To whom it may concern,

In the past trade-offs have been made regarding environmental impact created by nuclear generating facilities. Walkways going nowhere around Bivalve and a multitude of bird watching platforms are the current environmental offsets.

In response to these projects, it's not birds being sucked into intakes, changes in water temperature or infringement of spawning areas. The fish population is bearing the blunt of generating facilities.

Isn't it time for projects like public fishing piers at feasible locations?

In closing it's fish and fishing that suffer the most impact, not birds and birdwatchers.

Sincerely,

Michael Liss
