fire alarm, indication, or report. For EAL assessment purposes, the emergency declaration clock starts at the time that the initial alarm, indication, or report was received, and not the time that a subsequent verification action was performed. Similarly, the fire duration clock also starts at the time of receipt of the initial alarm, indication or report.

Depending upon the plant mode at the time of the event, escalation of the emergency classification level would be via IC CA6 or SA9.

**Initiating Condition:** FIRE potentially degrading the level of safety of the plant  
**EAL:**

**HU4.2 Unusual Event**

Receipt of a single fire alarm (i.e., no other indications of a FIRE)

**AND**

The fire alarm is indicating a FIRE within **any** Table H-1 area

**AND**

The existence of a FIRE is **not** verified within 30 min. of alarm receipt (Note 1)

Note 1: The Emergency Coordinator should declare the event promptly upon determining that time limit has been exceeded, or will likely be exceeded.

**Table H-1 Fire Areas**

- Reactor Building
- Auxiliary Building
- Turbine Building
- Standby Shutdown Facility
- Intake Structure
- Electrical Blockhouse
- Keowee Hydro & associated transformers
- Transformer Yard
- Protected Service Water Building
- Essential Siphon Vacuum Building

**Mode Applicability:**

All

**Definition(s):**

*FIRE* - Combustion characterized by heat and light. Sources of smoke such as slipping drive belts or overheated electrical equipment do not constitute fires. Observation of flame is preferred but is NOT required if large quantities of smoke and heat are observed.

**Basis:**

The 30 minute requirement begins upon receipt of a single valid fire detection system alarm. The alarm is to be validated using available Control Room indications or alarms to prove that it is not spurious, or by reports from the field. Actual field reports must be made within the 30 minute time limit or a classification must be made. If a fire is verified to be occurring by field report, classification shall be made based on EAL HU4.1.

ATTACHMENT 1  
EAL Bases

Control Room indications that may be used to validate a single fire alarm include (ref. 3):

- Remote camera system
- CRD service structure air temperature
- PZR tailpipe temperature
- RB dome temperature
- RBCU inlet and outlet temperatures
- RCP parameters
- Status lights of components located inside RB

Table H-1 Fire Areas are those areas that contain equipment necessary for safe operation and shutdown of the plant (ref. 1, 2).

The ONS Fire Protection Program is based on 10 CFR 50.48 (a) and (c) requiring compliance with NFPA 805. The NFPA 805 based Fire Protection Program requirements provide are consistent with the NEI 99-01 basis stated below (ref. 1, 4).

This IC addresses the magnitude and extent of FIRES that may be indicative of a potential degradation of the level of safety of the plant.

This EAL addresses receipt of a single fire alarm, and the existence of a FIRE is not verified (i.e., proved or disproved) within 30-minutes of the alarm. Upon receipt, operators will take prompt actions to confirm the validity of a single fire alarm. For EAL assessment purposes, the 30-minute clock starts at the time that the initial alarm was received, and not the time that a subsequent verification action was performed.

A single fire alarm, absent other indication(s) of a FIRE, may be indicative of equipment failure or a spurious activation, and not an actual FIRE. For this reason, additional time is allowed to verify the validity of the alarm. The 30-minute period is a reasonable amount of time to determine if an actual FIRE exists; however, after that time, and absent information to the contrary, it is assumed that an actual FIRE is in progress.

If an actual FIRE is verified by a report from the field, then HU4.1 is immediately applicable, and the emergency must be declared if the FIRE is not extinguished within 15-minutes of the report. If the alarm is verified to be due to an equipment failure or a spurious activation, and this verification occurs within 30-minutes of the receipt of the alarm, then this EAL is not applicable and no emergency declaration is warranted.

Basis-Related Requirements from Appendix R

Appendix R to 10 CFR 50, states in part:

Criterion 3 of Appendix A to this part specifies that "Structures, systems, and components important to safety shall be designed and located to minimize, consistent with other safety requirements, the probability and effect of fires and explosions."

When considering the effects of fire, those systems associated with achieving and maintaining safe shutdown conditions assume major importance to safety because damage to them can lead to core damage resulting from loss of coolant through boil-off.

Because fire may affect safe shutdown systems and because the loss of function of systems used to mitigate the consequences of design basis accidents under post-fire conditions does not per se impact public safety, the need to limit fire damage to systems required to achieve and maintain safe shutdown conditions is greater than the need to

ATTACHMENT 1  
EAL Bases

limit fire damage to those systems required to mitigate the consequences of design basis accidents.

In addition, Appendix R to 10 CFR 50, requires, among other considerations, the use of 1-hour fire barriers for the enclosure of cable and equipment and associated non-safety circuits of one redundant train (G.2.c). As used in HU4.2, the 30-minutes to verify a single alarm is well within this worst-case 1-hour time period.

Depending upon the plant mode at the time of the event, escalation of the emergency classification level would be via IC CA6 or SA9.

5. NEI 99-01 HU4

ATTACHMENT 1  
EAL Bases

**Category:** H – Hazards and Other Conditions Affecting Plant Safety

**Subcategory:** 4 – Fire

**Initiating Condition:** FIRE potentially degrading the level of safety of the plant

**EAL:**

**HU4.3 Unusual Event**

A FIRE within the PROTECTED AREA not extinguished within 60 min. of the initial report, alarm or indication (Note 1)

Note 1: The Emergency Coordinator should declare the event promptly upon determining that time limit has been exceeded, or will likely be exceeded.

**Mode Applicability:**

All

**Definition(s):**

*FIRE* - Combustion characterized by heat and light. Sources of smoke such as slipping drive belts or overheated electrical equipment do not constitute fires. Observation of flame is preferred but is NOT required if large quantities of smoke and heat are observed.

*PROTECTED AREA* - That part of the nuclear station property consisting of the Reactor, Auxiliary, Turbine, and Service Building and grounds, contained within the owner controlled security fence.

**Basis:**

This IC addresses the magnitude and extent of FIRES that may be indicative of a potential degradation of the level of safety of the plant.

In addition to a FIRE addressed by EAL HU4.1 or HU4.2, a FIRE within the plant PROTECTED AREA not extinguished within 60-minutes may also potentially degrade the level of plant safety.

Depending upon the plant mode at the time of the event, escalation of the emergency classification level would be via IC CA6 or SA9.

**ONS Basis Reference(s):**

1. NEI 99-01 HU4

ATTACHMENT 1  
EAL Bases

**Category:** H – Hazards and Other Conditions Affecting Plant Safety

**Subcategory:** 4 – Fire

**Initiating Condition:** FIRE potentially degrading the level of safety of the plant

**EAL:**

**HU4.4 Unusual Event**

A FIRE within the PROTECTED AREA that requires firefighting support by an offsite fire response agency to extinguish

**Mode Applicability:**

All

**Definition(s):**

*FIRE* - Combustion characterized by heat and light. Sources of smoke such as slipping drive belts or overheated electrical equipment do not constitute fires. Observation of flame is preferred but is NOT required if large quantities of smoke and heat are observed.

*PROTECTED AREA* - That part of the nuclear station property consisting of the Reactor, Auxiliary, Turbine, and Service Building and grounds, contained within the owner controlled security fence.

**Basis:**

This IC addresses the magnitude and extent of FIRES that may be indicative of a potential degradation of the level of safety of the plant.

If a FIRE within the PLANT PROTECTED AREA is of sufficient size to require a response by an offsite firefighting agency (e.g., a local town Fire Department), then the level of plant safety is potentially degraded. The dispatch of an offsite firefighting agency to the site requires an emergency declaration only if it is needed to actively support firefighting efforts because the fire is beyond the capability of the Fire Brigade to extinguish. Declaration is not necessary if the agency resources are placed on stand-by, or supporting post-extinguishment recovery or investigation actions.

Depending upon the plant mode at the time of the event, escalation of the emergency classification level would be via IC CA6 or SA9.

**ONS Basis Reference(s):**

1. NEI 99-01 HU4

ATTACHMENT 1  
EAL Bases

**Category:** H – Hazards and Other Conditions Affecting Plant Safety  
**Subcategory:** 5 – Hazardous Gases  
**Initiating Condition:** Gaseous release IMPEDING access to equipment necessary for normal plant operations, cooldown or shutdown

**EAL:**

<p><b>HA5.1 Alert</b></p> <p>Release of a toxic, corrosive, asphyxiant or flammable gas into <b>any</b> Table H-2 rooms or areas</p> <p align="center"><b>AND</b></p> <p>Entry into the room or area is prohibited or IMPEDED (Note 5).</p>
---

Note 5: If the equipment in the listed room or area was already inoperable or out-of-service before the event occurred, then no emergency classification is warranted.

Table H-2 Safe Operation & Shutdown Rooms/Areas	
Room/Area	Mode Applicability
Turbine Building	1, 2, 3
Equipment and Cable Rooms	1, 2, 3
Auxiliary Building	1, 2, 3, 4, 5
Reactor Buildings	3, 4, 5

**Mode Applicability:**

All

**Definition(s):**

*IMPEDE(D)* - Personnel access to a room or area is hindered to an extent that extraordinary measures are necessary to facilitate entry of personnel into the affected room/area (e.g., requiring use of protective equipment, such as SCBAs, that is not routinely employed).

**Basis:**

If the equipment in the listed room or area was already inoperable, or out-of-service, before the event occurred, then no emergency should be declared since the event will have no adverse impact beyond that already allowed by Technical Specifications at the time of the event.

The list of plant rooms or areas with entry-related mode applicability identified specify those rooms or areas that contain equipment which require a manual/local action as specified in operating procedures used for normal plant operation, cooldown and shutdown. Rooms or areas in which actions of a contingent or emergency nature would be performed (e.g., an action to address an off-normal or emergency condition such as emergency repairs, corrective measures or emergency operations) are not included. In addition, the list specifies the plant mode(s) during which entry would be required for each room or area (ref. 1).

ATTACHMENT 1  
EAL Bases

This IC addresses an event involving a release of a hazardous gas that precludes or impedes access to equipment necessary to maintain normal plant operation, or required for a normal plant cooldown and shutdown. This condition represents an actual or potential substantial degradation of the level of safety of the plant.

An Alert declaration is warranted if entry into the affected room/area is, or may be, procedurally required during the plant operating mode in effect at the time of the gaseous release. The emergency classification is not contingent upon whether entry is actually necessary at the time of the release.

Evaluation of the IC and EAL do not require atmospheric sampling; it only requires the Emergency Coordinator's judgment that the gas concentration in the affected room/area is sufficient to preclude or significantly impede procedurally required access. This judgment may be based on a variety of factors including an existing job hazard analysis, report of ill effects on personnel, advice from a subject matter expert or operating experience with the same or similar hazards. Access should be considered as impeded if extraordinary measures are necessary to facilitate entry of personnel into the affected room/area (e.g., requiring use of protective equipment, such as SCBAs, that is not routinely employed).

An emergency declaration is not warranted if any of the following conditions apply:

- The plant is in an operating mode different than the mode specified for the affected room/area (i.e., entry is not required during the operating mode in effect at the time of the gaseous release). For example, the plant is in Mode 1 when the gaseous release occurs, and the procedures used for normal operation, cooldown and shutdown do not require entry into the affected room until Mode 4.
- The gas release is a planned activity that includes compensatory measures which address the temporary inaccessibility of a room or area (e.g., fire suppression system testing).
- The action for which room/area entry is required is of an administrative or record keeping nature (e.g., normal rounds or routine inspections).
- The access control measures are of a conservative or precautionary nature, and would not actually prevent or impede a required action.
- If the equipment in the listed room or area was already inoperable, or out-of-service, before the event occurred, then no emergency should be declared since the event will have no adverse impact beyond that already allowed by Technical Specifications at the time of the event.

An asphyxiant is a gas capable of reducing the level of oxygen in the body to dangerous levels. Most commonly, asphyxiants work by merely displacing air in an enclosed environment. This reduces the concentration of oxygen below the normal level of around 19%, which can lead to breathing difficulties, unconsciousness or even death.

This EAL does not apply to firefighting activities that automatically or manually activate a fire suppression system in an area..

Escalation of the emergency classification level would be via Recognition Category R, C or F ICs.

ATTACHMENT 1  
EAL Bases

**ONS Basis Reference(s):**

1. Attachment 3 Safe Operation & Shutdown Rooms/Areas Tables R-3 & H-2 Bases
2. NEI 99-01 HA5

ATTACHMENT 1  
EAL Bases

**Category:** H – Hazards and Other Conditions Affecting Plant Safety  
**Subcategory:** 6 – Control Room Evacuation  
**Initiating Condition:** Control Room evacuation resulting in transfer of plant control to alternate locations

**EAL:**

**HA6.1 Alert**

An event has resulted in plant control being transferred from the Control Room to the Auxiliary Shutdown Panel or Standby Shutdown Facility

**Mode Applicability:**

All

**Definition(s):**

None

**Basis:**

The Control Room Supervisor (CRS) determines if the Control Room is uninhabitable and requires evacuation. Control Room inhabitability may be caused by fire, dense smoke, noxious fumes, bomb threat in or adjacent to the Control Room, or other life threatening conditions.

AP/1,2,3/A/1700/008, Loss of Control Room, provides the instructions for tripping the unit, and maintaining RCS inventory and Hot Shutdown conditions from outside the Control Room due to reasons other than fire (ref. 1).

AP/1,2,3/A/1700/050, Challenging Plant Fire, provides the instructions for tripping the unit, and maintaining RCS inventory and Hot Shutdown conditions from outside the Control Room due to a fire (ref. 2).

If normal post-trip conditions cannot be maintained with the Auxiliary Shutdown Panel or there is a challenging fire in an SSF risk area, plant shutdown may be directed from the Standby Shutdown Facility (ref. 3, 4).

Inability to establish plant control from outside the Control Room escalates this event to a Site Area Emergency per EAL HS6.1.

This IC addresses an evacuation of the Control Room that results in transfer of plant control to alternate locations outside the Control Room. The loss of the ability to control the plant from the Control Room is considered to be a potential substantial degradation in the level of plant safety.

Following a Control Room evacuation, control of the plant will be transferred to alternate shutdown locations. The necessity to control a plant shutdown from outside the Control Room, in addition to responding to the event that required the evacuation of the Control Room, will present challenges to plant operators and other on-shift personnel. Activation of the ERO and emergency response facilities will assist in responding to these challenges.

Escalation of the emergency classification level would be via IC HS6.

5. NEI 99-01 HA6

ATTACHMENT 1  
EAL Bases

**Category:** H – Hazards and Other Conditions Affecting Plant Safety  
**Subcategory:** 6 – Control Room Evacuation  
**Initiating Condition:** Inability to control a key safety function from outside the Control Room  
**EAL:**

**HS6.1 Site Area Emergency**

An event has resulted in plant control being transferred from the Control Room to the Auxiliary Shutdown Panel or Standby Shutdown Facility

**AND**

Control of **any** of the following key safety functions is **not** re-established within 15 min.  
(Note 1):

- Reactivity (Modes 1, 2 and 3 **only**)
- Core cooling
- RCS heat removal

Note 1: The Emergency Coordinator should declare the event promptly upon determining that time limit has been exceeded, or will likely be exceeded.

**Mode Applicability:**

1 - Power Operation, 2 - Startup, 3 - Hot Standby, 4 – Hot Shutdown, 5 – Cold Shutdown, 6 - Refuel

**Definition(s):**

None

**Basis:**

The Control Room Supervisor (CRS) determines if the Control Room is uninhabitable and requires evacuation. Control Room inhabitability may be caused by fire, dense smoke, noxious fumes, bomb threat in or adjacent to the Control Room, or other life threatening conditions.

AP/1,2,3/A/1700/008, Loss of Control Room, provides the instructions for tripping the unit, and maintaining RCS inventory and Hot Shutdown conditions from outside the Control Room due to reasons other than fire (ref. 1).

AP/1,2,3/A/1700/050, Challenging Plant Fire, provides the instructions for tripping the unit, and maintaining RCS inventory and Hot Shutdown conditions from outside the Control Room due to a fire (ref. 2).

If normal post-trip conditions cannot be maintained with the Auxiliary Shutdown Panel or there is a challenging fire in an SSF risk area, plant shutdown may be directed from the Standby Shutdown Facility (ref. 3, 4).

The intent of this EAL is to capture events in which control of the plant cannot be reestablished in a timely manner. The fifteen minute time for transfer starts when the Control Room is evacuated (when CRS leaves the Control Room, not when AP/1,2,3/A/1700/008 or AP/1,2,3/A/1700/050 is entered). The time interval is based on how quickly control must be

ATTACHMENT 1  
EAL Bases

reestablished without core uncover and/or core damage. The determination of whether or not control is established from outside the Control Room is based on Emergency Coordinator judgment. The Emergency Coordinator is expected to make a reasonable, informed judgment that control of the plant from outside the Control Room cannot be established within the fifteen minute interval.

Once the Control Room is evacuated, the objective is to establish control of important plant equipment and maintain knowledge of important plant parameters in a timely manner. Primary emphasis should be placed on components and instruments that supply protection for and information about safety functions. Typically, these safety functions are reactivity control (ability to shutdown the reactor and maintain it shutdown), RCS inventory (ability to cool the core), and secondary heat removal (ability to maintain a heat sink).

This IC addresses an evacuation of the Control Room that results in transfer of plant control to alternate locations, and the control of a key safety function cannot be reestablished in a timely manner. The failure to gain control of a key safety function following a transfer of plant control to alternate locations is a precursor to a challenge to one or more fission product barriers within a relatively short period of time.

The determination of whether or not "control" is established at the remote safe shutdown location(s) is based on Emergency Coordinator judgment. The Emergency Coordinator is expected to make a reasonable, informed judgment within 15 minutes whether or not the operating staff has control of key safety functions from the remote safe shutdown location(s).

Escalation of the emergency classification level would be via IC FG1 or CG1

ATTACHMENT 1  
EAL Bases

**Category:** H – Hazards and Other Conditions Affecting Plant Safety  
**Subcategory:** 7 – Emergency Coordinator Judgment  
**Initiating Condition:** Other conditions existing that in the judgment of the Emergency Coordinator warrant declaration of a UE

**EAL:**

**HU7.1 Unusual Event**

Other conditions exist which in the judgment of the Emergency Coordinator indicate that events are in progress or have occurred which indicate a potential degradation of the level of safety of the plant or indicate a security threat to facility protection has been initiated. No releases of radioactive material requiring offsite response or monitoring are expected unless further degradation of SAFETY SYSTEMS occurs.

**Mode Applicability:**

All

**Definition(s):**

*SAFETY SYSTEM* - A system required for safe plant operation, cooling down the plant and/or placing it in the cold shutdown condition, including the ECCS. These are typically systems classified as safety-related (as defined in 10CFR50.2):

Those structures, systems and components that are relied upon to remain functional during and following design basis events to assure:

- (1) The integrity of the reactor coolant pressure boundary;
- (2) The capability to shut down the reactor and maintain it in a safe shutdown condition;
- (3) The capability to prevent or mitigate the consequences of accidents which could result in potential offsite exposures.

**Basis:**

The Emergency Coordinator is the designated onsite individual having the responsibility and authority for implementing the ONS Emergency Plan (ref. 1). The Operations Shift Manager (SM) initially acts in the capacity of the Emergency Coordinator and takes actions as outlined in the Emergency Plan implementing procedures (ref. 2). If required by the emergency classification or if deemed appropriate by the Emergency Coordinator, emergency response personnel are notified and instructed to report to their emergency response locations. In this manner, the individual usually in charge of activities in the Control Room is responsible for initiating the necessary emergency response, but plant management is expected to manage the emergency response as soon as available to do so in anticipation of the possible wide-ranging responsibilities associated with managing a major emergency.

This IC addresses unanticipated conditions not addressed explicitly elsewhere but that warrant declaration of an emergency because conditions exist which are believed by the Emergency Coordinator to fall under the emergency classification level description for an Unusual Event.

**Category:** H – Hazards and Other Conditions Affecting Plant Safety  
**Subcategory:** 7 – Emergency Coordinator Judgment  
**Initiating Condition:** Other conditions exist that in the judgment of the Emergency Coordinator warrant declaration of an Alert

**EAL:**

**HA7.1 Alert**

Other conditions exist which, in the judgment of the Emergency Coordinator, indicate that events are in progress or have occurred which involve an actual or potential substantial degradation of the level of safety of the plant or a security event that involves probable life threatening risk to site personnel or damage to site equipment because of HOSTILE ACTION. Any releases are expected to be limited to small fractions of the EPA Protective Action Guideline exposure levels.

**Mode Applicability:**

All

**Definition(s):**

*HOSTILE ACTION* - An act toward ONS or its personnel that includes the use of violent force to destroy equipment, take hostages, and/or intimidate the licensee to achieve an end. This includes attack by air, land, or water using guns, explosives, projectiles, vehicles, or other devices used to deliver destructive force. Other acts that satisfy the overall intent may be included. Hostile action should not be construed to include acts of civil disobedience or felonious acts that are not part of a concerted attack on ONS. Non-terrorism-based EALs should be used to address such activities (i.e., this may include violent acts between individuals in the owner controlled area).

**Basis:**

The Emergency Coordinator is the designated onsite individual having the responsibility and authority for implementing the ONS Emergency Plan (ref. 1). The Operations Shift Manager (SM) initially acts in the capacity of the Emergency Coordinator and takes actions as outlined in the Emergency Plan implementing procedures (ref. 2). If required by the emergency classification or if deemed appropriate by the Emergency Coordinator, emergency response personnel are notified and instructed to report to their emergency response locations. In this manner, the individual usually in charge of activities in the Control Room is responsible for initiating the necessary emergency response, but Plant Management is expected to manage the emergency response as soon as available to do so in anticipation of the possible wide-ranging responsibilities associated with managing a major emergency.

This IC addresses unanticipated conditions not addressed explicitly elsewhere but that warrant declaration of an emergency because conditions exist which are believed by the Emergency Coordinator to fall under the emergency classification level description for an Alert.

EAL Bases

**Category:** H – Hazards and Other Conditions Affecting Plant Safety  
**Subcategory:** 7 – Emergency Coordinator Judgment  
**Initiating Condition:** Other conditions existing that in the judgment of the Emergency Coordinator warrant declaration of a Site Area Emergency

**EAL:**

**HS7.1 Site Area Emergency**

Other conditions exist which in the judgment of the Emergency Coordinator indicate that events are in progress or have occurred which involve actual or likely major failures of plant functions needed for protection of the public or HOSTILE ACTION that results in intentional damage or malicious acts, (1) toward site personnel or equipment that could lead to the likely failure of or, (2) that prevent effective access to equipment needed for the protection of the public. Any releases are not expected to result in exposure levels which exceed EPA Protective Action Guideline exposure levels beyond the SITE BOUNDARY

**Mode Applicability:**

All

**Definition(s):**

*HOSTILE ACTION* - An act toward ONS or its personnel that includes the use of violent force to destroy equipment, take hostages, and/or intimidate the licensee to achieve an end. This includes attack by air, land, or water using guns, explosives, projectiles, vehicles, or other devices used to deliver destructive force. Other acts that satisfy the overall intent may be included. Hostile action should not be construed to include acts of civil disobedience or felonious acts that are not part of a concerted attack on ONS. Non-terrorism-based EALs should be used to address such activities (i.e., this may include violent acts between individuals in the owner controlled area).

*SITE BOUNDARY* - That area, including the PROTECTED AREA, in which Duke Energy has the authority to control all activities including exclusion or removal of personnel and property (1 mile radius) from the center of Unit 2.

**Basis:**

The Emergency Coordinator is the designated onsite individual having the responsibility and authority for implementing the ONS Emergency Plan (ref. 1). The Operations Shift Manager (SM) initially acts in the capacity of the Emergency Coordinator and takes actions as outlined in the Emergency Plan implementing procedures (ref. 2). If required by the emergency classification or if deemed appropriate by the Emergency Coordinator, emergency response personnel are notified and instructed to report to their emergency response locations. In this manner, the individual usually in charge of activities in the Control Room is responsible for initiating the necessary emergency response, but Plant Management is expected to manage the emergency response as soon as available to do so in anticipation of the possible wide-ranging responsibilities associated with managing a major emergency.

**Subcategory:** 7 – Emergency Coordinator Judgment  
**Initiating Condition:** Other conditions exist which in the judgment of the Emergency Coordinator warrant declaration of a General Emergency

**EAL:**

**HG7.1 General Emergency**

Other conditions exist which in the judgment of the Emergency Coordinator indicate that events are in progress or have occurred which involve actual or IMMEDIATE substantial core degradation or melting with potential for loss of containment integrity or HOSTILE ACTION that results in an actual loss of physical control of the facility. Releases can be reasonably expected to exceed EPA Protective Action Guideline exposure levels offsite for more than the immediate site area.

**Mode Applicability:**

All

**Definition(s):**

*HOSTILE ACTION* - An act toward ONS or its personnel that includes the use of violent force to destroy equipment, take hostages, and/or intimidate the licensee to achieve an end. This includes attack by air, land, or water using guns, explosives, projectiles, vehicles, or other devices used to deliver destructive force. Other acts that satisfy the overall intent may be included. Hostile action should not be construed to include acts of civil disobedience or felonious acts that are not part of a concerted attack on ONS. Non-terrorism-based EALs should be used to address such activities (i.e., this may include violent acts between individuals in the owner controlled area).

*IMMEDIATE* - The trajectory of events or conditions is such that an EAL will be met within a relatively short period of time regardless of mitigation or corrective actions.

**Basis:**

The Emergency Coordinator is the designated onsite individual having the responsibility and authority for implementing the ONS Emergency Plan (ref. 1). The Operations Shift Manager (SM) initially acts in the capacity of the Emergency Coordinator and takes actions as outlined in the Emergency Plan implementing procedures (ref. 2). If required by the emergency classification or if deemed appropriate by the Emergency Coordinator, emergency response personnel are notified and instructed to report to their emergency response locations. In this manner, the individual usually in charge of activities in the Control Room is responsible for initiating the necessary emergency response, but Plant Management is expected to manage the emergency response as soon as available to do so in anticipation of the possible wide-ranging responsibilities associated with managing a major emergency.

Releases can reasonably be expected to exceed EPA PAG plume exposure levels outside the Site Boundary.

ATTACHMENT 1  
EAL Bases

**Category S – System Malfunction**

EAL Group: Hot Conditions (RCS temperature > 210°F); EALs in this category are applicable only in one or more hot operating modes.

Numerous system-related equipment failure events that warrant emergency classification have been identified in this category. They may pose actual or potential threats to plant safety.

The events of this category pertain to the following subcategories:

1. Loss of Essential AC Power

Loss of essential electrical power can compromise plant safety system operability including decay heat removal and emergency core cooling systems which may be necessary to ensure fission product barrier integrity. This category includes loss of onsite and offsite sources for 4160V AC essential buses.

2. Loss of Vital DC Power

Loss of emergency electrical power can compromise plant safety system operability including decay heat removal and emergency core cooling systems which may be necessary to ensure fission product barrier integrity. This category includes loss of vital plant 125V DC power sources.

3. Loss of Control Room Indications

Certain events that degrade plant operator ability to effectively assess plant conditions within the plant warrant emergency classification. Losses of indicators are in this subcategory.

4. RCS Activity

During normal operation, reactor coolant fission product activity is very low. Small concentrations of fission products in the coolant are primarily from the fission of tramp uranium in the fuel clad or minor perforations in the clad itself. Any significant increase from these base-line levels (2% - 5% clad failures) is indicative of fuel failures and is covered under the Fission Product Barrier Degradation category. However, lesser amounts of clad damage may result in coolant activity exceeding Technical Specification limits. These fission products will be circulated with the reactor coolant and can be detected by coolant sampling.

5. RCS Leakage

The reactor vessel provides a volume for the coolant that covers the reactor core. The reactor pressure vessel and associated pressure piping (reactor coolant system) together provide a barrier to limit the release of radioactive material should the reactor fuel clad integrity fail. Excessive RCS leakage greater than Technical Specification limits indicates potential pipe cracks that may propagate to an extent threatening fuel clad, RCS and containment integrity.

6. RPS Failure

This subcategory includes events related to failure of the Reactor Protective System (RPS) to initiate and complete reactor trips. In the plant licensing basis, postulated failures of the RPS to complete a reactor trip comprise a specific set of analyzed events referred to as

ATTACHMENT 1  
EAL Bases

Anticipated Transient Without Scram (ATWS) events. For EAL classification, however, ATWS is intended to mean any trip failure event that does not achieve reactor shutdown. If RPS actuation fails to assure reactor shutdown, positive control of reactivity is at risk and could cause a threat to fuel clad, RCS and containment integrity.

7. Loss of Communications

Certain events that degrade plant operator ability to effectively communicate with essential personnel within or external to the plant warrant emergency classification.

8. Containment Failure

Failure of containment isolation capability (under conditions in which the containment is not currently challenged) warrants emergency classification. Failure of containment pressure control capability also warrants emergency classification.

9. Hazardous Event Affecting Safety Systems

Various natural and technological events that result in degraded plant safety system performance or significant visible damage warrant emergency classification under this subcategory.

ATTACHMENT 1  
EAL Bases

**Category:** S – System Malfunction  
**Subcategory:** 1 – Loss of Essential AC Power  
**Initiating Condition:** Loss of all offsite AC power capability to essential buses for 15 minutes or longer

**EAL:**

**SU1.1 Unusual Event**

Loss of all offsite AC power capability, Table S-1, to essential 4160 V buses MFB-1 and MFB-2 for  $\geq 15$  min. (Note 1)

Note 1: The Emergency Coordinator should declare the event promptly upon determining that time limit has been exceeded, or will likely be exceeded.

<b>Table S-1 AC Power Sources</b>
<p><b>Offsite:</b></p> <ul style="list-style-type: none"><li>• Unit Normal Transformer (backcharged)</li><li>• Unit Startup Transformer (SWYD)</li><li>• Another Unit Startup Transformer (aligned) (SWYD)</li><li>• CT5 (Central/energizing Standby Bus)</li></ul> <p><b>Emergency:</b></p> <ul style="list-style-type: none"><li>• Unit Startup Transformer (Keowee)</li><li>• Another Unit Startup Transformer (aligned) (Keowee)</li><li>• CT4</li><li>• CT5 (dedicated line/energizing Standby Bus)</li></ul>

**Mode Applicability:**

1 - Power Operation, 2 - Startup, 3 - Hot Standby, 4 – Hot Shutdown

**Definition(s):**

None

**Basis:**

The 4160 V AC System provides the power requirements for operation and safe shutdown of the plant. 4160 V buses MFB-1 and MFB-2 are the essential buses (ref. 1).

The condition indicated by this EAL is the degradation of all offsite AC power sources such that only onsite AC power capability exists for 15 minutes or longer.

Each unit is provided with two physically independent circuits from the switching station. One is the circuit from the 230 kV switching station through the startup transformer, which is designed to be available within a few seconds following a loss of coolant accident. The second circuit is the path from the switchyard through the main step-up transformer, the main generator bus and the unit auxiliary transformer with the generator disconnected from the main bus. The second circuit is currently used during refueling as an additional power feed for the shutdown

ATTACHMENT 1  
EAL Bases

unit(s) from the 230 kV switchyard. Whenever there is inadequate power from the generating units, the 230 kV switching station and the hydro units, power is available to the standby power buses either directly from the 100 kV Central Tie Substation or from Lee Steam Station via Transformer CT5. (ref. 2)

Upon loss of power from the Oconee generating unit and 230 kV switchyard, power is supplied from both Keowee Hydro Station units through two separate and independent routes. One route is an underground feeder to Transformer CT4 which supplies the two redundant Main Feeder Buses (MFB-1 and MFB-2). The other route is an overhead feeder to the 230 KV switching station which supplies each unit startup transformer. (ref. 3)

The Standby Shutdown Facility (SSF) consists of standby systems for use in an extreme emergency and is equipped with a manually started diesel generator that can supply power necessary to maintain hot shutdown of the reactors of each unit in the event of loss of power. However, the SSF cannot supply power to the essential buses and therefore not credited in this EAL (ref. 3).

The 15-minute interval was selected as a threshold to exclude transient or momentary power losses.

This IC addresses a prolonged loss of offsite power. The loss of offsite power sources renders the plant more vulnerable to a complete loss of power to AC essential buses. This condition represents a potential reduction in the level of safety of the plant.

For emergency classification purposes, "capability" means that an offsite AC power source(s) is available to the essential buses, whether or not the buses are powered from it.

Escalation of the emergency classification level would be via IC SA1.

- Another Unit Startup Transformer (aligned) (Keowee)
- CT4
- CT5 (dedicated line/energizing Standby Bus)

**Mode Applicability:**

1 - Power Operation, 2 - Startup, 3 - Hot Standby, 4 - Hot Shutdown

**Definition(s):**

**SAFETY SYSTEM** - A system required for safe plant operation, cooling down the plant and/or placing it in the cold shutdown condition, including the ECCS. These are typically systems classified as safety-related (as defined in 10CFR50.2):

Those structures, systems and components that are relied upon to remain functional during and following design basis events to assure:

- (1) The integrity of the reactor coolant pressure boundary;
- (2) The capability to shut down the reactor and maintain it in a safe shutdown condition;

ATTACHMENT 1  
EAL Bases

- (3) The capability to prevent or mitigate the consequences of accidents which could result in potential offsite exposures.

**Basis:**

For emergency classification purposes, "capability" means that an AC power source is available to and capable of powering the emergency bus(es) within 15 min, whether or not the buses are currently powered from it.

The 4160 V AC System provides the power requirements for operation and safe shutdown of the plant. 4160 V buses MFB-1 and MFB-2 are the essential buses (ref. 1).

The condition indicated by this EAL is the degradation of the offsite and onsite power sources such that any additional single failure would result in a loss of all AC power to the essential buses.

Each unit is provided with two physically independent circuits from the switching station. One is the circuit from the 230 kV switching station through the startup transformer, which is designed to be available within a few seconds following a loss of coolant accident. The second circuit is the path from the switchyard through the main step-up transformer, the main generator bus and the unit auxiliary transformer with the generator disconnected from the main bus. The second circuit is currently used during refueling as an additional power feed for the shutdown unit(s) from the 230 kV switchyard. Whenever there is inadequate power from the generating units, the 230 kV switching station and the hydro units, power is available to the standby power buses either directly from the 100 kV Central Tie Substation or from Lee Steam Station via a Transformer CT5. (ref. 2)

Upon loss of power from the Oconee generating unit and 230 kV switchyard, power is supplied from both Keowee Hydro Station units through two separate and independent routes. One route is an underground feeder to Transformer CT4 which supplies the two redundant Main Feeder Buses (MFB-1 and MFB-2). The other route is an overhead feeder to the 230 KV switching station which supplies each unit startup transformer. (ref. 3)

The Standby Shutdown Facility (SSF) consists of standby systems for use in an extreme emergency and is equipped with a manually started diesel generator that can supply power necessary to maintain hot shutdown of the reactors of each unit in the event of loss of power. However, the SSF cannot supply power to the essential buses and therefore not credited in this EAL (ref. 3).

The 15-minute interval was selected as a threshold to exclude transient or momentary power losses. If the capability of a second source of emergency bus power is not restored within 15 minutes, an Alert is declared under this EAL.

This IC describes a significant degradation of offsite and onsite AC power sources such that any additional single failure would result in a loss of all AC power to SAFETY SYSTEMS. In this condition, the sole AC power source may be powering one, or more than one, train of safety-related equipment. This IC provides an escalation path from IC SU1.

An "AC power source" is a source recognized in APs and EOPs, and capable of supplying required power to an essential bus. Some examples of this condition are presented below.

- A loss of all offsite power with a concurrent failure of all but one essential power source (e.g., CT4, CT5, CT1, 2 ,3 (Keowee)).

ATTACHMENT 1  
EAL Bases

- A loss of essential power sources (e.g., CT4, CT5, CT1, CT2, CT3 (Keowee)) with a single train of essential buses being back-fed from an offsite power source.

Escalation of the emergency classification level would be via IC SS1.

ATTACHMENT 1  
EAL Bases

**Category:** S – System Malfunction  
**Subcategory:** 1 – Loss of Essential AC Power  
**Initiating Condition:** Loss of all offsite power and all emergency AC power to essential buses for 15 minutes or longer

**EAL:**

**SS1.1 Site Area Emergency**

Loss of all offsite and all emergency AC power capability to essential 4160 V buses MFB-1 and MFB-2 for  $\geq 15$  min. (Note 1)

Note 1: The Emergency Coordinator should declare the event promptly upon determining that time limit has been exceeded, or will likely be exceeded.

**Mode Applicability:**

1 - Power Operation, 2 - Startup, 3 - Hot Standby, 4 - Hot Shutdown

**Definition(s):**

None

**Basis:**

For emergency classification purposes, "capability" means that an AC power source is available to and capable of powering the emergency bus(es) within 15 minutes, whether or not the buses are currently powered from it.

The condition indicated by this EAL is the degradation of the offsite and emergency power sources resulting in a loss of all AC power to the emergency buses. 4160 V buses MFB-1 and MFB-2 are the essential buses (ref. 1).

Each unit is provided with two physically independent circuits from the switching station. One is the circuit from the 230 kV switching station through the startup transformer, which is designed to be available within a few seconds following a loss of coolant accident. The second circuit is the path from the switchyard through the main step-up transformer, the main generator bus and the unit auxiliary transformer with the generator disconnected from the main bus. The second circuit is currently used during refueling as an additional power feed for the shutdown unit(s) from the 230 kV switchyard. Whenever there is inadequate power from the generating units, the 230 kV switching station and the hydro units, power is available to the standby power buses either directly from the 100 kV Central Tie Substation or from Lee Steam Station via a Transformer CT5. (ref. 2)

Upon loss of power from the Oconee generating unit and 230 kV switchyard, power is supplied from both Keowee Hydro Station units through two separate and independent routes. One route is an underground feeder to Transformer CT4 which supplies the two redundant Main Feeder Buses (MFB-1 and MFB-2). The other route is an overhead feeder to the 230 KV switching station which supplies each unit startup transformer. (ref. 3)

The Standby Shutdown Facility (SSF) consists of standby systems for use in an extreme emergency and is equipped with a manually started diesel generator that can supply power necessary to maintain hot shutdown of the reactors of each unit in the event of loss of power.

ATTACHMENT 1  
EAL Bases

However, the SSF cannot supply power to the essential buses and therefore not credited in this EAL. (ref. 3).

The 15-minute interval was selected as a threshold to exclude transient or momentary power losses. The interval begins when both offsite and onsite AC power capability are lost.

This IC addresses a total loss of AC power that compromises the performance of all SAFETY SYSTEMS requiring electric power including those necessary for emergency core cooling, containment heat removal/pressure control, spent fuel heat removal and the ultimate heat sink. In addition, fission product barrier monitoring capabilities may be degraded under these conditions. This IC represents a condition that involves actual or likely major failures of plant functions needed for the protection of the public.

Escalation of the emergency classification level would be via ICs RG1, FG1 or SG1.

**EAL:**

**SG1.1 General Emergency**

Loss of **all** offsite and **all** emergency AC power capability to essential 4160 V buses MFB-1 and MFB-2

**AND**

Failure to power SSF equipment and PSW unavailable

**AND EITHER:**

- Restoration of at least one essential bus in < 4 hour is **not** likely (Note 1)
- CETC reading > 1200°F

Note 1: The Emergency Coordinator should declare the event promptly upon determining that time limit has been exceeded, or will likely be exceeded.

**Mode Applicability:**

1 - Power Operation, 2 - Startup, 3 - Hot Standby, 4 - Hot Shutdown

**Definition(s):**

None

**Basis:**

For emergency classification purposes, "capability" means that an AC power source is available to and capable of powering the essential bus(es), whether or not the buses are currently powered from it. 4160 V buses MFB-1 and MFB-2 are the essential buses (ref. 1).

Each unit is provided with two physically independent circuits from the switching station. One is the circuit from the 230 kV switching station through the startup transformer, which is designed to be available within a few seconds following a loss of coolant accident. The second circuit is the path from the switchyard through the main step-up transformer, the main generator bus and the unit auxiliary transformer with the generator disconnected from the main bus. The second circuit is currently used during refueling as an additional power feed for the shutdown unit(s) from the 230 kV switchyard. Whenever there is inadequate power from the generating units, the 230 kV switching station and the hydro units, power is available to the standby power buses either directly from the 100 kV Central Tie Substation or from Lee Steam Station via Transformer CT5. (ref. 2)

Upon loss of power from the Oconee generating unit and 230 kV switchyard, power is supplied from both Keowee Hydro Station units through two separate and independent routes. One route is an underground feeder to Transformer CT4 which supplies the two redundant Main

ATTACHMENT 1  
EAL Bases

Feeder Buses (MFB-1 and MFB-2). The other route is an overhead feeder to the 230 KV switching station which supplies each unit startup transformer. (ref. 3)

The Standby Shutdown Facility (SSF) consists of standby systems for use in an extreme emergency and is equipped with a manually started diesel generator and Protected Service Water (PSW) power supply that can supply power necessary to maintain hot shutdown of the reactors of each unit in the event of loss of power. Although the SSF requires manual initiation, it is considered in this EAL because it may be capable of powering the SSF load center (ref. 3, 4).

The station blackout coping period is four hours (ref. 5).

Core Exit Thermocouple readings of 1200°F are indicative of superheat conditions and inability to adequately remove heat from the core (ref. 6).

This IC addresses a prolonged loss of all power sources to AC essential buses. A loss of all AC power compromises the performance of all SAFETY SYSTEMS requiring electric power including those necessary for emergency core cooling, containment heat removal/pressure control, spent fuel heat removal and the ultimate heat sink. A prolonged loss of these buses will lead to a loss of one or more fission product barriers. In addition, fission product barrier monitoring capabilities may be degraded under these conditions.

The EAL should require declaration of a General Emergency prior to meeting the thresholds for IC FG1. This will allow additional time for implementation of offsite protective actions.

Escalation of the emergency classification from Site Area Emergency will occur if it is projected that power cannot be restored to at least one AC essential bus by the end of the analyzed station blackout coping period. Beyond this time, plant responses and event trajectory are subject to greater uncertainty, and there is an increased likelihood of challenges to multiple fission product barriers.

The estimate for restoring at least one essential bus should be based on a realistic appraisal of the situation. Mitigation actions with a low probability of success should not be used as a basis for delaying a classification upgrade. The goal is to maximize the time available to prepare for, and implement, protective actions for the public.

The EAL will also require a General Emergency declaration if the loss of AC power results in parameters that indicate an inability to adequately remove decay heat from the core.

ATTACHMENT 1  
EAL Bases

**Category:** S –System Malfunction  
**Subcategory:** 1 – Loss of Essential AC Power  
**Initiating Condition:** Loss of all essential AC and vital DC power sources for 15 minutes or longer

**EAL:**

**SG1.2 General Emergency**

Loss of all offsite and all emergency AC power capability to essential 4160 V buses MFB-1 and MFB-2 for  $\geq 15$  min.

**AND**

Failure to power SSF equipment and PSW unavailable

**AND**

Loss of 125 VDC power based on battery bus voltage indications  $< 105$  VDC on both vital DC Distribution Centers DCA and DCB for  $\geq 15$  min. (Note 1)

Note 1: The Emergency Coordinator should declare the event promptly upon determining that time limit has been exceeded, or will likely be exceeded.

**Mode Applicability:**

1 - Power Operation, 2 - Startup, 3 - Hot Standby, 4 - Hot Shutdown

**Definition(s):**

None

**Basis:**

This EAL is indicated by the loss of all offsite and emergency AC power capability to 4160 V essential buses MFB-1 and MFB-2 for greater than 15 minutes in combination with degraded vital DC power voltage. This EAL addresses operating experience from the March 2011 accident at Fukushima Daiichi.

For emergency classification purposes, "capability" means that an AC power source is available to and capable of powering the emergency bus(es) within 15 minutes, whether or not the buses are currently powered from it.

Each unit is provided with two physically independent circuits from the switching station. One is the circuit from the 230 kV switching station through the startup transformer, which is designed to be available within a few seconds following a loss of coolant accident. The second circuit is the path from the switchyard through the main step-up transformer, the main generator bus and the unit auxiliary transformer with the generator disconnected from the main bus. The second circuit is currently used during refueling as an additional power feed for the shutdown unit(s) from the 230 kV switchyard. Whenever there is inadequate power from the generating units, the 230 kV switching station and the hydro units, power is available to the standby power buses either directly from the 100 kV Central Tie Substation or from Lee Steam Station via Transformer CT5. (ref. 2)

ATTACHMENT 1  
EAL Bases

Upon loss of power from the Oconee generating unit and 230 kV switchyard, power is supplied from both Keowee Hydro Station units through two separate and independent routes. One route is an underground feeder to Transformer CT4 which supplies the two redundant Main Feeder Buses (MFB-1 and MFB-2). The other route is an overhead feeder to the 230 KV switching station which supplies each unit startup transformer. (ref. 3)

The Standby Shutdown Facility (SSF) consists of standby systems for use in an extreme emergency and is equipped with a manually started diesel generator and Protected Service Water (PSW) power supply that can supply power necessary to maintain hot shutdown of the reactors of each unit in the event of loss of power. Although the SSF requires manual initiation, it is considered in this EAL because it may be capable of powering the SSF load center (ref. 3).

For each unit, two independent and physically separated 125 volt DC batteries and DC buses are provided for the vital instrumentation and control power system. (ref. 4, 5). Minimum DC bus voltage is 105 VDC (ref. 6).

This IC addresses a concurrent and prolonged loss of both emergency AC and Vital DC power. A loss of all emergency AC power compromises the performance of all SAFETY SYSTEMS requiring electric power including those necessary for emergency core cooling, containment heat removal/pressure control, spent fuel heat removal and the ultimate heat sink. A loss of vital DC power compromises the ability to monitor and control SAFETY SYSTEMS. A sustained loss of both emergency AC and vital DC power will lead to multiple challenges to fission product barriers.

Fifteen minutes was selected as a threshold to exclude transient or momentary power losses. The 15-minute emergency declaration clock begins at the point when both EAL thresholds are met.

EAL Bases

**Category:** S – System Malfunction  
**Subcategory:** 3 – Loss of Control Room Indications  
**Initiating Condition:** UNPLANNED loss of Control Room indications for 15 minutes or longer

**EAL:**

**SU3.1 Unusual Event**

An UNPLANNED event results in the inability to monitor one or more Table S-2 parameters from within the Control Room for  $\geq 15$  min. (Note 1)

Note 1: The Emergency Coordinator should declare the event promptly upon determining that time limit has been exceeded, or will likely be exceeded.

**Table S-2 Safety System Parameters**

- Reactor power
- RCS level
- RCS pressure
- CETC temperature
- Level in at least one S/G
- EFW flow to at least one S/G

**Mode Applicability:**

1 - Power Operation, 2 - Startup, 3 - Hot Standby, 4 - Hot Shutdown

**Definition(s):**

*UNPLANNED* - A parameter change or an event that is not 1) the result of an intended evolution or 2) an expected plant response to a transient. The cause of the parameter change or event may be known or unknown.

**Basis:**

SAFETY SYSTEM parameters listed in Table S-2 are monitored in the Control Room through a combination of hard control panel indicators as well as computer based information systems. The SPDS serves as a redundant compensatory indicator which may be utilized in lieu of normal Control Room indicators (ref. 1).

This IC addresses the difficulty associated with monitoring normal plant conditions without the ability to obtain SAFETY SYSTEM parameters from within the Control Room. This condition is a precursor to a more significant event and represents a potential degradation in the level of safety of the plant.

As used in this EAL, an "inability to monitor" means that values for one or more of the listed parameters cannot be determined from within the Control Room. This situation would require a loss of all of the Control Room sources for the given parameter(s). For example, the reactor power level cannot be determined from any analog, digital and recorder source within the Control Room.

ATTACHMENT 1  
EAL Bases

An event involving a loss of plant indications, annunciators and/or display systems is evaluated in accordance with 10 CFR 50.72 (and associated guidance in NUREG-1022) to determine if an NRC event report is required. The event would be reported if it significantly impaired the capability to perform emergency assessments. In particular, emergency assessments necessary to implement abnormal operating procedures, emergency operating procedures, and emergency plan implementing procedures addressing emergency classification, accident assessment, or protective action decision-making.

This EAL is focused on a selected subset of plant parameters associated with the key safety functions of reactivity control, core cooling and RCS heat removal. The loss of the ability to determine one or more of these parameters from within the Control Room is considered to be more significant than simply a reportable condition. In addition, if all indication sources for one or more of the listed parameters are lost, then the ability to determine the values of other SAFETY SYSTEM parameters may be impacted as well. For example, if the value for reactor vessel level cannot be determined from the indications and recorders on a main control board, the SPDS or the plant computer, the availability of other parameter values may be compromised as well.

Fifteen minutes was selected as a threshold to exclude transient or momentary losses of indication.

Escalation of the emergency classification level would be via IC SA3.

- RCS level
- RCS pressure
- CETC temperature
- Level in at least one S/G
- EFW flow to at least one S/G

**Table S-3 Significant Transients**

- Reactor trip
- Runback > 25% thermal power
- Electrical load rejection > 25% electrical load
- ECCS actuation

**Mode Applicability:**

1 - Power Operation, 2 - Startup, 3 - Hot Standby, 4 - Hot Shutdown

**Definition(s):**

**UNPLANNED** - A parameter change or an event that is not 1) the result of an intended evolution or 2) an expected plant response to a transient. The cause of the parameter change or event may be known or unknown.

ATTACHMENT 1  
EAL Bases

**Basis:**

SAFETY SYSTEM parameters listed in Table S-2 are monitored in the Control Room through a combination of hard control panel indicators as well as computer based information systems. The SPDS serves as a redundant compensatory indicator which may be utilized in lieu of normal Control Room indicators (ref. 1).

Significant transients are listed in Table S-3 and include response to automatic or manually initiated functions such as reactor trips, runbacks involving greater than 25% thermal power change, electrical load rejections of greater than 25% full electrical load, reactor power cutbacks or ECCS (SI) injection actuations.

This IC addresses the difficulty associated with monitoring rapidly changing plant conditions during a transient without the ability to obtain SAFETY SYSTEM parameters from within the Control Room. During this condition, the margin to a potential fission product barrier challenge is reduced. It thus represents a potential substantial degradation in the level of safety of the plant.

As used in this EAL, an "inability to monitor" means that values for one or more of the listed parameters cannot be determined from within the Control Room. This situation would require a loss of all of the Control Room sources for the given parameter(s). For example, the reactor power level cannot be determined from any analog, digital and recorder source within the Control Room.

An event involving a loss of plant indications, annunciators and/or display systems is evaluated in accordance with 10 CFR 50.72 (and associated guidance in NUREG-1022) to determine if an NRC event report is required. The event would be reported if it significantly impaired the capability to perform emergency assessments. In particular, emergency assessments necessary to implement abnormal operating procedures, emergency operating procedures, and emergency plan implementing procedures addressing emergency classification, accident assessment, or protective action decision-making.

This EAL is focused on a selected subset of plant parameters associated with the key safety functions of reactivity control, core cooling and RCS heat removal. The loss of the ability to determine one or more of these parameters from within the Control Room is considered to be more significant than simply a reportable condition. In addition, if all indication sources for one or more of the listed parameters are lost, then the ability to determine the values of other SAFETY SYSTEM parameters may be impacted as well. For example, if the value for reactor vessel level cannot be determined from the indications and recorders on a main control board, the SPDS or the plant computer, the availability of other parameter values may be compromised as well.

Fifteen minutes was selected as a threshold to exclude transient or momentary losses of indication.

Escalation of the emergency classification level would be via ICs FS1 or IC RS1

ATTACHMENT 1  
EAL Bases

**Category:** S – System Malfunction  
**Subcategory:** 4 – RCS Activity  
**Initiating Condition:** Reactor coolant activity greater than Technical Specification allowable limits

**EAL:**

**SU4.1 Unusual Event**

RCS activity > 50  $\mu\text{Ci/gm}$  Dose Equivalent I-131 for > 48 hr continuous period

**OR**

RCS activity > 280  $\mu\text{Ci/gm}$  Dose Equivalent Xe-133 for > 48 hr continuous period

**Mode Applicability:**

1 - Power Operation, 2 - Startup, 3 - Hot Standby, 4 - Hot Shutdown

**Definition(s):**

None

**Basis:**

The specific iodine activity is limited to  $\leq 50 \mu\text{Ci/gm}$  Dose Equivalent I-131 for > 48 hr continuous period. The specific Xe-133 activity is limited to  $\leq 280 \mu\text{Ci/gm}$  Dose Equivalent Xe-133 for > 48 hr continuous period. Entry into Condition C of LCO 3.4.11 meets the intent of this EAL (ref 1).

This IC addresses a reactor coolant activity value that exceeds an allowable limit specified in Technical Specifications. This condition is a precursor to a more significant event and represents a potential degradation of the level of safety of the plant.

Escalation of the emergency classification level would be via ICs FA1 or the Recognition Category R ICs.

(Note 1)</p>
---

Note 1: The Emergency Coordinator should declare the event promptly upon determining that time limit has been exceeded, or will likely be exceeded.

**Mode Applicability:**

1 - Power Operation, 2 - Startup, 3 - Hot Standby, 4 - Hot Shutdown

**Definition(s):**

None

**Basis:**

Manual or computer-based methods of performing an RCS inventory balance are normally used to determine RCS leakage (ref. 1).

Identified leakage includes (ref. 2):

- Leakage such as that from pump seals or valve packing (except reactor coolant pump (RCP) seal water injection or leakoff), that is captured and conducted to collection systems or a sump or collecting tank, or
- Leakage into the containment atmosphere from sources that are both specifically located and known either not to interfere with the operation of leakage detection systems or not to be pressure boundary leakage, or
- RCS leakage through a steam generator to the secondary system.

Unidentified leakage is all leakage (except RCP seal water injection or leakoff) that is not identified leakage (ref. 2).

Pressure Boundary leakage is leakage (except SG leakage) through a nonisolable fault in an RCS component body, pipe wall, or vessel wall (ref. 2).

Reactor coolant leakage outside of the containment that is not considered identified or unidentified leakage per Technical Specifications includes leakage via interfacing systems.

Escalation of this EAL to the Alert level is via Category F, Fission Product Barrier Degradation, EAL FA1.1.

[Document No.]	Rev. 0	Page 164 of 240
----------------	--------	-----------------

ATTACHMENT 1  
EAL Bases

This IC addresses RCS leakage which may be a precursor to a more significant event. In this case, RCS leakage has been detected and operators, following applicable procedures, have been unable to promptly isolate the leak. This condition is considered to be a potential degradation of the level of safety of the plant.

The first and second EAL conditions are focused on a loss of mass from the RCS due to "unidentified leakage", "pressure boundary leakage" or "identified leakage" (as these leakage types are defined in the plant Technical Specifications). The third condition addresses an RCS mass loss caused by an UNISOLABLE leak through an interfacing system. These conditions thus apply to leakage into the containment, a secondary-side system (e.g., steam generator tube leakage) or a location outside of containment.

The leak rate values for each condition were selected because they are usually observable with normal Control Room indications. Lesser values typically require time-consuming calculations to determine (e.g., a mass balance calculation). The first condition uses a lower value that reflects the greater significance of unidentified or pressure boundary leakage.

The release of mass from the RCS due to the as-designed/expected operation of a relief valve does not warrant an emergency classification. An emergency classification would be required if a mass loss is caused by a relief valve that is not functioning as designed/expected (e.g., a relief valve sticks open and the line flow cannot be isolated).

The 15-minute threshold duration allows sufficient time for prompt operator actions to isolate the leakage, if possible.

Escalation of the emergency classification level would be via ICs of Recognition Category R or F.

ATTACHMENT 1  
EAL Bases

**Category:** S – System Malfunction  
**Subcategory:** 6 – RPS Failure  
**Initiating Condition:** Automatic or manual trip fails to shut down the reactor

**EAL:**

**SU6.1 Unusual Event**

An automatic trip did **not** shut down the reactor as indicated by reactor power  $\geq 5\%$  after any RPS setpoint is exceeded

**AND**

A subsequent automatic trip or the manual trip pushbutton is successful in shutting down the reactor as indicated by reactor power  $< 5\%$  (Note 8)

Note 8: A manual trip action is **any** operator action, or set of actions, which causes the control rods to be rapidly inserted into the core, and does **not** include manually driving in control rods or implementation of boron injection strategies.

**Mode Applicability:**

1 - Power Operation

**Definition(s):**

None

**Basis:**

The first condition of this EAL identifies the need to cease critical reactor operations by actuation of the automatic Reactor Protective System (RPS) trip function. A reactor trip is automatically initiated by the RPS when certain continuously monitored parameters exceed predetermined setpoints (ref. 1).

Following a successful reactor trip, rapid insertion of the control rods occurs. Nuclear power promptly drops to a fraction of the original power level and then decays to a level several decades less with a negative startup rate. The reactor power drop continues until reactor power reaches the point at which the influence of source neutrons on reactor power starts to be observable. A predictable post-trip response from an automatic reactor trip signal should therefore consist of a prompt drop in reactor power as sensed by the nuclear instrumentation and a lowering of power into the source range. For the purpose of emergency classification a successful trip has occurred when there is sufficient rod insertion from the trip of RPS to bring the reactor power below the Power Operation Mode threshold of 5% (ref. 2).

5% rated power is the Power Operation mode threshold. Below 5%, plant response will be similar to that observed during a normal shutdown. Nuclear instrumentation can be used to determine if reactor power is greater than or equal to 5 % power (ref. 1, 2).

For the purposes of emergency classification, a successful manual trip action is that which can be quickly performed from the reactor control console (actuation of the manual trip pushbutton). There is a separate set of switch contacts in series with the output of each reactor trip component. All switch contacts are actuated through a mechanical linkage from a single pushbutton. Reactor shutdown achieved by use of other trip actions such as opening supply

ATTACHMENT 1  
EAL Bases

breakers, emergency boration, or manually driving control rods) do not constitute a successful manual trip (ref. 3).

Following any automatic RPS trip signal, insertion of redundant manual trip signals are performed to back up the automatic RPS trip function and ensure reactor shutdown is achieved. Even if the first subsequent manual trip signal inserts all control rods to the full-in position immediately after the initial failure of the automatic trip, the lowest level of classification that must be declared is an Unusual Event.

In the event that the operator identifies a reactor trip is imminent and initiates a successful manual reactor trip before the automatic RPS trip setpoint is reached, no declaration is required. The successful manual trip of the reactor before it reaches its automatic trip setpoint or reactor trip signals caused by instrumentation channel failures do not lead to a potential fission product barrier loss. However, if subsequent manual reactor trip actions fail to reduce reactor power below 5%, the event escalates to the Alert under EAL SA6.1.

If by procedure, operator actions include the initiation of an immediate manual trip following receipt of an automatic trip signal and there are no clear indications that the automatic trip failed (such as a time delay following indications that a trip setpoint was exceeded), it may be difficult to determine if the reactor was shut down because of automatic trip or manual actions. If a subsequent review of the trip actuation indications reveals that the automatic trip did not cause the reactor to be shut down, consideration should be given to evaluating the fuel for potential damage, and the reporting requirements of 10CFR50.72 should be considered for the transient event.

This IC addresses a failure of the RPS to initiate or complete an automatic or manual reactor trip that results in a reactor shutdown, and either a subsequent operator manual action taken at the reactor control consoles or an automatic trip is successful in shutting down the reactor. This event is a precursor to a more significant condition and thus represents a potential degradation of the level of safety of the plant.

Following the failure on an automatic reactor trip, operators will promptly initiate manual actions at the reactor control consoles to shutdown the reactor (e.g., initiate a manual reactor trip). If these manual actions are successful in shutting down the reactor, core heat generation will quickly fall to a level within the capabilities of the plant's decay heat removal systems.

If an initial manual reactor trip is unsuccessful, operators will promptly take manual action at another location(s) on the reactor control consoles to shutdown the reactor (e.g., initiate a manual reactor trip) using a different switch). Depending upon several factors, the initial or subsequent effort to manually trip the reactor, or a concurrent plant condition, may lead to the generation of an automatic reactor trip signal. If a subsequent manual or automatic trip is successful in shutting down the reactor, core heat generation will quickly fall to a level within the capabilities of the plant's decay heat removal systems.

A manual action at the reactor control consoles is any operator action, or set of actions, which causes the control rods to be rapidly inserted into the core (e.g., initiating a manual reactor trip). This action does not include manually driving in control rods or implementation of boron injection strategies. Actions taken at back-panels or other locations within the Control Room, or any location outside the Control Room, are not considered to be "at the reactor control consoles".

ATTACHMENT 1  
EAL Bases

The plant response to the failure of an automatic or manual reactor trip will vary based upon several factors including the reactor power level prior to the event, availability of the condenser, performance of mitigation equipment and actions, other concurrent plant conditions, etc. If subsequent operator manual actions taken at the reactor control consoles are also unsuccessful in shutting down the reactor, then the emergency classification level will escalate to an Alert via IC SA6. Depending upon the plant response, escalation is also possible via IC FA1. Absent the plant conditions needed to meet either IC SA6 or FA1, an Unusual Event declaration is appropriate for this event.

Should a reactor trip signal be generated as a result of plant work (e.g., RPS setpoint testing), the following classification guidance should be applied.

- If the signal causes a plant transient that should have included an automatic reactor trip and the RPS fails to automatically shutdown the reactor, then this IC and the EALs are applicable, and should be evaluated.
- If the signal does not cause a plant transient and the trip failure is determined through other means (e.g., assessment of test results), then this IC and the EALs are not applicable and no classification is warranted.

**Category:** S – System Malfunction  
**Subcategory:** 6 – RPS Failure  
**Initiating Condition:** Automatic or manual trip fails to shut down the reactor

**EAL:**

**SU6.2 Unusual Event**

A manual trip did **not** shut down the reactor as indicated by reactor power  $\geq 5\%$  after **any** manual trip action was initiated

**AND**

A subsequent automatic trip or the manual trip pushbutton is successful in shutting down the reactor as indicated by reactor power  $< 5\%$  (Note 8)

Note 8: A manual trip action is **any** operator action, or set of actions, which causes the control rods to be rapidly inserted into the core, and does **not** include manually driving-in control rods or implementation of boron injection strategies.

**Mode Applicability:**

1 - Power Operation

**Definition(s):**

None

**Basis:**

This EAL addresses a failure of a manually initiated trip in the absence of having exceeded an automatic RPS trip setpoint and a subsequent automatic or manual trip is successful in shutting down the reactor (ref. 1).

Following a successful reactor trip, rapid insertion of the control rods occurs. Nuclear power promptly drops to a fraction of the original power level and then decays to a level several decades less with a negative startup rate. The reactor power drop continues until reactor power reaches the point at which the influence of source neutrons on reactor power starts to be observable. A predictable post-trip response from an automatic reactor trip signal should therefore consist of a prompt drop in reactor power as sensed by the nuclear instrumentation and a lowering of power into the source range. For the purpose of emergency classification a successful trip has occurred when there is sufficient rod insertion from the manual trip to bring the reactor power below the Power Operation Mode threshold level of 5% (ref. 2).

5% rated power is the Power Operation mode threshold. Below 5%, plant response will be similar to that observed during a normal shutdown. Nuclear instrumentation can be used to determine if reactor power is greater than or equal to 5% power (ref. 1, 2).

For the purposes of emergency classification, a successful manual trip action is that which can be quickly performed from the reactor control console (actuation of the manual trip pushbutton). There is a separate set of switch contacts in series with the output of each reactor trip component. All switch contacts are actuated through a mechanical linkage from a single pushbutton. Reactor shutdown achieved by use of other trip actions such as opening supply

ATTACHMENT 1  
EAL Bases

breakers, emergency boration, or manually driving control rods) do not constitute a successful manual trip (ref. 3).

Following any automatic RPS trip signal, insertion of redundant manual trip signals are performed to back up the automatic RPS trip function and ensure reactor shutdown is achieved. Even if a subsequent automatic trip signal or the first subsequent manual trip signal inserts all control rods to the full-in position immediately after the initial failure of the manual trip, the lowest level of classification that must be declared is an Unusual Event.

If both subsequent automatic and subsequent manual reactor trip actions in the Control Room fail to reduce reactor power < 5% following a failure of an initial manual trip, the event escalates to an Alert under EAL SA6.1.

This IC addresses a failure of the RPS to initiate or complete an automatic or manual reactor trip that results in a reactor shutdown, and either a subsequent operator manual action taken at the reactor control consoles or an automatic trip is successful in shutting down the reactor. This event is a precursor to a more significant condition and thus represents a potential degradation of the level of safety of the plant.

Following the failure on an automatic reactor trip, operators will promptly initiate manual actions at the reactor control consoles to shutdown the reactor (e.g., initiate a manual reactor trip). If these manual actions are successful in shutting down the reactor, core heat generation will quickly fall to a level within the capabilities of the plant's decay heat removal systems.

If an initial manual reactor trip is unsuccessful, operators will promptly take manual action at another location(s) on the reactor control consoles to shutdown the reactor (e.g., initiate a manual reactor trip) using a different switch). Depending upon several factors, the initial or subsequent effort to manually the reactor, or a concurrent plant condition, may lead to the generation of an automatic reactor trip signal. If a subsequent manual or automatic trip is successful in shutting down the reactor, core heat generation will quickly fall to a level within the capabilities of the plant's decay heat removal systems.

A manual action at the reactor control consoles is any operator action, or set of actions, which causes the control rods to be rapidly inserted into the core (e.g., initiating a manual reactor trip). This action does not include manually driving in control rods or implementation of boron injection strategies. Actions taken at back-panels or other locations within the Control Room, or any location outside the Control Room, are not considered to be "at the reactor control consoles".

The plant response to the failure of an automatic or manual reactor trip will vary based upon several factors including the reactor power level prior to the event, availability of the condenser, performance of mitigation equipment and actions, other concurrent plant conditions, etc. If subsequent operator manual actions taken at the reactor control consoles are also unsuccessful in shutting down the reactor, then the emergency classification level will escalate to an Alert via IC SA6. Depending upon the plant response, escalation is also possible via IC FA1. Absent the plant conditions needed to meet either IC SA6 or FA1, an Unusual Event declaration is appropriate for this event.

Should a reactor trip signal be generated as a result of plant work (e.g., RPS setpoint testing), the following classification guidance should be applied.

ATTACHMENT 1  
EAL Bases

- If the signal causes a plant transient that should have included an automatic reactor trip and the RPS fails to automatically shutdown the reactor, then this IC and the EALs are applicable, and should be evaluated.
- If the signal does not cause a plant transient and the trip failure is determined through other means (e.g., assessment of test results), then this IC and the EALs are not applicable and no classification is warranted.

ATTACHMENT 1  
EAL Bases

**Category:** S – System Malfunction  
**Subcategory:** 6 – RPS Failure  
**Initiating Condition:** Automatic or manual trip fails to shut down the reactor and subsequent manual actions taken at the reactor control consoles are not successful in shutting down the reactor

**EAL:**

**SA6.1 Alert**

An automatic or manual trip fails to shut down the reactor as indicated by reactor power  $\geq 5\%$

**AND**

Manual trip pushbutton is **not** successful in shutting down the reactor as indicated by reactor power  $\geq 5\%$  (Note 8)

Note 8: A manual trip action is **any** operator action, or set of actions, which causes the control rods to be rapidly inserted into the core, and does **not** include manually driving in control rods or implementation of boron injection strategies.

**Mode Applicability:**

1 - Power Operation

**Definition(s):**

None

**Basis:**

This EAL addresses any automatic or manual reactor trip signal that fails to shut down the reactor followed by a subsequent manual trip that fails to shut down the reactor to an extent the reactor is producing significant power (ref. 1).

Following a successful reactor trip, rapid insertion of the control rods occurs. Nuclear power promptly drops to a fraction of the original power level and then decays to a level several decades less with a negative startup rate. The reactor power drop continues until reactor power reaches the point at which the influence of source neutrons on reactor power starts to be observable. A predictable post-trip response from an automatic reactor trip signal should therefore consist of a prompt drop in reactor power as sensed by the nuclear instrumentation and a lowering of power into the source range. For the purpose of emergency classification a successful trip has occurred when there is sufficient rod insertion from the manual trip to bring the reactor power below 5% (ref. 2).

5% rated power is the Power Operation mode threshold. Below 5%, plant response will be similar to that observed during a normal shutdown. Nuclear instrumentation can be used to determine if reactor power is greater than or equal to 5% power (1, 2).

For the purposes of emergency classification, a successful manual trip action is that which can be quickly performed from the reactor control console (actuation of the manual trip pushbutton). There is a separate set of switch contacts in series with the output of each reactor trip component. All switch contacts are actuated through a mechanical linkage from a single

ATTACHMENT 1  
EAL Bases

pushbutton. Reactor shutdown achieved by use of other trip actions such as opening supply breakers, emergency boration, or manually driving control rods) do not constitute a successful manual trip (ref. 3).

Escalation of this event to a Site Area Emergency would be under EAL SS6.1 or Emergency Coordinator judgment.

This IC addresses a failure of the RPS to initiate or complete an automatic or manual reactor trip that results in a reactor shutdown, and subsequent operator manual actions taken at the reactor control consoles to shutdown the reactor are also unsuccessful. This condition represents an actual or potential substantial degradation of the level of safety of the plant. An emergency declaration is required even if the reactor is subsequently shutdown by an action taken away from the reactor control consoles since this event entails a significant failure of the RPS.

A manual action at the reactor control console is any operator action, or set of actions, which causes the control rods to be rapidly inserted into the core (e.g., initiating a manual reactor trip). This action does not include manually driving in control rods or implementation of boron injection strategies. If this action(s) is unsuccessful, operators would immediately pursue additional manual actions at locations away from the reactor control console (e.g., locally opening breakers). Actions taken at back panels or other locations within the Control Room, or any location outside the Control Room, are not considered to be "at the reactor control console".

The plant response to the failure of an automatic or manual reactor trip will vary based upon several factors including the reactor power level prior to the event, availability of the condenser, performance of mitigation equipment and actions, other concurrent plant conditions, etc. If the failure to shut down the reactor is prolonged enough to cause a challenge to the core cooling or RCS heat removal safety functions, the emergency classification level will escalate to a Site Area Emergency via IC SS6. Depending upon plant responses and symptoms, escalation is also possible via IC FS1. Absent the plant conditions needed to meet either IC SS6 or FS1, an Alert declaration is appropriate for this event.

It is recognized that plant responses or symptoms may also require an Alert declaration in accordance with the Recognition Category F ICs; however, this IC and EAL are included to ensure a timely emergency declaration.

A reactor shutdown is determined in accordance with applicable Emergency Operating Procedure criteria.

ATTACHMENT 1  
EAL Bases

**Category:** S – System Malfunction

**Subcategory:** 6 – RPS Failure

**Initiating Condition:** Inability to shut down the reactor causing a challenge to core cooling or RCS heat removal

**EAL:**

**SS6.1 Site Area Emergency**

An automatic or manual trip fails to shut down the reactor as indicated by reactor power  $\geq 5\%$

**AND**

All actions to shut down the reactor are **not** successful as indicated by reactor power  $\geq 5\%$

**AND EITHER:**

- CETCs  $>1200^{\circ}\text{F}$  on ICCM
- RCS subcooling  $< 0^{\circ}\text{F}$

**Mode Applicability:**

1 - Power Operation

**Definition(s):**

None

**Basis:**

This EAL addresses the following:

- Any automatic reactor trip signal (ref. 1) followed by a manual trip that fails to shut down the reactor to an extent the reactor is producing energy in excess of the heat load for which the safety systems were designed (ref. 5), and
- Indications that either core cooling is extremely challenged or heat removal is extremely challenged.

The combination of failure of both front line and backup protection systems to function in response to a plant transient, along with the continued production of heat, poses a direct threat to the Fuel Clad and RCS Barriers.

Reactor shutdown achieved by use of other trip actions such as opening supply breakers, emergency boration, or manually driving control rods are also credited as a successful manual trip provided reactor power can be reduced below 5% before indications of an extreme challenge to either core cooling or heat removal exist (ref. 2, 3).

5% rated power is the Power Operation mode threshold. Below 5%, plant response will be similar to that observed during a normal shutdown. Nuclear instrumentation can be used to determine if reactor power is greater than or equal to 5% power.

ATTACHMENT 1  
EAL Bases

Indication of continuing core cooling degradation is manifested by CETCs are reading greater than 1200°F. This setpoint is used as an indication of an extreme ICC condition and entry into the Oconee Severe Accident Guidelines (OSAG) is initiated for further mitigative actions (ref. 4).

Indication of inability to adequately remove heat from the RCS is manifested by subcooling less than 0°F (ref. 6).

This IC addresses a failure of the RPS to initiate or complete an automatic or manual reactor trip that results in a reactor shutdown, all subsequent operator actions to manually shutdown the reactor are unsuccessful, and continued power generation is challenging the capability to adequately remove heat from the core and/or the RCS. This condition will lead to fuel damage if additional mitigation actions are unsuccessful and thus warrants the declaration of a Site Area Emergency.

In some instances, the emergency classification resulting from this IC/EAL may be higher than that resulting from an assessment of the plant responses and symptoms against the Recognition Category F ICs/EALs. This is appropriate in that the Recognition Category F ICs/EALs do not address the additional threat posed by a failure to shut down the reactor. The inclusion of this IC and EAL ensures the timely declaration of a Site Area Emergency in response to prolonged failure to shutdown the reactor.

A reactor shutdown is determined in accordance with applicable Emergency Operating Procedure criteria.

Escalation of the emergency classification level would be via IC RG1 or FG1.

Satellite Phone		X	

**Mode Applicability:**

1 - Power Operation, 2 - Startup, 3 - Hot Standby, 4 - Hot Shutdown

**Definition(s):**

None

ATTACHMENT 1  
EAL Bases

**Basis:**

Onsite, offsite and NRC communications include one or more of the systems listed in Table S-4 (ref. 1).

1. Commercial phone service

The Commercial phone service does not go through the site telephone system.

2. ONS site phone system

The site phone system is generator and battery backed with:

- Fiber-Optic to Charlotte GO (65 lines)
- Telephone line to Easley (6 circuits)
- Anderson (4 lines)
- Six Mile (4 lines)
- Site Telephone System: Inward and outward direct dial available from the Control Room, TSC, and OSC

3. EOF phone system

The emergency communications systems at the Charlotte EOF are designed to ensure the reliable, timely flow of information between all parties having an emergency response role.

4. Public Address (Paging) system

The paging system provides paging and party line communications between stations located throughout the plant. Inside and outside type wall and desk-mounted stations are used to communicate between roaming personnel and fixed work locations. Plant-wide instructions are issued using the paging feature.

5. Onsite radio system

The onsite radio system receives emergency backup power from Keowee Hydro Units supporting communications with: Control Room 1&2, 3, Fire Brigade, Chemistry, Safety, Radiation Protection, Maintenance, Medical Emergency Response Team, and Hazardous Materials Response Team.

6. DEMNET

DEMNET is the primary means of offsite communication. This circuit allows intercommunication among the EOF, TSC, control room, counties, and states. DEMNET operates as an internet based (VoIP) communications system with a satellite back-up. Should the internet transfer rate become slow or unavailable, the DEMNET will automatically transfer to satellite mode.

7. Offsite radio system

The offsite radio system is battery backed supporting communications with: Control Room Units 1&2, TSC, Field Monitoring Teams, EOF, counties and State of South Carolina.

ATTACHMENT 1  
EAL Bases

8. NRC Emergency Telephone System (ETS)

The NRC uses a Duke Energy dedicated telephone line which allows direct telephone communications from the plant to NRC regional and national offices. The Duke Energy communications line provides a link independent of the local public telephone network. Telephones connected to this network are located in the Oconee Control Rooms, TSC, and EOF and can be used to establish NRC Emergency Notification System (ENS) and Health Physics Network (HPN) capability.

9. Satellite Phone

Satellite Phones can be used for external communications

This EAL is the hot condition equivalent of the cold condition EAL CU5.1.

This IC addresses a significant loss of on-site or offsite communications capabilities. While not a direct challenge to plant or personnel safety, this event warrants prompt notifications to OROs and the NRC.

This IC should be assessed only when extraordinary means are being utilized to make communications possible (e.g., use of non-plant, privately owned equipment, relaying of on-site information via individuals or multiple radio transmission points, individuals being sent to offsite locations, etc.).

The first EAL condition addresses a total loss of the communications methods used in support of routine plant operations.

The second EAL condition addresses a total loss of the communications methods used to notify all OROs of an emergency declaration. The OROs referred to here are the State EOC and FEO, Pickens County LEC and EOC, and Oconee County LEC and EOC.

The third EAL addresses a total loss of the communications methods used to notify the NRC of an emergency declaration.

ATTACHMENT 1  
EAL Bases

**Category:** S – System Malfunction

**Subcategory:** 8 – Containment Failure

**Initiating Condition:** Failure to isolate containment or loss of containment pressure control.

**EAL:**

**SU8.1 Unusual Event**

Any penetration is **not** closed within 15 min. of a VALID ES actuation signal

**OR**

Containment pressure > 10 psig with < one full train of containment heat removal system (1 RBS with > 700 gpm spray flow **OR** 2 RBCUs) operating per design for  $\geq$  15 min. (Note 1)

Note 1: The Emergency Coordinator should declare the event promptly upon determining that time limit has been exceeded, or will likely be exceeded.

**Mode Applicability:**

1 - Power Operation, 2 - Startup, 3 - Hot Standby, 4 - Hot Shutdown

**Definition(s):**

*VALID* - An indication, report, or condition, is considered to be valid when it is verified by (1) an instrument channel check, or (2) indications on related or redundant indicators, or (3) by direct observation by plant personnel, such that doubt related to the indicator's operability, the condition's existence, or the report's accuracy is removed. Implicit in this definition is the need for timely assessment.

**Basis:**

Reactor Building isolations are initiated by Engineered Safeguards Actuation Channels 5 and 6 in response to a high reactor building pressure signal (3.0 psig) (ref. 1, 2, 4).

Two engineered safeguards systems, the Reactor Building Spray System and the Reactor Building Cooling System, are provided to remove heat from the containment atmosphere following an accident. Both the Reactor Building Spray System and the Reactor Building Cooling System, with either at full capacity, are individually capable of maintaining the containment pressure below the design limit following a LOCA or MSLB. (ref. 1, 3)

The Reactor Building Spray (RBS) System consists of two separate trains of equal capacity. Spray flow greater or equal to 700 gpm satisfies the spray flow design requirement. The Reactor Building pressure setpoint (10 psig) is the pressure at which the Reactor Building Spray equipment should actuate and begin performing its function (ref. 1, 2, 3, 5).

Each of three Reactor Building Cooling Units (RBCUs) consists of a fan, cooling coils, and the required distribution duct work. The Reactor Building atmosphere is circulated past cooling coils by fans and returned to the building. Cooling water for the cooling units is supplied by the Low Pressure Service Water System. The Reactor Building Cooling System provides the design heat removal capacity with two of three coolers operating (ref. 1).

ATTACHMENT 1  
EAL Bases

This EAL addresses a failure of one or more containment penetrations to automatically isolate (close) when required by an actuation signal. It also addresses an event that results in high containment pressure with a concurrent failure of containment pressure control systems. Absent challenges to another fission product barrier, either condition represents potential degradation of the level of safety of the plant.

For the first condition, the containment isolation signal must be generated as the result on an off-normal/accident condition (e.g., a safety injection or high containment pressure); a failure resulting from testing or maintenance does not warrant classification. The determination of containment and penetration status – isolated or not isolated – should be made in accordance with the appropriate criteria contained in the plant APs and EOPs. The 15-minute criterion is included to allow operators time to manually isolate the required penetrations, if possible.

The second condition addresses a condition where containment pressure is greater than the setpoint at which containment energy (heat) removal systems are designed to automatically actuate, and less than one full train of equipment is capable of operating per design. The 15-minute criterion is included to allow operators time to manually start equipment that may not have automatically started, if possible. The inability to start the required equipment indicates that containment heat removal/depressurization systems (e.g., containment sprays) are either lost or performing in a degraded manner.

This event would escalate to a Site Area Emergency in accordance with IC FS1 if there were a concurrent loss or potential loss of either the Fuel Clad or RCS fission product barriers.

ATTACHMENT 1  
EAL Bases

**Category:** S – System Malfunction  
**Subcategory:** 9 – Hazardous Event Affecting Safety Systems  
**Initiating Condition:** Hazardous event affecting a SAFETY SYSTEM needed for the current operating mode

**EAL:**

**SA9.1 Alert**

The occurrence of **any** Table S-5 hazardous event

**AND EITHER:**

- Event damage has caused indications of degraded performance in at least one train of a SAFETY SYSTEM needed for the current operating mode
- The event has caused **VISIBLE DAMAGE** to a SAFETY SYSTEM component or structure needed for the current operating mode

**Table S-5 Hazardous Events**

- Seismic event (earthquake)
- Internal or external FLOODING event
- High winds or tornado strike
- FIRE
- EXPLOSION
- Other events with similar hazard characteristics as determined by the Shift Manager

**Mode Applicability:**

1 - Power Operation, 2 - Startup, 3 - Hot Standby, 4 - Hot Shutdown

**Definition(s):**

**EXPLOSION** - A rapid, violent and catastrophic failure of a piece of equipment due to combustion, chemical reaction or overpressurization. A release of steam (from high energy lines or components) or an electrical component failure (caused by short circuits, grounding, arcing, etc.) should not automatically be considered an explosion. Such events require a post-event inspection to determine if the attributes of an explosion are present.

**FIRE** - Combustion characterized by heat and light. Sources of smoke such as slipping drive belts or overheated electrical equipment do not constitute fires. Observation of flame is preferred but is NOT required if large quantities of smoke and heat are observed.

**FLOODING** - A condition where water is entering a room or area faster than installed equipment is capable of removal, resulting in a rise of water level within the room or area.

**SAFETY SYSTEM** - A system required for safe plant operation, cooling down the plant and/or placing it in the cold shutdown condition, including the ECCS. These are typically systems

ATTACHMENT 1  
EAL Bases

classified as safety-related (as defined in 10CFR50.2):

Those structures, systems and components that are relied upon to remain functional during and following design basis events to assure:

- (1) The integrity of the reactor coolant pressure boundary;
- (2) The capability to shut down the reactor and maintain it in a safe shutdown condition;
- (3) The capability to prevent or mitigate the consequences of accidents which could result in potential offsite exposures.

**VISIBLE DAMAGE** - Damage to a component or structure that is readily observable without measurements, testing, or analysis. The visual impact of the damage is sufficient to cause concern regarding the operability or reliability of the affected component or structure.

**Basis:**

- The significance of seismic events are discussed under EAL HU2.1 (ref. 1).
- Internal FLOODING may be caused by events such as component failures, equipment misalignment, or outage activity mishaps.
- External flooding at ONS is highly unlikely since the probable maximum flood (PMF) would be contained by the Keowee Reservoir. Plant grade elevation is 796.0 ft MSL. The minimum external access elevation for the Auxiliary, Turbine, and Service Buildings is 796.5 ft MSL which provides a 6 inch water sill. (ref. 2)
- High winds in excess of design (95 mph) or tornado strikes can cause significant structural damage (ref. 3).
- Areas containing functions and systems required for safe shutdown of the plant are identified by fire area (ref. 4, 5).
- An explosion that degrades the performance of a SAFETY SYSTEM train or visibly damages a SAFETY SYSTEM component or structure would be classified under this EAL.

This IC addresses a hazardous event that causes damage to a SAFETY SYSTEM, or a structure containing SAFETY SYSTEM components, needed for the current operating mode. This condition significantly reduces the margin to a loss or potential loss of a fission product barrier, and therefore represents an actual or potential substantial degradation of the level of safety of the plant.

The first condition addresses damage to a SAFETY SYSTEM train that is in service/operation since indications for it will be readily available. The indications of degraded performance should be significant enough to cause concern regarding the operability or reliability of the SAFETY SYSTEM train.

The second condition addresses damage to a SAFETY SYSTEM component that is not in service/operation or readily apparent through indications alone, or to a structure containing SAFETY SYSTEM components. Operators will make this determination based on the totality of available event and damage report information. This is intended to be a brief assessment not requiring lengthy analysis or quantification of the damage.

Escalation of the emergency classification level would be via IC FS1 or RS1.

## ATTACHMENT 1

### EAL Bases

#### Category F – Fission Product Barrier Degradation

EAL Group: Hot Conditions (RCS temperature > 200°F); EALs in this category are applicable only in one or more hot operating modes.

EALs in this category represent threats to the defense in depth design concept that precludes the release of highly radioactive fission products to the environment. This concept relies on multiple physical barriers any one of which, if maintained intact, precludes the release of significant amounts of radioactive fission products to the environment. The primary fission product barriers are:

- A. Fuel Clad (FC): The Fuel Clad Barrier consists of the cladding material that contains the fuel pellets.
- B. Reactor Coolant System (RCS): The RCS Barrier includes the RCS primary side and its connections up to and including the pressurizer safety and relief valves, and other connections up to and including the primary isolation valves.
- C. Containment (CMT): The Containment (Reactor Building) Barrier includes the Reactor Building and connections up to and including the outermost containment isolation valves. This barrier also includes the main steam, feedwater, and blowdown line extensions outside the Reactor Building up to and including the outermost secondary side isolation valve. Containment Barrier thresholds are used as criteria for escalation of the ECL from Alert to a Site Area Emergency or a General Emergency.

The EALs in this category require evaluation of the loss and potential loss thresholds listed in the fission product barrier matrix of Table F-1 (Attachment 2). "Loss" and "Potential Loss" signify the relative damage and threat of damage to the barrier. "Loss" means the barrier no longer assures containment of radioactive materials. "Potential Loss" means integrity of the barrier is threatened and could be lost if conditions continue to degrade. The number of barriers that are lost or potentially lost and the following criteria determine the appropriate emergency classification level:

Alert:

*Any loss or any potential loss of either Fuel Clad or RCS Barrier*

Site Area Emergency:

*Loss or potential loss of any two barriers*

General Emergency:

*Loss of any two barriers and loss or potential loss of third barrier*

The logic used for emergency classification based on fission product barrier monitoring should reflect the following considerations:

- The Fuel Clad Barrier and the RCS Barrier are weighted more heavily than the Containment Barrier.
- Unusual Event ICs associated with RCS and Fuel Clad Barriers are addressed under System Malfunction ICs.
- For accident conditions involving a radiological release, evaluation of the fission product barrier thresholds will need to be performed in conjunction with dose assessments to

ATTACHMENT 1  
EAL Bases

ensure correct and timely escalation of the emergency classification. For example, an evaluation of the fission product barrier thresholds may result in a Site Area Emergency classification while a dose assessment may indicate that an EAL for General Emergency IC RG1 has been exceeded.

- The fission product barrier thresholds specified within a scheme reflect plant-specific ONS design and operating characteristics.
- As used in this category, the term RCS leakage encompasses not just those types defined in Technical Specifications but also includes the loss of RCS mass to any location— inside the primary containment, an interfacing system, or outside of the primary containment. The release of liquid or steam mass from the RCS due to the as designed/expected operation of a relief valve is not considered to be RCS leakage.
- At the Site Area Emergency level, EAL users should maintain cognizance of how far present conditions are from meeting a threshold that would require a General Emergency declaration. For example, if the Fuel Clad and RCS fission product barriers were both lost, then there should be frequent assessments of containment radioactive inventory and integrity. Alternatively, if both the Fuel Clad and RCS fission product barriers were potentially lost, the Emergency Coordinator would have more assurance that there was no immediate need to escalate to a General Emergency.

ATTACHMENT 1  
EAL Bases

**Category:** Fission Product Barrier Degradation

**Subcategory:** N/A

**Initiating Condition:** Any loss or any potential loss of either Fuel Clad or RCS barrier

**EAL:**

<b>FA1.1</b>	<b>Alert</b>
--------------	--------------

Any loss or any potential loss of either Fuel Clad or RCS barrier (Table F-1)
---

**Mode Applicability:**

1 - Power Operation, 2 - Startup, 3 - Hot Standby, 4 - Hot Shutdown

**Definition(s):**

None

**Basis:**

Fuel Clad, RCS and Containment comprise the fission product barriers. Table F-1 (Attachment 2) lists the fission product barrier thresholds, bases and references.

At the Alert classification level, Fuel Clad and RCS barriers are weighted more heavily than the Containment barrier. Unlike the Containment barrier, loss or potential loss of either the Fuel Clad or RCS barrier may result in the relocation of radioactive materials or degradation of core cooling capability. Note that the loss or potential loss of Containment barrier in combination with loss or potential loss of either Fuel Clad or RCS barrier results in declaration of a Site Area Emergency under EAL FS1.1

**ONS Basis Reference(s):**

1. NEI 99-01 FA1

ATTACHMENT 1  
EAL Bases

**Category:** Fission Product Barrier Degradation

**Subcategory:** N/A

**Initiating Condition:** Loss or potential loss of **any** two barriers

**EAL:**

**FS1.1 Site Area Emergency**

Loss or potential loss of **any** two barriers (Table F-1)

**Mode Applicability:**

1 - Power Operation, 2 - Startup, 3 - Hot Standby, 4 - Hot Shutdown

**Definition(s):**

None

**Basis:**

Fuel Clad, RCS and Containment comprise the fission product barriers. Table F-1 (Attachment 2) lists the fission product barrier thresholds, bases and references.

At the Site Area Emergency classification level, each barrier is weighted equally. A Site Area Emergency is therefore appropriate for any combination of the following conditions:

- One barrier loss and a second barrier loss (i.e., loss - loss)
- One barrier loss and a second barrier potential loss (i.e., loss - potential loss)
- One barrier potential loss and a second barrier potential loss (i.e., potential loss - potential loss)

At the Site Area Emergency classification level, the ability to dynamically assess the proximity of present conditions with respect to the threshold for a General Emergency is important. For example, the existence of Fuel Clad and RCS Barrier loss thresholds in addition to offsite dose assessments would require continual assessments of radioactive inventory and Containment integrity in anticipation of reaching a General Emergency classification. Alternatively, if both Fuel Clad and RCS potential loss thresholds existed, the Emergency Coordinator would have greater assurance that escalation to a General Emergency is less imminent.

**EAL:**

**FG1.1      General Emergency**  
Loss of **any** two barriers  
**AND**  
Loss or potential loss of third barrier (Table F-1)

**Mode Applicability:**  
1 - Power Operation, 2 - Startup, 3 - Hot Standby, 4 - Hot Shutdown

**Definition(s):**  
None

**Basis:**  
Fuel Clad, RCS and Containment comprise the fission product barriers. Table F-1 (Attachment 2) lists the fission product barrier thresholds, bases and references.

At the General Emergency classification level each barrier is weighted equally. A General Emergency is therefore appropriate for any combination of the following conditions:

- Loss of Fuel Clad, RCS and Containment Barriers
- Loss of Fuel Clad and RCS Barriers with potential loss of Containment Barrier
- Loss of RCS and Containment Barriers with potential loss of Fuel Clad Barrier
- Loss of Fuel Clad and Containment Barriers with potential loss of RCS Barrier

**ONS Basis Reference(s):**  
1. NEI 99-01 FG1

ATTACHMENT 2  
Fission Product Barrier Loss/Potential Loss Matrix and Bases

**Introduction**

Table F-1 lists the threshold conditions that define the Loss and Potential Loss of the three fission product barriers (Fuel Clad, Reactor Coolant System, and Containment). The table is structured so that each of the three barriers occupies adjacent columns. Each fission product barrier column is further divided into two columns; one for Loss thresholds and one for Potential Loss thresholds.

The first column of the table (to the left of the Fuel Clad Loss column) lists the categories (types) of fission product barrier thresholds. The fission product barrier categories are:

- A. RCS or SG Tube Leakage
- B. Inadequate Heat removal
- C. CMT Radiation / RCS Activity
- D. CMT Integrity or Bypass
- E. Emergency Coordinator Judgment

Each category occupies a row in Table F-1 thus forming a matrix defined by the categories. The intersection of each row with each Loss/Potential Loss column forms a cell in which one or more fission product barrier thresholds appear. If NEI 99-01 does not define a threshold for a barrier Loss/Potential Loss, the word "None" is entered in the cell.

Thresholds are assigned sequential numbers within each Loss and Potential Loss column beginning with number one. In this manner, a threshold can be identified by its category title and number. For example, the first Fuel Clad Barrier Loss in Category A would be assigned "FC Loss A.1," the third Containment Barrier Potential Loss in Category C would be assigned "CMT P-Loss C.3," etc.

If a cell in Table F-1 contains more than one numbered threshold, each of the numbered thresholds, if exceeded, signifies a Loss or Potential Loss of the barrier. It is not necessary to exceed all of the thresholds in a category before declaring a barrier Loss/Potential Loss.

Subdivision of Table F-1 by category facilitates association of plant conditions to the applicable fission product barrier Loss and Potential Loss thresholds. This structure promotes a systematic approach to assessing the classification status of the fission product barriers.

When equipped with knowledge of plant conditions related to the fission product barriers, the EAL-user first scans down the category column of Table F-1, locates the likely category and then reads across the fission product barrier Loss and Potential Loss thresholds in that category to determine if a threshold has been exceeded. If a threshold has not been exceeded, the EAL-user proceeds to the next likely category and continues review of the thresholds in the new category

If the EAL-user determines that any threshold has been exceeded, by definition, the barrier is lost or potentially lost – even if multiple thresholds in the same barrier column are exceeded, only that one barrier is lost or potentially lost. The EAL-user must examine each of the three fission product barriers to determine if other barrier thresholds in the category are lost or potentially lost. For example, if containment radiation is sufficiently high, a Loss of the Fuel Clad and RCS Barriers and a Potential Loss of the Containment Barrier can occur. Barrier

ATTACHMENT 2  
Fission Product Barrier Loss/Potential Loss Matrix and Bases

Losses and Potential Losses are then applied to the algorithms given in EALs FG1.1, FS1.1, and FA1.1 to determine the appropriate emergency classification.

In the remainder of this Attachment, the Fuel Clad Barrier threshold bases appear first, followed by the RCS Barrier and finally the Containment Barrier threshold bases. In each barrier, the bases are given according category Loss followed by category Potential Loss beginning with Category A, then B, ..., E.

**Degradation Threat:** Potential Loss  
**Threshold:**

1. RVLS $\leq$ 0" (Note 9)
----------------------------

**Note 9:** RVLS is **not** valid if **EITHER** of the following exists:

- One or more RCPs are running
- OR**
- LPI pump(s) are running **AND** taking suction from the LPI drop line

**Definition(s):**

None

**Basis:**

RVLS indicated level  $\leq$  0" with all RCPs not running and both LPI pumps taking suction from the drop line not running represents reactor vessel level below the bottom of the RCS hotleg (without instrument uncertainty considered). This is the lowest measurable reactor vessel level and is used in lieu of actual reactor vessel level indication of level at or below top of active fuel.

This reading indicates a reduction in reactor vessel water level sufficient to allow the onset of heat-induced cladding damage.

**ONS Basis Reference(s):**

1. OSC-2820 Emergency Procedure Setpoints, Setpoint No. 7.1.6.5
2. NEI 99-01 RCS or SG Tube Leakage Potential Loss 1.A

**Degradation Threat:** Potential Loss  
**Threshold:**

2. RCS heat removal cannot be established

**AND**

RCS subcooling < 0°F

**Definition(s):**

None

**Basis:**

In combination with RCS Potential Loss B.1, meeting this threshold results in a Site Area Emergency.

The combination of these conditions indicates the ultimate heat sink function is under extreme challenge (i.e., superheated). This threshold addresses loss of functions required for hot shutdown with the reactor at pressure and temperature and thus a potential loss of the Fuel Clad Barrier (ref. 1).

This condition indicates an extreme challenge to the ability to remove RCS heat using the steam generators (i.e., loss of an effective secondary-side heat sink). This condition represents a potential loss of the Fuel Clad Barrier. In accordance with EOPs, there may be unusual accident conditions during which operators intentionally reduce the heat removal capability of the steam generators; during these conditions, classification using threshold is not warranted.

0.5 - < 2.0	80	40	400	195
2.0 - < 8.0	32	15	160	75
≥ 8.0	10	5	50	25

**Definition(s):**

None

**Basis:**

The specified containment radiation monitor readings (ref. 1) indicate the release of reactor coolant, with elevated activity indicative of fuel damage, into the Containment. The readings are derived assuming the instantaneous release and dispersal of the reactor coolant noble gas and iodine inventory associated with approximately 4% fuel cladding failure into the Containment atmosphere. Reactor coolant concentrations of this magnitude are several times larger than the maximum concentrations (including iodine spiking) allowed within technical specifications. This value is higher than that specified for RCS barrier Loss #3.

Monitors used for this fission product barrier loss threshold are the Containment High Range Radiation Monitors RIA 57 and RIA 58 (ref. 1).

The radiation monitor reading corresponds to an instantaneous release of all reactor coolant mass into the containment, assuming that reactor coolant activity equals 300 µCi/gm dose equivalent I-131. Reactor coolant activity above this level is greater than that expected for iodine spikes and corresponds to an approximate range of 2% to 5% fuel clad damage. Since this condition indicates that a significant amount of fuel clad damage has occurred, it represents a loss of the Fuel Clad Barrier.

ATTACHMENT 2  
Fission Product Barrier Loss/Potential Loss Matrix and Bases

The radiation monitor reading in this threshold is higher than that specified for RCS Barrier Loss threshold C.1 since it indicates a loss of both the Fuel Clad Barrier and the RCS Barrier. Note that a combination of the two monitor readings appropriately escalates the ECL to a Site Area Emergency.

**Barrier:** Fuel Clad  
**Category:** C. CMT Radiation / RCS Activity  
**Degradation Threat:** Loss  
**Threshold:**

2. Coolant activity > 300 $\mu$ Ci/ml DEI
---

**Definition(s):**

None

**Basis:**

Elevated reactor coolant activity represents a potential degradation in the level of safety of the plant and a potential precursor of more serious problems. The threshold Dose Equivalent I-131 (DEI) concentration is well above that expected for iodine spikes and corresponds to about 2% to 5% fuel clad damage. When reactor coolant activity reaches this level the Fuel Clad Barrier is considered lost (ref. 1).

This threshold indicates that RCS radioactivity concentration is greater than 300  $\mu$ Ci/gm dose equivalent I-131. Reactor coolant activity above this level is greater than that expected for iodine spikes and corresponds to an approximate range of 2% to 5% fuel clad damage. Since this condition indicates that a significant amount of fuel clad damage has occurred, it represents a loss of the Fuel Clad Barrier.

It is recognized that sample collection and analysis of reactor coolant with highly elevated activity levels could require several hours to complete. Nonetheless, a sample-related threshold is included as a backup to other indications.

There is no Potential Loss threshold associated with RCS Activity / Containment Radiation.

**Degradation Threat:** Loss  
**Threshold:**

1. <b>Any</b> condition in the judgment of the Emergency Coordinator that indicates loss of the Fuel Clad Barrier
---

**Definition(s):**

None

**Basis:**

The Emergency Coordinator judgment threshold addresses any other factors relevant to determining if the Fuel Clad Barrier is lost. Such a determination should include imminent barrier degradation, barrier monitoring capability and dominant accident sequences.

- Imminent barrier degradation exists if the degradation will likely occur within relatively short period of time based on a projection of current safety system performance. The term "imminent" refers to recognition of the inability to reach safety function acceptance criteria before completion of all checks.
- Barrier monitoring capability is decreased if there is a loss or lack of reliable indicators. This assessment should include instrumentation operability concerns, readings from portable instrumentation and consideration of offsite monitoring results.
- Dominant accident sequences lead to degradation of all fission product barriers and likely entry to the EOPs. The Emergency Coordinator should be mindful of the Loss of AC power (Station Blackout) and ATWS EALs to assure timely emergency classification declarations.

This threshold addresses any other factors that are to be used by the Emergency Coordinator in determining whether the Fuel Clad barrier is lost

**Threshold:**

1. <b>Any</b> condition in the judgment of the Emergency Coordinator that indicates potential loss of the Fuel Clad Barrier
---

**Basis:**

The Emergency Coordinator judgment threshold addresses any other factors relevant to determining if the Fuel Clad Barrier is potentially lost. Such a determination should include imminent barrier degradation, barrier monitoring capability and dominant accident sequences.

- Imminent barrier degradation exists if the degradation will likely occur within relatively short period of time based on a projection of current safety system performance. The term "imminent" refers to recognition of the inability to reach safety function acceptance criteria before completion of all checks.
- Barrier monitoring capability is decreased if there is a loss or lack of reliable indicators. This assessment should include instrumentation operability concerns, readings from portable instrumentation and consideration of offsite monitoring results.
- Dominant accident sequences lead to degradation of all fission product barriers and likely entry to the EOPs. The Emergency Coordinator should be mindful of the Loss of AC power (Station Blackout) and ATWS EALs to assure timely emergency classification declarations.

This threshold addresses any other factors that are to be used by the Emergency Coordinator in determining whether the Fuel Clad barrier is potentially lost. The Emergency Coordinator should also consider whether or not to declare the barrier potentially lost in the event that barrier status cannot be monitored.

**ONS Basis Reference(s):**

1. NEI 99-01 Emergency Director Judgment Potential Fuel Clad Loss 6.A

ATTACHMENT 2  
Fission Product Barrier Loss/Potential Loss Matrix and Bases

**Barrier:** Reactor Coolant System  
**Category:** A. RCS or SG Tube Leakage  
**Degradation Threat:** Loss  
**Threshold:**

1. An automatic or manual ES actuation required by **EITHER:**
- UNISOLABLE RCS leakage
  - SG tube RUPTURE

**Definition(s):**

*UNISOLABLE* - An open or breached system line that cannot be isolated, remotely or locally.

*RUPTURE* - The condition of a steam generator in which primary-to-secondary leakage is of sufficient magnitude to require a safety injection.

**Basis:**

A RCS leak should be considered UNISOLABLE if the leak cannot be isolated within 15 minutes

This threshold is based on an UNISOLABLE RCS leak of sufficient size to require an automatic or manual actuation of the Emergency Core Cooling System (ECCS). This condition clearly represents a loss of the RCS Barrier.

This threshold is applicable to unidentified and pressure boundary leakage, as well as identified leakage. It is also applicable to UNISOLABLE RCS leakage through an interfacing system. The mass loss may be into any location – inside containment, to the secondary-side (i.e., steam generator tube leakage) or outside of containment.

A steam generator with primary-to-secondary leakage of sufficient magnitude to require a safety injection is considered to be RUPTURED. If a RUPTURED steam generator is also FAULTED outside of containment, the declaration escalates to a Site Area Emergency since the Containment Barrier Loss threshold 1.A will also be met.

**ONS Basis Reference(s):**

2. NEI 99-01 RCS or SG Tube Leakage Reactor Coolant System Loss 1.A

ATTACHMENT 2  
Fission Product Barrier Loss/Potential Loss Matrix and Bases

**Barrier:** Reactor Coolant System  
**Category:** A. RCS or SG Tube Leakage  
**Degradation Threat:** Potential Loss  
**Threshold:**

1. RCS leakage > normal makeup capacity due to **EITHER:**
- UNISOLABLE RCS leakage
  - SG tube leakage

**Definition(s):**

*UNISOLABLE* - An open or breached system line that cannot be isolated, remotely or locally.

**Basis:**

A RCS leak should be considered UNISOLABLE if the leak cannot be isolated within 15 min.

This threshold is based on the inability to maintain liquid inventory within the RCS by normal operation of the High Pressure Injection System (HPI). The HPI includes three pumps. (ref. 1)

Any one HPI pump runout flow rate is 475 gpm (ref. 2).

This threshold is based on an UNISOLABLE RCS leak that results in the inability to maintain pressurizer level within specified limits by operation of a normally used charging (makeup) pump, but an ES actuation has not occurred. The threshold is met when an operating procedure, or operating crew supervision, directs that a HPI (makeup) pump be placed in service to restore and maintain pressurizer level.

This threshold is applicable to unidentified and pressure boundary leakage, as well as identified leakage. It is also applicable to UNISOLABLE RCS leakage through an interfacing system. The mass loss may be into any location – inside containment, to the secondary-side (i.e., steam generator tube leakage) or outside of containment.

If a leaking steam generator is also FAULTED outside of containment, the declaration escalates to a Site Area Emergency since the Containment Barrier Loss threshold 1.A will also be met.

**Degradation Threat:** Potential Loss  
**Threshold:**

2. RCS cooldown to < 400°F at > 100°F/hr  
**OR**  
HPI has operated in the injection mode with no RCPs operating

**Definition(s):**

None

**Basis:**

400°F is the temperature below which a cooldown greater than 100°F/hr requires implementation of Pressurized Thermal Shock (PTS) guidance (rule 8) (ref. 1, 2).

HPI operating in the injection mode with no RCPs operating also invokes Rule 8 (ref. 3).

This condition indicates an extreme challenge to the integrity of the RCS pressure boundary due to pressurized thermal shock – a transient that causes rapid RCS cooldown while the RCS is in Mode 3 or higher (i.e., hot and pressurized).

**ONS Basis Reference(s):**

**Barrier:** Reactor Coolant System  
**Category:** B. Inadequate Heat Removal  
**Degradation Threat:** Potential Loss  
**Threshold:**

- |   |
|---|
| 1. RCS heat removal cannot be established<br><b>AND</b><br>RCS subcooling < 0°F |
|---|

**Definition(s):**

None

**Basis:**

In combination with FC Potential Loss B.1, meeting this threshold results in a Site Area Emergency.

The combination of these conditions indicates the ultimate heat sink function is under extreme challenge (i.e., superheated). This threshold addresses loss of functions required for hot shutdown with the reactor at pressure and temperature and thus a potential loss of the RCS Barrier.

This condition indicates an extreme challenge to the ability to remove RCS heat using the steam generators (i.e., loss of an effective secondary-side heat sink). This condition represents a potential loss of the RCS Barrier. In accordance with EOPs, there may be unusual accident conditions during which operators intentionally reduce the heat removal capability of the steam generators; during these conditions, classification using threshold is not warranted.

Meeting this threshold results in a Site Area Emergency because this threshold is identical to Fuel Clad Barrier Potential Loss threshold B.2; both will be met. This condition warrants a Site Area Emergency declaration because inadequate RCS heat removal may result in fuel heat-up sufficient to damage the cladding and increase RCS pressure to the point where mass will be lost from the system.

|--|

**Definition(s):**

N/A

**Basis:**

Containment radiation monitor readings greater than the specified values (ref. 1) indicate the release of reactor coolant to the Containment. The readings assume the instantaneous release and dispersal of the reactor coolant noble gas and iodine inventory associated with normal operating concentrations (i.e., within Technical Specifications) into the Containment atmosphere. Because of the very high fuel clad integrity, only small amounts of noble gases would be dissolved in the primary coolant.

Monitors used for this fission product barrier loss threshold are the Containment High Range Radiation Monitors RIA-57 and RIA-58. The difference in the threshold values is due to the relative strength of the detector check source which affects the background readings for the detector (the source for 2RIA-57 is stronger than that for the other detectors). (ref. 1)

The radiation monitor reading corresponds to an instantaneous release of all reactor coolant mass into the containment, assuming that reactor coolant activity equals Technical Specification allowable limits. This value is lower than that specified for Fuel Clad Barrier Loss threshold C.1 since it indicates a loss of the RCS Barrier only.

There is no Potential Loss threshold associated with RCS Activity / Containment Radiation.

**Threshold:**

1. <b>Any</b> condition in the judgment of the Emergency Coordinator that indicates loss of the RCS Barrier
---

**Definition(s):**

None

**Basis:**

The Emergency Coordinator judgment threshold addresses any other factors relevant to determining if the RCS Barrier is lost. Such a determination should include imminent barrier degradation, barrier monitoring capability and dominant accident sequences.

- Imminent barrier degradation exists if the degradation will likely occur within relatively short period of time based on a projection of current safety system performance. The term "imminent" refers to recognition of the inability to reach safety function acceptance criteria before completion of all checks.
- Barrier monitoring capability is decreased if there is a loss or lack of reliable indicators. This assessment should include instrumentation operability concerns, readings from portable instrumentation and consideration of offsite monitoring results.
- Dominant accident sequences lead to degradation of all fission product barriers and likely entry to the EOPs. The Emergency Coordinator should be mindful of the Loss of AC power (Station Blackout) and ATWS EALs to assure timely emergency classification declarations.

This threshold addresses any other factors that may be used by the Emergency Coordinator in determining whether the RCS Barrier is lost.

ATTACHMENT 2  
Fission Product Barrier Loss/Potential Loss Matrix and Bases

**Barrier:** Containment  
**Category:** A. RCS or SG Tube Leakage  
**Degradation Threat:** Loss  
**Threshold:**

1. A leaking SG is FAULTED outside of containment
---

**Definition(s):**

*FAULTED* - The term applied to a steam generator that has a steam leak on the secondary side of sufficient size to cause an uncontrolled drop in steam generator pressure or the steam generator to become completely depressurized.

**Basis:**

This threshold addresses a leaking Steam Generator (SG) that is also FAULTED outside of containment. The condition of the SG leakage, is determined in accordance with the thresholds for RCS Barrier Potential Loss A.1 and Loss A.1, respectively. This condition represents a bypass of the containment barrier.

FAULTED is a defined term within the NEI 99-01 methodology; this determination is not necessarily dependent upon entry into, or diagnostic steps within, an EOP. For example, if the pressure in a steam generator is decreasing uncontrollably (part of the FAULTED definition) and the FAULTED steam generator isolation procedure is not entered because EOP user rules are dictating implementation of another procedure to address a higher priority condition, the steam generator is still considered FAULTED for emergency classification purposes.

The FAULTED criterion establishes an appropriate lower bound on the size of a steam release that may require an emergency classification. Steam releases of this size are readily observable with normal Control Room indications. The lower bound for this aspect of the containment barrier is analogous to the lower bound criteria specified in IC SU4 for the fuel clad barrier (i.e., RCS activity values) and IC SU5 for the RCS barrier (i.e., RCS leak rate values).

This threshold also applies to prolonged steam releases necessitated by operational considerations such as the forced steaming of a leaking steam generator directly to atmosphere to cooldown the plant. These type of condition will result in a significant and sustained release of radioactive steam to the environment (and are thus similar to a FAULTED condition). The inability to isolate the steam flow without an adverse effect on plant cooldown meets the intent of a loss of containment.

Steam releases associated with the expected operation of a SG Atmospheric Dump Valve(s) do not meet the intent of this threshold. Such releases may occur intermittently for a short period of time following a reactor trip as operators process through emergency operating procedures to bring the plant to a stable condition and prepare to initiate a plant cooldown. Steam releases associated with the unexpected operation of a valve (e.g., a stuck-open safety valve) do meet this threshold.

ATTACHMENT 2  
Fission Product Barrier Loss/Potential Loss Matrix and Bases

Following an SG tube leak, there may be minor radiological releases through a secondary-side system component (e.g., air ejectors, gland seal exhausters, valve packing, steam traps, terry turbine exhaust, etc.). These types of releases do not constitute a loss or potential loss of containment but should be evaluated using the Recognition Category R ICs.

The ECLs resulting from primary-to-secondary leakage, with or without a steam release from the FAULTED SG, are summarized below.

<b>P-to-S Leak Rate</b>	<b>Affected SG is FAULTED Outside of Containment?</b>	
	<b>Yes</b>	<b>No</b>
Less than or equal to 25 gpm	No classification	No classification
Greater than 25 gpm	Unusual Event per SU5.1	Unusual Event per SU5.1
Greater than normal makeup pump capacity ( <i>RCS Barrier Potential Loss</i> )	Site Area Emergency per FS1.1	Alert per FA1.1
Requires an automatic or manual ECCS (ES) actuation ( <i>RCS Barrier Loss</i> )	Site Area Emergency per FS1.1	Alert per FA1.1

There is no Potential Loss threshold associated with RCS or SG Tube Leakage.

**Degradation Threat:** Potential Loss  
**Threshold:**

1. CETCs > 1200°F  
**AND**  
Restoration procedures **not** effective within 15 min. (Note 1)

Note 1: The Emergency Coordinator should declare the event promptly upon determining that time limit has been exceeded, or will likely be exceeded.

**Definition(s):**

None

**Basis:**

Core Exit Thermocouples (CETCs) are a component of Inadequate Core Cooling Instrumentation and provide an indirect indication of fuel clad temperature by measuring the temperature of the reactor coolant that leaves the core region. Although clad rupture due to high temperature is not expected for CETC readings less than the threshold, temperatures of this magnitude signal significant superheating of the reactor coolant and core uncover (ref. 1).

The restoration procedures are those emergency operating procedures that address the recovery of the RCS and core heat removal acceptance criteria. The procedure is considered effective if the temperature is decreasing or if the vessel water level is increasing (ref. 1). The 15 minute threshold starts when operator action begins taking procedurally directed functional recovery actions.

If CETC readings are greater than 1,200°F, Fuel Clad barrier is also lost.

This threshold addresses any other factors that may be used by the Emergency Coordinator in determining whether the Containment Barrier is potentially lost. The Emergency Director should also consider whether or not to declare the barrier potentially lost in the event that barrier status cannot be monitored.

2.0 - < 8.0	32	15	160	75
≥ 8.0	10	5	50	25

**Definition(s):**

None

**Basis:**

Containment radiation monitor readings greater than the values shown (ref. 1) indicate significant fuel damage well in excess of that required for loss of the RCS Barrier and the Fuel Clad Barrier.

The specified containment radiation monitor readings (ref. 1) indicate the release of reactor coolant, with significant fuel damage well in excess of that required for loss of the RCS Barrier and the Fuel Clad Barrier, into the Containment. The readings are derived assuming the instantaneous release and dispersal of the reactor coolant noble gas and iodine inventory associated with 20% clad failure into the Containment atmosphere.

Containment radiation readings at or above the Containment Barrier Potential Loss threshold signify a loss of two fission product barriers and Potential Loss of a third, indicating the need to upgrade the emergency classification to a General Emergency.

Monitors used for this fission product barrier loss threshold are the Containment High Range Radiation Monitors RIA-57 and RIA-58 (ref. 1).

ATTACHMENT 2  
Fission Product Barrier Loss/Potential Loss Matrix and Bases

The radiation monitor reading corresponds to an instantaneous release of all reactor coolant mass into the containment, assuming that 20% of the fuel cladding has failed. This level of fuel clad failure is well above that used to determine the analogous Fuel Clad Barrier Loss and RCS Barrier Loss thresholds.

NUREG-1228, Source Estimations During Incident Response to Severe Nuclear Power Plant Accidents, indicates the fuel clad failure must be greater than approximately 20% in order for there to be a major release of radioactivity requiring offsite protective actions. For this condition to exist, there must already have been a loss of the RCS Barrier and the Fuel Clad Barrier. It is therefore prudent to treat this condition as a potential loss of containment which would then escalate the ECL to a General Emergency.

ATTACHMENT 2  
Fission Product Barrier Loss/Potential Loss Matrix and Bases

**Barrier:** Containment  
**Category:** D. CMT Integrity or Bypass  
**Degradation Threat:** Loss  
**Threshold:**

1. Containment isolation is required

**AND EITHER:**

- Containment integrity has been lost based on Emergency Coordinator judgment
- UNISOLABLE pathway from Containment to the environment exists

**Definition(s):**

*UNISOLABLE* - An open or breached system line that cannot be isolated, remotely or locally.

**Basis:**

The pathway should be considered UNISOLABLE if the Containment cannot be isolated within 15 min.

Reactor Building Essential and Non-essential Isolation occurs on an Engineered Safeguards signal of 3 psig (ref. 1).

These thresholds address a situation where containment isolation is required and one of two conditions exists as discussed below. Users are reminded that there may be accident and release conditions that simultaneously meet both bulleted thresholds.

First Threshold – Containment integrity has been lost, i.e., the actual containment atmospheric leak rate likely exceeds that associated with allowable leakage (or sometimes referred to as design leakage). Following the release of RCS mass into containment, containment pressure will fluctuate based on a variety of factors; a loss of containment integrity condition may (or may not) be accompanied by a noticeable drop in containment pressure. Recognizing the inherent difficulties in determining a containment leak rate during accident conditions, it is expected that the Emergency Coordinator will assess this threshold using judgment, and with due consideration given to current plant conditions, and available operational and radiological data (e.g., containment pressure, readings on radiation monitors outside containment, operating status of containment pressure control equipment, etc.).

Refer to the middle piping run of Figure 1. Two simplified examples are provided. One is leakage from a penetration and the other is leakage from an in-service system valve. Depending upon radiation monitor locations and sensitivities, the leakage could be detected by any of the four monitors depicted in the figure.

Another example would be a loss or potential loss of the RCS barrier, and the simultaneous occurrence of two FAULTED locations on a steam generator where one fault is located inside containment (e.g., on a steam or feedwater line) and the other outside of containment. In this case, the associated steam line provides a pathway for the containment atmosphere to escape to an area outside the containment.

ATTACHMENT 2  
Fission Product Barrier Loss/Potential Loss Matrix and Bases

Following the leakage of RCS mass into containment and a rise in containment pressure, there may be minor radiological releases associated with allowable (design) containment leakage through various penetrations or system components. These releases do not constitute a loss or potential loss of containment but should be evaluated using the Recognition Category R ICs.

Second Threshold – Conditions are such that there is an UNISOLABLE pathway for the migration of radioactive material from the containment atmosphere to the environment. As used here, the term “environment” includes the atmosphere of a room or area, outside the containment, that may, in turn, communicate with the outside-the-plant atmosphere (e.g., through discharge of a ventilation system or atmospheric leakage). Depending upon a variety of factors, this condition may or may not be accompanied by a noticeable drop in containment pressure.

Refer to the top piping run of Figure 1. In this simplified example, the inboard and outboard isolation valves remained open after a containment isolation was required (i.e., containment isolation was not successful). There is now an UNISOLABLE pathway from the containment to the environment.

The existence of a filter is not considered in the threshold assessment. Filters do not remove fission product noble gases. In addition, a filter could become ineffective due to iodine and/or particulate loading beyond design limits (i.e., retention ability has been exceeded) or water saturation from steam/high humidity in the release stream.

Leakage between two interfacing liquid systems, by itself, does not meet this threshold.

Refer to the bottom piping run of Figure 1. In this simplified example, leakage in an RCP seal cooler is allowing radioactive material to enter the Auxiliary Building. The radioactivity would be detected by the Process Monitor. If there is no leakage from the closed water cooling system to the Auxiliary Building, then no threshold has been met. If the pump developed a leak that allowed steam/water to enter the Auxiliary Building, then second threshold would be met. Depending upon radiation monitor locations and sensitivities, this leakage could be detected by any of the four monitors depicted in the figure and cause the first threshold to be met as well.

Following the leakage of RCS mass into containment and a rise in containment pressure, there may be minor radiological releases associated with allowable containment leakage through various penetrations or system components. Minor releases may also occur if a containment isolation valve(s) fails to close but the containment atmosphere escapes to an enclosed system. These releases do not constitute a loss or potential loss of containment but should be evaluated using the Recognition Category R ICs.

The status of the containment barrier during an event involving steam generator tube leakage is assessed using Loss Threshold A.1.

ATTACHMENT 2  
Fission Product Barrier Loss/Potential Loss Matrix and Bases

**Barrier:** Containment  
**Category:** D. CMT Integrity or Bypass  
**Degradation Threat:** Loss  
**Threshold:**

2. Indications of RCS leakage outside of Containment
--

**Definition(s):**

None

**Basis:**

Containment sump, temperature, pressure and/or radiation levels will increase if reactor coolant mass is leaking into the containment. If these parameters have not increased, then the reactor coolant mass may be leaking outside of containment (i.e., a containment bypass sequence). Increases in sump, temperature, pressure, flow and/or radiation level readings outside of the containment may indicate that the RCS mass is being lost outside of containment.

Unexpected elevated readings and alarms on radiation monitors with detectors outside containment should be corroborated with other available indications to confirm that the source is a loss of RCS mass outside of containment. If the fuel clad barrier has not been lost, radiation monitor readings outside of containment may not increase significantly; however, other unexpected changes in sump levels, area temperatures or pressures, flow rates, etc. should be sufficient to determine if RCS mass is being lost outside of the containment.

Refer to the middle piping run of Figure 1. In this simplified example, a leak has occurred at a reducer on a pipe carrying reactor coolant in the Auxiliary Building. Depending upon radiation monitor locations and sensitivities, the leakage could be detected by any of the four monitors depicted in the figure and cause threshold D.1 to be met as well.

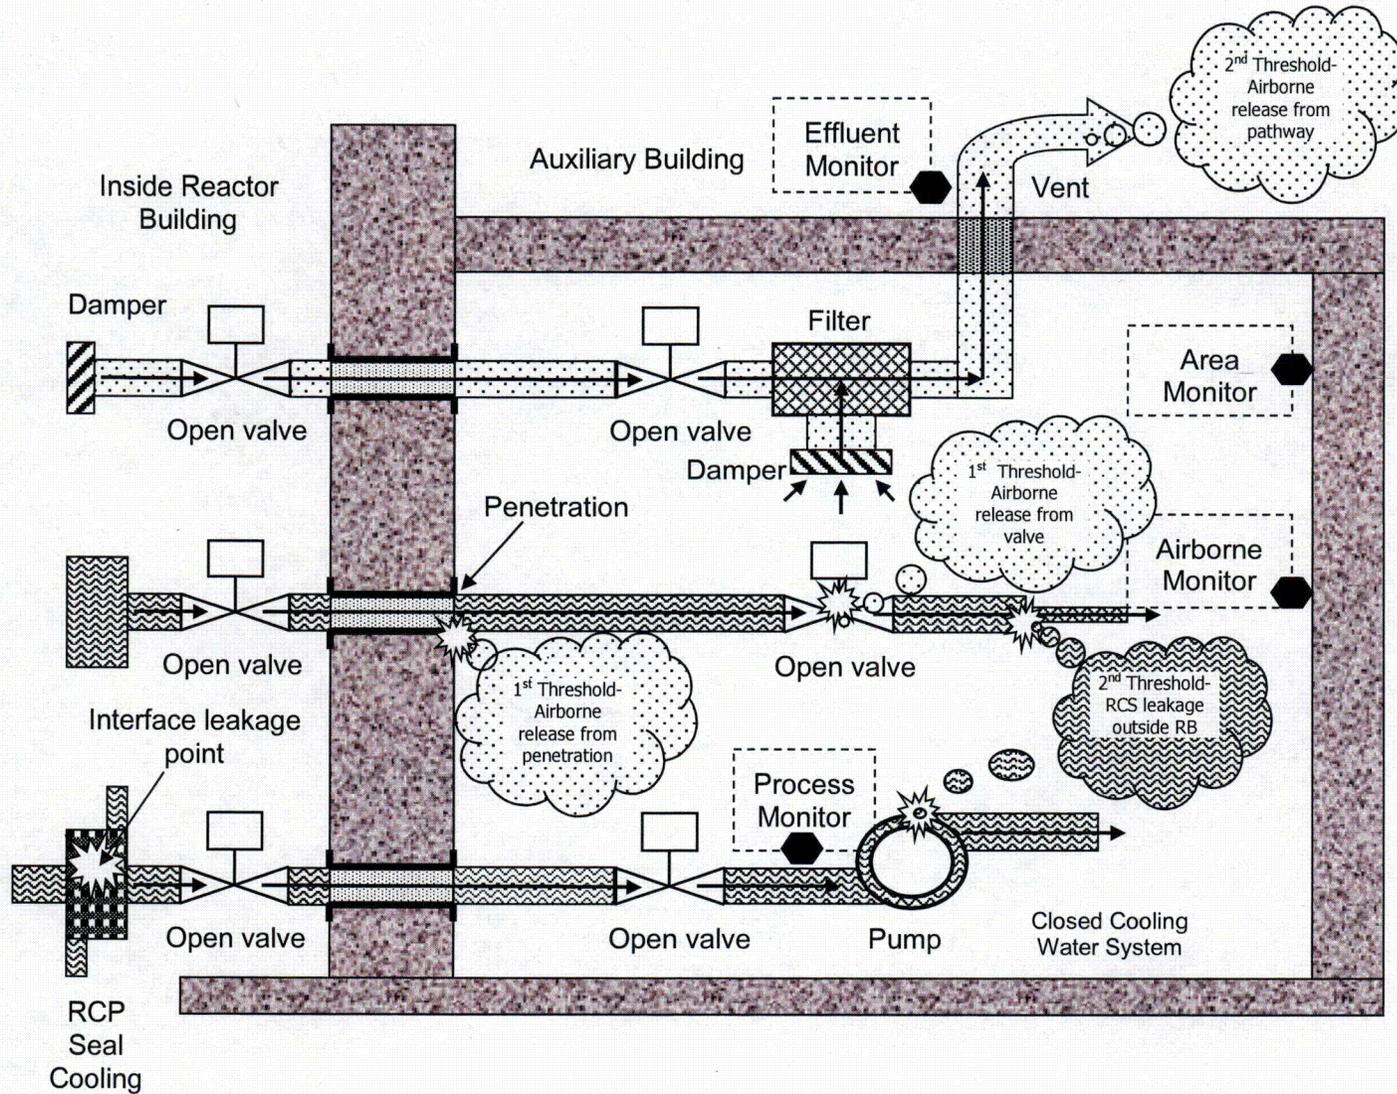

To ensure proper escalation of the emergency classification, the RCS leakage outside of containment must be related to the mass loss that is causing the RCS Loss and/or Potential Loss threshold A.1 to be met.

**Barrier:** Containment  
**Category:** D. CMT Integrity or Bypass  
**Degradation Threat:** Potential Loss  
**Threshold:**

1. Containment pressure > 59 psig
-----------------------------------

**Definition(s):**

None

**Basis:**

The Reactor Building is designed for an internal pressure of 59 psig (ref. 1).

If containment pressure exceeds the design pressure, there exists a potential to lose the Containment Barrier. To reach this level, there must be an inadequate core cooling condition for an extended period of time; therefore, the RCS and Fuel Clad barriers would already be lost. Thus, this threshold is a discriminator between a Site Area Emergency and General Emergency since there is now a potential to lose the third barrier.

**Barrier:** Containment  
**Category:** D. CMT Integrity or Bypass  
**Degradation Threat:** Potential Loss  
**Threshold:**

2. Containment hydrogen concentration  $\geq$  4%

**Definition(s):**

None

**Basis:**

Following a design basis accident, hydrogen gas may be generated inside the containment by reactions such as zirconium metal with water, corrosion of materials of construction and radiolysis of aqueous solution in the core and sump.

The 4% hydrogen concentration threshold is generally considered the lower limit for hydrogen deflagrations. ONS is equipped with a Containment Hydrogen Monitoring System (CHMS) that provides continuous indication of hydrogen concentration in the containment atmosphere. The measurement capability is provided over the range of 0% to 10%. A continuous indication of the hydrogen concentration is not required in the control room at all times during normal operation. If continuous indication of the hydrogen concentration is not available at all times, continuous indication and recording shall be functioning within 90 minutes of the initiation of the safety injection. (ref. 1, 2)

The existence of an explosive mixture means, at a minimum, that the containment atmospheric hydrogen concentration is sufficient to support a hydrogen burn (i.e., at the lower deflagration limit). A hydrogen burn will raise containment pressure and could result in collateral equipment damage leading to a loss of containment integrity. It therefore represents a potential loss of the Containment Barrier.

**Threshold:**

3. Containment pressure > 10 psig with < one full train of containment heat removal system (1 RBS with > 700 gpm spray flow <b>OR</b> 2 RBCUs) operating per design for ≥ 15 min. (Note 1)
--

Note 1: The Emergency Coordinator should declare the event promptly upon determining that time limit has been exceeded, or will likely be exceeded.

**Definition(s):**

None

**Basis:**

Two engineered safeguards systems, the Reactor Building Spray System and the Reactor Building Cooling System, are provided to remove heat from the containment atmosphere following an accident. Both the Reactor Building Spray System and the Reactor Building Cooling System, with either at full capacity, are individually capable of maintaining the containment pressure below the design limit following a LOCA or MSLB. (ref. 1, 3)

- The Reactor Building Spray (RBS) System consists of two separate trains of equal capacity. Spray flow greater or equal to 700 gpm satisfies the spray flow design requirement. The Reactor Building pressure setpoint (10 psig) is the pressure at which the Reactor Building Spray equipment should actuate and begin performing its function (ref. 1, 2, 3, 4).
- Each of three Reactor Building Cooling Units (RBCUs) consists of a fan, cooling coils, and the required distribution duct work. The Reactor Building atmosphere is circulated past cooling coils by fans and returned to the building. Cooling water for the cooling units is supplied by the Low Pressure Service Water System. The Reactor Building Cooling System provides the design heat removal capacity with two of three coolers operating (ref. 1).

This threshold describes a condition where containment pressure is greater than the setpoint at which containment energy (heat) removal systems are designed to automatically actuate, and less than one full train of equipment is capable of operating per design. The 15-minute criterion is included to allow operators time to manually start equipment that may not have automatically started, if possible. This threshold represents a potential loss of containment in that containment heat removal/depressurization systems (e.g., containment sprays, ice condenser fans, etc., but not including containment venting strategies) are either lost or performing in a degraded manner.

**Barrier:** Containment  
**Category:** E. Emergency Coordinator Judgment  
**Degradation Threat:** Loss  
**Threshold:**

1. **Any** condition in the judgment of the Emergency Coordinator that indicates loss of the Containment Barrier

**Definition(s):**

None

**Basis:**

The Emergency Coordinator judgment threshold addresses any other factors relevant to determining if the Containment Barrier is lost. Such a determination should include imminent barrier degradation, barrier monitoring capability and dominant accident sequences.

- Imminent barrier degradation exists if the degradation will likely occur within relatively short period of time based on a projection of current safety system performance. The term "imminent" refers to recognition of the inability to reach safety function acceptance criteria before completion of all checks.
- Barrier monitoring capability is decreased if there is a loss or lack of reliable indicators. This assessment should include instrumentation operability concerns, readings from portable instrumentation and consideration of offsite monitoring results.
- Dominant accident sequences lead to degradation of all fission product barriers and likely entry to the EOPs. The Emergency Coordinator should be mindful of the Loss of AC power (Station Blackout) and ATWS EALs to assure timely emergency classification declarations.

This threshold addresses any other factors that may be used by the Emergency Coordinator in determining whether the Containment Barrier is lost.

## ATTACHMENT 3

### Safe Operation & Shutdown Rooms/Areas Tables R-2 & H-2 Bases

#### Background

NEI 99-01 Revision 6 ICs AA3 and HA5 prescribe declaration of an Alert based on impeded access to rooms or areas (due to either area radiation levels or hazardous gas concentrations) where equipment necessary for normal plant operations, cooldown or shutdown is located. These areas are intended to be plant operating mode dependent. Specifically the Developers Notes for AA3 and HA5 states:

*The "site-specific list of plant rooms or areas with entry-related mode applicability identified" should specify those rooms or areas that contain equipment which require a manual/local action as specified in operating procedures used for normal plant operation, cooldown and shutdown. Do not include rooms or areas in which actions of a contingent or emergency nature would be performed (e.g., an action to address an off-normal or emergency condition such as emergency repairs, corrective measures or emergency operations). In addition, the list should specify the plant mode(s) during which entry would be required for each room or area.*

*The list should not include rooms or areas for which entry is required solely to perform actions of an administrative or record keeping nature (e.g., normal rounds or routine inspections).*

Further, as specified in IC HA5:

*The list need not include the Control Room if adequate engineered safety/design features are in place to preclude a Control Room evacuation due to the release of a hazardous gas. Such features may include, but are not limited to, capability to draw air from multiple air intakes at different and separate locations, inner and outer atmospheric boundaries, or the capability to acquire and maintain positive pressure within the Control Room envelope.*

### ATTACHMENT 3

#### Safe Operation & Shutdown Rooms/Areas Tables R-2 & H-2 Bases

#### ONS Table R-2 and H-2 Bases

NEI 99-01 Rev 06 addresses elevated radiation levels and hazardous gases in certain plant rooms/areas sufficient to preclude or impede personnel from performing actions necessary to maintain normal plant operation, or to perform a normal plant shutdown and cool down.

Power Operation was reviewed to determine if any actions are "necessary" to maintain power operations. Over reasonable periods (several days), there are some actions outside the Control Room that are required to be performed to maintain normal operations. The following table lists the locations into which an operator may be dispatched in order perform a normal plant operation, shutdown and cool down.

The review was completed using the following procedures as the controlling documents:

- OP\*/A/1102/010 (Controlling Procedure for Unit Shutdown)
- OP\*/A/1106/001 (Turbine Generator)
- OP\*/A/1106/015 (EHC System)
- OP\*/A/1103/004A (RCS Boration)
- OP\*/A/1104/027 (Bleed Transfer Pump Recirculation)
- PT\*/A/0600/001 B (Surveillance to go to Mode 3)
- OP\*/A/1102/010 (Unit SD Mode 1 to Mode 3)
- IP\*/A/0200/047 (LTOP Calibration)
- OP\*/A/1103/006 (RCP Operations)
- OP\*/A/1104/012 (CCW Pump Operations)
- CP/1/A/2002/014 (RCS Sampling)
- OP\*/A/1104/049 (LTOP Operation)
- OP/1/A/1104/001 (Core Flood Operations)
- OP/0/A/1104/048 (TBS Operations)
- OP\*/A/1104/004 (Low Pressure Injection System)
- OP\*/A/1103/008 (RCS Crud Burst)

Travel paths to the locations where the equipment is operated were considered as part of the determination of affected rooms. ONS Reactor and Auxiliary Building design consist of mostly single entry rooms located off of a common hallway, therefore access to the hallway is required to access a given room. Some equipment is located within the hallway itself.
