

ACMUI Sub-Committee Draft Report on Training & Experience For Authorized Users of Alpha and Beta Emitters under 10 CFR 35.390

Submitted on March 10, 2016

**Nuclear Regulatory Commission (NRC)
Advisory Committee on the Medical Uses of Isotopes (ACMUI)
Report on Training & Experience for Authorized Users of Alpha and Beta Emitters
under 10 CFR 35.390**

**Sub-Committee Members: V. Dilsizian M.D., R. Ennis M.D., S. Langhorst Ph.D.,
C. Palestro, M.D. (chair), L. Weil, P. Zanzonico, Ph.D.**

Introduction

The Sub-Committee on Training & Experience for Authorized Users was charged with the following tasks:

1. To determine if the current requirement of 700 hours for training and experience for authorized users (AU) of alpha and beta emitters, in 10CFR 35.390 (Training for use of unsealed byproduct material for which a written directive is required), places hardship on the patient community and to make recommendations for ACMUI action.

2. To establish a recommendation for the total number of hours of T&E for authorized users of such emitters that appropriately balances safety with reasonable patient access to these agents.

Submitted on March 10, 2016

22 **Charge 1:**

23 **Background:** Radiolabeled antibody treatment of lymphoma with beta emitters was approved
24 by the U. S. FDA approximately 14 years ago. Two agents initially were available: yttrium-90
25 ibritumomab tiuxetan (Zevalin®) and iodine-131 tositumomab (Bexxar®). Use of both agents,
26 which peaked a few years after introduction, has, despite favorable clinical results, steadily
27 declined since (Figure 1). Bexxar®, in fact, was withdrawn from the market in 2014, because of
28 a lack of use (fewer than 75 patients treated in 2014).

32

The subcommittee examined the factors that could possibly account for the decrease in
33 use of these agents.

ACMUI Sub-Committee Draft Report on Training & Experience For Authorized Users of Alpha and Beta Emitters under 10 CFR 35.390

Submitted on March 10, 2016

34 **Lack of knowledge:** According to Dr. Cultrera' s presentation at the Fall 2015 ACMUI meeting,
35 hematology/oncology fellows are not exposed to these agents during their training so they may
36 not be aware that these agents are available and consequently do not prescribe them. This is
37 an educational, not a regulatory issue.

38 **Competition:** Since these agents were introduced about 14 years ago, new, effective, therapies
39 that do not involve radiation have been developed, and it likely that some of the decrease in
40 use is related to the availability of these newer agents. This is not unique to radiolabeled
41 antibodies; this is common to all drugs: as newer, equally or more effective, agents become
42 available, the use of older agents declines.

43 **Shortage of Authorized Users:** It has been suggested that the infrequent and declining use of
44 these agents is a direct result of the requirement for 700 hours of training and experience to
45 obtain Authorized User (AU) status that went into effect shortly after these agents were
46 introduced. In his letter of 1/25/2016 to the ACMUI, Dr. Joseph Mace states that to his
47 knowledge, "... no oncologist has been able to receive AU status under the alternate pathway,
48 since the regulations went into effect..." Without knowledge of how many oncologists sought
49 AU status prior to the rule change, it is not possible to assess the significance of this statement.
50 The only way to determine the impact on AU's that the change in T&E requirements had, would
51 be to have aggregate data on AU's over time, data, which unfortunately, are not available.

Submitted on March 10, 2016

52 These considerations, it would appear, provide at least prima facie evidence that lack of clinical
53 use of Bexxar® and Zevalin® is not due to a lack of AUs.

54 The assertion that a shortage of AUs is the cause of the decline in the use of these agents is
55 undermined by the fact that even at many large medical centers with an abundance of
56 clinicians and AUs who work closely together, these radiopharmaceuticals are used infrequently
57 (Figure 2). According to his January 2015 letter, Dr. Mace, who receives consultations from
58 “across the state of Florida” has administered beta emitters, including Zevalin® to more than 40
59 patients over the past decade, or only about 4 per year.

Submitted on March 10, 2016

64 **Safety:** The exceptional safety record that has accompanied beta, and more recently alpha
65 emitting radiopharmaceuticals, is indisputable. Therefore why not reduce the T&E
66 requirements anyway, regardless of whether or not there is a shortage of AU's? It is important
67 to note that the excellent safety records achieved with these agents have been attained, in the
68 majority of cases, by or in conjunction with, AU's who have successfully completed the rigorous
69 T&E requirements.

70

71 **SUMMARY:**

72 The ramifications of a change in T&E are potentially significant. In terms of safety, as already
73 noted, the excellent safety records achieved with these agents have been attained, for the most
74 part, by or in conjunction with AU's who have successfully completed the rigorous T&E
75 requirements. Whether or not the safety records would be comparable in the hands of AU's
76 with considerably less T&E is a matter of conjecture. It has been suggested that 80 hours of
77 T&E is sufficient for administration of these agents. This is based on the concept that if 80 hours
78 of T&E is sufficient for radioactive iodine administration which, it has been asserted, is far more
79 complex and hazardous, then a comparable amount of T&E is sufficient for administration of
80 alpha & beta emitters. It is important to note that the field of Nuclear Medicine, including
81 therapy, originated to a great extent in endocrinology, because of the role of radioactive iodine
82 in the diagnosis and treatment of thyroid disease. Thus endocrinologists have a long history of
83 familiarity with the use of radioactive materials.

ACMUI Sub-Committee Draft Report on Training & Experience For Authorized Users of Alpha and Beta Emitters under 10 CFR 35.390

Submitted on March 10, 2016

84 Virtually all of the letters in support of a change in T&E support this change for oncologists.
85 Surely there are other individuals, in other specialties, who are capable of administering these
86 agents; should they also be included? Finally, should satisfactory completion of T&E allow an
87 individual to administer all of these agents, or should use be restricted to specific
88 radiopharmaceuticals as suggested in the February 9th, 2016 letter of Hilliard et al. to the
89 ACMUI?

90 Since it is not possible to conclude that the current T&E requirements are the only, or even the
91 principal, cause of the decreased use of radiopharmaceuticals like Zevalin[®] and Bexxar[®], and
92 because of the potential issues raised by the proposed changes in T&E, the subcommittee
93 recommends against the reduction in the number of hours of T&E required for 10 CFR 35.396
94 use.

95 **Charge 2:**

96 Establish a recommendation for the total number of hours of T&E for authorized users of alpha
97 and beta emitters to ensure safety.

98 While, for the reasons stated, the subcommittee opposes the reduction in the number of hours
99 of T&E, we also recognize the need for a thorough review of the current T&E requirements.
100 One important reason for this review is that it has been nearly 15 years since the current
101 requirements were established. Since that time new radiopharmaceuticals have been

ACMUI Sub-Committee Draft Report on Training & Experience For Authorized Users of Alpha and Beta Emitters under 10 CFR 35.390

Submitted on March 10, 2016

102 introduced and this is a trend that likely will continue. Appropriate T&E requirements for these
103 agents need to be established.

104 There is another important reason to undertake this review. The educational paradigm has
105 changed over time. There has been a shift away from prescriptive curricula (i.e. specific number
106 of classroom hours) to competency-based education. The time has come to reevaluate our
107 educational approach to T&E, with an emphasis on competency, not just experience.

108 This undertaking is complicated and cannot be completed in weeks or even months. It requires
109 input from many stakeholders, if it is to be successful. Once established, the T&E requirements
110 need regular, periodic review, to ensure that they are current.

111 Therefore the subcommittee recommends that the ACMUI establish a standing subcommittee
112 with the specific charge of periodically reviewing the T&E requirements currently in effect and
113 making recommendations for changes as warranted.

114

115 **Endorsement**

116 This report was unanimously approved by the subcommittee on February 24, 2016. However, a
117 differing opinion with respect to the barriers to access follows:

ACMUI Sub-Committee Draft Report on Training & Experience For Authorized Users of Alpha and Beta Emitters under 10 CFR 35.390

Submitted on March 10, 2016

118 *I support the Subcommittee's assertion that the Training and Experience requirements*
119 *need to be reviewed and re-evaluated. But I do not agree that the current requirements*
120 *do not effectively create some barriers to access to care.*

121 *As the Subcommittee Report states, the 700 hour Training and Experience requirement*
122 *for AUs of alpha and beta emitters is surely not the primary reason why these agents are*
123 *not frequently used in many major medical centers. There is no shortage of clinicians*
124 *available and authorized to administer these radiopharmaceuticals, and other factors*
125 *must contribute to the lack of utilization.*

126 *It is important to acknowledge that this condition may not hold true for the community*
127 *setting, where NHL patients often receive treatment. NHL patients often live with the*
128 *disease for many years, and require a varied armamentarium of therapies to address*
129 *each subsequent recurrence. Many of these patients are elderly, unable to travel, have*
130 *very limiting medical insurance networks, and may be too frail to tolerate the*
131 *debilitating side effects of cytotoxic therapies. To assert that all patients have access to*
132 *RIT is to ignore the logistical barriers that exist for those who are limited to receiving*
133 *therapy in the rural or community setting. The 700 hour T&E requirement effectively*
134 *limits AUs to those medical specialties that cover the requirements in residency training.*
135 *Those specialists may simply not be available in the community setting, creating a real*

**ACMUI Sub-Committee Draft Report on Training & Experience For Authorized Users of Alpha
and Beta Emitters under 10 CFR 35.390**

Submitted on March 10, 2016

136 *barrier to access for those patients who are unable to seek treatment in a larger medical*
137 *center.*

138 *Respectfully submitted,*

139 *Laura Weil, ACMUI Patients' Rights Advocate*
