Re: Oconee Nuclear Station
Docket Nos. 50-269, -270, -287

Dear Mr. Giambusso:

On July 11, 1974, six of the 24 condenser cooling water (CCW) intake screens at the Oconee Nuclear Station were inspected. A number of small fingerling fish were found impinged upon these screens. Oconee Environmental Technical Specification 1.4(A) requires a report of any significant fish mortalities, and in any case, any mortality which involves greater than 100 fish.

A total of 3,481 fish weighing 22 pounds had collected on the screens during the two-week interval from June 27 to July 11. The fish were removed from the screens and categorized, where possible, as to screen location, type, size, degree of decomposition, and weight. This information is tabulated in Enclosure 1.

The six intake screens were for CCW pumps 1A, 2A, and 3A. Eighty-eight percent of the fish were located on the screens for pump 1A. During the two weeks since the last inspection, the CCW pumps operated in the normal mode for the following time percentages:

CCW Pump 1A	89%
CCW Pump 2A	31%
CCW Pump 3A	84%

It appears that screen location and not water velocity was the major factor in the collection of these fish.

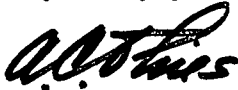

6322

Mr. Angelo Giambusso
Page 2
July 22, 1974

It is concluded that the mortality of these 22 pounds of fish had an insignificant effect on the environment.

Very truly yours,

A. C. Thies
