General Comment

Please add my voice in opposition to the NRC document "A Compendium of Spent Fuel Transportation". The NRC has once again failed to address the core problem involving transportation of highly radioactive used fuel rods. In order to transport, the fuel rods will have to be transferred to a transport cask. Here is the problem. The fragile, 1/2" thick canisters that are being used at most nuclear facilities may be leaking radiation at the time of transfer, thus making transfer itself a potentially lethal undertaking, Add to this the absence of a permanent storage facility and the potential for terrorism during transport you have a lethal scenario before you. Please reject this proposal.
