(12) REMARKS

DUKE POWER COMPANY
OCONEE NUCLEAR STATION
POST ACCIDENT
CAUSTIC INJECTION INTO THE LOW
PRESSURE INJECTION SYSTEM

1.0 Discussion

1.1 Purpose

This procedure is to provide instruction for determining the amount and method of caustic addition into the LPI System during a LOCA.

1.2 Principle

Caustic is injected into the LPI System during a LOCA to neutralize the borated water used in the Reactor Building Emergency Spray System to pH 7.0 - 8.0. The neutralization of the boric acid with caustic results in the formation of the salt sodium tetraborate. This reaction of a very weak acid with a strong base is shown below:

The neutralization will inhibit the generation of hydrogen gas and promote a higher partition factor for iodine.

2.0 Limits and Precautions

- 2.1 Adequate precautions in handling sodium hydroxide must be taken. Personnel shall wear safety goggles, face shield, pvc gloves, and a corrosive suit.
- 2.2 Under accident conditions, valve alignments shall NOT be made and injection shall NOT begin without prior authorization from the Technical Support Center (TSC)!
- 2.3 Under accident conditions, do NOT attempt any phase of this procedure without Health Physics approval and coverage!
- 2.4 Refer to CP/0/B/2007/01A for action to be taken in the event of a caustic spill.

3.0 Procedure

- 3.1 Take the following action prior to switchover to recirculation of core cooling.
 - 3.1.1 Ensure valve line-up by completing Enclosure 5.1.
 - 3.1.2 Pump 100 gallons of 35% NaOH into caustic tank using electric drum pump.
- 3.2 When switchover to recirculation of core cooling has been made, the TSC will authorize Chemistry to begin caustic addition.
 - 3.2.1 Upon authorization, start caustic pump at maximum flow setting. The caustic pump switch is located on the chemical addition control panel. The maximum pump capacity is approximately 2 gpm.
 - 3.2.2 The mix tank is in recirc. Check visually for recirc to ensure pump is pumping.
 - 3.2.3 If Unit 1 is affected, make valve alignment per Enclosure 5.2 to allow Caustic Injection into the LPI on Unit 1.
 - 3.2.4 If Unit 2 is affected make valve alignment per Enclosure 5.3 to allow caustic injection into the LPI on Unit 2.
 - 3.2.5 Pump caustic until the caustic level reaches the bottom of the gauge glass. Turn caustic pump off. Approximately 50 minutes will be required to pump one mix tank.
 - 3.2.6 Supervisor or his designee shall calculate the amount of caustic required for the neutralization of the borated water added to the core.
 - 3.2.7 The calculated amount of NaOH will probably exceed 100 gals. Therefore, several additions will be required. Repeat the following for each addition until approximately 50% of the required amount of caustic has been added. Record data for each mix on Enclosure 5.4.
 - 3.2.7.1 Close CA-34
 - 3.2.7.2 Close CA-35
 - 3.2.7.3 Pump 100 gal. 35% NaOH to caustic tank
 - 3.2.7.4 Open CA-34
 - 3.2.7.5 Open CA-35
 - 3.2.7.6 Start pump and continue pumping until caustic level reaches bottom of gauge glass.
 - 3.2.7.7 Turn pump off.

- 3.2.8 Allow LPI recirc time of 1-2 hours then when authorized by the TSC have sample taken to determine pH of reactor coolant. pH _____ Time _____
- 3.2.9 From results of sample, Supervisor or his designee shall determine the required amount of NaOH needed to complete the neutralization to pH of 7.0 - 8.0.
- 3.2.10 Repeat 3.2.7.1 through 3.2.7.7 until all necessary caustic has been injected. Allow LPI recirc time of 1-2 hours and request another sample for pH. pH _____ Time _____
- 3.2.11 If pH > 7.0, result will be reported to Emergency Coordinator and system should be returned to normal at the discretion of the Station Chemist (per Enclosure 5.1).
- 3.2.12 If pH < 7.0, Station Chemist will authorize additional injections as necessary.
