There are no post COL activities related to this section.

6.3.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant addressed the required information relating to the passive containment cleanliness program, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements. In addition, the staff concludes that the relevant information presented in the WLS COL FSAR is acceptable and meets the regulatory requirements and guidance discussed in Section 6.3.3 of this report. The staff based its conclusion on the following:

- WLS DEP 3.2-1 and WLS DEP 6.3-1, related to design modifications to the condensate return portion of the Passive Core Cooling System and quantifying the duration that the PRHR-HX can maintain safe shutdown conditions, respectively, are reviewed and found acceptable by the staff in Section 21.1 of this SER.

- STD COL 6.3-1 is acceptable because the containment cleanliness program complies with the guidance in RG 1.82.

- STD COL 1.9-2, related to BL 03-01 and GL 04-02, is acceptable because the only two items that need to be addressed by the COL applicant have been resolved. The protective coatings program is evaluated in Section 6.1.2 of this report, and the containment cleanliness program is evaluated under STD COL 6.3-1.

- STD COL 1.9-3, related to GSI-191, is acceptable because the only two items that need to be addressed by the COL applicant have been resolved. The protective coatings program is evaluated in Section 6.1.2 of this report, and the containment cleanliness program is evaluated under STD COL 6.3-1.

6.4 Habitability Systems

6.4.1 Introduction

There are a set of systems which provide habitability functions in the design and for the operation of WLS. These systems include the nuclear island non-radioactive ventilation system (VBS), the main control room (MCR) emergency habitability system (VES), the radiation monitoring system (RMS), the plant lighting system (ELS), and the fire protection system (FPS).

6.4.2 Summary of Application

WLS COL FSAR, Revision 11, Section 6.4, incorporates by reference AP1000 DCD, Revision 19, Section 6.4. In addition, in WLS COL FSAR Section 6.4, the applicant provided information to address the following:

Departures

- WLS DEP 6.4-1

The applicant provided information about WLS DEP 6.4-1 in Section 6.4 of the FSAR related to design changes affecting habitability of the MCR and changes to the calculated doses to control room operators. This information, as well as related WLS DEP 6.4-1 information appearing in other chapters of the FSAR, is reviewed in Section 21.2 of this report.

- WLS DEP 6.4-2

The applicant provided information about WLS DEP 6.4-2 in Section 6.4 of the FSAR related to design changes affecting habitability of the MCR and changes to the maximum temperatures and heat generated in the MCR. This information, as well as related WLS DEP 6.4-2 information appearing in other chapters of the FSAR, is reviewed in Section 21.3 of this report.

AP1000 COL Information Items

- STD COL 6.4-1

The applicant provided a list of onsite chemicals to supplement the list of chemicals identified in AP1000 DCD Table 6.4-1. STD COL 6.4-1 is discussed in WLS COL FSAR Chapter 6, Sections 6.4.4, "System Safety Evaluation"; 6.4.4.2, "Toxic Chemical Habitability Analysis"; and 6.4.7, "Combined License Information," as well as in WLS COL FSAR Sections 2.2.3.1.1.4, 2.2.3.1.3, and 2.2.3.1.4. The chemicals in Table 6.4-202 associated with STD COL 6.4-1 (as annotated in the left margin) include: hydrogen (both in a gas and liquid form); nitrogen; carbon dioxide; hydrazine, morpholine; sulfuric acid; sodium hydroxide; fuel oil; sodium molybdate; sodium hexametaphosphate; sodium hypochlorite and ammonium comp. polyethoxylate. In a November 4, 2010, letter, the applicant endorsed the June 17, 2010, letter from VEGP regarding the storage of standard chemicals described under STD COL 6.4-1. In an April 25, 2011, letter, the WLS COL applicant endorsed the July 30, 2010, letter from the VEGP applicant that proposed modifications to the WLS COL FSAR related to the maximum size and stated location of the liquid hydrogen storage tank.

- STD COL 6.4-2

The applicant provided information in STD COL 6.4-2 to address AP1000 COL Information Item 6.4-2 regarding the procedures and training for control room (CR) habitability pursuant to the resolution of GSI-83, "Control Room Habitability." STD COL 6.4-2 is discussed in WLS COL FSAR Sections 6.4.3, "System Operation"; and 6.4.7, "Combined License Information."

- WLS COL 6.4-1 and WLS COL 9.4-1b

The applicant provided WLS COL 6.4-1 to address AP1000 COL Information Item 6.4-1. The applicant provided information in the WLS COL FSAR regarding the storage of plant-specific hazardous chemicals. WLS COL 6.4-1 is discussed in WLS COL FSAR Chapter 6, Sections 6.4.4, "System Safety Evaluation"; and 6.4.4.2, "Toxic Chemical Habitability Analysis"; and 6.4.7, "Combined License Information," as well as in WLS COL FSAR Sections 2.2.3.1.1.4, 2.2.3.1.3, and 2.2.3.1.4.

Supplemental Information

- STD SUP 6.4-1

The applicant provided information in STD SUP 6.4-1 to address Control Room (CR) doses for accident analyses in the downwind unit of a dual-unit site. STD SUP 6.4-1 is discussed in WLS COL FSAR Section 6.4.4.1, "Dual Unit Analysis."

6.4.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements. The acceptance criteria associated with the relevant requirements of NRC regulations for habitability systems are given in NUREG-0800, Section 6.4. MCR habitability is addressed in the following:

- GDC 4, "Environmental and Dynamic Effects Design Bases," as it relates to SSCs important to safety being designed to accommodate the effects of and to be compatible with the environmental conditions associated with postulated accidents

- GDC 5, "Sharing of Structures, Systems and Components," as it relates to ensuring that sharing among nuclear power units of SSCs important to safety will not significantly impair the ability to perform safety functions, including, in the event of an accident in one unit, an orderly shutdown and cooldown of the remaining unit(s)

- GDC 19, "Control Room," as it relates to maintaining the nuclear power unit in a safe condition under accident conditions and providing adequate radiation protection

- 10 CFR 50.34(f)(2)(xxviii), as it relates to evaluations and design provisions to preclude certain MCR habitability problems

- 10 CFR 52.80(a), which requires that a COL application address the proposed inspections, tests, and analyses, including those applicable to emergency planning, that the licensee shall perform, and the acceptance criteria that are necessary and sufficient to provide reasonable assurance that, if the inspections, tests, and analyses are performed and the acceptance criteria met, the facility has been constructed and will operate in conformity with the COL, the provisions of the Atomic Energy Act of 1954, as amended, and NRC regulations

- NUREG-0737, "Clarification of TMI [Three Mile Island] Action Plan Requirements"

- TMI Action Plan, Item III.D.3.4, "Control Room Habitability"

- RG 1.78, Revision 1, "Evaluating the Habitability of a Nuclear Power Plant Control Room during a Postulated Hazardous Chemical Release"

- RG 1.52, Revision 3, "Design, Inspection, and Testing Criteria for Air Filtration and Adsorption Units of Post Accident Engineered Safety Feature Atmosphere Cleanup Systems in Light Water Cooled Nuclear Power Plants"

- RG 1.196, "Control Room Habitability at Light Water Nuclear Power Reactors," May 2003

6.4.4 Technical Evaluation

The staff reviewed WLS COL FSAR Section 6.4, and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The staff's review confirmed that the information in the WLS COL application and incorporated by reference addresses the required information relating to habitability systems. The results of the staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this report provides a discussion of the strategy used by the staff to perform one technical review for each standard issue outside the scope of the DC and use this review to evaluate subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the VEGP reference COL application were equally applicable to the WLS COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR to the WLS COL FSAR, except for the evaluation of STD COL 6.4-1 and STD SUP 6.4-1. For these two items, the staff compared the BLN COL FSAR, Revision 2, to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from responses to RAIs.

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed and that those changes were actualized in the WLS COL FSAR.

- The staff verified that the site-specific differences, if any, did not adversely affect any previous relevant evaluation or conclusion.

The staff completed its review and concluded that the evaluation performed for the standard content is directly applicable to the VEGP COL application. This standard content material is identified in this report by use of italicized, double-indented formatting. Section 1.2.3 of this report provides an explanation of why the standard content material from the SER for the VEGP reference COL application includes evaluation material from the SER for the BLN COL application. Any confirmatory items in the standard content material retain the numbers assigned in the VEGP SER.

<u>Control Room Radiological Habitability</u>

The staff evaluated the WLS COL FSAR incorporation by reference of the AP1000 DCD evaluation of control room habitability, taking into consideration the WLS site characteristics.

Compliance with the control room habitability dose requirements of GDC-19 requires that the applicant show that, for a plant located at the site, the control room provides adequate radiation protection to ensure that radiation exposures shall not exceed 0.05 Sv (5 radiation equivalent man (rem)) total effective dose equivalent (TEDE) to permit access and occupancy of the control room under accident conditions for the duration of the accident. The applicant did not provide site-specific doses in the control room for the design basis accidents referenced in the AP1000 DCD, Revision 19, but instead incorporated by reference the analysis of the radiological control room habitability from the AP1000 DCD, Revision 19, Section 6.4.4, “System Safety Evaluation.”

AP1000 DCD, Revision 19, Chapter 6.4, provided the results of the analysis of the control room radiological consequences for the design basis accidents analyzed for offsite radiological consequences in AP1000 DCD Chapter 15. The details and assumptions used in modeling the radiological consequences to control room operators were described in detail in the AP1000 DCD Section 15.6.5.3. The staff’s technical evaluation of the information incorporated by reference related to the modeling of the control room in design basis accident radiological consequences analyses is documented in a supplement to NUREG-1793. The design basis accident control room radiological consequences analyses in the AP1000 DCD used design reference (site parameter) values for the atmospheric dispersion factors (χ/Qs), in place of site-specific values. The atmospheric dispersion factors are the only input to the design base accident (DBA) radiological consequences analyses that are impacted by the site characteristics. The applicant provided and discussed the WLS site-specific site characteristic control room χ/Qs in resolution of WLS COL 2.3-4. The WLS site characteristic control room χ/Qs are given in WLS COL FSAR Tables 2.3-222 and 2.3-223. In Section 2.3 of this report, the staff discusses its review of the resolution to WLS COL 2.3-4, related to the WLS site characteristic χ/Qs. All other inputs and assumptions in the radiological consequences analyses remain the same as in the AP1000 DCD. Smaller χ/Q values are associated with greater dilution capability, resulting in lower radiological doses. When comparing a DCD site parameter χ/Q value and a site characteristic χ/Q value, the site is acceptable for the design if the site characteristic χ/Q value is smaller than the site parameter χ/Q value. Such a comparison shows that the site has better dispersion characteristics than that required by the reactor design.

For each time averaging period, the WLS site-specific control room χ/Q values are less than the design reference control room χ/Q values used in AP1000 DCD, Revision 19, for the radiological consequence analyses for each of the design basis accidents. Since (1) the result of the radiological consequence analysis for a design basis accident during any time period of radioactive material release from the plant is directly proportional to the atmospheric dispersion factor for that time period, and (2) the WLS site characteristic χ/Q values are less than the comparable design site parameter χ/Q values in the DCD for all time periods for each accident, the WLS site-specific total dose for each design basis accident is therefore less than the AP1000 DCD, Revision 19, reference total dose for each design basis accident.

Since the AP1000 DCD, Revision 19, analyses show that the radiological consequences in the control room meet the regulatory dose requirements of GDC-19 by resulting in a TEDE less than 0.05 Sv (5 rem), and since the WLS site-specific design basis accident control room radiological consequences are less than those for the AP1000 DCD, Revision 19, then the staff concludes that the applicant has adequately shown that the design basis accident control room radiological consequences meet the dose requirements of GDC-19, and is therefore acceptable.

The following portion of this technical evaluation section is reproduced from VEGP SER Section 6.4.4:

<u>AP1000 COL Information Items</u>

- *STD COL 6.4-1*

The following portion of this technical evaluation section is reproduced from Section 6.4.4 of the BLN SER. The staff notes that Table 6.4-202 in the BLN FSAR, Revision 2, is equivalent to Table 6.4-201 in the VEGP COL FSAR. Information in the BLN COL FSAR having a left margin annotation STD SUP 6.4-2 was assigned a left margin annotation of STD SUP 6.4-3 in the VEGP COL FSAR, and revisions proposed by the applicant, described below, combined the information from STD SUP 6.4-3 and STD COL 6.4-1 under a single left margin annotation of STD COL 6.4-1. Therefore, the evaluation of STD COL 6.4-1 in this SER includes references to material identified as STD SUP 6.4-2 in the BLN COL FSAR.

- *STD SUP 6.4-2*

STD SUP 6.4-2 provides the chemical names, state of the chemical, quantity and location of the chemicals. The chemicals include: hydrogen (both in a gas and liquid form), hydrazine, morpholine, sulfuric acid, sodium hydroxide, fuel oil, sodium molybdate (molybdic acid, disodium salt), sodium hexametaphosphate, and sodium hypochlorite.

Subsequent to the issuance of Section 2.2.3 of this report, the staff reviewed the applicant's inventory of chemicals contained in STD SUP 6.4-2 for threats to CR habitability. The staff has determined, with the exception of hydrazine, that the STD SUP 6.4-2 chemicals do not warrant additional analysis for CR habitability because they do not exceed the immediate danger to life and health (IDLH) limit at ground level at the location of the CR.

Regarding hydrazine, a further analysis with the HABIT computer code (RG 1.78) confirms that the hydrazine may exceed the IDLH limit at ground level. However, additional analysis shows that the hydrazine concentrations at the CR intake and inside the CR will not exceed the IDLH limit when crediting the design of the CR ventilation intake located at the auxiliary building (57 ft. above ground), calculations show concentrations much less than the IDLH limit. These results are based on a temperature of 25 °C and a wind speed of 1 m/sec, with meteorology F class, which are the conditions used by the applicant and RG 1.78. Hence, it is determined that the hydrazine listed in STD SUP 6.4-2 will not pose a threat to CR habitability.

AP1000 COL Information Items

- *STD COL 6.4-1*

STD COL 6.4-1 information also provides the chemical names, state of the chemical, quantity and location of the chemicals. The chemicals include: nitrogen, carbon dioxide, and ammonium comp polyethoxylate.

Subsequent to the issuance of Section 2.2.3 of this report, the staff reviewed the applicant's inventory of chemicals listed in STD COL 6.4-1, and screened out the toxic chemicals that do not pose a threat to CR habitability. The staff has determined that with the exception of carbon dioxide the STD COL 6.4-1 chemicals do not warrant additional analysis because they do not exceed the IDLH limit at ground level at the location of the CR.

Regarding carbon dioxide, analysis with the HABIT computer code (RG 1.78) finds that carbon dioxide will not exceed the IDLH limit at ground level. This analysis is based on a temperature of 25 °C and a wind speed of 1 m/sec, with meteorology F class, which are the conditions used by the applicant and RG 1.78. Hence, it is determined that the carbon dioxide contained in STD COL 6.4-1 will not pose a threat to CR habitability.

The staff notes that the chemical analysis relied on by the COL applicant includes assumptions associated with design features, such as the intake location for the CR ventilation system. In RAI 6.4-8, the staff asked if any of the analyses of the chemicals in Table 6.4-202 credit design features, such as an elevated CR intake, to keep the chemical concentration in the CR below the IDLH levels, in which case a description of the design features credited in the safety analyses should be provided in the FSAR. This is Open Item 6.4-1.

Resolution of Standard Content Open Item 6.4-1

In a letter dated June 17, 2010, the applicant proposed modifications to Table 6.4-201 in the VEGP COL FSAR to address Open Item 6.4-1. The proposed modifications included addition of a column entitled "MCR Habitability Impact Evaluation" to the table that indicated when design features were considered in the impact evaluation, including either the MCR intake height or other design details beyond the intake height. The staff determined that the modifications sufficiently described the design assumptions considered by the applicant, and Open Item 6.4-1 is resolved. The incorporation of this modification to Table 6.4-201 into a future revision of the VEGP COL FSAR is being tracked as Confirmatory Item 6.4-1.

Resolution of Standard Content Confirmatory Item 6.4-1

Confirmatory Item 6.4-1 is an applicant commitment to revise its FSAR Table 6.4-201 to add a column entitled "MCR Habitability Impact Evaluation" that will indicate when design features are considered in the impact evaluation, including either the MCR intake height or other design details beyond the intake *height. The staff verified that VEGP COL FSAR Table 6.4-201 was appropriately revised. As a result, Confirmatory Item 6.4-1 is now closed.*

Evaluation of Additional Revisions to STD COL 6.4-1

In the letter dated June 17, 2010, the applicant proposed additional voluntary revisions to Table 6.4-201 in the VEGP COL FSAR regarding the storage of standard chemicals described under STD COL 6.4-1. The proposed revisions included changes to the chemical quantities, evaluated distances, and storage locations, as well as changes to the table organization, column headings, and table notes. The proposed revisions also included combining the chemicals listed under separately STD COL 6.4-1 and STD SUP 6.4-3 under a single left margin annotation of STD COL 6.4-1, thereby eliminating STD SUP 6.4-3.

In a letter dated July 30, 2010, the applicant proposed additional revisions to STD COL 6.4-1 related to the evaluated maximum quantity and location of the liquid hydrogen storage tank.

On April 14 and June 7, 2010, the NRC staff audited the applicant's proprietary calculation notes, APP-VES-M3C-006, entitled "Main Control Room Emergency Habitability from Toxic Chemical Effluents," Revision 0 and Revision 1 to verify the information supporting STD COL 6.4-1 and VEGP COL FSAR Table 6.4-201. As a result of these audits, the staff issued RAI 6.4-5. The applicant subsequently prepared calculation notes APP-PGS-M3C-011, entitled "AP1000 Gas Spill or Release Effects on Control Room Habitability," Revision 0 and Revision 1 that were audited by the staff on July 26 and August 23, 2010. In a letter dated September 3, 2010, the applicant proposed the following changes to the FSAR and provided the following additional information about calculated concentrations of chemicals that would occur at the MCR intake to address RAI 6.4-5:

- *Proposed to change the evaluated minimum distance between the MCR and the storage locations for liquid hydrogen, nitrogen, and carbon dioxide.*

- *For hydrogen, nitrogen, and carbon dioxide, proposed to indicate that MCR design details were considered in evaluating the potential impact to the MCR.*

- *Proposed to clarify that the MCR design details considered included MCR volume, envelope boundaries, ventilation systems, and occupancy factor.*

- *Provided information about how the analysis considered the effect of wind speeds less than 1 meter/second.*

- *Provided information about concentrations occurring at the MCR intake more than two minutes after a potential release occurs.*

- *For hydrogen, nitrogen, and carbon dioxide, provided information about concentrations occurring at the MCR intake when no building wake effects are considered.*

- *For carbon dioxide, provided information about concentrations occurring in the MCR based on a corrected conservative value for the MCR outside air exchange rate.*

In the evaluation presented in Section 2.2.3 of this SER, the staff reviewed the applicant's revised chemical inventory information listed in STD COL 6.4-1, and screened out the toxic chemicals that do not pose a threat to MCR habitability. The staff determined that, with the exception of hydrazine and carbon dioxide, the STD COL 6.4-1 chemicals do not warrant additional analysis for MCR habitability because they would not exceed the IDLH limit at ground level below the MCR ventilation intake. Hydrazine and carbon dioxide are evaluated below.

Regarding hydrazine, the NRC staff used the HABIT computer code (as referenced in RG 1.78) to confirm that hydrazine concentration may exceed the IDLH limit at ground level below the MCR intake. The staff then conducted an additional analysis showing that the hydrazine concentration at the MCR intake and inside the MCR would not exceed the IDLH limit when crediting the design of the MCR ventilation intake located at the auxiliary building (which is located 17.37 m (57 ft) above ground). The applicant annotated "IH" in VEGP COL FSAR Table 6.4-201 to indicate that the credit of MCR ventilation intake height had been taken in the safety analysis.

Regarding carbon dioxide, the NRC staff used the HABIT computer code to confirm that the carbon dioxide concentration may exceed the IDLH limit at the MCR intake. The staff then conducted an additional analysis showing that the carbon dioxide concentration inside the MCR would remain below the IDLH limit.

Based on the FSAR revisions proposed and additional information provided by the applicant and the confirmatory analyses performed by the staff, the staff determined that the hydrazine and carbon dioxide would not pose a threat to MCR habitability, and RAI 6.4-5 is closed.

The incorporation of the revisions to STD COL 6.4-1 Table 6.4-201 into a future revision of the VEGP COL FSAR, as proposed in letters from the applicant dated June 17, July 30, and September 3, 2010, is being tracked as Confirmatory Item 6.4-2.

Resolution of Standard Content Confirmatory Item 6.4-2

Confirmatory Item 6.4-2 is an applicant commitment to revise its FSAR Table 6.4-201 to revise information related to standard chemicals. The staff verified that VEGP COL FSAR Table 6.4-201 was appropriately revised. As a result, Confirmatory Item 6.4-2 is now closed.

The following portion of this technical evaluation section is reproduced from Section 6.4.4 of the BLN SER:

- *STD COL 6.4-2*

The NRC staff reviewed STD COL 6.4-2, related to COL Information Item 6.4-2 and COL Action Item 6.4-1, included under Section 6.4.3 of the BLN COL FSAR. The applicant stated that procedures and training for CR habitability are written in accordance with Section 13.5 for CR operating procedures, and Section 13.2 for operator training. In Section 6.4.3 of the FSAR, the applicant states that the procedures and training will be verified to be consistent with the intent of GSI-83.

However, the level of detail provided in the standard portion of BLN COL FSAR Section 6.4.3 is not adequate to determine if the regulatory requirements are met. As a result, the staff issued RAI 6.4-7, which asked the applicant to provide in the FSAR the essential elements of the training and procedures necessary to demonstrate that the regulatory requirements are met. The staff questioned what the operators would be directed and trained to do to meet the recommendations in RG 1.196. Specifically, in RAI 6.4-7, the staff requested information addressing the following:

- *RG 1.78, Regulatory Position C.5, "Emergency Planning"*
- *RG 1.196, Regulatory Position 2.5, "Hazardous Chemicals"*
- *RG 1.196, Regulatory Position 2.2.1, "Comparison of System Design, Configuration, and Operation with the Licensing Basis"*
- *RG 1.196, Regulatory Position 2.7.1, "Periodic Evaluations and Maintenance"*

The resolution of RAI 6.4-7 is identified as Open Item 6.4-2.

<u>Resolution of Standard Content Open Item 6.4-2</u>

The BLN response to RAI 6.4-7 dated January 5, 2010, stated that the operational aspects of the identified guidance had been met as documented in BLN COL FSAR Appendix 1AA. The BLN applicant's response also stated that the additional information would be provided in a future revision to BLN COL FSAR Section 6.4.3, addressing how procedures, testing and training related to CR habitability would be consistent with the above stated regulatory positions in RG 1.78 and RG 1.196. The VEGP applicant endorsed the BLN response to RAI 6.4-7 in a letter dated June 17, 2010, and committed to appropriately update Section 6.4.3 of the VEGP COL FSAR. Therefore, Standard Content Open Item 6.4-2 is resolved for the VEGP application, and incorporation of the proposed revision to Section 6.4.3 of the VEGP COL FSAR is being tracked as Confirmatory Item 6.4-3.

<u>Resolution of Standard Content Confirmatory Item 6.4-3</u>

Confirmatory Item 6.4-3 is an applicant commitment to revise its FSAR Section 6.4.3 to include information regarding procedures, testing and training *related to CR habitability. The staff verified that VEGP COL FSAR Section 6.4.3 was appropriately revised. As a result, Confirmatory Item 6.4-3 is now closed.*

- WLS COL 6.4-1 and WLS COL 9.4-1b

The applicant added Section 6.4.4.2, “Toxic Chemical Habitability Analysis,” at the end of AP1000 DCD Section 6.4.4, “System Safety Evaluation.” In WLS COL FSAR Section 6.4.4.2, the applicant added new text and a table for WLS COL 6.4-1 to address the issue of handling local toxic gas services and monitoring. The applicant determined that no toxic gas monitoring is required, while AP1000 DCD Section 6.4.7 states, “Combined License applicants referencing the AP1000 certified design are responsible for the amount and location of possible sources of hazardous chemicals in or near the plant and for seismic Category I Class 1E hazardous chemical monitoring, as required.”

The staff reviewed the text added to AP1000 DCD Section 6.4, by WLS COL 6.4-1. WLS performed an analysis of a chlorine release event and concluded that chlorine monitors are not needed, as permitted by RG 1.78, because the results of the HABIT EXTRAN analysis indicate that under ideal conditions a pressurized liquid chlorine tractor-trailer burst-type accident would not elevate control room HVAC intake concentrations beyond IDLH values. The applicant incorporated Table 6.4-202 from the VEGP COL FSAR, which consists of an updated list of toxic chemicals and parameters that have been reviewed and determined acceptable with respect to impact on the control room. In RAI 19, Questions 06.04-1 through 06.04-7, the staff requested that the applicant provide the results of its analysis of an offsite accidental release of chlorine, the source and assumptions of the input values used in the HABIT analysis, the number of operators to be protected from toxic gas release, operator response during chlorine release, and the definition of “steam vent” where atmospheric dispersion factors were considered.

Regarding the chlorine analysis methodology, in a May 31, 2012, response, the applicant stated that alternative modeling software was used. The applicant used a combination of ALOHA and HABIT to properly analyze the accidental release of chlorine. ALOHA code is limited to a 1 hour run time and terminates prior to the chemical release reaching the control room intake 5100 meter (m) (3.2 miles (mi)) from the release point. Therefore, a two phase analysis approach was developed using ALOHA for the initial phase of the event when the release behaves as a heavier-than-air gas until the chlorine cloud concentration decreases to 10,000 parts per million (ppm), and using HABIT for the remaining distance because according to the user’s manual for ALOHA, when the concentration of heavy gas drops below about 10,000 ppm, the chlorine behaves like a neutrally buoyant gas. HABIT treats the input chemical as neutrally buoyant and can be modified to allow for longer run times (while ALOHA is capped at 1 hour), therefore, HABIT can model long enough to capture the plume peak, the trailing plume edge, and the control room peak concentration. The staff finds the applicant’s proposed modeling approach for accidental off-site releases of chlorine, described in the previous paragraph and in WLS COL FSAR Section 2.2.3.1.3.3, is acceptable and, therefore, considers RAI 19, Questions 06.04-1 through 06.04-7 resolved. With regard to the other chemical analysis provided, the staff finds the applicant’s results also acceptable because the assumptions were conservative and the modeling approach reasonable, resulting in concentrations that remained below the IDLH.

The staff also issued RAI 103, Question 02.02.03-8, regarding analysis details on chemicals Methoxypropylamine (MPA) and Dimethylamine (DMA). In a March 28, 2012, response, the applicant provided information pertaining to the analysis of MPA and DMA. The applicant selected U.S. Environmental Protection Agency (EPA) code SLAB to conduct the analysis. The key points considered in the selection of SLAB are that the model is developed specifically to deal with dispersion of dense gases, and that the model has the capability of predicting concentrations at an elevated control room intake. The staff notes that the SLAB code enabled the applicant to correctly credit the heavy gas aspects of the release and also correctly account for the elevated intake in the AP1000 design. Also the applicant revised the WLS COL FSAR to indicate the credit for the elevated intake by modifying the table to add the “IH” for the chemicals in question. The staff finds the applicant’s modeling approach acceptable and, therefore, considers RAI 103, Question 02.02.03-8, resolved. The applicant’s WLS COL FSAR Sections 2.2.3.1.3, 6.4.4.2, and Table 6.4-202 reflect this discussion.

Supplemental Information

> - *STD SUP 6.4-1*
>
> *The NRC staff reviewed STD SUP 6.4-1 related to the evaluation of CR doses in the other unit of a dual unit plant included under Section 6.4.4 of the BLN COL FSAR. The staff concludes that STD SUP 6.4-1 is acceptable because the dose to the CR operators at an adjacent AP1000 due to a radiological release from another unit is bounded by the dose to CR operators on the affected unit. Further, simultaneous accidents at multiple units at a common site are not considered to be a credible event, unless there is a reliance on shared systems between the two units. This is not the case for the AP1000 design.*

A portion of the standard technical evaluation from the VEGP COL SER is not included above. The staff concluded that the omitted portion was not relevant to WLS.

6.4.5 Post Combined License Activities

There are no post COL activities related to this section

6.4.6 Conclusion

The staff reviewed the WLS COL application and checked the referenced DCD. The staff’s review confirmed that the applicant addressed the required information relating to MCR habitability, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the staff’s technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements. Based on its review of the application, the staff concludes that the information presented in the WLS COL FSAR is acceptable because it meets the acceptance criteria associated with the relevant requirements of NRC regulations for habitability systems given in NUREG-0800, Section 6.4. The staff based its conclusions on the following:

- WLS DEP 6.4-1, relating to design changes affecting habitability of the MCR and changes to the calculated doses to control room operators, is reviewed and found acceptable by the staff in Section 21.2 of this SER.

- WLS DEP 6.4-2, related to design changes affecting habitability of the MCR and changes to the maximum temperatures and heat generated in the MCR, is reviewed and found acceptable by the staff in Section 21.3 of this SER.

- STD COL 6.4-1 is acceptable because the chemicals do not exceed the IDLH limit at ground level at the intake of the MCR, using the regulatory guidance in RG 1.78.

- STD COL 6.4-2 is acceptable because the procedures, testing and training related to MCR habitability will be consistent with the stated regulatory positions in RG 1.78 and RG 1.196.

- WLS COL 6.4-1 and WLS COL 9.4-1b are acceptable, because the plant-specific chemicals do not exceed the IDLH limit at the intake of the MCR, using the regulatory guidance in RG 1.78.

- STD SUP 6.4-1 is acceptable because the dose to the MCR operators at an adjacent AP1000 due to a radiological release from another unit is bounded by the dose to MCR operators on the affected unit, using the regulatory guidance in NUREG-0800, Section 6.4.

6.5 Fission Product Removal and Control Systems

In the event of a design basis LOCA there is an assumed core degradation that results in a significant release of radioactivity to the containment atmosphere. This activity would consist of noble gases, particulates, and a small amount of elemental and organic iodine. Fission product removal and control systems are considered to be those systems for which credit is taken in reducing accidental release of fission products. The AP1000 design has no active system to control fission products in the containment following a postulated accident. The fission product control system is the primary containment. AP1000 DCD, Appendix 15B, “Removal of Airborne Activity from the Containment Atmosphere Following a LOCA,” discusses satisfactory removal of airborne activity (elemental iodine and particulates) from the containment atmosphere by natural removal processes (e.g., deposition and sedimentation) without the use of containment spray.

WLS COL FSAR, Revision 11, Section 6.5, incorporates by reference, with no departures or supplements, AP1000 DCD, Revision 19, Section 6.5. The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.[1] The staff’s review confirmed that there is no outstanding issue related to this section. The results of the staff’s technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

6.6 Inservice Inspection of Class 2, 3, and MC Components

6.6.1 Introduction

Inservice inspection (ISI) programs must meet requirements of 10 CFR 50.55a, “Codes and Standards,” in which American Society of Mechanical Engineers (ASME) Boiler and Pressure Vessel Code (B&PV)) is incorporated by reference. This section addresses the ISI of ASME Code Class 2 and 3 components. ASME Code Class 2 and 3 components must meet the applicable inspection requirements set forth in ASME B&PV Code, Section XI, “Rules for Inservice Inspection (ISI) of Nuclear Power Plant Components,” Subsections IWC and IWD.” Subsection IWC and IWD also include requirements for preservice examinations prior to initial plant startup as provided in Subarticles IWC-2200 and IWD-2200.

6.6.2 Summary of Application

WLS COL FSAR, Revision 11, Section 6.6, incorporates by reference AP1000 DCD, Revision 19, Section 6.6. In addition, in WLS COL FSAR Section 6.6, the applicant provided information to address the following:

AP1000 COL Information Items

- STD COL 6.6-1

The applicant provided information in STD COL 6.6-1 to address AP1000 COL Information Item 6.6-1. The information relates to plant-specific preservice inspection (PSI) and ISI programs. STD COL 6.6-1 is discussed in WLS COL FSAR Sections 6.6, “Inservice Inspection of Class 2, 3, and MC Components”; 6.6.1, “Components Subject to Examination”; 6.6.3.1, “Examination Methods”; 6.6.3.2, “Qualification of Personnel and Examination Systems for Ultrasonic Examination”; 6.6.3.3, “Relief Requests”; 6.6.4, “Inspection Intervals”; 6.6.6, “Evaluation of Examination Results”; and 6.6.9.1, Inspection Programs.”

- STD COL 6.6-2

The applicant provided information in STD COL 6.6-2 to address AP1000 COL Information Item 6.6-2. The information relates to preservation of component accessibility design considerations during the construction phase. This COL information item is discussed in WLS COL Sections 6.6.2, “Accessibility,” and 6.6.9.2, “Construction Activities.”

Supplemental Information

- STD SUP 6.6-1

The applicant provided information related to the design stage consideration of component accessibility to enable the performance of ISI examinations.

License Condition

- WLS COLA Part 10, “Proposed License Conditions (Including ITAAC),” License Condition 6, “Operational Program Readiness”

This proposed license condition states that the COL holder shall provide an operational program implementation schedule to support NRC inspections. For the purpose of the review of WLS COL FSAR Section 6.6, the relevant operational programs are the Inservice Inspection Program and the Preservice Inspection Program.

6.6.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements. The acceptance criteria associated with the relevant requirements of NRC regulations for ISI of ASME B&PV Code Class 2 and 3 components are given in NUREG-0800, Section 6.6. The applicable regulatory requirements for acceptance of the resolution of COL information items and supplementary information on ISI and testing of ASME B&PV Code Class 2 and 3 components are established in GDC 45, “Inspection of Cooling Water System” located in 10 CFR Part 50, Appendix A, as it relates to periodic inspection of important components, such as heat exchangers and piping to assure the integrity and capability of the system. The applicable policy for acceptance of COL information items, as it relates to fully describing an operational program, is located in SECY-05-0197.

6.6.4 Technical Evaluation

The staff reviewed Section 6.6 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The staff’s review confirmed that the information in the application and incorporated by reference addresses the required information relating to the ISI of Class 2 and 3 components. The results of the staff’s evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this report provides a discussion of the strategy used by the staff to perform one technical review for each standard issue outside the scope of the DC and use this review to evaluate subsequent COL applications. To ensure that the staff’s findings on standard content that were documented in the SER for the VEGP reference COL application were equally applicable to the WLS COL application, the staff undertook the following reviews:

- The staff compared the VEGP to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed and that those changes were actualized in the WLS COL FSAR.

- The staff verified that the site-specific differences, if any, did not adversely affect any previous relevant evaluation or conclusion.

The staff has completed its review and found the evaluation performed for the standard content is directly applicable to the WLS COL application. This standard content material is identified in this report by use of italicized, double-indented formatting. Section 1.2.3 of this report provides an explanation of why the standard content material from the SER for the VEGP reference COL application includes evaluation material from the SER for the BLN COL application.

The following portion of this technical evaluation section is reproduced from Section 6.6.4 of the VEGP SER:

> *<u>AP1000 COL Information Items</u>*
>
> - *STD COL 6.6-1*
>
> *In Section 6.6 of the NRC staff FSER (NUREG-1793, dated September 2004), the staff concluded that the AP1000 ISI program for ASME Code Class 2 and 3 components is acceptable and meets the requirements of 10 CFR 50.55a with regard to the preservice and inservice inspectability of these components. The specific version of the ASME Code, Section XI used as the baseline Code in the AP1000 certified design, is the 1998 Edition up to and including the 2000 Addenda. It should be noted that the staff did not identify any portions of the AP1000 ISI program for Class 1, 2, and 3 components that were excluded from the scope of the staff's review of the AP1000 DC (as the staff did for inservice testing of valves in AP1000 FSER Section 3.9.6.4). Therefore, the staff's conclusions regarding the acceptability of the AP1000 ISI program based on the 1998 Edition up to and including the 2000 Addenda of the ASME Code, Section XI with regard to preservice and inservice inspectability of Class 2 and 3 components remains unchanged. The staff's evaluation of the operational program aspects of the ASME Code Class 2 and 3 ISI program is addressed with Class 1 ISI in Section 5.2.4 of this SER. The review of the COL applicant's supplemental information also includes the adequacy of the ISI program for reactor containment (Class MC). In Revision 17 of the AP1000 DCD, Class MC components were added to the DCD, Section 6.6, as being within the scope of the ISI Program. The COL applicant incorporated DCD Section 6.6 in its entirety under Revision 1 of its FSAR. Accordingly, the staff's evaluation of this section focused on the acceptability of the COL applicant's supplemental information and responses to AP1000 COL information items and action items as they relate to ISI of ASME Code Class 2, 3, and MC components.*
>
> *As part of STD COL 6.6-1, the COL applicant added to the end of DCD Section 6.6.2 words to state that the initial ISI program will incorporate the latest Edition and Addenda of the ASME Code (Section XI) approved in 10 CFR 50.55a(b) on the date 12 months before initial fuel load. The COL applicant stated that successive 120-month inspection intervals must comply with the requirements of the latest Edition and Addenda of the Code incorporated by reference in 10 CFR 50.55a(b) 12 months before the start of the 120-month interval, subject to the limitations and modifications listed in 10 CFR 50.55a(b). The requirements in 10 CFR 50.55a(g) state that inservice examinations of components and system pressure tests conducted during the initial 120-month inspection interval must comply with the requirements in the latest Edition and*

Addenda of the Code incorporated by reference in paragraph (b) of 10 CFR 50.55a on the date 12 months before the date scheduled for initial loading of fuel under a COL under 10 CFR Part 52. The staff concludes that the supplemental information provided by the COL applicant meets the NRC's regulations and is, therefore, acceptable.

As part of STD COL 6.6-1, the COL applicant added to the end of DCD Section 6.6.1 words to state that Class 2 and 3 components are included in the equipment designation list contained in the ISI program. The requirements in 10 CFR 50.55a(g)(3)(ii) state, in part, that Class 2 and 3 components be designed and provided with access to enable the performance of ISI examinations. In addition, the inclusion of Class 2 and 3 components is consistent with the requirements of an ISI program as defined under ASME Section XI, and is, therefore, acceptable. The staff concludes that the supplemental information provided by the COL applicant meets the NRC's regulations and is, therefore, acceptable.

In Section 6.6 of the FSER (NUREG-1793), the staff identified COL Action Item 6.6-1 in which the COL applicant will prepare a PSI program and an ISI program for ASME Code, Class 2 and 3 systems, components and supports. The PSI and ISI programs will address the equipment and techniques used. As part of STD COL 6.6-1, the COL applicant describes the use of visual, surface, ultrasonic, alternative examination techniques, and the use of automated equipment to perform the examinations. The COL applicant referenced the relevant portions of the ASME Code, Section XI to describe the nondestructive examination techniques and alternative examinations. The COL applicant also added information to describe the 120-month inspection interval as defined by IWB-2400 for Inspection Program B and the evaluation of examination results as defined by the ASME Code, Section XI, paragraphs IWC-, IWD-, IWE-, or IWF-3400 acceptance criteria. In addition, the COL applicant appropriately referenced 10 CFR 50.55a(b)(2)(xix) and IWA-2240 as described in the 1997 Addenda of the ASME Code, Section XI when applying alternative examination provisions. The supplemental information provided by the COL applicant meets the requirements in 10 CFR 50.55a, the ASME Code, Section XI, and the guidelines in RG 1.206, Section C.III.1, Chapter 6, C.I.6.6.3, and is, therefore, acceptable. Based on the discussion above, the staff concludes that the supplemental information under STD COL 6.6-1 is acceptable.

- *STD COL 6.6-2*

As part of STD COL 6.6-2, the COL applicant states that during the construction phase of the project, anomalies and construction issues are addressed using change control procedures. Modifications reviewed following DC will adhere to the same level of review as the certified design, thus, control of accessibility is maintained during post-DC activities. Control of accessibility for inspectability and testing during post-DC activities is provided via procedures for design control and plant modifications. In the NRC staff's FSER (NUREG-1793), the staff identified COL Action Item 6.6-2, which recommends COL applicants referencing the AP1000 certified design address the controls to preserve accessibility and *inspectability for ASME Code, Section III, Class 2 and 3 components and piping during construction or other post-DC activities. The NRC staff reviewed the applicant's proposed resolution of COL Action Item 6.6-2 using NUREG-0800, Section 6.6. The staff finds that the accessibility needed to perform PSI/ISI examinations is maintained during the design, construction and operational phases, which satisfies NUREG-0800, Section 6.6 recommendations for accessibility. In addition, the supplemental information meets the regulations under 10 CFR 50.55a(g)(3)(ii), which requires that Class 1, 2, and 3 components be designed and provided with access that enables the performance of ISI examinations, and the requirements under ASME Code, Section XI, IWA-1500. Based on the discussion above, the staff concludes that STD COL 6.6-2 is acceptable.*

<u>Supplemental Information</u>

- *STD SUP 6.6-1*

As part of STD SUP 6.6-1, the COL applicant added supplemental information to the AP1000 DCD, Section 6.6.2, to address accessibility of Class 2, 3, and Class MC pressure retaining components to permit preservice and inservice examinations. Factors considered, such as examination requirements, techniques, accessibility, geometry, and material selections, are used in establishing the designs with the goals being to eliminate uninspectable components, reduce occupational radiation exposure, reduce inspection times, allow state-of-the-art inspection systems, and enhance detection and the reliability of flaw characterization.

The requirements in 10 CFR 50.55a(g)(3)(ii) state, in part, that Class 2 and 3 components be designed and provided with access to enable the performance of ISI examinations. ASME Code, Section XI, IWA-1500 requires that access be provided to enable the performance of ISI examinations, along with design considerations to render ISI practical. The staff finds that the supplemental information under STD SUP 6.6-1 meets the requirements of 10 CFR 50.55a and ASME Code, Section XI, and is, therefore, acceptable.

<u>License Condition</u>

- *Part 10, License Condition 6*

The COL applicant proposed a license condition for BLN for all operational programs requiring that the licensee shall submit to the appropriate Director of the NRC a schedule, no later than 12 months after issuance of the COL, that supports planning for and conduct of NRC inspections of operational programs. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until either the operational program has been implemented or the plant has been placed into commercial service. A separate license condition for PSI and ISI program implementation requirements is not necessary in the BLN COL FSAR since it is a requirement under 10 CFR 50.55a. However, submittal of the schedule for the PSI and ISI program *development is necessary to plan for and conduct NRC inspections during construction. The staff finds that this schedule will enable the staff to adequately plan and schedule inspections of the PSI and ISI programs during the construction phase. This proposed license condition is consistent with the policy established in SECY-05-0197, and is acceptable.*

6.6.5 Post Combined License Activities

For the reasons discussed in the technical evaluation section above, the staff finds the following license condition associated with the PSI and ISI programs acceptable:

- License Condition (6-3) – No later than 12 months after issuance of the COL, the licensee shall submit to the appropriate Director of NRO a schedule that supports planning for and conduct of NRC inspections of the PSI and ISI programs. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until the PSI and ISI programs have been fully implemented.

6.6.6 Conclusion

The staff reviewed the application and checked the referenced AP1000 DCD. The staff's review confirmed that the applicant addressed the required information relating to ISI of ASME Code Class 2 and 3 components, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the WLS COL FSAR is acceptable and meets the requirements of GDC 45 and 10 CFR 50.55a. The staff based its conclusion on the following:

- STD COL 6.6-1 is acceptable because the staff concluded that the applicant's AP1000 ISI program for ASME Code Class 2, 3, and Metal Containment (MC) components is acceptable and meets the requirements of 10 CFR 50.55a with regard to the preservice and inservice inspectability of these components.

- STD COL 6.6-2 is acceptable because the staff concluded that the accessibility needed to perform PSI/ISI examinations is maintained during the design, construction and operational phases, and satisfies NUREG-0800, Section 6.6 acceptance criteria for accessibility.

- STD SUP 6.6-1 is acceptable because the staff concluded that accessibility to perform ISI examinations would be incorporated into the design, and satisfies the regulations under 10 CFR 50.55a(g)(3)(ii).

7 INSTRUMENTATION AND CONTROLS

Nuclear power plant instrumentation senses various plant parameters and transmits appropriate signals to the control systems during normal operation and to the reactor trip and engineered safety feature systems during abnormal and accident conditions. The information provided in this chapter emphasizes those instruments and associated equipment that constitute the protection and safety systems.

7.1 Introduction

7.1.1 Introduction

The Westinghouse AP1000 Design Control Document (DCD), Revision 19, contains Combined License (COL) Information Item 7.1-1 that requires the COL applicant to address setpoint calculations for protective functions

7.1.2 Summary of Application

Section 7.1 of the William States Lee III Nuclear Station (WLS) COL Final Safety Analysis Report (FSAR), Revision 11, incorporates by reference AP1000 DCD, Revision 19, Section 7.1, with the departures and/or supplements with respect to AP1000 DCD, Section 7.1.6.1, pertaining to "Setpoint Calculations for Protective Functions." This change to AP1000 DCD, Section 7.1.6.1 addressed the new COL Information Item (COL 7.1-1), which was incorporated in AP1000 DCD, Revision 18.

To address the above COL Information Item 7.1-1, the applicant provided the following additional information in the COL application:

AP1000 COL Information Item

- STD COL 7.1-1

Standard (STD) COL 7.1-1 addresses setpoint calculations for protective functions.

7.1.3 Regulatory Basis

The regulatory basis of the information incorporated by reference in the WLS COL application is addressed in NUREG-1793, "Final Safety Evaluation Report Related to Certification of the AP1000 Standard Design," and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of NRC regulations for Instrumentation and Controls are included in NUREG-0800, Section 7.1, "Standard Review Plan for the Review of Safety Analysis Reports for Nuclear Power Plants."

The applicable regulatory requirements for the information being reviewed in this section are as follows:

- Title 10 of the *Code of Federal Regulations* (10 CFR) 50.36, "Technical specifications"

- 10 CFR 52.79(a)(30), "Contents of applications; technical information"

7.1.4 Technical Evaluation

The staff reviewed WLS COL FSAR Section 7.1 and checked the referenced DCD to ensure that the combination of the DCD information incorporated by reference and the information in the COL application represents the complete scope of information relating to this review topic.[1] The NRC staff's review confirmed that the information in the WLS COL application and the information incorporated by reference from the AP1000 DCD application addressed the required information relating to setpoint calculations for protective functions. The results of the staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this safety evaluation report (SER) provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the design certification (DC) and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (Vogtle Electric Generating Plant (VEGP), Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews.

- The staff compared the VEGP COL FSAR, Revision 5, to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from requests for additional information (RAIs).

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.

- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the WLS COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) may include evaluation material from the SER for the Bellefonte Nuclear Plant (BLN), Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from VEGP SER Section 7.1.4:

> *The applicant, in its letter dated May 21, 2010, proposed to incorporate the Setpoint Program (SP) that will be added to the AP1000 DCD into the VEGP Technical Specifications (TS). This proposal was made to address Open Item 6.1-1. In Chapter 16 of this safety evaluation report (SER), the staff concludes that the response to Open Item 16.1-1 is acceptable. The incorporation of this program into the VEGP TS in a later revision was being*

---

[1] See Section 1.2.2 for a discussion of the staff's review related to verification of the scope of information to be included in a COL application that references a design certification (DC).

*tracked as **Confirmatory Item 16.1-1**. The closure of this Confirmatory Item is addressed in SER Section 16.1.*

In addition, in a letter dated June 4, 2010, the applicant proposed adding STD COL 7.1-1 as a new COL information item addressed in the VEGP COL FSAR.

<u>AP1000 COL Information Item</u>

- STD COL 7.1-1

The applicant proposed adding a new line item to VEGP COL FSAR Table 1.8-202 to address COL Information Item 7.1-1. The applicant also proposed the following addition to VEGP COL FSAR Section 7.1:

> *7.1.6.1 Setpoint Calculations for Protective Functions*
>
> *The Setpoint Program described in Technical Specifications Section 5.5 provides the appropriate controls for update of the instrumentation setpoints following completion of the calculation of setpoints for protective functions and the reconciliation of the setpoints against the final design.*

The applicant states that the TS program identified in the proposed Section 7.1.6.1 was that addressed in the VEGP revised response to Bellefonte Nuclear Plant (BLN) Open Item 16.1-1, dated May 21, 2010, and that the calculation and reconciliation of the setpoints discussed is required by the AP1000 Inspections, Tests, Analyses and Acceptance Criteria (ITAAC) included in AP1000 DCD Tier 1, Table 2.5.2-8, Item 10. In Chapter 16 of this SER, the staff concludes that the May 21, 2010, response to BLN Open Item 16.1-1 is acceptable.

Based on the ITAAC in Table 2.5.2-8, Item 10 and the TS controls in Section 5.5, the staff finds there are adequate controls for updating the instrumentation and controls (I&C) setpoints. Therefore, the staff finds STD COL 7.1-1 acceptable.

*The incorporation of the changes associated with proposed STD COL 7.1-1 into a future revision of the VEGP COL FSAR is **Confirmatory Item 7.1-1**.*

<u>Resolution of Standard Content Confirmatory Item 7.1-1</u>

Confirmatory Item 7.1-1 is an applicant commitment to revise its WLS COL FSAR Table 1.8-202 and Section 7.1 to address COL Information Item STD COL 7.1-1. The staff verified that the WLS COL FSAR was appropriately revised to address STD COL 7.1-1. As a result, Confirmatory Item 7.1-1 is now closed.

7.1.5 Post Combined License Activities

There are no post COL activities related to this section.

7.1.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant addressed the required information relating to setpoint calculations for protective functions, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

In addition, the staff compared the application to relevant NRC regulations and other NRC regulatory guides and concludes that, pending closure of the identified confirmatory items, the applicant is in compliance with NRC regulations. The staff based its conclusion on the following:

- To address AP1000 COL Information Item STD COL 7.1-1, the applicant provided a program for setpoint calculations for protective functions in accordance with the requirements of 10 CFR 50.36 and 10 CFR 52.79(a)(30).

7.2 Reactor Trip

WLS COL FSAR, Revision 11, Section 7.2, incorporates by reference, AP1000 DCD, Revision 19, Section 7.2, "Reactor Trip." In addition, in WLS COL FSAR, the applicant provided the following:

Departures

- WLS DEP 6.4-2

The applicant provided additional information in Figure 7.2-202 of the WLS COL FSAR about WLS DEP 6.4-2 related to design changes affecting how the temperature and humidity in the main control room are maintained within the limits for reliable human performance. This information, as well as related WLS DEP 6.4-2 information appearing in other chapters of the FSAR, is reviewed in Section 21.3 of this SER.

- WLS DEP 7.3-1

The applicant provided additional information in Figure 7.2-201 of the WLS COL FSAR about WLS DEP 7.3-1 related to required design changes for the protection and safety monitoring system (PMS) source range neutron flux doubling logic to comply with the requirements of IEEE Std. 603-1991, Clause 6.6. This information, as well as related WLS DEP 7.3-1 information appearing in other chapters of the FSAR, is reviewed in Section 21.5 of this SER.

The NRC staff reviewed Section 7.2 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of the information relating to this section.[1] The NRC staff's review confirmed that the applicant addressed the required information to satisfy the evaluation criteria. There is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

7.3 Engineered Safety Features

WLS COL FSAR, Revision 11, Section 7.3, incorporates by reference, AP1000 DCD, Revision 19, Section 7.3, “Engineered Safety Features.” In addition, in WLS COL FSAR, the applicant provided the following:

Departures

- WLS DEP 6.4-1

The applicant provided additional information in Section 7.3.1.2.17 of the WLS COL FSAR about WLS DEP 6.4-1 related to design changes affecting habitability of the main control room and changes to the calculated doses to control room operators. This information, as well as related WLS DEP 6.4-1 information appearing in other chapters of the FSAR, is reviewed in Section 21.2 of this SER.

- WLS DEP 6.4-2

The applicant provided additional information in Section 7.3.1.2.17 of the WLS COL FSAR about WLS DEP 6.4-2 related to design changes affecting how the temperature and humidity in the main control room are maintained within the limits for reliable human performance. This information, as well as related WLS DEP 6.4-2 information appearing in other chapters of the FSAR, is reviewed in Section 21.3 of this SER.

- WLS DEP 7.3-1

The applicant provided additional information in Section 7.3.1.2.14 of the WLS COL FSAR about WLS DEP 7.3-1 related to required design changes for the PMS source range neutron flux doubling logic to comply with the requirements of IEEE Std. 603-1991, Clause 6.6. This information, as well as related WLS DEP 7.3-1 information appearing in other chapters of the FSAR, is reviewed in Section 21.5 of this SER.

The NRC staff reviewed Section 7.3.1.2 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this section.[1] The NRC staff’s review confirmed that the applicant addressed the required information to satisfy the evaluation criteria. There is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the NRC staff’s technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

In RAI 01-04, issued to the applicant for the BLN Units 3 and 4, the staff questioned how the applicant would verify that the as-built Instrument & Control (I&C) system configuration conformed to schematics. In its response to RAI 01-04, the BLN applicant indicated that it or a designee would verify I&C cabinets as-built against the design drawings during manufacturing and would functionally test each system. In addition, the BLN applicant’s response indicated that the I&C cabinets would be tested during preoperational testing and in accordance with several ITAAC related to the I&C system. The BLN response to RAI 01-04 was endorsed as standard for WLS by Duke Energy Carolinas, Inc., in its February 5, 2009, letter.

The staff notes that vendor qualification testing, which may be done offsite, and preoperational testing fall under the applicant's quality assurance program. Any anomalies found during the testing or any problems identified from the time the testing is complete until the components are installed at the site would be corrected in accordance with the applicant's quality assurance program.

The staff finds the verification of the as-built I&C system configuration against schematics using a combination of vendor and onsite testing that falls under the applicant's quality assurance program acceptable. In addition, the staff finds that adequate program controls exist to ensure that once the testing was complete, the I&C system configuration would be maintained as valid throughout the life of the plant. Based on the above, the staff finds the response to BLN RAI 01-04 and the WLS endorsement of that response acceptable.

7.4 Systems Required for Safe Shutdown

WLS COL FSAR, Revision 11, Section 7.4 incorporates by reference AP1000 DCD, Revision 19, Section 7.4, "Systems Required for Safe Shutdown," with the following departures:

Departures

- WLS DEP 6.3-1 and WLS DEP 3.2-1

The applicant provided additional information for WLS DEP 6.3-1 and WLS DEP 3.2-1 in WLS COL FSAR Section 7.4.1.1 related to extended operation of the PRHR-HX, the ability to maintain safe shutdown conditions, changing the indefinite duration to at least 72 hours, and operator directed actions to preserve battery capability. This information, as well as related WLS DEP 6.3-1 information appearing in other chapters of the WLS COL FSAR, is reviewed in Section 21.1 of this SER.

The staff reviewed WLS COL FSAR Section 7.4.1.1 and checked the referenced DCD to ensure that the combination of the DCD and the WLS COL application represents the complete scope of information relating to this section. The staff's review confirmed that the applicant adequately addressed the required information to satisfy the evaluation criteria. There is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements. Section 21.1 of this report evaluates the departures from the AP1000 DCD provided in WLS DEP 6.3-1 and WLS DEP 3.2-1.

7.5 Safety-Related Display Information (Related to RG 1.206, Section C.III.1, Chapter 7, C.I.7.5, "Information Systems Important to Safety")

7.5.1 Introduction

Safety-related display information includes equipment that processes safety-related information and displays it for use by the operator to monitor and maintain the safety of the AP1000 throughout operating conditions that include anticipated operational occurrences and accident and post-accident conditions.

The AP1000 DCD contains COL Information Item 7.5-1 that requires the COL applicant to address post accident monitoring variables listed as site-specific in DCD Tables 7.5-1 and 7.5-8.

7.5.2 Summary of Application

WLS COL FSAR, Revision 11, Section 7.5, incorporates by reference AP1000 DCD, Revision 19, Section 7.5 with departures and/or supplements.

To address the departures and/or supplements, the applicant provided the following additional information:

Departure

- WLS DEP 6.4-2

The applicant provided additional information in Section 7.5 of the WLS COL FSAR about WLS DEP 6.4-2 related to design changes affecting how the temperature and humidity in the main control room are maintained within the limits for reliable human performance. This information, as well as related WLS DEP 6.4-2 information appearing in other chapters of the FSAR, is reviewed in Section 21.3 of this SER.

AP1000 Information Items

- WLS COL 7.5-1 and STD COL 7.5-1

The applicant provided additional information in WLS COL FSAR Section 7.5, "Safety-Related Display Information," describing the WLS COL FSAR Table 7.5-201 supplement (SUP) to AP1000 DCD Table 7.5-1 and AP1000 DCD Table 7.5-8 providing variable data shown in the DCD tables as "site specific."

7.5.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the information systems important to safety are given in NUREG-0800, Section 7.5.

The applicable regulatory requirements, guidelines, and related acceptance criteria for the supplemental information item are as follows:

- General Design Criterion (GDC) 13, "Instrumentation and Control"
- GDC 64, "Monitoring Radioactivity Releases"

The regulatory bases require, in part, that instrumentation be provided to monitor variables and systems over their anticipated ranges for normal operation, for anticipated operational occurrences, and for accident conditions as appropriate to ensure adequate safety. Monitoring should include checking the plant environs for radioactivity that may be released from postulated accidents.

7.5.4 Technical Evaluation

The staff reviewed WLS COL FSAR Section 7.5 and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The staff's review confirmed that the information in the COL application and the DCD information incorporated by reference addressed the required information relating to safety-related display information. The results of the staff's evaluation of the DCD information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

The staff reviewed the information in the WLS COL FSAR:

AP1000 Information Items

- WLS COL 7.5-1 and STD COL 7.5-1

The AP1000 DCD references and commits to Regulatory Guide (RG) 1.97, "Instrumentation for Light-Water-Cooled Nuclear Power Plants to Assess Plant and Environs Conditions During and Following an Accident," Revision 3, as the method of complying with GDC 13 and GDC 64.

WLS COL FSAR, Appendix 1AA, Revision 3, takes exception to RG 1.97, Revision 4. Instead, the applicant stated conformance to RG 1.97, Revision 3. The applicant stated, "Portable equipment outside the DCD scope conforms to Revision 3 of this Regulatory Guide for consistency with DCD scope since Revision 4 indicates that partial implementation is not advised." The acceptability of RG 1.97, Revision 3, is discussed by the staff in Section 12.1 of this report.

RG 1.97, Revision 3, states that the variable and range information should be provided for environs radiation and radioactivity, and meteorological instrumentation.

The staff issued RAI 4, Question 07.05-1, to the applicant requesting information on boundary environs radiation and meteorological instrumentation. The staff finds that the range of the boundary environs radiation instruments is necessary to ensure that the instruments are adequate for monitoring radioactivity that may be released from a postulated accident. The meteorological range and accuracy information conforms to the guidance of RG 1.97, Revision 3 with the exception of the differential temperature range. In its October 1, 2009, response to RAI 4, Question 07.05-1, the applicant proposed a range of -4°C to 8°C instead of - 5°C to 10°C and provided the following justification:

> *Stability class is estimated from the vertical temperature gradient between the 60m and 10m levels on the meteorological tower. As noted in footnote (f) of revised FSAR Table 2.3-281 transmitted as an enclosure to Reference 1, Delta-T is calculated by the datalogger. The datalogger Delta-T reading is verified to be within +0.05 degrees when the temperature sensors are placed in a drywell isothermal environment during calibration. A stated range of -4°C to +8°C is referenced based on procedural tolerances and ranges used at Duke Energy's operating nuclear stations. This range is adequate for Delta-T in determining the stability class per Table 1 of Regulatory Guide 1.23, Revision 1, with Delta-T criteria covering an overall range of (dT **<** -1.9°C) to (dT **>** +4.0°C) per a 100m separation. For the Lee 60m meteorological tower, with a 50m separation between the upper and lower temperature measurement levels, this equates to*

Delta-T criteria for estimating stability class within the overall range of (dT **<** *-0.95°C) to (Dt* **>** *+2.0°C).*

The staff finds the applicant's reduced differential temperature range acceptable because the data logger reading is verified to be within 0.05 degrees, which meets the 0.1 degrees resolution requirements of RG 1.23 (Revision 1), and the Delta-T calibration range (-4°C to +8°C) bounds RG 1.23 (Revision 1) Ambient Temperature Change with Height criteria as identified in RG 1.23, Revision 1, Table 1(AS1), "Classification of Atmospheric Stability." RG 1.23 provides guidance on meteorological instrumentation, which is referenced by RG 1.97.

The staff notes that the supplemental information conforms to the guidance of RG 1.97, Revision 3. The staff confirmed the incorporation of the instrumentation supplemental information in the WLS COL FSAR. The staff finds the supplemental response acceptable and considers RAI 4, Question 07.05-1 resolved.

In a May 26, 2010, letter, Westinghouse proposed a change to the AP1000 DCD to add COL Information Item 7.5-1 requiring that COL applicants provide information for variables listed as "site specific" in DCD Tables 7.5-1 and 7.5-8. Although this information was provided for WLS as part of WLS SUP 7.5-1 and incorporated in the WLS COL FSAR, the identification of COL Information Item 7.5-1 in theAP1000 DCD required that the applicant address this information with a COL identifier rather than as supplemental information. Accordingly, the applicant's November 4, 2010, letter proposes to replace WLS SUP 7.5-1 with STD COL 7.5-1 (for standard information) and WLS COL 7.5-1 (for WLS specific information). This change of identifiers does not impact the staff's conclusion regarding the instrumentation information added to the WLS COL FSAR. The incorporation of the changed identifiers into the WLS COL FSAR was treated as **Confirmatory Item 7.5-1**.

<u>Resolution of Standard Content Confirmatory Item 7.5-1</u>

Confirmatory Item 7.5-1 is an applicant commitment to revise its WLS COL FSAR Table 1.8-202, and Sections 7.5.2, 7.5.3.5, and 7.5.5 to address COL Information Item STD COL 7.5-1. The staff verified that the WLS COL FSAR was appropriately revised. Accordingly, the staff considers Confirmatory Item 7.5-1 closed.

7.5.5 Post Combined License Activities

There are no post COL activities related to this section.

7.5.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant adequately addressed the required information relating to safety-related display information, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the staff's technical evaluation of the DCD information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

In addition, the staff compared the application to the relevant NRC regulations and other NRC regulatory guides and concludes that, the applicant is in compliance with NRC regulations. The applicant has satisfactorily addressed the guidance of Revision 3 of RG 1.97 through the response to RAI 4, Question 07.05-1. The staff based its conclusion on the following:

- WLS DEP 6.4-2, related to design changes affecting how the temperature and humidity in the main control room are maintained within the limits for reliable human performance, is reviewed and found acceptable by the staff in Section 21.3 of this SER.
- To address WLS COL 7.5-1 and STD COL 7.5-1, the applicant provided sufficient information regarding the safety-related display information, which is acceptable in accordance with the requirements of 10 CFR Part 50, Appendix A, GDC 13 and GDC 64.

7.6 Interlock Systems Important to Safety

WLS COL FSAR Section 7.6, Revision 11, incorporates by reference, with no departures or supplements, AP1000 DCD, Section 7.6, “Interlock Systems Important to Safety,” Revision 19. The staff reviewed the WLS COL application and checked the referenced DCD to ensure that no issue relating to this section remained for review.[1] The staff’s review confirmed that there is no outstanding issue related to this section. The results of the staff’s technical evaluation of the DCD information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

7.7 Control and Instrumentation Systems (Related to RG 1.206, Section C.III.1, Chapter 7, C.I.7.7, “Control Systems Not Required for Safety”)

WLS COL FSAR, Revision 11, Section 7.7, incorporates by reference, with no departures or supplements, AP1000 DCD, Revision 19, Section 7.7, “Control and Instrumentation Systems,” The staff reviewed the WLS COL application and checked the referenced DCD to ensure that no issue relating to this section remained for review.[1] The staff’s review confirmed that there is no outstanding issue related to this section. The results of the staff’s technical evaluation of the DCD information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

8 ELECTRIC POWER

The electric power system is the source of power for station auxiliaries during normal operation and for the reactor protection system and engineered safety features during abnormal and accident conditions. This chapter provides information on the functional adequacy of the offsite power systems and safety-related onsite electric power systems, as applicable to the AP1000 passive design, and ensures that these systems have adequate capacity, capability, redundancy, independence, and testability in conformance with the current criteria established by the U.S. Nuclear Regulatory Commission (NRC).

Chapter 8, “Electric Power,” of this safety evaluation report (SER) describes the results of the review by the staff (the staff) of the William States Lee III Nuclear Station (WLS) combined license (COL) final safety analysis report (FSAR), Part 2 of the COL application, submitted by Duke Energy (DE), the COL applicant (the applicant).

8.1 Introduction

8.1.1 Introduction

This section provides the applicant’s description of the electric power system with regard to the interrelationships between the nuclear unit, the utility grid, and the interconnecting grids.

In addition, this section includes a regulatory requirements applicability matrix that lists all design bases, criteria, regulatory guides (RGs), standards, and other documents to be implemented in the design of the electrical systems that are beyond the scope of the design certification (DC).

8.1.2 Summary of Application

WLS COL FSAR, Revision 11, Section 8.1, incorporates by reference AP1000 design control document (DCD), Revision 19, Section 8.1 with departures and/or supplements.

To address these departures and supplements, in WLS COL FSAR, Section 8.1, the applicant provided the following additional information:

Supplemental Information

- WLS SUP 8.1-1

The applicant provided supplemental (SUP) information in WLS COL FSAR Section 8.1, “Introduction,” describing DE’s 525 and 230-kilovolt (kV) transmission systems, and the connection interface with the WLS Unit 1 to the 230-kV switchyard and WLS Unit 2 to the 525-kV switchyard at the plant site.

- WLS SUP 8.1-2

The applicant provided supplemental information in WLS COL FSAR Section 8.1 describing additional information pertaining to regulatory guides and Institute of Electrical and Electronics Engineers (IEEE) standards identified in AP1000 DCD, Table 8.1-1 and to other applicable regulatory guides as indicated in WLS COL FSAR Table 8.1-201, "Site-Specific Guidelines for Electric Power Systems."

8.1.3 Regulatory Basis

The regulatory basis for the information incorporated by reference is addressed in NUREG-1793, "Final Safety Evaluation Report Related to Certification of the AP1000 Standard Design," and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of NRC regulations for the introduction to the electric power systems are given in NUREG-0800, "Standard Review Plan for the Review of Safety Analysis Reports for Nuclear Power Plants (LWR Edition)," Section 8.1.

The applicable regulatory requirements, guidelines, and related acceptance criteria for the supplemental information items are as follows:

- Title 10 of the *Code of Federal Regulations* (10 CFR) 50.63, "Loss of all alternating current power"
- RG 1.155, "Station Blackout"
- RG 1.206, "Combined License Applications for Nuclear Power Plants (LWR Edition)"

8.1.4 Technical Evaluation

The staff reviewed WLS COL FSAR Section 8.1 and checked the referenced DCD to ensure that the combination of the DCD and the application represents the complete scope of information relating to this review topic.[1] The staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the introduction to the electric power systems. The results of the staff's evaluation of the information incorporated by reference in the WLS application are documented in NUREG-1793 and its supplements.

The staff reviewed the following information in the WLS COL FSAR:

Supplemental Information

- WLS SUP 8.1-1

The staff reviewed the resolution to the supplemental information WLS SUP 8.1-1 related to the DE transmission system and its connection to the WLS Units 1 and 2 included in WLS COL FSAR Section 8.1. The applicant provided the following supplements to WLS COL FSAR Section 8.1.1.

The DE transmission system consists of interconnected hydro plants, fossil-fueled plants, combustion turbine units and nuclear plants supplying energy to the service area at various

---

[1] See Section 1.2.2 of this report for a discussion of the staff's review related to verification of the scope of information to be included in a COL application that references a DC.

voltages up to 525 kV. The 525-kV switchyard is tied to DE's 525-kV transmission network by two single-circuit overhead lines. The 230-kV switchyard is tied to the DE's 230-kV transmission network by two double-circuit overhead lines. Both switchyards utilize breaker-and-a-half bus configurations. The two switchyards are connected by two 230-kV to 525-kV autotransformers.

The staff finds that the applicant has adequately described the WLS Units 1 and 2, connection to the utility grid and the information provided is in accordance with the recommendation of RG 1.206 and the guidance in NUREG-0800, Section 8.1.

- WLS SUP 8.1-2

The staff reviewed supplemental information in SUP 8.1-2, related to regulatory guidelines and industry standards and found it to be consistent with NUREG-0800, Section 8.1 with the exception of the information discussed below.

WLS COL FSAR Table 8.1-201, Item (1b) indicates that RG 1.155 is not applicable to WLS. This item was deemed as standard among COL applications being discussed in Bellefonte Nuclear Station's (BLN) response to request for additional information (RAI) 08.01-2. In a February 5, 2009, letter, the WLS applicant stated that the standard response to RAI 08.01-2 also applies to the WLS application.

The standard response submitted by BLN in a June 24, 2008, letter is summarized as follows. BLN stated that the AP1000 design meets the requirements of 10 CFR 50.63 for 72 hours and, therefore, no specific procedures or training specific to station blackout (SBO) are necessary. The staff determined that the above response was inconsistent with the recommendations of RG 1.155 and the requirements of 10 CFR 50.63. The staff recognizes that the passive systems can maintain safe-shutdown conditions after design-basis events for 72 hours, without operator action, following a loss of both onsite and offsite alternating current (ac) power sources. However, the applicant needs to establish SBO procedures and training for operators to include actions necessary to restore offsite power after 72 hours by addressing ac power restoration (e.g., coordination with transmission system load dispatcher), and severe weather guidance (e.g., identification of site-specific actions to prepare for the onset of severe weather such as an impending tornado) in accordance with RG 1.155, Regulatory Positions C.2 and C.3.4.

Several discussions were held between the staff and the BLN applicant regarding this issue. Subsequently, in an April 15, 2009, letter, the BLN applicant stated that the training and procedures to support mitigation of an SBO event would be implemented in accordance with BLN FSAR Sections 13.2 and 13.5, respectively. As recommended by NUMARC 87-00, "Guidelines and Technical Bases for NUMARC Initiatives Addressing Station Blackout at Light Water Reactors," which is endorsed by RG 1.155, the loss of all ac power event mitigation procedures will address response (e.g., restoration of onsite power sources), ac power restoration (e.g., coordination with transmission system load dispatcher), and severe weather guidance (e.g., identification of actions to prepare for the onset of severe weather such as an impending tornado), as applicable. In addition, the BLN applicant stated that there are no nearby large power sources, such as a gas turbine or black start fossil fuel plant that can directly connect to the station to mitigate the event.

The staff verified that the WLS applicant has updated WLS COL FSAR Sections 1.9.5.1.5 and 1.9.6 to include the above-mentioned items including the implementation of training and procedures to support mitigation of an SBO event. The staff finds this update satisfies RG 1.155, Regulatory Positions C.2 and C.3.4. Based on the above, the staff finds this item resolved.

8.1.5 Post Combined License Activities

There are no post COL activities related to this section.

8.1.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant addressed the required information relating to the introduction to the electric power systems, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the staff's technical evaluation of the information incorporated by reference in the WLS application are documented in NUREG-1793 and its supplements.

In addition, the staff compared the additional COL-specific supplemental information in the application to the relevant NRC regulations; guidance in NUREG-0800, Section 8.1, and other NRC regulatory guides and concluded that the applicant is in compliance with NRC regulations. The staff based its conclusion on the following:

- WLS SUP 8.1-1 is acceptable because the applicant provided sufficient information regarding the WLS connections to various transmission systems in accordance with the recommendations of RG 1.206.

- WLS SUP 8.1-2 is acceptable because the COL-specific regulatory guidelines and industry standards, and additional new regulatory guidelines are adequately addressed by the applicant. The applicant has also provided sufficient information for satisfying the requirements of 10 CFR 50.63 and the guidance in RG 1.155

8.2 Offsite Power System

8.2.1 Introduction

The offsite power system is referred to in regulatory guides and industry standards as the "preferred power system." It includes two or more physically independent circuits capable of operating independently of the onsite standby power sources and encompasses the grid, transmission lines (overhead or underground), transmission line towers, transformers and other switchyard components.

The AP1000 passive reactor plant standard design supports an exemption in 10 CFR Part 52, "Licenses, certifications, and approvals for nuclear power plants," Appendix D, "Design Certification Rule for the AP1000 Design," paragraph V.B.3, to the requirement of 10 CFR Part 50, "Domestic licensing of production and utilization facilities," Appendix A, "General Design Criteria for Nuclear Power Plants," General Design Criterion (GDC) 17, "Electric Power Systems," to have only one (not two) physically independent offsite circuit to provide for safety-related passive systems for core cooling and containment integrity.

Therefore, for WLS Units 1 and 2, the single offsite power source provided from the transmission network is reviewed below to assure that it satisfies the requirements of GDC 17 with respect to its capacity and capability.

8.2.2 Summary of Application

WLS COL FSAR, Revision 11, Section 8.2, incorporates by reference AP1000 DCD, Revision 19, Section 8.2, with departures and supplements.

To address these departures and/or supplements, in WLS COL FSAR Section 8.2 the applicant provided the following additional information:

AP1000 COL Information Items

- WLS COL 8.2-1

The applicant provided additional information in WLS COL 8.2-1 to address COL Information Item 8.2-1 (COL Action Items 8.2.3-1 and 8.2.3.3-1) to address the design of the ac power transmission system and its testing and inspection plan. The information describes: (1) the designs of the plant site 525-kV and 230-kV switchyards, the two 525-kV transmission lines connecting the plant switchyard to DE’s 525-kV transmission system, and the four 230-kV lines connecting the 230-kV switchyard, the connection of two switchyards through autotransformers, and the interface of the switchyards with the transmission grid; (2) the connections of the generator step-up (GSU) transformers and the reserve auxiliary transformers (RATs) to the switchyard; (3) the designs of the switchyard circuit breakers and disconnect switches; (4) the transformer area arrangement for each unit; (5) the ratings of the GSU transformers, unit auxiliary transformers (UATs), RATs, and autotransformers; 6) the design of the control building in the plant site 525-kV and 230-kV switchyards; (7) the administrative control of 525-kV and 230-kV switchyards and transmission lines circuit breakers; and (8) the switchyard and transmission lines testing and inspection plan; and 9) voltage operating range, frequency decay rate, and preservation of grid connection. WLS COL 8.2-1 is addressed in WLS COL FSAR Sections 8.2.1, 8.2.1.1, 8.2.1.2, 8.2.1.3, and 8.2.1.4.

In addition, the WLS applicant provided supplemental information describing details of a failure mode and effects analysis (FMEA) performed for the offsite power distribution system and the plant site switchyard.

- WLS COL 8.2-2

The applicant provided additional information in COL 8.2-2 to address COL Information Item 8.2-2 (COL Action Items 8.2.3.1-1, 8.2.3.1-2, and 8.2.3.1-3) describing: (1) the 525-kV and 230-kV switchyards arrangement and design of the protective relaying scheme; and (2) a transmission system study performed regularly to verify grid stability, switchyard voltage, and frequency to confirm the transmission system capability to maintain reactor coolant pump (RCP) operation for 3 seconds following a turbine trip as specified in AP1000 DCD Section 8.2.2. WLS COL 8.2.2 is addressed in WLS COL FSAR Sections 8.2.1.2.2, and 8.2.2.

Site-Specific Information Replacing Conceptual Design Information

- WLS CDI

The applicant provided COL-specific conceptual design information (CDI) describing the transformer area located next to each unit's turbine building and containing the GSU transformer, the UATs, and the RATs. This replaced the CDI located in the AP1000 DCD.

Supplemental Information

- WLS SUP 8.2-1

The applicant provided supplemental information on the transmission system provider/transmission system operator (TSP/TSO), and the detailed voltage and other requirements to be maintained by the TSP/TSO.

- WLS SUP 8.2-2

The applicant provided supplemental information describing the formal agreement between DE's Nuclear Generation Department (NGD) and DE's Power Delivery (PD) department, which is the TSO, setting the requirements for transmission system studies and analyses.

- WLS SUP 8.2-3

The applicant provided supplemental information describing the establishment of the PD department's responsibility for maintaining area bulk transmission system reliability and demonstrating, by power system simulation studies, projections, and analyses, the current and future reliability of the system.

- WLS SUP 8.2-4

The applicant provided supplemental information describing the agreement between the NGD and the PD departments demonstrating that protocols are in place for WLS to remain cognizant of grid vulnerabilities in order to make informed decisions regarding maintenance activities critical to the electric system.

- WLS SUP 8.2-5

The applicant provided supplemental information describing the reliability of the DE transmission system's 525-kV and 230-kV transmission lines based on 12 years of outage data.

Interface Requirements

The plant/offsite electrical power interfaces for the AP1000 standard design are discussed in AP1000 DCD Tier 2, Section 8.2.5. AP1000 DCD Tier 2, Table 1.8-1, Items 8.1, 8.2, and 8.3 identify these interfaces as non-nuclear safety (NNS) interfaces.

Inspections, Tests, Analyses and Acceptance Criteria

In a letter dated August 28, 2014, the applicant provided a supplemental response to RAI 108, Question 08-1 that proposed to revise COL application Part 10, Appendix B, to include two new inspections, tests, analyses and acceptance criteria (ITAAC), numbered 4.g and 7, in order to address Bulletin 2012-01, "Design Vulnerability in Electric Power System."

8.2.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of NRC regulations for the offsite power system are given in NUREG-0800, Sections 8.1 and 8.2.

The regulatory bases for acceptance of the COL information and supplementary information items are established as follows:

- 10 CFR Part 50, “Domestic licensing of production and utilization facilities,” Appendix A, “General Design Criteria [GDC] for Nuclear Power Plants,” Criterion 17, “Electric power systems”
- GDC 5, “Sharing of structures, systems, and components”
- GDC 18, “Inspection and testing of electrical power systems”
- 10 CFR 50.65, “Requirements for Monitoring the Effectiveness of Maintenance at Nuclear Power Plants”
- RG 1.206, “Combined License Applications for Nuclear Power Plants (LWR Edition)”
- Generic Letter (GL) 2006-02, “Grid Reliability and the Impact on Plant Risk and the Operability of Offsite Power”

8.2.4 Technical Evaluation

The staff reviewed WLS COL FSAR Section 8.2 and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The staff’s review confirmed that the information in the COL application and the DCD information incorporated by reference addresses the required information relating to the offsite power system. The results of the staff’s evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this report provides a discussion of the strategy used by the staff to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff’s findings on standard content that were documented in the SER for the reference COL application (Vogtle Electric Generating Plant (VEGP) Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.
- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed by the WLS COL applicant.

- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and finds the evaluation performed for the standard content to be directly applicable to the WLS application. This standard content material is identified in this report by use of italicized, double-indented formatting. Any confirmatory items in the standard content material retain the numbers assigned in the VEGP SER. Confirmatory items that are first identified in this report section have a WLS designation (e.g., Confirmatory Item WLS 8.2-1).

The staff reviewed the information in the WLS COL FSAR:

AP1000 COL Information Item

- WLS COL 8.2-1

The applicant provided additional information in WLS COL 8.2-1 to resolve COL Information Item 8.2-1, which states:

> Combined License applicants referencing the AP1000 certified design will address the design of the ac power transmission system and its testing and inspection plan (DCD Section 8.2.5).

The commitment was also captured as COL Action Items 8.2.3-1 and 8.2.3.3-1 in NUREG-1793, Appendix F, which states:

> The operating voltage for the high side of the AP1000 transformer and transmission switchyard, as well as the frequency decay rate are site specific and, therefore, will be addressed in the COL application. The COL applicant will provide analysis of these matters, including transient stability, voltage operating range, and preservation of the grid connections, in the COL application (COL Action Item 8.2.3-1).
>
> Combined License applicants referencing the AP1000 certified design will address the design of the ac power transmission system and its testing and inspection plan (COL Action Item 8.2.3.3-1).

The staff reviewed the resolution to the WLS COL 8.2-1 related to the transmission system design, testing, and inspection included under WLS COL FSAR Section 8.2. The staff's evaluation is as follows:

WLS Units 1 and 2, receive offsite ac power from a common 525/230-kV switchyard, which is connected to the DE transmission network. The two switchyards are connected by two 230-kV to 525-kV autotransformers. Unit 2 is connected to the 525-kV switchyard, and Unit 1 is connected to the 230-kV switchyard. The power from Unit 2 is transmitted via overhead transmission line to the 525-kV switchyard. Similarly, the power from Unit 1 is transmitted via overhead transmission lines to the 230-kV switchyard.

There are four transmission lines connected to the 230-kV switchyard, and two transmission lines connected to the 525-kV switchyard. Each transmission line is tied into a DE transmission line or switchyard located between 19 and 95 miles from the station.

Unit 1 is connected to the DE Transmission System via the Roddey East and Roddey West 230-kV lines. The Roddey lines consist of a section of line, 55 km (34 miles (mi)) in length, from WLS to Catawba Nuclear Station and a section of line, 31 km (19 mi) in length, from WLS to Pacolet Tie. The 230-kV line is constructed on a 46 m (150 foot (ft)) wide right-of-way with double circuit lattice steel towers; varying in height from 37 m to 58 m(120 ft to 190 ft) with a nominal height of 46 m (150 ft). Unit 2 is connected to the DE Transmission System via the Asbury 525-kV line. This line consists of a section of line, 66 km (41 mi) in length, from WLS to Newport Tie and a section of line, 153 km (95 mi) in length, from WLS to Oconee Nuclear Station. The 525-kV line is constructed on a 61 m (200 ft) wide right-of-way with single circuit lattice steel towers, varying in height from 37 m to 46 m (120 ft to 150 ft) with a nominal height of 43 m (140 ft). Conductors are two per phase in a horizontal bundle. All lines are designed to meet or exceed the requirements of the American National Standards Institute (ANSI) C2, "National Electric Safety Code."

The staff reviewed the layout of transmission lines and concluded that at least one offsite power source will be available to both Units 1and 2. The staff finds that the above satisfies the requirements of GDC 17.

In WLS COL FSAR Section 8.2.1.4, the applicant addressed the switchyard and transmission lines testing and inspection plan. In RAI 5, Question 08.02-7, the staff questioned the statement made in WLS COL FSAR Section 8.2.1.4, which states, "PD follows its own field test manuals, vendor manuals and drawings, industry's maintenance practices and observes Federal Energy Regulatory Commission (FERC) requirements and North American Electric Reliability Corporation (NERC) reliability standards." The staff requested the applicant explain whether the statement is intended to indicate that DE NGD will follow the FERC and NERC standards for switchyard maintenance and testing. In a September 5, 2008, response, the applicant stated that this statement was intended to indicate that DE follows the applicable NERC reliability standards associated with switchyard maintenance and testing. The applicant stated that it will revise the WLS COL FSAR as follows, for purposes of clarity:

> For performance of maintenance, testing, calibration, and inspection, TSO follows its own field test manuals, vendor manuals and drawings, and industry's maintenance practices to comply with applicable NERC reliability standards.

The staff has verified that the WLS COL FSAR has been updated to include the above-mentioned revised paragraph. Since the goal of GDC 18 is to assure testability of, in this case, the switchyard and transmission lines and the goal of GDC 17 is, among other things, to assure a high reliability of the offsite power system, full conformance to the applicable NERC reliability standards acceptably addresses the staff's concern. Therefore, the staff finds the issue in RAI 5, Question 08.02-7 resolved.

In COL 8.2-1 (WLS COL FSAR Section 8.2.1.1), the applicant also provided a brief summary of the FMEA performed on the WLS switchyard. In RAI 1, Question 08.02-2, the staff requested that the applicant describe in detail how each event (a breaker not operating during a fault on an offsite line; fault on a switchyard bus; fault on an auto bank; a spurious relay trip; a loss of control power; and other cases discussed in the WLS COL FSAR). In a September 5, 2008, response, the applicant provided the requested information and stated that the WLS COL FSAR will be revised to include the detailed FMEA.

The staff verified that WLS COL FSAR Section 8.2.1.1 has been updated to include the detailed FMEA results. The staff reviewed the FMEA of the WLS switchyard and concludes that a single initiating event, such as (1) a breaker not operating during a fault condition; (2) a fault on a switchyard bus; (3) a spurious relay trip; (4) or a loss of control power supply would not cause failure of more than one single offsite line, or a loss of offsite power to either WLS Unit 1 or 2. Therefore, the staff finds that the issue in RAI 1, Question 08.02-2 has been adequately addressed and resolved.

Additionally, the applicant provided the site-specific voltage and frequency variations expected at the WLS Units 1 and 2, switchyard during transient and steady state operating conditions and the site-specific frequency decay rate to satisfy COL 8.2-1.

- WLS COL 8.2-2

The applicant provided additional information in WLS COL 8.2-2 to resolve COL Information Item 8.2-2, which states:

> The Combined License applicant will address the technical interfaces for this nonsafety-related system listed in Table 1.8-1 and Section 8.2.2. These technical interfaces include those for ac power requirements from offsite and the analysis of the offsite transmission system and the setting of protective devices.

The staff's evaluation of the technical interfaces is addressed under "Interface Requirements" in this section of the report.

The commitment was also captured as COL Action Items 8.2.3.1-1, 8.2.3.1-2, and 8.2.3.1-3 in NUREG-1793, Appendix F, which states:

> The COL applicant will perform a site-specific grid stability analysis to show that, with no electrical system failures, the grid will remain stable and the reactor coolant pump bus voltage will remain above the voltage necessary to maintain the flow assumed in the Chapter 15 analyses for a minimum of 3 seconds following a turbine trip (COL Action Items 8.2.3.1-1 and 8.2.3.1-3).
>
> The COL applicant will set the protective devices controlling the switchyard breakers in such a way as to preserve the grid connection following a turbine trip (COL Action Item 8.2.3.1-2).

The staff reviewed the resolution to the COL Information Item WLS COL 8.2-2, related to the transmission system stability analysis and switchyard circuit breaker protective device settings included under WLS COL FSAR Section 8.2. The staff's evaluation is as follows:

WLS COL 8.2-2 was provided by the applicant describing details of: (1) the 525-kV and 230-kV switchyard arrangements and protective relaying schemes; and (2) a transmission system study performed regularly to verify grid stability, switchyard voltage, and frequency to maintain RCP operation for three seconds following a turbine trip as specified in AP1000 DCD Section 8.2.2. WLS COL 8.2-2 is addressed in WLS COL FSAR Sections 8.2.1.2.2 and 8.2.2.

The WLS 525-kV and 230-kV switchyards each have two main buses for each voltage level. All of the 525-kV and 230-kV lines and each of the GSU transformers are connected to both buses. The switchyards have breaker-and-a-half scheme. This arrangement is used for reliability and flexibility. This arrangement allows for isolation of components and buses, while preserving the plant’s connection to the grid.

The transmission line relay protection circuits continuously monitor the conditions of the offsite power system and are designed to detect and isolate the faults with maximum speed and minimum disturbance to the system. Each of the 525-kV and 230-kV lines is protected by two independent pilot systems to clear a fault anywhere on the line. The two autotransformers each have primary and secondary protecting relaying. The primary and secondary relaying use separate instrument current transformers for monitoring, and use separate direct current (dc) power supplies.

In the event of a breaker failure, the breaker failure relays operate after a preset time delay. Should a breaker fail to trip within the time setting, the associated breaker failure trip relay will trip and lock out all breakers necessary to isolate the failed breaker from all local sources. A breaker failure relay operation for 230-kV and or 525-kV switchyard breakers that are connected to a GSU, RAT, and auto bank transformers will also isolate the appropriate remote sources through a direct transfer trip operation.

The staff finds that the switchyard breaker arrangement, the protection of lines by independent high speed relay schemes, and the breaker failure scheme would preserve the WLS connection to the grid following a turbine trip. The staff finds this satisfies COL Action Item 8.2.3.1-2.

With regard to grid stability, the applicant stated that the WLS grid stability analysis confirms that, with no electrical system failures, the grid will remain stable and the RCP bus voltage will remain above the voltage necessary to maintain the flow assumed in the Chapter 15 analyses for a minimum of 3 seconds following a turbine trip as specified in AP1000 DCD Section 8.2.2 (COL Action Item 8.2.3.1-3). This requirement is also met when there is transmission element out of service, including the largest generator or most critical transmission line. Also, the grid stability analysis has confirmed that the interface requirements for steady state load, inrush kilovolt amp (kVA) for motors, nominal voltage, allowable voltage regulation, nominal frequency, allowable frequency fluctuation, maximum frequency decay rate and limiting under-frequency value for RCP have been met. Based upon the staff’s review of this information, the staff finds that the design will maintain acceptable voltage and frequency at the RCP buses for a minimum of 3 seconds in accordance with the Chapter 15 safety analyses, and is therefore acceptable.

However, based upon the wording in WLS COL FSAR Section 8.2, the staff was concerned that at WLS, the grid voltage could drop up to 20 percent on the high side of the GSU and RATs. This voltage drop could damage auxiliary and safety-related equipment. Therefore, in RAI 1, Question 08.02-1, the staff requested that the applicant clarify: (a) if the 20 percent voltage drop was based on worst expected switchyard voltage; (b) if the 20 percent voltage drop criteria is consistent with NERC criteria (or those of a local reliability council); and (c) what effect this voltage drop will have on the operation of the onsite auxiliary power system equipment including the Class 1E battery chargers and uninterruptible power supplies (UPSs). Subsequent clarification of this issue was provided by the applicant as discussed in the following three paragraphs.

In a September 5, 2008, letter supplemented by a September 14, 2011, letter, the applicant stated that in the WLS grid stability evaluation, switchyard equipment, including the transformers, were modeled to confirm required voltage would be available at the generator bus or high side of the transformer being used for bus supply. In addition, the applicant stated that the TSP/TSO maintains switchyard voltage such that steady state voltage on the 26-kV isophase bus is within 0.95-1.05 per unit (pu) of its nominal value. Based on the analysis, the expected voltage at the generator terminals is 1.00 pu for Unit 1 and 1.01 pu for Unit 2. In addition, the applicant stated that there were several different pre-contingency cases created with various generation outages that established initial conditions; then contingencies were applied. The base case, with all lines in service, and the combinations of generation outages and grid contingencies simulate different grid configurations that create several different pre-trip steady state voltages. Therefore, a series of different pre-trip voltages were studied. Steady state studies showed that, for Unit 2, a turbine trip with an Asbury West 525-kV line outage caused a 4.35-kV decrease on the 525-kV bus and a 1.18-kV decrease on the 230-kV bus, both less than a 1 percent change. For Unit 1, an outage of the 525/230-kV autotransformer caused a 3.29-kV decrease on the 230-kV bus and a 1.93-kV decrease on the 525-kV bus, both less than a 2 percent change. The voltage changes from the worst case contingency on each unit satisfy the voltage requirement for the RCP.

With regard to item (b) above, the applicant stated that the DE Bulk Electric System is designed to meet NERC reliability standards. The NERC standards do not give specific voltage or voltage drop criteria, but require that the system remain stable and consistent with the voltage requirements of the control area. However, maintaining switchyard voltage such that steady state voltage on the 26-kV isophase bus is within 0.95-1.05 pu of its nominal value would be considered to be consistent with the NERC requirement for system stability. Additionally, the criterion that the voltage cannot drop below a level that provides less than 80 percent of the nominal voltage at the RCP is consistent with DE practices to supply sufficient voltage at the nuclear switchyards or notify the plant operator when the minimum voltage may not be available.

With regard to item (c) above, the applicant clarified that the 80 percent voltage level discussed in the WLS COL FSAR referred to the equipment ratings and was not part of their description of the stability study results. The steady state studies showed changes of less than 2 percent and 1 percent for WLS Units 1 and 2, respectively, based on contingencies considered to be sufficiently extensive and at an appropriate severity level to bound the reasonably expected voltages. Based upon the above clarification and detailed response of the applicant to RAI 1, Question 08.02-1, the staff has no further concerns on this item and considers RAI 1, Question 08.02-1 resolved.

In reference to the Class 1E battery chargers, the applicant stated that the battery chargers are a qualified Class 1E isolation device. The battery charger function is to provide isolation between input ac and the safety-related dc system and to provide dc source power when ac power is available. Safe shutdown of the plant does not require the support of the battery chargers. The battery charger is designed to allow the battery to support the dc loads during times of ac input undervoltage. This could occur during the 3-second turbine trip transient discussed above, during which the RCP must remain above 80-percent stall voltage. The battery charger supply breaker at the ac motor control center is not designed to trip on this undervoltage condition. Additionally, there is no design requirement in the AP1000 to lock out the battery charger on an ac input undervoltage condition.

The staff reviewed the above information and concludes that this information is sufficient to demonstrate that the grid will remain stable to maintain RCP operation for 3 seconds following a turbine trip. The staff finds that the applicant has satisfied the portion of COL Information

Item 8.2-2 to maintain the voltage at the RCP to ≥ 80 percent for at least 3 seconds following a turbine trip, to maintain the reactor coolant flow assumed in the Chapter 15 analyses.

The staff finds the applicant's response acceptable because the analysis meets the AP1000 design requirements, the requirements of GDC 17 and the guidelines of RG 1.206. Therefore, the staff considers the issues in RAI 1, Question 08.02-1 resolved.

In RAI 5, Question 08.02-4, the staff stated that to confirm that the single offsite power circuit provided from the transmission network satisfies the requirements of GDC 17, the applicant should provide the voltage and frequency variations expected at the 525-kV and 230-kV switchyards and confirm that these voltage and frequency limits are acceptable for auxiliary power system equipment operation during different operating conditions.

Confirmation that these voltage and frequency limits are acceptable was shown by the following calculations: load flow analysis (bus and load terminal voltages of the station auxiliary system); short circuit analysis; equipment sizing studies; protective relay setting and coordination; motor starting with minimum and maximum grid voltage conditions. A separate set of calculations also was performed for each available connection to the offsite power supply. In addition, the applicant provided a discussion of how the results of the calculations will be verified before fuel load.

In a September 26, 2008, response to RAI 5, Question 08.02-4, the applicant stated that there is no requirement for functionality of the offsite power to accomplish safe shutdown of the AP1000 and that the design is partially exempted from the GDC 17. The applicant also stated that the 525-kV switchyard voltage was set to 523-kV (525-kV nominal) and the 230-kV switchyard was set to 233-kV. This is the anticipated voltage and is consistent with standard practice for grid studies at DE. For an AP1000 turbine trip event, adequate grid voltage is required for 3 seconds. The unit's electric generator will motor immediately following a turbine trip, providing megavolt ampere reactive (MVAR) power to support this voltage and, therefore, the generator bus voltage remains relatively stable.

In addition, the applicant stated that the above grid voltage evaluation results are verified during the preoperational testing identified in AP1000 DCD Section 14.2.10, which includes the following tests:

- 100 Percent Load Rejection (DCD Section 14.2.10.4.21)
- Plant Trip from 100 Percent Power (DCD Section 14.2.10.4.24)
- Loss of Offsite Power (DCD Section 14.2.10.4.26)

In a public meeting with the Nustart Consortium on April 7, 2009, there was an agreement that portions of BLN RAI 177, Question 08.02-3 (equivalent WLS RAI 5, Question 08.02-4) were not within the scope of the BLN COL, but rather within the scope of the AP1000 DC. This is considered a standard item applicable to all COL applications including WLS. Therefore, the staff finds that the relevant portions of RAI 5, Question 08.02-4 are resolved for WLS.

In RAI 5, Question 08.02-3, the staff requested that the applicant provide a discussion as to how single offsite power circuits complied with GDC 2, "Design Bases for Protection Against Natural Phenomena"; GDC 4, "Environmental and Dynamic Effects Design Bases"; GDC 5, "Sharing of Structures, Systems, and Components"; GDC 17, "Electric Power Systems"; and GDC 18, "Inspection and Testing of Electric Power Systems," as well as with guidance in NUREG-0800, Section 8.2.II, and how the applicant intends to meet the requirements of 10 CFR 50.65. In a September 26, 2008, response, the applicant stated that there is no portion of the single offsite circuit required to comply with GDC 2, GDC 4, GDC 5, and GDC 18 and that these GDC are for structures, systems, and components (SSCs) important to safety. Based upon this response, the staff agrees that GDC 2 and GDC 4 do not apply to the AP1000 design.

With respect to GDC 5, the applicant stated that the transmission lines and switchyards are designed so the full output of the plants can be carried out to the network; the capacity is more than sufficient for any incoming power requirements. Based on the above, the staff concludes that since WLS Units 1 and 2 UATs and RATs are not shared among the units and the capacity of the offsite power system is more than sufficient compared to the minimal safety-related loads powered by the offsite power (battery chargers and UPS), the WLS Units 1 and 2 offsite power system design meets the requirements of GDC 5 and, therefore, the staff considers this item resolved.

With respect to GDC 17, the staff finds that the results of the grid stability analysis demonstrate the offsite source capacity and capability to power plant components during normal, shutdown, startup, and turbine trip conditions. The results of the failure modes and effects analysis demonstrate the reliability of the offsite source, which minimizes the likelihood of its failure under normal, abnormal and accident conditions. Therefore, the staff concludes that the WLS Units 1 and 2 offsite power systems design meets the requirements of GDC 17, as it is applicable to AP1000 design; therefore, the staff considers this item resolved.

With regard to GDC 18, NUREG-1793, Section 8.2.3.2 identifies COL Action Item 8.2.3.3-1 to demonstrate that the testing and inspection capability of the offsite power system be in conformance with GDC 18; therefore, this interface item must also be satisfied by the applicant.

The staff verified that WLS COL FSAR Section 8.3.1.4 has been revised to include implementation of procedures for periodic verification of proper operation of the onsite ac power system capability for automatic and manual transfer from the preferred power supply to the maintenance power supply and return from the maintenance power supply to the preferred power supply. The staff finds that the above satisfies the requirements of GDC 18 and is therefore acceptable.

WLS COL FSAR Section 17.6 describes implementation of the requirements of 10 CFR 50.65. As indicated therein, implementation of the Nuclear Energy Institute (NEI) 07-02A, "Generic FSAR Template Guidance for Maintenance Rule Program Description for Plants Licensed under 10 CFR Part 52," program description will determine the applicability of the maintenance requirements for the offsite power circuit. NEI 07-02A provides a template for presenting this information that also has been endorsed by the staff in a January 24, 2008, letter to NEI. The staff verified that the reference to this NEI report is in WLS COL FSAR Table 1.6-201. Since the scope of SSCs covered by the maintenance rule (MR) program is determined using the scoping procedures defined in the MR program description in accordance with NEI 07-02A, the offsite power system and its components will be evaluated for inclusion in the MR program in accordance with these scoping procedures during program implementation. The staff notes that NEI 07-02A, Section 17.X.1.5, "Risk Assessment and Risk Management per 10 CFR 50.65(a)(4)," addresses risk assessment and risk management from maintenance activities in accordance with 10 CFR 50.65(a)(4), and includes consideration of the issues associated with grid/offsite power system reliability as identified in NRC GL 2006-02, Items 5 and 6. Therefore, although detailed maintenance risk assessment is not anticipated in advance of the schedule defined in WLS COL FSAR Table 13.4-201, performance of "grid-risk-sensitive" maintenance activities is a necessary consideration of the program in accordance with NEI 07-02A guidance. Based on the above, the staff finds this item resolved.

With regard to the submerged or inaccessible electrical cable recommendations in GL 2007-01, "Inaccessible or Underground Power Cable Failures that Disable Accident Mitigation Systems or Cause Plant Transients," and the guidance in NUREG/CR-7000, and NUREG-0800 Section 8.2.III.1.L., WLS identified the standard content related to this item in its WLS COL FSAR Section 17.6.

The following portion of this technical evaluation section is reproduced from VEGP SER Section 8.2.4:

> <u>*Submerged/Inaccessible Electrical Cables*</u>
>
> *In RAI 8.2-14, the staff asked the applicant to describe the inspection, testing and monitoring program to detect degradation of inaccessible or underground control and power cables that support equipment and other systems that are within the scope of 10 CFR 50.65. The description should include the frequency of testing and inspection. Guidance on the selection of electric cable condition monitoring can be found in Sections 3 and 4.5 of NUREG/CR-7000, "Essential Elements of an Electric Cable Condition Monitoring Program."*
>
> *In a letter dated May 6, 2010, the applicant stated that the Maintenance Rule (MR) program will not be implemented until prior to fuel load; as such, specific information necessary to determine appropriate inspections, tests and monitoring is not available at this time. In order to determine the method and frequency, a review of detailed design and procurement information is needed. The applicant also stated that the latest industry experience and other available information, including NUREG/CR-7000, will be followed in developing a cable condition monitoring program as part of the MR program. The applicant also committed to revise its FSAR to include condition monitoring of underground or inaccessible cables in its MR program. The commitment will be reflected in the COL application Part 2, FSAR Chapter 17, Section 17.6 as shown below.*
>
> > *Condition monitoring of underground or inaccessible cables is incorporated into the maintenance rule program. The cable condition monitoring program incorporates lessons learned from industry operating experience, addresses regulatory guidance, and utilizes information from detailed design and procurement documents to determine the appropriate inspections, tests and monitoring criteria for underground and inaccessible cables within the scope of the maintenance rule (i.e., 10 CFR 50.65). The program takes into consideration Generic Letter 2007-01.*
>
> *Based on the above, the staff concludes that the applicant's condition monitoring program for underground or inaccessible cables satisfies the recommendations of GL 2007-01, "Inaccessible or Underground Power Cable Failures that Disable Accident Mitigation Systems or Cause Plant Transients," and the guidance in*

> *NUREG/CR-7000 and NUREG-0800 Section 8.2.III.1.L. Therefore, this item is resolved subject to the verification that the VEGP COL FSAR has been updated to include applicable portions of the RAI response. This is identified as Confirmatory Item 8.2-3.*
>
> *Resolution of Standard Content Confirmatory Item 8.2-3*
>
> *Confirmatory Item 8.2-3 is an applicant commitment to revise its FSAR Section 17.6 to address condition monitoring of underground or inaccessible cables. The staff verified that the VEGP COL FSAR was appropriately revised. As a result, Confirmatory Item 8.2-3 is now closed.*

Supplemental Information

WLS SUPs 8.2-1 through 8.2-5 address information on the offsite power system requested by RG 1.206. RG 1.206 includes the request for detailed information about the offsite power system to allow the staff to determine the relative quality of the design. The requested information includes: a description of the overall grid configuration, interfaces with the grid operator, results of grid reliability studies, protocols for operation and pertinent historical grid reliability data.

- WLS SUP 8.2-1

With regard to WLS SUP 8.2-1, the applicant provided the following information:

> DE is a regulated, vertically integrated utility with regards to its electric generation and transmission operations. DE's NGD has a formal agreement titled Nuclear Switchyard Interface Agreement with the TSO which is DE's PD department. The PD department includes the Transmission Planning and Control Center (TCC), transmission System Operation Center (SOC), and Planning and Grid Operations (PGO). The Nuclear Switchyard Interface Agreement and the associated Department Directives serve as a communications protocol with the TSO.
>
> DE is also the transmission system provider. The TSP/TSO establishes a voltage schedule for the 525-kV and 230-kV switchyards. The nuclear power plant, while generating, is expected to supply or absorb reactive power to help regulate voltage in the 525/230-kV switchyard in accordance with TSP/TSO voltage schedule criteria. The TSP/TSO also maintains switchyard voltage such that voltage on the 26-kV isophase bus is within 0.95–1.05 pu of its nominal value.
>
> The plant's operator workstations monitor switchyard voltage, frequency, and other offsite power system parameters. The operator workstations are set to alert the nuclear plant operator if the grid may not be able to supply offsite power of sufficient voltage. Procedures direct the plant operators to contact the TSO and request a status of the most current contingency analysis for existing grid conditions. If the results of the contingency analysis indicate that insufficient voltage would exist in the switchyard, the procedures direct the plant operators to take appropriate actions.

The staff reviewed the information provided by the applicant on the functions of the TSO that establishes a voltage schedule for the WLS 500 kV switchyard and also maintains switchyard voltage such that steady state voltage on the 26 kV isophase bus is within 0.95-1.05 pu of nominal value. Based on the information provided by the applicant on the functions of the TSP/TSO and the detailed voltage and other requirements to be maintained by the TSP/TSO, the staff finds that the applicant has demonstrated that protocols are in place for WLS to remain cognizant of grid vulnerabilities in order to make informed decisions regarding maintenance activities critical to the electric system. This is, in part, consistent with GL 2006-2 in which one provision is to reduce the likelihood of losing offsite power. The staff finds that the information provided meets the requirements of GDC 17 and GDC 18 also conforms to the guidelines of RG 1.206. Therefore, the staff considers WLS SUP 8.2-1 acceptable.

- WLS SUP 8.2-2

With regard to WLS SUP 8.2-2, the applicant provided the following information:

> The Nuclear Switchyard Interface agreement between NGD and PD sets the requirements for transmission grid studies and analyses. These analyses demonstrate the capability of the offsite power system to support plant start up and shutdown.

The staff reviewed the information provided by the applicant on the Nuclear Switchyard Interface agreement. Based on the information provided by the applicant on the agreement, the staff finds that the applicant has demonstrated that analyses have been completed that demonstrate the capability of the grid to support operations, such as plant shutdown and startup. This is, in part, consistent with GL 2006-2 of which one provision is to reduce the likelihood of losing offsite power. The staff finds that the information provided complies with the requirements of GDC 17 and conforms to the guidelines of RG 1.206. Therefore, the staff considers WLS SUP 8.2-2 acceptable.

- WLS SUP 8.2-3

> DE’s Power Delivery (PD) Department is the approving grid organization for reliability studies performed on the area bulk electric system. PD conducts planning studies of the transmission grid on an ongoing basis. Model data used to perform simulation studies of projected future conditions is maintained and updated as load forecasts and future generation/transmission changes evolve. Studies are performed annually to assess future system performance in accordance with NERC reliability standards. These studies form a basis for identifying future transmission expansion needs.
>
> New large generating units requesting to connect to the area bulk electric system are required to complete the Large Generator Interconnection Procedure. The studies performed by DE TSO as part of this procedure, examine the generating unit (combined turbine-generator-exciter) and the main step-up transformer(s).

The staff reviewed the information provided by the applicant on planning and reliability studies and simulation studies. Based on the information provided by the applicant, the staff finds that the information provided complies with the requirements of GDC 17 and conforms to the guidelines of RG 1.206 and GL 2006-2. Therefore, the staff considers WLS SUP 8.2-3 acceptable.

- WLS SUP 8.2-4

With regard to WLS SUP 8.2-4, the applicant provided the following information:

> The Nuclear Switchyard Interface Agreement between NGD and PD demonstrates protocols in place for the plant to remain cognizant of grid vulnerabilities and make informed decisions regarding maintenance activities critical to the electrical system.
>
> In the operations horizon, the DE TSO continuously monitors real-time power flows and assesses contingency impacts. Operational planning studies are also performed using offline power flow study tools to assess near term operating conditions under varying load, generation, and transmission topology patterns.

Based on the information provided by the applicant on the functions of TSO, the staff finds that the applicant has demonstrated that protocols are in place for WLS to remain cognizant of grid vulnerabilities in order to make informed decisions regarding maintenance activities critical to the electric system. Therefore, the staff finds that the application complies with the requirements of GDC 17 and GDC 18, 10 CFR 50.60 and conforms to the guidelines of GL 2006-2 of which one of the provisions is to reduce the likelihood of losing offsite power.

- WLS SUP 8.2-5

With regard to WLS SUP 8.2-5, the applicant provided the last 12 years of average outage data available on the DE transmission system as follows:

1. The Momentary Average Interruption Frequency Index is 0.28 for the 230-kV system and 0.78 for the 525-kV system.
2. The Transmission System Average Interruption Frequency Index for sustained (>1 minute) outages is 0.08 for the 230-kV system and 0.37 for the 525-kV system.
3. The Transmission System Average Interruption Duration Index (minutes) is 31.8 for the 230-kV system and 210 for the 525-kV system.

The staff reviewed the supplemental information provided regarding the grid availability historical data and finds that the information complies with the requirements of GDC 17 and conforms to the guidelines of RG 1.206. Therefore, the staff considers WLS SUP 8.2-5 acceptable.

- WLS SUP 8.2-6

With regard to WLS SUP 8.2-6, the applicant provided the following information in WLS COL FSAR Section 8.2.1.2.3.

> Section 8.2.1.2.3 Plant Response to High Voltage Open Phase Condition
>
> A monitoring system is installed on the credited GDC 17 offsite power circuit that provides continuous open phase condition monitoring of the MSU transformer HV input power supply (see Reference 201). The system detects an open phase condition (with or without a concurrent high impedance ground on the HV side of the transformer) on one or more phases under all transformer loading conditions.

The open phase condition monitoring system provides an alarm to the operators in the control room should an open phase condition occur on the HV source to the MSU transformers. The system design utilizes commercially available components including state of the art digital relaying equipment and input parameters as required to provide loss of phase detection and alarm capability.

Additionally, a high-voltage open phase condition with or without a ground fault can manifest itself as an unacceptable voltage on the 6.9 kV medium voltage ES-1 and ES-2 buses during normal loading conditions. The presence of unacceptable voltages on the ES-1 and ES-2 buses results in isolation of the affected medium voltage bus from the offsite power supply and enables the onsite standby diesel generators to start and restore AC power to the ES-1 and ES-2 buses and associated defense-in-depth loads. The onsite AC power system is described in DCD Section 8.3.1.

Motor management relays for the medium voltage motors on ES-1 and ES-2 provide detection of unacceptably high negative sequence currents. High negative sequence current motor trips or other running load trips provide alarms in the MCR, which can assist in the detection of a high-voltage open phase condition with or without a ground fault. Electric circuit protection for the medium voltage system and equipment is described in DCD Section 8.3.1.1.1.1.

A high-voltage open phase condition with or without a ground fault can also manifest itself as an unacceptable voltage on the 480 VAC low-voltage buses powered from ES-1 and ES-2. The safety-related IDS battery chargers are powered from the low-voltage buses and continue to charge the IDS batteries unless the battery charger input or output monitored electrical parameters are unacceptable. If the monitored electrical parameters degrade to the point that the battery charger no longer provides sufficient DC bus voltage, the Class 1E electrical system DC bus receives power from the applicable IDS battery and the battery charger maintains isolation between the Non-Class 1E AC and Class 1E DC power systems which generates alarms in the MCR. The onsite AC power system is described in DCD Section 8.3.1 and the Class 1E DC power system is described in DCD Section 8.3.2.1.1.

Operator actions and maintenance and testing activities are addressed in procedures, as described in Section 13.5. Plant operating procedures, including off-normal operating procedures associated with the monitoring system will be developed prior to fuel load. Maintenance and testing procedures, including calibration, surveillance testing, setpoint determination and troubleshooting procedures associated with the monitoring system will be developed prior to fuel load.

Control Room operator and maintenance technician training associated with the operation and maintenance of the monitoring system will be conducted in accordance with the milestones for Non Licensed Plant Staff and Reactor Operator Training Programs in Table 13.4.201.

This supplement was added to the FSAR to address the issues in Bulletin 2012-01. The staff’s review and evaluation follows directly below.

NRC Bulletin 2012-01, "Design Vulnerability in Electric Power System"

In light of recent operating experience that involved the loss of one of the three phases of the offsite power circuit (i.e., loss of a single-phase) at Byron Station, Unit 2, the NRC issued Bulletin 2012-01, "Design Vulnerability in Electric Power System," on July 27, 2012, to all holders of operating and combined licenses requesting information about the facilities' electric power system designs. The above operating event resulted in neither the onsite nor the offsite electric power system being able to perform its intended safety functions (i.e., to provide electric power to the important to safety buses with sufficient capacity and capability to permit functioning of structures, systems, and components important to safety). NRC Bulletin 2012-01 was issued to operating and new reactor licensees to affirm compliance with GDC 17 requirements and to evaluate whether further NRC action is warranted to address this design vulnerability. Subsequently, the staff also issued RAI 108, Question 08-1, to the applicant for WLS Units 1 and 2, to address the matters described in NRC Bulletin 2012-01 and to ensure that the WLS design meets GDC 17.

In an October 23, 2012, letter, the applicant provided its response to RAI 108, Question 08-1, "Single-Phase Open Circuit Condition," for WLS Units 1 and 2. The proposed design utilized existing undervoltage relays on the ES-1 and ES-2 buses as well as existing undervoltage relays on the loads, on or downstream of the ES-1 and ES-2 buses. Based on review of this response, the staff could not determine whether the WLS Units 1 and 2 existing protection schemes would detect open circuit conditions on the high voltage side of a transformer connecting a GDC 17 offsite power circuit to the transmission system for all operating electrical system configurations and loading conditions.

On November 1, 2013, the NRC conducted a public meeting with representatives from the Nuclear Energy Institute and other industry representatives to discuss the industry initiative associated with resolving NRC Bulletin 2012-01. During the meeting, industry representatives provided feedback regarding their review of an offsite power two-phase open circuit event that occurred at Forsmark Nuclear Power Plant in Sweden (see NRC Information Notice 2006-18, Supplement 1: "Significant Loss of Safety-Related Electrical Power at Forsmark Unit 1 in Sweden"). The industry representatives informed the staff that their detailed analyses of this condition indicated that the proposed single-open phase detection system may not be sensitive enough to detect a two-phase open circuit condition. Therefore, the industry has taken the position that a two-phase open circuit condition must be considered when developing a resolution for the NRC Bulletin open phase issue.

GDC 17 requires, in part, "An onsite electric power system and an offsite electric power system shall be provided to permit functioning of structures, systems, and components important to safety. The safety function for each system (assuming the other system is not functioning) shall be to provide sufficient capacity and capability to assure: (1) specified acceptable fuel design limits and design conditions of the reactor coolant pressure boundary are not exceeded as a result of anticipated operational occurrences, and (2) the core is cooled and containment integrity and other vital functions are maintained in the event of postulated accidents." For AP1000 reactors, the main ac power system is non-Class 1E and not safety-related. During a loss of offsite power, ac power is supplied by the onsite standby diesel generators, which are also not safety-related. However, the ac power system is designed such that plant auxiliaries can be powered from the grid under all modes of operation. Furthermore, the ac power systems do supply power to equipment that is important to safety since that equipment serves defense-in-depth functions. The offsite power supply system provides power to the safety-related loads through the battery chargers, and both the offsite power system and the standby diesel generators provide defense-in-depth functions to supplement the capability of the safety-related passive systems for reactor coolant makeup and decay heat removal. In this regard, offsite power is the preferred power source, and supports the first line of defense. In addition, the safety analyses take credit for the grid remaining stable to maintain reactor coolant pump operation for three seconds following a turbine trip in accordance with the guidance of RG 1.206. Accordingly, these electric power systems are important to safety, and subject to the requirements of GDC 17. Consequently, it was the staff's position that AP1000 COL applicants address the design vulnerability identified in NRC Bulletin 2012-01.

Furthermore, it is the staff's position that an acceptable approach for passive designs includes the following four elements: (1) a dedicated automatic detection for an offsite power system single-phase open circuit condition with, and without, a high impedance ground fault condition on the high voltage side of the main power transformer including two open phase conditions under all loading and operating configurations; (2) an alarm in the main control room for operators to take manual actions if necessary; (3) an inspection, test, analysis, and acceptance criteria (ITAAC) to confirm that the analyses for developing the proper set points were completed in accordance with the acceptance criteria and to perform testing to demonstrate that the design functions as described in the WLS COL FSAR; and (4) procedures and training for the operating and maintenance staff. Since the system is continuously monitoring for open phase conditions using digital relays, the Staff concluded that the monitoring system automatically detects an open phase for either of the one or two open phase conditions (i.e. continuous monitoring meets the staff position of automatic detection). With regard staff position (4), Section 13.5 of this report states that the staff has reasonable assurance that the administrative procedures will be established to provide licensed operators and non-licensed plant staff with sufficient knowledge and operating experience to start up, operate, and maintain the plant in a safe manner. This approach ensures the required offsite ac power source with adequate capacity and capability is available to important safety equipment including safety-related battery chargers to meet their intended safety function in accordance with GDC 17 requirements.

In an August 28, 2014, supplemental response to RAI 108, Question 08-1, the applicant provided text that will be added to the next revision of the WLS COL FSAR, including but not limited to, ITAAC to confirm that the analyses for developing the proper set points were completed in accordance with the acceptance criteria and to perform testing to demonstrate that the design functions as described in the WLS COL FSAR. These proposed additions to the WLS COL FSAR and the ITAAC acceptably address the staff's position as that which is necessary to protect a plant with regard to an open phase condition as described in NRC Bulletin 2012-01, and that the WLS design meets GDC 17. Therefore, the staff considers this issue resolved and RAI 108, Question 08-1, closed pending the staff's confirmation that the revisions to the WLS COL FSAR noted above are incorporated in the WLS Units 1 and 2 application. RAI 108, Question 08-1 was being tracked as Confirmatory Item 8.2-1.

<u>Resolution of Confirmatory Item 8.2-1</u>

Confirmatory Item 8.2-1 is an applicant commitment to update its WLS COL FSAR and ITAAC to include details necessary to protect a plant with regard to an open phase condition, described in NRC Bulletin 2012-01. The applicant added the requested design description under WLS SUP 8.2-6 (above). The staff verified that the WLS COL FSAR and ITAAC were appropriately updated and that the WLS design meets GDC 17. Accordingly, the staff considers Confirmatory Item 8.2-1 related to RAI 108, Question 08-1, resolved.

Interface Requirements

The plant interfaces for the standard design of the AP1000 are discussed in AP1000 DCD Tier 2, Section 8.2.5 and DCD Table 1.8-1, Items 8.1, 8.2, and 8.3, where they are identified as "NNS" interfaces.

The applicant incorporated by reference AP1000 DCD Section 1.8. This section of the AP1000 DCD identifies certain interfaces with the standard design that have to be addressed in accordance with 10 CFR 52.47(a)(1)(vii).[2] As required by 10 CFR 52.79(d)(2), the COL application must demonstrate how these interface items have been met.

To satisfy AP1000 DCD, Tier 2, Table 1.8-1, Interface Item 8.1, the applicant provided a listing of the design criteria, regulatory guides, and IEEE standards in WLS COL FSAR Section 8.1.4.3 to which the applicant commits to as interface requirements for the offsite power system. The staff finds this information consistent with NUREG-0800, Section 8.1 as well as AP1000 DCD Table 1.8-1. Accordingly, the staff finds that this interface item for the offsite power system has been met.

With regard to plant AP1000 DCD, Tier 2, Table 1.8-1, Interface Item 8.2, the staff observed that in WLS COL FSAR Section 8.2.2, the applicant stated that the grid stability study has confirmed that the interface requirements for steady state load, nominal voltage, allowable voltage regulation, nominal frequency, allowable frequency fluctuation, and maximum frequency decay rate, have been met. In RAI 5, Question 08.02-6, the staff requested that the applicant provide the summary of the grid stability analysis results, the assumptions made, and the acceptance criteria for each case analyzed. Additionally, the staff requested that the applicant provide the nominal frequency, allowable frequency fluctuation, maximum frequency decay rate, and the limiting under-frequency values used for the RCP in the analysis. In a September 26, 2008, response to RAI 5, Question 08.02-6, the applicant provided the required parameter values and the associated analysis results. Additionally, the applicant stated that the WLS COL FSAR would be revised to include the parameter values. The staff has verified that Revision 4 to the WLS COL FSAR includes the proposed change. The staff has verified the change has been actualized in the WLS COL FSAR and concludes that the parameter values and the analysis results meet the AP1000 design requirements, the requirements of GDC 17 and the guidelines of RG 1.206. Accordingly, the staff considers this RAI resolved and AP1000 DCD Tier 2, Table 1.8-1, Interface Item 8.2 satisfied.

AP1000 DCD Tier 2, Table 1.8-1, Plant Interface Item 8.3 calls for a design feature that provides that "the protective devices controlling the switchyard breakers are set with consideration given to preserving the plant grid connection following a turbine trip." In the absence of a description of such a design feature, the staff asked the applicant to provide a reference as to where this issue is discussed in the application, or to provide a proposed revision to the application to address the issue (WLS RAI 74, Question 08.02-9).

[2] Following the update to 10 CFR Part 52 (72 *Federal Register* (FR) 49517), this provision has changed to 10 CFR 52.47(a)(25).

In an August 20, 2009, response to WLS RAI 74, Question 08.02-9, the applicant identified a proposed revision to WLS COL FSAR Section 8.2.1.2.2 that states, “The protective devices controlling the switchyard breakers are set with consideration given to preserving the plant grid connection following a turbine trip.” The staff verified that the WLS COL FSAR was updated to include this change and concludes that the switchyard arrangement, the protection of lines by independent high speed relaying, and the breaker failure scheme would preserve the WLS connection to the grid following a turbine trip satisfying the requirements of GDC 17. Therefore, the staff finds this interface has been met and the issue in WLS RAI 74, Question 08.02-9 resolved. On this basis, the staff considers COL Information Item 8.2.3.1-2, also resolved.

The staff reviewed the information supplied by the applicant and concludes that the applicant has adequately addressed AP1000 DCD Tier 2, Table 1.8-1, Interface Items 8.1, 8.2, and 8.3.

Inspections, Tests, Analyses and Acceptance Criteria

As part of the applicant’s resolution of electrical power issues, discussed in the subsection NRC Bulletin 2012-01, “Design Vulnerability in Electric Power System*,”* above, the applicant made changes to the WLS COL application, Part 10, Appendix B, “Inspections, Tests, Analysis and Acceptance Criteria.” The applicant proposed the following site-specific ITAAC for the Main ac Power System (ECS) to be added as new Item 4.g in Table 2.6.1-4, in the application, to that already required by AP1000 DCD Tier 1, Section 2.6.1. This ITAAC was not required by the staff to make the acceptability finding for resolution of NRC Bulletin 2012-01.

Design Commitment	Inspections, Tests, and Analyses	Acceptance Criteria
4.g) The ECS provides an alarm in the MCR [main control room] and automatic protection actuation if an undervoltage condition is detected on any one or more AC phases of either switchgear ECS-ES-1 or ECS-ES-2.	i) Testing of the as-built ECS will be conducted by simulating an undervoltage condition on ECS-ES-1 and ECS-ES-2 to confirm that an MCR alarm is generated when one or more ECS bus phase voltages is below setpoint on either switchgear ECS-ES-1 or ECS-ES-2.	i) Undervoltage relays on ECS-ES-1 and ECS-ES-2 provide alarm when one or more AC phases on the 6.9 kV buses are below setpoint.
	ii) Testing of the as-built ECS will be conducted by simulating an undervoltage condition on ECS-ES-1 and ECS-ES-2 to confirm that loss of one or more ECS bus phases automatically actuates the electrical protection function logic.	ii) Undervoltage relays on ECS-ES-1 and ECS-ES-2 initiate protective action when one or more AC phases on the 6.9 kV buses are below setpoint.

The applicant proposed the following site-specific ITAAC for the offsite power system to be added in the WLS application, Part 10, Appendix B, as new line item 7 in AP1000 DCD Tier 1, Table 2.6.12-1.

Design Commitment	Inspections, Tests, and Analyses	Acceptance Criteria
7. The credited GDC 17 off-site power source is monitored by an open phase condition monitoring system that can detect the following at the high voltage terminals of the transformer connecting to the off-site source, over the full range of transformer loading from no load to full load: (1) loss of one of the three phases of the offsite power source a. with a high impedance ground fault condition, or b. without a high impedance ground fault condition; or (2) loss of two of the three phases of the offsite power source a. with a high impedance ground fault condition, or b. without a high impedance ground fault condition. Upon detection of any condition described above, the system will actuate an alarm in the main control room.	i) Analysis shall be used to determine the required alarm set points for the open phase condition monitoring system to indicate the presence of open phase conditions described in the design commitment. ii) Testing of the credited GDC-17 off-site power source open phase condition monitoring system will be performed using simulated signals to verify that the as-built open phase condition monitoring system detects open phase conditions described in the design commitment and at the established set points actuates an alarm in the main control room.	i) Alarm set points for the open phase condition monitoring system to indicate the presence of open phase conditions as described in the design commitment have been determined by analysis. ii) Testing demonstrates the credited GDC 17 off-site power source open phase condition monitoring system detects open phase conditions described in the design commitment and at the established set points actuates an alarm in the main control room.

The evaluation of the applicant-proposed site-specific ITAAC item 7 is presented in the subsection, NRC Bulletin 2012-01, "Design Vulnerability in Electric Power System," above.

8.2.5 Post Combined License Activities

As discussed in the technical evaluation section above, the staff finds acceptable ITAAC items 4g and 7 as defined in the WLS COL application, Part 10, Appendix B.

8.2.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant addressed the required information relating to the offsite power system, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the staff's technical evaluation of the information incorporated by reference in the application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the WLS COL FSAR is acceptable and meets the requirements of GDC 17 and GDC 18. The staff based its conclusion on the following:

- WLS COL 8.2-1 is acceptable because the applicant provided sufficient information involving the design details of the plant site switchyard, its interface with the local transmission grid, protective device settings, its testing and inspection plan and details of a FMEA performed for the plant site switchyard and meets the requirements of GDC 17 and GDC 18 and the guidelines of RG 1.206.

- WLS COL 8.2-2 is acceptable because the applicant provided sufficient information to demonstrate that the grid will remain stable to maintain RCP operation for three seconds following a turbine trip in accordance the requirements of GDC 17 and the guidelines of RG 1.206 and GL 2006-2.

- WLS CDI in WLS COL FSAR Section 8.2.1 is acceptable because the applicant provided sufficient information concerning the transformer area located next to each unit's turbine building in accordance with the requirements of GDC 17 and conforms to the guidelines of RG 1.206.

- WLS SUP 8.2-1 is acceptable because the applicant provided sufficient information on TSP/TSO, and the detailed voltage and other requirements to be maintained by TSP/TSO in accordance with the requirements of GDC 17 and GDC 18 and conforms to the guidelines of RG 1.206.

- WLS SUP 8.2-2 is acceptable because the applicant provided sufficient information describing the formal agreement between the NGD and PDs, which is the TSO, setting the requirements for transmission system studies and analyses in accordance with the requirements of GDC 17 and conforms to the guidelines of RG 1.206 and GL 2006-2.

- WLS SUP 8.2-3 is acceptable because the applicant provided sufficient information to describe the PD's responsibility for maintaining area bulk transmission system reliability and demonstrating, by power system simulation studies, projections, and analyses, the current and future reliability of the system in accordance with the requirements of GDC 17 and conforms to the guidelines of RG 1.206, and GL 2006-2.

- WLS SUP 8.2-4 is acceptable because the applicant provided sufficient information to demonstrate that protocols are in place for WLS to remain cognizant of grid vulnerabilities in order to make informed decisions regarding maintenance activities critical to the electric system in accordance with the requirements of GDC 17 and GDC 18, and 10 CFR 50.65, and conforms to the guidelines of RG 1.206 and GL 2006-2.

- WLS SUP 8.2-5 is acceptable because the applicant provided sufficient information regarding the 525-kV and 230-kV transmission lines outage data available over the past 12 years in accordance with the requirements of GDC 17 and GDC 18, 10 CFR 50.65, and conforms to the guidelines of RG 1.206.

- WLS SUP 8.2-6 is acceptable because the applicant provided sufficient information on a monitoring system for the offsite power circuit that provides continuous open phase condition monitoring that complies with the requirements of GDC 17 and conforms to the guidelines of RG 1.206 and GL 2006-2. Therefore, the staff finds this acceptable and considers the issue resolved.

- The applicant's addressing NRC Bulletin 2012-01, "Design Vulnerability in Electric Power System," is acceptable because the proposed additions to the WLS COL FSAR and the ITAAC acceptably address the staff position as that which is necessary to protect a plant with regard to an open phase condition as described in NRC Bulletin 2012-01, and that the WLS design meets GDC 17.

- The applicant provided sufficient information regarding the interfaces for standard design from the generic AP1000 DCD Table 1.8-1, Items 8.1, 8.2, and 8.3 in accordance with the requirements of GDC 17 for the staff to find acceptable.

- ITAAC – The applicant proposed the site-specific ITAAC for the Main ac Power System to be added to the WLS COL application, Part 10, Appendix B as new Item 4.g in Table 2.6.1-4. In addition, the applicant proposed site-specific ITAAC for the offsite power system to be added as new line Item 7 in AP1000 DCD Tier 1, Table 2.6.12-1. The staff finds that the proposed ITAAC items acceptably address the staff position with regard to an open phase condition as described in NRC Bulletin 2012-01, and that the WLS design meets the requirements of GDC 17.

8.2.A Site-Specific ITAAC for Offsite Power Systems

8.2.A.1 *Introduction*

This section specifically addresses the site-specific inspections, tests, analyses and acceptance criteria (SS-ITAAC), that the applicant proposed related to the offsite power system that are necessary and sufficient to provide reasonable assurance that the facility has been constructed and will operate in conformance with the COL, the provisions of the Atomic Energy Act of 1954, as amended, and NRC regulations.

8.2.A.2 Summary of Application

WLS COL FSAR, Revision 11, Section 14.3, incorporates by reference AP1000 DCD, Revision 19, Section 14.3, and contains the following supplemental information.

Supplemental Information

- STD SUP 14.3-1

The applicant provided supplemental information related to the offsite power system in STD SUP 14.3-1 in WLS COL FSAR Section 14.3.2.3.3.

8.2.A.3 *Regulatory Basis*

The regulatory basis for the review of the information incorporated by reference is addressed in NUREG-1793, "Final Safety Evaluation Report Related to Certification of the AP1000 Standard Design," and its supplements. In addition, the acceptance criteria associated with the relevant requirements of NRC regulations for ITAAC are given in NUREG-0800, Section 14.3.

The applicable regulatory requirements for electrical SS-ITAAC are in 10 CFR 52.80(a), "Contents of applications; additional technical information."

8.2.A.4 Technical Evaluation

The staff reviewed WLS COL FSAR Section 14.3 and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to SS-ITAAC for offsite power systems. The results of the staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this report provides a discussion of the strategy used by the staff to perform one technical review for each standard issue outside the scope of the design certification and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the report for the reference COL application (VEGP Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5 to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.

- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the WLS COL application. This standard content material is identified in this report by use of italicized, double-indented formatting. Section 1.2.3 of this report provides an explanation of why the standard content material from the report for the reference application (VEGP) contains evaluation material from the report for the BLN Units 3 and 4, application.

The following portion of this technical evaluation section is reproduced from VEGP SER Section 8.2.A.4:

<u>Supplemental Information</u>

- *STD SUP 14.3-1, addressing SS-ITAACs*

ITAAC Screening Summary Table 14.3-201 of the BLN FSAR identified the transmission switchyard and offsite power system as a site-specific system and selected them for ITAAC, but the table indicated "title only, no entry for COLA." Consequently, Section 2.6.12 of Part 10 of Appendix B, "License Conditions and ITTAC" of the BLN COL application (COLA) provided no ITAAC information for the transmission switchyard and offsite power system. The COL applicant must provide this site-specific ITAAC for compliance with 10 CFR 52.79(d) and 10 CFR 52.80(a). In RAI 14.3-1, the NRC staff stated that RG 1.206, CIII.7.2, Site-Specific ITAAC, recommends that applicants develop ITAAC for the site-specific systems that are designed to meet the significant interface requirements of the standard certified design, that is, the site-specific systems that are needed for operation of the plant (e.g., offsite power). Therefore, the applicant should justify why there is no ITAAC entry associated with offsite power, or revise Table 14.3-201 of the BLN FSAR to include ITAAC entries for the transmission switchyard and the offsite power system.

By letter dated June 24, 2008, the applicant stated that approved DCD Section 14.3 refers to the selection criteria and processes used for developing the AP1000 Certified Design Material (CDM) and identifies no interfaces (e.g., systems for storm drain, raw water, and closed circuit TV system, etc.) meeting this definition. Thus, according to the applicant, the CDM does not include ITAAC or a requirement for COL developed ITAAC for the offsite power interface system. The staff found the above response to be inconsistent with the requirements of 10 CFR 52.80(a), and guidance of NUREG-0800 Section 14.3 and RG 1.206.

Several discussions were held between the applicant and the NRC staff to discuss this issue. The staff pointed out that the offsite power system performs an important function in the passive designs as it provides power to the safety-related loads through battery chargers during normal, abnormal and accident conditions. It also provides power to those active systems that provide defense-in-depth capabilities for reactor coolant make-up and decay heat removal.

These active systems are the first line of defense to reduce challenges to the passive systems in the event of plant transients. The above function of the offsite power system in passive designs supports the need for ITAAC for these systems so that the staff can verify that (1) the designed and installed systems, structures, or components of the offsite power systems will perform as designed *and (2) the required single circuit from the transmission network satisfies the requirements of GDC 17.*

Subsequently, in a letter dated May 11, 2009, the applicant revised its response to RAI 14.3-1 and provided an ITAAC for the offsite power system to verify that the as-built offsite portion of the power supply from the transmission network to the interface with the onsite ac power system will satisfy the applicable provisions of GDC 17. Specifically, the ITAAC shall verify:

(1) A minimum of one offsite circuit supplies electric power from the transmission network to the interface with the onsite portions of the ac power system.

(2) Each offsite circuit interfacing with the onsite ac power system is adequately rated to supply assumed loads during normal, abnormal and accident conditions.

(3) During steady state operation, each offsite circuit is capable of supplying required voltage to the interface with the onsite ac power system that will support operation of assumed loads during normal, abnormal and accident conditions.

(4) During steady state operation, each offsite circuit is capable of supplying required frequency to the interface with the onsite ac power system that will support operation of assumed loads during normal, abnormal and accident conditions.

(5) The fault current contribution of each offsite portion circuit is compatible with the interrupting capability of the onsite ac power system fault current interrupting devices.

(6) The reactor coolant pumps continue to receive power from either the main generator or the grid for a minimum of 3 seconds following a turbine trip.

To ensure that the requirements of GDC 17 for the adequacy of the offsite power source within the standard design scope are met, the proposed ITAAC would verify the capacity and capability of the offsite source to feed the onsite power system. The proposed ITAAC provides for the inspection of the connection of the offsite source to the onsite power system.

Additionally, the applicant identified all associated changes that will be made in a future revision of the Bellefonte FSAR. On the basis of its review, the staff finds that the applicant has adequately addressed the site-specific ITAAC for the offsite power system so that the staff can verify that the designed and installed systems, structures, or components of the offsite power system will perform as designed. Therefore, the staff concludes that the applicant meets the requirements of 10 CFR 52.79(d) and 10 CFR 52.80(a), and the guidance of SRP 14.3 and RG 1.206. The applicant will revise the BLN COL FSAR to include the proposed ITAAC for offsite power system. This is identified as

Confirmatory Item 8.2A-1, pending NRC review and approval of the revised BLN COL FSAR.

<u>Resolution of Standard Content Confirmatory Item 8.2A-1</u>

The applicant proposed a license condition in Part 10 of the VEGP COL application, which will incorporate the ITAAC identified in Appendix B. Appendix B includes ITAAC for the offsite power system. The license condition's proposed text is evaluated in Chapter 1 of this SER.

Confirmatory Item 8.2A-1 required the applicant to update its FSAR to include proposed ITAAC for the offsite power system. The NRC staff verified that the VEGP COL application was appropriately updated. The ITAAC associated with the offsite power system are shown in VEGP COL Part 10, Appendix B, Table 2.6.12-1. Table 8.2A-1 of this SER reflects this table. As a result, Confirmatory Item 8.2A-1 is resolved. Therefore, the staff will include the ITAAC for the offsite power system in the license.

8.2.A.5 *Post Combined License Activities*

For the reasons discussed in WLS COL FSAR, Part 10, Appendix B, Table 2.6.12-4, "Offsite Power System," the staff finds the ITAAC proposed by the applicant acceptable.

8.2.A.6 *Conclusion*

The staff concludes that the relevant information presented in the WLS COL FSAR is acceptable and meets the requirements of GDC 17 and GDC 18.

8.3 Onsite Power Systems

8.3.1 AC Power Systems

8.3.1.1 *Introduction*

The onsite ac power system includes those standby power sources, distribution systems, and auxiliary supporting systems provided to supply power to safety-related equipment or equipment important to safety for all normal operating and accident conditions. In the AP1000 passive reactor design used at WLS, the onsite ac power system is a non-Class 1E system that provides reliable ac power to the various system electrical loads. It does not perform any safety-related functions. These loads enhance an orderly shutdown under emergency conditions when offsite power is not available. Additional loads for investment protection can be manually loaded on the standby power supplies. Diesel generator sets are used as the standby power source for the onsite ac power system.

8.3.1.2 *Summary of Application*

WLS COL FSAR, Revision 11, Section 8.3 incorporates by reference AP1000 DCD, Revision 19, Section 8.3, and contains COL information items and supplemental information to address any departures and/or supplements.

COL Information Items

- WLS COL 8.3-1

WLS COL 8.3-1 describes: (1) the grounding grid system design within the plant boundary; and (2) a lightning protection risk assessment and general system design for the switchyard and buildings comprising WLS Units 1 and 2. This COL information item is also referenced in WLS COL FSAR Section 8.3.3.

- STD COL 8.3-2

STD COL 8.3-2 describes the details of: (1) Class 1E and non-Class 1E battery maintenance, clearing of faults, and testing of chargers and voltage regulating transformers; (2) the bases of operation, inspection, and maintenance procedures for the onsite standby diesel generators; and (3) procedures for the periodic testing of penetration overcurrent protective devices. This COL information item is also referenced in WLS COL FSAR Section 8.3.3.

Supplemental Information

- WLS SUP 8.3-1

WLS SUP 8.3-1 states that the site conditions provided in WLS COL FSAR Sections 2.1 and 2.3 are bounded by the standard site conditions used to rate the diesel engine and the associated generator in AP1000 DCD Section 8.3.1.1.2.3.

8.3.1.3 *Regulatory Basis*

The regulatory basis for the review of the information incorporated by reference is addressed in NUREG-1793, “Final Safety Evaluation Report Related to Certification of the AP1000 Standard Design,” and its supplements. In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the ac power systems are given in NUREG-0800, Section 8.3.1.

The regulatory basis for the review of WLS COL 8.3-1, addressing the grounding and lightning protection systems are the guidelines of:

- RG 1.204, “Guidelines for Lightning Protection of Nuclear Power Plants”
- IEEE Standard 80, “Guide for Safety in AC Substation Grounding”
- IEEE Standard 665, “Guide for Generating Station Grounding”
- IEEE C.62.23, “Application Guide for Surge Protection of Electric Generating Plants”
- National Fire Protection Association (NFPA) 780, “Standard for the Installation of Lightning Protection Systems”

The regulatory bases for the review of the part of STD COL 8.3-2 addressing the recommendations in operation, inspection, and maintenance procedures for the non-Class 1E onsite standby diesel generators are the manufacturer’s guidelines. The regulatory bases for the review of the part of STD COL 8.3-2 addressing procedures for penetration protective device testing are the guidelines of RG 1.63, Revision 3, "Electric Penetration Assemblies in Containment Structures for Nuclear Power Plants." The regulatory basis for the review of WLS SUP 8.3-1 was the standard site conditions outlined in NUREG-1793. The regulatory bases for acceptance of STD SUP 8.3-2 is the requirements of GDC 18, "Inspection and Testing of Electric Power Systems."

8.3.1.4 *Technical Evaluation*

The staff reviewed WLS COL FSAR Section 8.3.1 and checked the referenced DCD to ensure that the combination of the DCD information incorporated by reference and the information included in WLS COL application represents the complete scope of information relating to this review topic.[1] The staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the ac power systems. The results of the staff's evaluation of the information incorporated by reference in the application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this report provides a discussion of the strategy used by the staff to perform one technical review for each standard issue outside the scope of the design certification and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the WLS Units 1 and 2 application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.

- The staff verified that the site-specific differences were not relevant.

The staff completed its review and found the evaluation performed for the standard content to be directly applicable to the WLS application. This standard content material is identified in this report by use of italicized, double-indented formatting. Section 1.2.3 of this report provides an explanation of why the standard content material from the SER for the reference application (VEGP) contains evaluation material from the SER for the BLN Units 3 and 4 application.

The staff reviewed the information in the WLS COL FSAR:

<u>AP1000 COL Information Items</u>

- COL 8.3-1

The staff reviewed COL 8.3-1 related to the AP1000 DCD COL Information Item 8.3-1 that states:

> Combined License applicants referencing the AP1000 certified design will address the design of grounding and lightning protection.

The commitment was also captured as COL Action Item 8.3.1.6-1 in NUREG-1793, Appendix F, which states:

> The COL applicant will provide the design of the site-specific grounding and lightning protection.

The staff reviewed the resolution to COL Information Item 8.3-1, related to the ground grid system and lightning protection included under WLS COL FSAR Section 8.3. The staff's evaluation is described below.

The applicant stated that a grounding system calculation was performed to establish a ground grid design within the plant boundary resulting in step and touch potentials near equipment that are within the acceptable limit for personnel safety. Computer analysis utilized actual resistivity measurements from soil samples taken at the plant site, and were used to create a soil model for the plant site. The ground grid conductor size was then determined using the methodology outlined in IEEE Standard 80, and a grid configuration for the site was created. The grid configuration was modeled in conjunction with the soil model. The resulting step and touch potentials were calculated, and found to be within the acceptable limit. Based on the above, the staff concludes that IEEE Standard 80 provides an acceptable method for determining the right size for ground conductors; therefore, the COL information item provided by the applicant on station grounding grid is acceptable.

In reference to lightning protection, the applicant states that in accordance with IEEE 665, a lightning protection risk assessment for the buildings comprising the WLS was performed based on the methodology in NFPA 780. The tolerable lightning frequency for each of the buildings was determined to be less than the expected lightning frequency; therefore, lightning protection is required for WLS buildings in accordance with NFPA 780 and IEEE C.62.23. The zone of protection is based on the elevations and geometry of the structures. It includes the space covered by a rolling sphere having a radius sufficient enough to cover the building to be protected. The zone of protection method is based on the use of ground masts, air terminals and shield wires. Either copper or aluminum is used for lightning protection. Lightning protection grounding is interconnected with the station or switchyard grounding system. Based on the above, the staff concludes that the applicant adequately addressed the guidance of IEEE Standard 80, IEEE Standard 665, IEEE C.62.23, and NFPA 780, and provided an acceptable method for lightning protection; therefore, the supplemental information provided by the applicant on lightning protection is acceptable.

With regard to the protection of electrical penetration assemblies and the onsite standby diesel generator inspection and maintenance, WLS identified the standard content related to these two items in its WLS COL FSAR Section 8.3. The following portion of this technical evaluation section is reproduced from VEGP SER Section 8.3.1.4.

- STD COL 8.3-2

The staff reviewed STD COL 8.3-2 related to AP1000 DCD COL Information Item 8.3-2, which states, in part:

> *The Combined License applicant will establish plant procedures as required for:*
>
> – *Periodic testing of penetration protective devices*

– *Diesel generator operation, inspection and maintenance in accordance with manufacturers' recommendations*

The commitment was also captured as COL Action Items 8.3.1.2-1 and 8.4.1-1 in the staff's FSER for the AP1000 DCD, Appendix F (NUREG-1793), which state:

> *The COL applicant will establish plant procedures for preoperational testing to verify proper operation of the ac power system. (COL Action Item 8.3.1.2-1).*
>
> *The COL applicant will establish plant procedures for periodic testing of penetration protective devices. (COL Action Item 8.4.1-1).*

A part of standard information item, STD COL 8.3-2, was provided by the applicant describing the bases of the recommendations in operation, inspection, and maintenance procedures for the onsite standby diesel generators. This part of STD COL 8.3-2 is addressed in BLN COL FSAR Section 8.3.1.1.2.4.

A part of standard information item, STD COL 8.3-2, was provided by the applicant describing procedures for the testing of penetration protective devices. This portion of STD COL 8.3-2 is addressed in BLN COL FSAR Section 8.3.1.1.6.

The NRC staff reviewed the resolution to COL information item, STD COL 8.3-2, related to testing procedures for standby diesel generators and electrical penetrations included under Section 8.3 of the BLN COL FSAR. The NRC staff's evaluation follows.

For the operation, inspection and maintenance for diesel generators, the applicant's procedures will consider both the diesel generator manufacturer and industry diesel working group recommendations.

In RAI 8.3.1-2, the NRC staff stated that COL Action Item 8.3.1.2-1 in the NRC's FSER for the AP1000 DCD (NUREG-1793), contains the following discussion:

> *Preoperational tests are conducted to verify proper operation of the ac power system. The preoperational tests include operational testing of the diesel load sequencer and diesel generator capacity testing. The diesel generators are not safety-related and will be maintained in accordance with the requirements of the overall plant maintenance program. This program will cover the preventive, corrective, and predictive maintenance activities of the plant systems and equipment and will be presented in the COL application. This COL information is discussed in DCD Tier 2, Section 8.3.3, "Combined License Information for Onsite Electrical Power."*

In RAI 8.3.1-2, the applicant was asked to provide a reference to where the preoperational testing program and the preventive, corrective, and predictive *maintenance activities for the diesel generators are discussed in the application, or provide a proposed revision to the application to address this issue.*

In a letter dated April 6, 2009, the applicant stated that COL Action Item 8.3.1.2-1 in Appendix F of the FSER does not indicate that "pre-operational testing" of the diesel generators has been addressed in the DCD. Pre-operational testing of the ac power system is described in FSER Section 14, DCD Section 14, and BLN COL FSAR Chapter 14. Specifically, DCD Sections 14.2.9.2.15 and 14.2.9.2.17 address the onsite ac power system and diesel generator testing, including diesel generator capacity and sequencer tests. BLN COL FSAR Section 14.2.9.4.23 describes testing of the offsite power system. The NRC staff agrees that pre-operational testing of the diesel generators is addressed in DCD Section 14.2.9.2.17 and was found acceptable by the staff as indicated in FSER NUREG-1793 Section 14.2.9. Based on the above, the NRC staff finds that the applicant's response to the portion of the RAI regarding COL areas of responsibility is acceptable.

In addition, the applicant stated that BLN COL FSAR Section 8.3.1.1.2.4 will be revised to include inspection and maintenance (including preventive, corrective, and predictive maintenance) procedures considering both the diesel generator manufacturer's recommendations and industry diesel working group recommendations.

The NRC staff concludes that following the manufacturer and industry diesel generator working group recommendations for onsite standby diesel generator inspection and maintenance including preventive, corrective, and predictive maintenance provides reasonable assurance that the diesel generators will be adequately maintained. Therefore, DCD COL Information, Item 8.3-2 and FSER COL Action Item 8.3.1.2-1 are resolved subject to the verification that the BLN COL FSAR has been updated to include applicable portions of the RAI response. This is identified as Confirmatory Item 8.3.1-1.

With regard to establishing plant procedures for periodic testing of protective devices that provide penetration overcurrent protection, the applicant will implement procedures to periodically test a sample of each different type of overcurrent device. Testing includes:

- *Verification of thermal and instantaneous trip characteristics of molded case circuit breakers*
- *Verification of long time, short time, and instantaneous trips of medium voltage air circuit breakers*
- *Verification of long time, short time, and instantaneous trips of low voltage air circuit breakers*

Because the above testing is consistent with the recommendation of RG 1.63, the NRC staff concludes that the above information satisfies COL Information Item 8.3-2 and FSER COL Action Item 8.3.1.6-1, and that these items are resolved.

<u>*Resolution of Standard Content Confirmatory Item 8.3.1-1*</u>

Confirmatory Item 8.3.1-1 required the applicant to update its FSAR to specify that onsite standby diesel generator inspection and maintenance (including preventive, corrective, and predictive maintenance) procedures will consider both the diesel generator manufacturer's recommendations and industry diesel working group recommendations. The NRC staff verified that the VEGP COL FSAR was appropriately updated. As a result, Confirmatory Item 8.3.1-1 is resolved.

<u>Supplemental Information</u>

- WLS SUP 8.3-1

In WLS SUP 8.3-1, the applicant stated that its site conditions provided in WLS COL FSAR Sections 2.1 and 2.3 were bounded by the standard site conditions in AP1000 DCD Section 8.3.1.1.2.3 used to rate the diesel engine and the associated generator. The staff agrees that the WLS site conditions are bounded by the standard site conditions used to determine the rating.

- STD SUP 8.3-2

The applicant provided information in STD SUP 8.3-2 to include implementation of procedures for periodic verification of proper operation of the onsite ac power system capability for automatic and manual transfer from the preferred power supply to the maintenance power supply and return from the maintenance power supply to the preferred power supply. The staff finds that the above satisfies the requirements of GDC 18 and is acceptable.

8.3.1.5 *Post Combined License Activities*

There are no post COL activities related to this section.

8.3.1.6 *Conclusion*

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant addressed the required information relating to onsite ac power systems, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the staff's technical evaluation of the information incorporated by reference in the application are documented in NUREG-1793 and its supplements.

In addition, the staff compared the COL information items, the supplemental information, the interfaces for standard design, and the proposed design changes and corrections in the application to the relevant NRC regulations, guidance in NUREG-0800, Section 8.3.1, and other NRC regulatory guides and concludes that the applicant is in compliance with NRC regulations. The staff based its conclusion on the following:

- COL 8.3-1 is acceptable because the applicant provided sufficient information related to the grounding grid system design and lightning protection consistent with the recommendations of RG 1.204, IEEE Std. 80, IEEE Std. 665, IEEE Std. C.62.23, and NFPA 780.

- STD COL 8.3-2 is acceptable because the applicant demonstrated conformance to preoperational testing of the diesel generators and periodic testing of the penetration overcurrent protective devices consistent with manufacturers' guidelines for non-Class 1E onsite diesel generators and the recommendations of RG 1.63.

- WLS SUP 8.3-1 is acceptable because the applicant demonstrated conformance to site-specific conditions that are bounded by the standard site conditions in the AP1000 DCD for rating the diesel generator.

- STD SUP 8.3-2 is acceptable because the applicant established procedures for periodic verification of offsite power system capacity for automatic and manual transfer from the preferred power supply to maintenance power supply and vice versa, demonstrating compliance with the requirements of GDC 18.

8.3.2 Direct Current Power Systems

8.3.2.1 *Introduction*

The dc power systems include those dc power sources and distribution systems provided to supply motive or control power to safety-related equipment. Batteries and battery chargers serve as the power sources for the dc power system and convert power from the dc distribution system to ac instrumentation, and control power, as required. These components can provide a UPS that furnishes a continuous, highly reliable source of ac supply.

The AP1000 dc power system is comprised of independent Class 1E and non-Class 1E dc power systems. Each system consists of ungrounded stationary batteries, dc distribution equipment, and UPS.

8.3.2.2 *Summary of Application*

WLS COL FSAR, Revision 11, Section 8.3 incorporates by reference AP1000 DCD, Revision 19, Section 8.3. AP1000 DCD Section 8.3 also includes Section 8.3.2. AP1000 DCD, Revision 19 includes a standard COL information Item (STD COL 8.3-2) and a standard departure (STD DEP 8.3-1). However, the applicant proposed a COL information item, supplemental information, and a site-specific AP1000 FSAR Tier 2 departure (WLS DEP 8.3-1).

Tier 2 Departure

- WLS DEP 8.3-1

The applicant added Departure WLS DEP 8.3-1 to the WLS COL FSAR, revising AP1000 DCD Section 8.3.2.2 to add information on the Class 1E battery chargers' voltage regulating.

AP1000 COL Information Item

- STD COL 8.3-2

STD COL 8.3-2 describes the details of: (1) procedures for inspection, maintenance, and testing of Class 1E batteries; (2) the clearing of ground faults on the Class 1E dc power system; and (3) information related to periodic testing for the battery chargers and voltage regulating transformers.

Supplemental Information

- STD SUP 8.3-1

The applicant provided supplemental information stating that there are no site-specific non-Class 1E dc loads connected to the Class 1E dc system.

8.3.2.3 *Regulatory Basis*

The regulatory basis for the review of the information incorporated by reference is addressed in NUREG-1793, and its supplements. In addition, the acceptance criteria associated with the relevant requirements of NRC regulations for the dc power systems are given in NUREG-0800, Section 8.3.2.

The regulatory basis for review of WLS DEP 8.3-1 is established in:

- GDC 17, "Electric Power Systems"
- GDC 18, "Inspection and Testing of Electric Power Systems"
- RG 1.129, Revision 2, "Maintenance, Testing, and Replacement of Vented Lead-Acid Storage Batteries for Nuclear Power Plants
- RG 1.75, "Criteria For Independence Of Electrical Safety Systems," Revision 3
- IEEE Standard 384, "IEEE Standard Criteria for Independence of Class 1E Equipment and Circuit,"
- IEEE Standard 450, "IEEE Recommended Practice for Maintenance, Testing, and Replacement of Vented Lead-Acid Batteries for Stationary Applications"

The regulatory basis for the review of WLS COL 8.3-1 is 10 CFR Part 52, Appendix D, Section VIII.B.5 and the guidance of IEEE 384, and RG 1.75.

The regulatory basis for the review of STD COL 8.3-2 is 10 CFR Part 52, Appendix D, Section VIII.B.5 and manufacturer's recommendations.

8.3.2.4 *Technical Evaluation*

The staff reviewed WLS COL FSAR Section 8.3.2 and checked the referenced DCD to ensure that the combination of the DCD information incorporated by reference and the information in the COL application represents the complete scope of information relating to this review topic.[1] The staff's review confirmed that the information in the COL application and the DCD information incorporated by reference addresses the required information relating to the dc power systems. The results of the staff's evaluation of the information incorporated by reference in the application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this report provides a discussion of the strategy used by the staff to perform one technical review for each standard issue outside the scope of the design certification and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP

Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews.

- The staff compared the VEGP COL FSAR to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the application, as applicable) resulting from RAIs.

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.

- The staff verified that the site-specific differences were not relevant.

The staff completed its review and found the evaluation performed for the standard content to be directly applicable to the application. This standard content material is identified in this report by use of italicized, double-indented formatting. Section 1.2.3 of this report provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the BLN Units 3 and 4, application. However, the applicant took an exception and included the following FSAR Tier 2 departure WLS DEP 8.3-1 from the AP1000 DCD:

Tier 2 Departure

- WLS DEP 8.3-1 and STD COL 8.3-2

The AP1000 DCD states that the Class 1E battery chargers and Class 1E voltage regulating transformers are designed to limit the input (ac) current to an acceptable value under faulted conditions on the output side. In a December 5, 2011, letter, the applicant took a departure from AP1000 DCD Section 8.3.2.2 and added information on the Class 1E voltage regulating transformers current limiting features. The applicant added Departure (WLS DEP 8.3-1) to the COLA, Part 7, Section A, “Summary of FSAR Departures from the DCD,” and added a new Section 8.3.2.2 in WLS COL FSAR.

The departure relates to the AP1000 DCD Class 1E voltage regulating transformers current limiting features. Specifically, the applicant added a Tier 2 departure in WLS COL FSAR Section 8.3.2.2 where the isolation and protection function is provided by built-in circuit breakers between Class 1E loads and the non-Class 1E ac power source. The AP1000 voltage regulating transformers do not have active components to limit current. The applicant stated that the information in the similar departure for the reference COL is slightly different due to a certain supplier Deficiency Report (SDR) not being available at the time of the reference COL submittal; therefore, the WLS departure is site-specific. The applicant further stated that this Tier 2 departure does not impact the required design function (i.e., isolation) and, therefore, does not require NRC approval pursuant to 10 CFR Part 52, Appendix D, Section VIII.B.5. The staff finds the applicant’s assessment consistent with IEEE 384 and RG 1.75 and, therefore, acceptable.

The following portion of this technical evaluation section is reproduced from VEGP SER Section 8.3.2.4:

<u>AP1000 COL Information Item</u>

- *STD COL 8.3-2, involving the inspection, maintenance, and testing of Class 1E batteries and clearing of ground faults on the Class 1E dc system.*

The NRC staff reviewed STD COL 8.3-2 related to COL Information Item 8.3-2. COL Information Item 8.3-2 states (in part):

> *The Combined License applicant will establish plant procedures as required for:*
>
> – *Clearing ground fault on the Class 1E dc system*
>
> – *Checking sulfated battery plates or other anomalous conditions through periodic inspections*
>
> – *Battery maintenance and surveillance (for battery surveillance requirements, refer to DCD Chapter 16, Section 3.8)*

The commitment was also captured as COL Action Item 8.4.1-1 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:

> *The COL applicant will establish plant procedures for periodic testing of penetration protective devices. (COL Action Item 8.4.1-1)*

The Class 1E 125 volts direct current (Vdc) system components undergo periodic maintenance tests to determine the condition of the system. The applicant has established procedures for inspection and maintenance of Class 1E batteries and non-Class 1E batteries. Class 1E battery maintenance and service testing is performed in conformance with RG 1.129. Batteries are inspected periodically to verify proper electrolyte levels, specific gravity, cell temperature and battery float voltage. Cells are inspected in conformance with IEEE 450 and vendor recommendations. In addition, the applicant has established procedures for clearing of ground faults on the Class 1E dc system. The battery testing procedures are written in conformance with IEEE 450 and the Technical Specifications. The NRC staff concludes that the applicant has established procedures for inspection and maintenance of Class 1E and non-Class 1E batteries to satisfy COL Information Item 8.3-2; therefore, this item is resolved.

With regard to periodic testing of electrical penetration protective devices (COL Action Item 8.4.1-1) for dc systems, the applicant has not addressed periodic testing of the penetration over load protective devices related to dc systems. In RAI 8.3.1-1, the staff requested that the applicant address the periodic testing of the electrical penetration primary and backup protective devices protecting Class 1E and non-Class 1E dc circuits. In a letter dated January 2, 2009, the applicant stated that the BLN COL FSAR will be revised in the next COLA submittal to include periodic testing of the electrical penetration primary and backup protective devices protecting Class 1E and non-Class 1E dc circuits, as well as control of protective devices. The staff has reviewed the *information in the applicant's response, which provided for the testing of Class 1E and non-Class 1E dc penetration overload protection devices. The staff also reviewed the proposed change to BLN COL FSAR Section 8.3.1.1.6 and concludes that COL Action Item 8.4.1-1 is resolved subject to the verification that the BLN COL FSAR has been updated to include portions of the RAI response. This is identified as Confirmatory Item 8.3.2-1.*

Resolution of Standard Content Confirmatory Item 8.3.2-1

Confirmatory Item 8.3.2-1 required the applicant to update its FSAR to provide for the testing of Class 1E and non-Class 1E dc penetration overload protection devices. The NRC staff verified that the VEGP COL FSAR was appropriately updated. As a result, Confirmatory Item 8.3.2-1 is resolved.

WLS Resolution of Standard Content Confirmatory Item 8.3.2-1

The staff verified that WLS COL FSAR Section 8.3.1.1.6 was appropriately updated. As a result, standard content Confirmatory Item 8.3.2-1 is resolved for WLS.

The following portion of this technical evaluation section is reproduced from VEGP SER Section 8.3.2.4:

Evaluation of Tier 2 Departure STD DEP 8.3-1 and Revised STD COL 8.3-2

In a letter dated June 18, 2010, Westinghouse provided a response to Open Item OI-SRP8.3.2-EEB-09, Revision 3, related to the periodic testing of battery chargers and voltage regulating transformers. The response included a COL information item to be added to AP1000 DCD Section 8.3.3 to ensure that periodic testing is performed on the battery chargers and voltage regulating transformers. Specifically, this section will be revised to include the following COL information item:

> *The Combined License applicant will establish plant procedures as required for:*
>
> > *Combined License applicants referencing the AP1000 certified design will ensure that periodic testing is performed on the battery chargers and voltage regulating transformers.*

In a letter dated October 15, 2010, the applicant submitted its response to address the above identified AP1000 DCD revision to the Section 8.3.3 COL information item regarding battery charger and voltage regulating transformer testing. The applicant stated that procedures are established for periodic testing of the Class 1E battery chargers and the Class 1E regulating transformers in accordance with the manufacturer recommendations. The battery chargers and regulating transformers are tested periodically in accordance with manufacturer recommendations. Circuit breakers in the Class 1E battery chargers and Class 1E voltage regulating transformers that are credited for an isolation function are tested through the use of breaker test equipment. This verification confirms the ability of the circuit to perform the designed coordination and *corresponding isolation function between Class 1E and non-Class 1E components. Circuit breaker testing is done as part of the MR program and testing frequency is determined by that program. Fuses/fuse holders that are included in the isolation circuit are visually inspected. Class 1E battery chargers are tested to verify current limiting characteristic utilizing manufacturer recommendation and industry practices. Testing frequency is in accordance with that of the associated battery.*

The applicant clarified that the voltage regulating transformers do not have active components to limit current and, therefore, the voltage regulating transformer in combination with fuses and/or breakers will interrupt the input or output (ac) current under faulted conditions on the output side. The NRC staff finds this to be inconsistent with AP1000 DCD Section 8.3.2.2, which states that Class 1E voltage regulating transformers are designed to limit the input (ac) current to an acceptable value under faulted conditions on the output side. As such the use of the breakers/fuses for regulating transformers for isolation function in lieu of current limiting characteristics as presented in the AP1000 DCD is a departure for VEGP. The applicant stated that Part 7 of the COL application will be revised to include a departure from AP1000 DCD Section 8.3.2.2 clarifying the current limiting feature of voltage regulating transformers. The applicant has included, in its response, the appropriate changes related to the above departure that will be included in VEGP COL FSAR Sections 8.3.2.1.4 and 8.3.2.2, in Chapter 1, Table 1.8-201 and in Part 7 of the VEGP COL application. These changes will be included in a future revision to the VEGP COL application.

The NRC staff has reviewed the proposed changes to the VEGP COL application and concludes that the applicant has provided sufficient information regarding the isolation function and the periodic inspection and testing of the isolating devices for the Class 1E battery chargers and Class 1E voltage regulating transformers. In addition, the staff finds that, although the use of the breakers/fuses for regulating transformers isolation function in lieu of current limiting characteristics as presented in the AP1000 DCD is a departure for VEGP, the departure is acceptable because the use of the breakers/fuses for regulating transformers for isolation function is consistent with the recommendations in IEEE-384, "IEEE Standard Criteria for Independence of Class 1E Equipment and Circuits," endorsed by RG 1.75. Therefore, COL Information Item STD DEP 8.3-1 and the revised STD COL 8.3-2 are resolved subject to NRC staff verification of the revision to the VEGP COL FSAR sections discussed above. This is being tracked as Confirmatory Item 8.3.2-2.

Resolution of Standard Content Confirmatory Item 8.3.2-2

Confirmatory Item 8.3.2-2 is an applicant commitment to revise its FSAR Table 1.8-201 and Section 8.3.2.1.4 to address COL Information Item STD COL 8.3-2 and a departure, STD DEP 8.3-1. The staff verified that the VEGP COL FSAR was appropriately revised. As a result, Confirmatory Item 8.3.2-2 is now closed.

<u>WLS Resolution of Standard Content Confirmatory Item 8.3.2-2</u>

In a December 5, 2011, letter, the applicant proposed a revision to FSAR Table 1.8-201, "Summary of FSAR Departures," WLS COL FSAR Section 8.3.2.1.4, "Maintenance and Testing," and WLS COL FSAR Section 8.3.2.2, "Analysis." The change to WLS COL FSAR Section 8.3.2.1.4 included a left margin annotation for STD COL 8.3-2, to establish procedures for periodic testing of the Class 1E battery chargers and Class 1E voltage regulating transformers. The applicant also took exception to STD DEP 8.3-1 and provided a site-specific departure, WLS DEP 8.3-1. The staff confirmed that Standard Content Confirmatory Item 8.3.2-2 and Departure 8.3-1 related changes were included in WLS COL FSAR. Accordingly, the staff considers this item resolved.

The following portion of this technical evaluation section is reproduced from BLN SER Section 8.3.2.4:

> *<u>Supplemental Information</u>*
>
> - *STD SUP 8.3-1*
>
> *STD SUP 8.3-1 was provided by the applicant indicating that there are no site-specific non-Class 1E dc loads connected to the Class 1E dc system. The staff finds this acceptable because it is consistent with the guidance in RG 1.206.*
>
> *<u>Evaluation of Site-specific Response to Standard Content</u>*
>
> *In VEGP COL FSAR, Revision 2, the VEGP applicant changed the number of the supplemental information item from STD SUP 8.3-1 to STD SUP 8.3-3. The associated VEGP COL FSAR, Revision 2 text, which is identical to the BLN COL FSAR, Revision 1 text accepted by the staff, was not changed. Therefore, the staff concludes that this difference is not relevant and that the staff's evaluation of STD SUP 8.3-1 for BLN applies to STD SUP 8.3-3 for VEGP.*

8.3.2.5 *Post Combined License Activities*

There are no post COL activities related to this section.

8.3.2.6 *Conclusion*

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant addressed the required information relating to dc power systems, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the staff's technical evaluation of the information incorporated by reference in the application are documented in NUREG-1793 and its supplements.

In addition the staff concludes that the relevant information presented in the WLS COL FSAR is acceptable and meets the relevant NRC regulations, guidance in NUREG-0800, Section 8.3.2, and other NRC regulatory guides and concludes that with closure of the confirmatory item discussed above, the applicant is in compliance with NRC regulations. The staff based its conclusion on the following:

- WLS DEP 8.3-1 is acceptable because the applicant provided sufficient information involving the use of breakers/fuses for regulating transformers for isolation function that is consistent with IEEE-384, endorsed by RG 1.75.

- STD COL 8.3-2 is acceptable because the applicant provided sufficient information involving the inspection, maintenance, and testing of Class 1E batteries, the clearing of ground faults on the Class 1E dc system, and periodic testing of the battery chargers and voltage regulating transformers.

- STD SUP 8.3-1 is acceptable because the applicant made a commitment that there are no site-specific non-Class 1E dc loads connected to the Class 1E dc system.

9.0 AUXILIARY SYSTEMS

The auxiliary systems provide support systems that support the safe shutdown of the plant or the protection of the health and safety of the public. This area covers a wide range of systems including fuel storage and handling, water systems, compressed air, process sampling, drains, heating, ventilation, and air conditioning (HVAC), fire protection, communications, lighting, and emergency diesel generator support systems.

9.1 Fuel Storage and Handling

9.1.1 New Fuel Storage (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.1.1, "Criticality Safety of Fresh and Spent Fuel Storage and Handling," and C.I.9.1.2, "New and Spent Fuel Storage")

The new fuel storage facilities include the fuel assembly storage racks, the concrete storage pit that contains the storage racks, and auxiliary components including the spent fuel handling crane and pit cover. The storage facilities must maintain the new fuel in subcritical arrays during all credible storage conditions. In addition, new fuel must remain subcritical during fuel handling.

Section 9.1 of the William States Lee III Nuclear Station (WLS) combined license (COL) final safety analysis report (FSAR), Revision 11, incorporates by reference, with no departures or supplements, Section 9.1.1, "New Fuel Storage," of Revision 19 of the AP1000 design control document (DCD). The U.S. Nuclear Regulatory Commission (NRC) staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.[1] The NRC staff's review confirmed that there is no outstanding issue related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793, "Final Safety Evaluation Report [FSER] Related to Certification of the AP1000 Standard Design," and its supplements.

9.1.2 Spent Fuel Storage (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.1.1, "Criticality Safety of Fresh and Spent Fuel Storage and Handling," and C.I.9.1.2, "New and Spent Fuel Storage")

9.1.2.1 *Introduction*

The spent fuel storage facilities include the spent fuel storage racks, the spent fuel storage pool that contains the storage racks, and the associated equipment storage pits. The storage facilities must maintain the spent fuel in subcritical arrays during all credible storage conditions. In addition, spent fuel must remain subcritical during fuel handling.

[1] See Section 1.2.2 for a discussion of the staff's review related to verification of the scope of information to be included in a COL application that references a design certification (DC).

9.1.2.2 *Summary of Application*

Section 9.1 of the WLS COL FSAR, Revision 11, incorporates by reference Section 9.1 of the AP1000 DCD, Revision 19. Section 9.1 of the DCD includes Section 9.1.2.

In addition, in WLS COL FSAR Section 9.1.6, the applicant provided the following:

<u>AP1000 COL Information Item</u>

- STD COL 9.1-7

The applicant provided additional information in standard (STD) COL 9.1-7 to address COL Information Item 9.1-7.

<u>License Condition</u>

- Part 10, License Condition 2, Item 9.1-7

The applicant proposed a license condition related to STD COL 9.1-7 that sets the implementation milestone for the Metamic coupon monitoring program.

- Part 10, License Condition 6

The applicant proposed in WLS Part 10, Revision 4, a license condition to provide a schedule to support the NRC's inspection of operational programs and added the Metamic monitoring program to this list.

9.1.2.3 *Regulatory Basis*

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the fuel storage and handling are given in Section 9.1.2 of NUREG-0800, "Standard Review Plan for the Review of Safety Analysis Reports for Nuclear Power Plants: [Light-Water Reactor] LWR Edition."

The regulatory basis for acceptance of the COL information and supplementary information items are established in:

- Title 10 of the *Code of Federal Regulations* (10 CFR) Part 50, "Domestic licensing of production and utilization facilities," Appendix A, "General Design Criteria for Nuclear Power Plants," General Design Criteria (GDC) 4, "Environmental and Dynamic Effects Design Bases"

- GDC 61, "Fuel Storage and Handling and Radioactivity Control"

9.1.2.4 *Technical Evaluation*

The NRC staff reviewed Section 9.1.2 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to spent fuel storage. The results of the NRC staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this safety evaluation report (SER) provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (Vogtle Electric Generating Plant [VEGP], Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5 to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from requests for additional information (RAIs).

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.

- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the WLS COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the Bellefonte Nuclear Station (BLN), Units 3 and 4 COL application. Any confirmatory items in the standard content material retain the numbers assigned in the VEGP SER. Confirmatory items that are first identified in this SER section have a WLS designation (e.g., **Confirmatory Item WLS 9.1-1**).

The following portion of this technical evaluation section is reproduced from Section 9.1.2.4 of the VEGP SER:

> *AP1000 COL Information Item*
>
> - *STD COL 9.1-7*
>
> *COL Information Item 9.1-7 states:*
>
> > *The Combined License holder will implement a spent fuel rack Metamic coupon monitoring program when the plant is placed into commercial operation. This program will include tests to monitor bubbling, blistering, cracking, or flaking; and a test to monitor for*

> *corrosion, such as weight loss measurements and or visual examination.*

STD COL 9.1-7 states:

> *A spent fuel rack Metamic coupon monitoring program is to be implemented when the plant is placed into commercial operation. This program includes tests to monitor bubbling, blistering, cracking, or flaking; and a test to monitor for corrosion, such as weight loss measurements and or visual examination.*

The NRC staff reviewed STD COL 9.1-7 related to the Metamic coupon monitoring program included under Section 9.1 of the BLN COL FSAR. No additional details on the Metamic Coupon Monitoring Program are provided in Section 9.1 of the FSAR.

Since the applicant's proposed resolution of COL Information Item 9.1-7 was a restatement of the text of the COL information item from the DCD, the staff required additional information to be able to evaluate the applicant's closure of the item. An additional Request for Additional Information (RAI) response related to AP1000 DCD Section 9.1.2 (ML091120720) proposed a modification to the text of COL Information Item 9.1-7. The modified wording added neutron attenuation and thickness testing to the list of tests to be included in the Metamic monitoring program to be implemented by the COL holder. In RAI 9.1.2-1, the NRC staff requested that the applicant describe in detail the implementation of the aspects of the Metamic coupon monitoring program that are listed in STD COL 9.1-7, as modified by the additional AP1000 RAI response. In response to RAI 9.1.2-1, the applicant proposed modified wording for STD COL 9.1-7 as follows:

> *STD COL 9.1-7*
>
> *A spent fuel rack Metamic coupon monitoring program is to be implemented when the plant is placed into commercial operation. This program includes tests to monitor bubbling, blistering, cracking, or flaking; and a test to monitor for corrosion, such as weight loss measurements and / or visual examination. The program will also include tests to monitor changes in physical properties of the absorber material, including neutron attenuation and thickness measurements.*

This proposed wording matches the proposed revised text for AP1000 COL Information Item 9.1-7. However, the proposed wording is still a restatement of the COL information item and does not contain the level of detail needed by the staff to evaluate the adequacy of the Metamic monitoring program. Therefore, in RAI 9.1.2-2, the staff requested that the applicant describe the methodology and acceptance criteria for the tests listed, provide the corrective action requirements and provide the administrative controls applicable to the program. Additionally, the applicant should confirm the number of coupons and the withdrawal schedule will be the same as recommended in the DCD or provide an alternative. The *staff has identified this as **Open Item 9.1-1** to track resolution of this issue and to ensure that the additional details are included in the BLN COL FSAR.*

Resolution of Standard Content Open Item 9.1-1

To resolve Open Item 9.1-1, the VEGP applicant provided additional information in a letter dated April 23, 2010, which superseded the original response to Open Item 9.1-1 provided in a letter dated December 30, 2009.

With respect to the number of coupons and the withdrawal schedule, the applicant confirmed that the number of coupons and the withdrawal schedule will be the same as stated in AP1000 DCD Revision 19, Section 9.1.2.2.1. The applicant further stated that since AP1000 DCD Section 9.1 is incorporated by reference into the FSAR, no additional FSAR change would be required. The staff finds the applicant's response regarding the number of coupons and withdrawal schedule acceptable, because the applicant has confirmed the number of coupons and schedule will be the same as described in the AP1000 DCD Revision 19.

With respect to methodology and acceptance criteria, corrective actions and administrative controls, the applicant stated that since the Metamic coupon monitoring program has not yet been established, the level of detail requested is not completely available. The applicant further stated, "As stated in FSAR Subsection 9.1.6, a Metamic monitoring program will be implemented when the plant is placed into commercial operation. This program will include methodology to be employed, acceptance criteria, corrective actions and a description of administrative controls based on vendor recommendations and industry operating experience."

The applicant additionally stated that the VEGP COL FSAR will be revised to add the following to the end of the STD COL 9.1-7 discussion:

> *The program will include the methodology and acceptance criteria for the tests listed and provide corrective action requirements based on vendor recommendations and industry operating experience. The program will be implemented through plant procedures.*
>
> *Metamic Monitoring Acceptance Criteria:*
>
> - *Verification of continued presence of the boron is performed by neutron attenuation measurement. A decrease of no more than 5 percent in Boron-10 content, as determined by neutron attenuation, is acceptable. This is equivalent to a requirement for no loss in boron within the accuracy of the measurement.*
> - *Coupons are monitored for unacceptable swelling by measuring coupon thickness. An increase in coupon*

> *thickness at any point of no more than 10 percent of the initial thickness at that point is acceptable.*

Changes in excess of either of the above two acceptance criteria are investigated under the corrective action program and may require early retrieval and measurement of one or more of the remaining coupons to provide validation that the indicated changes are real. If the deviation is determined to be real, an engineering evaluation is performed to identify further testing or any corrective action that may be necessary.

Additional parameters are examined for early indications of the potential onset of Metamic degradation that would suggest a need for further attention and possibly a change in the coupon withdrawal schedule. These include visual inspection for surface pitting, blistering, cracking, corrosion or edge deterioration, or unaccountable weight loss in excess of the measurement accuracy.

The NRC staff concludes that the above information to be added to the VEGP COL FSAR provides the necessary level of detail for the Metamic monitoring program, including the methodology and acceptance criteria for the tests listed, the corrective action requirements, and the administrative controls applicable to the program.

The applicant proposed a markup of the VEGP COL application, Part 10, License Condition 6, adding a line item for the Metamic Monitoring Program. After the addition of this line item, the version of License Condition 6 included in Part 10 of the COL application, Revision 2, would be:

> *The licensee shall develop a schedule that supports planning for and conduct of NRC inspection of the operational program listed in VEGP COL FSAR Table 13.4-201, "Operational Program Required by NRC Regulations." This schedule must be available to the NRC staff no later than 12 months after issuance of the COL. The schedule shall be updated every 6 months until 12 months before scheduled fuel load, and every month thereafter until the operational programs listed in VEGP COL FSAR Table 13.4-201 have been fully implemented or the plant has been placed in commercial service, whichever comes first. This schedule shall address:*
>
> *a. the implementation of site-specific Severe Accident Management Guidance.*
>
> *b. the reactor vessel pressurized thermal shock evaluation at least 18 months prior to initial fuel load.*
>
> *c. the approved preoperational and startup test procedures in accordance with FSAR Section 14.2.3.*

d. the flow accelerated corrosion (FAC) program implementation, including the construction phase activities.

#. the spent fuel rack Metamic coupon monitoring program implementation.

(Where # will be replaced with the next sequential number in the final version of this license condition.)

The inclusion of the Metamic Coupon Monitoring Program in License Condition 6 ensures that the program will be treated as an operational program with respect to providing a schedule to support the NRC's inspection; thus, the applicant must submit and update the schedule for program implementation following the issuance of the COL, in order to support planning of NRC inspections. The staff, therefore, finds the applicant's proposed resolution of ***Open Item 9.1-1*** *acceptable because the applicant will modify proposed License Condition 6 to ensure the appropriate information is available for the staff's review of the details of the Metamic Monitoring Program prior to the start of plant operation.* ***Open Item 9.1-1*** *is, therefore, resolved. Incorporation of the proposed revision to Chapter 9 of the VEGP COL FSAR and to License Condition 6 in the VEGP COL application is being tracked as* ***Confirmatory Item 9.1-1****.*

<u>Resolution of Standard Content Confirmatory Item 9.1-1</u>

Confirmatory Item 9.1-1 is an applicant commitment to revise its FSAR Section 9.1.6 to include a requirement for inclusion of methodology, acceptance criteria and corrective action in the Metamic Coupon Monitoring Program. The staff verified that the VEGP COL FSAR was appropriately revised. As a result, Confirmatory Item 9.1-1 is now closed.

9.1.2.5 *Post Combined License Activities*

For the reasons discussed in the technical evaluation section above, the staff finds the following license condition acceptable:

- License Condition (9-1) – Prior to initial fuel load, the licensee shall implement the spent fuel rack Metamic Coupon Monitoring Program. No later than 12 months after issuance of the COL, the licensee shall submit to the Director of the Office of New Reactors(NRO) a schedule that supports planning for and conduct of NRC inspections of the spent fuel rack Metamic Coupon Monitoring Program. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until the spent fuel rack Metamic Coupon Monitoring Program has been fully implemented.

9.1.2.6 *Conclusion*

The NRC staff reviewed the application and checked the referenced DCD. The NRC staff's review confirmed that the applicant addressed the required information relating to spent fuel storage, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the NRC staff's technical evaluation of the

information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the WLS COL FSAR is acceptable and meets the guidelines given in Section 9.1.2 of NUREG-0800. The staff based its conclusion on the following:

- STD COL 9.1-7 is acceptable because the necessary level of detail for the Metamic monitoring program has been provided by the applicant, including the methodology and acceptance criteria for the tests listed, the corrective action requirements, and the administrative controls applicable to the program.

9.1.3 Spent Fuel Pool Cooling System (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.1.3, "Spent Fuel Pool Cooling and Cleanup System")

The spent fuel pool cooling system (SFS) is designed to remove decay heat, which is generated by stored fuel assemblies from the water in the spent fuel pool (SFP). The safety-related portion of the SFS credits the water inventory in the pool and safety-related makeup water to remove the decay heat. The nonsafety-related portion of the system is an active system during normal operations that pumps the high temperature water from within the fuel pool through a heat exchanger, and then returns the water to the pool. The SFS heat exchangers are cooled by the component cooling water system (CCS). A secondary function of the SFS is clarification and purification of the refueling water and the SFP.

Section 9.1.3 of the WLS COL FSAR, Revision 11, incorporates by reference, with no departures, Section 9.1.3, "Spent Fuel Pool Cooling System," of Revision 19 of the AP1000 DCD. To address recommendations of the Fukushima Near-Term Task Force described in SECY-12-0025, "Proposed Orders and Requests for Information in Response to Lessons Learned from Japan's March 11, 2011, Great Tohoku Earthquake and Tsunami," (ADAMS Accession No. ML12039A103), specifically Recommendation 7.1 related to reliable spent fuel pool instrumentation, the applicant provided additional information, including supplemental information (WLS SUP 9.1-1) in Section 9.1.3.7 of the FSAR and a proposed license condition. Section 20.2 of this SER presents the staff's evaluation of the application with respect to NTTF Recommendation 7.1.

The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.[1] The NRC staffs review confirmed that there is no outstanding issue related to this section. The results of the NRC staff's technical evaluation of information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

9.1.4 Light Load Handling System (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.1.4, "Light Load Handling System (Related to Refueling)")

9.1.4.1 *Introduction*

The light-load handling system (LLHS) consists of the equipment and structures needed for the refueling operation. This equipment is comprised of fuel assemblies, core component and reactor component hoisting equipment, handling equipment, and a dual basket fuel transfer system. The structures associated with the fuel handling equipment are the refueling cavity, the transfer canal, the fuel transfer tube, the SFP, the cask loading area, the new fuel storage area, and the new fuel receiving and inspection area.

9.1.4.2 *Summary of Application*

Section 9.1 of the WLS COL FSAR, Revision 11, incorporates by reference Section 9.1 of the AP1000 DCD, Revision 19. Section 9.1 of the DCD includes Section 9.1.4.

In addition, in WLS COL FSAR Section 9.1.4, the applicant provided the following:

AP1000 COL Information Items

- STD COL 9.1-5

The applicant provided additional information in STD COL 9.1-5 to address COL Information Item 9.1-5 (COL Action Item 9.1.6-5).

- STD COL 9.1-6

The applicant provided additional information in STD COL 9.1-6 to address COL Information Item 9.1-6 (COL Action Item 9.1.6-6).

9.1.4.3 *Regulatory Basis*

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the LLHS are given in Section 9.1.4 of NUREG-0800.

The regulatory basis for acceptance of the COL information items are established in:

- GDC 61

- American National Standards Institute/American Nuclear Society (ANSI/ANS) 57.1-1992, “Design Requirements for LWR Fuel Handling Systems”

9.1.4.4 *Technical Evaluation*

The NRC staff reviewed Section 9.1.4 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The NRC staff’s review confirmed that the information in the application and incorporated by reference addresses the required information relating to the LLHS. The results of the NRC staff’s evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5 to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.

- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the WLS COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the BLN Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from Section 9.1.4.4 of the VEGP SER:

> *<u>AP1000 COL Information Items</u>*
>
> - *STD COL 9.1-5*
>
> *COL Information Item 9.1-5 states:*
>
> > *The Combined License applicant is responsible for a program for inservice inspection of the light load handling system as specified in subsection 9.1.4.4 and the overhead heavy load handling system in accordance with ANSI B30.2, ANSI B30.9, ANSI N14.6, and ASME [American Society of Mechanical Engineers] NOG-1 as specified in subsection 9.1.5.4.*
>
> *The commitment was also captured as COL Action Item 9.1.6-5 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:*
>
> > *The Combined License applicant is responsible for a program for inservice inspection of the light load handling system as specified in DCD Tier 2, Section 9.1.4.4 and the overhead heavy load handling system in accordance with ANSI B30.2, ANSI B30.9, ANSI N14.6, and ASME NOG-1 as specified in DCD Tier 2, Section 9.1.5.4.*

STD COL 9.1-5 states:

> *The above requirements are part of the plant inspection program for the light load handling system, which is implemented through procedures. In addition to the above inspections, the procedures reflect the manufacturers' recommendations for inspection.*

The staff reviewed STD COL 9.1-5, which addresses COL Information Item 9.1-5 on the inservice inspection (ISI) program for the LLHS. The applicant stated that the inspection program for the LLHS is implemented through procedures and reflect the manufacturer's recommendations. RAI 9.1.4-1 requested that the applicant provide a copy of the procedures for verification by the staff or provide the schedule in relation to fuel loading for issuance of the procedures.

The applicant stated in its response to RAI 9.1.4-1, that an inspection and testing program will be developed to address the LLHS. Procedures defining the program will address the testing and inspection requirements outlined in Section 9.1.4.4, "Inspection and Test Requirements," of the AP1000 DCD and the procedures will include applicable manufacturer's recommendations and industry standards. The applicant stated that procedure development is tracked by the overall plant construction and test schedule. The applicant further stated that details of the implementation milestones for development of procedures are not currently available and are not expected to be available until a detailed construction schedule has been developed. When it becomes available, scheduling information will be provided to the NRC as necessary to support timely completion of NRC inspection and audit functions.

Although the response to RAI 9.1.4-1 states that the plant inspection program schedule information will be provided when available, BLN COL FSAR Table 1.8-202 lists STD COL 9.1-5 as having been completed by the applicant. The staff notes that STD COL 9.1-5 has not been fully addressed. The applicant is asked to revise BLN COL FSAR Table 1.8-202 to commit in the BLN COL FSAR to implementing the plant inspection program for the LLHS before receipt of fuel. This is ***Open Item 9.1-2****.*

- *STD COL 9.1-6*

COL Information Item 9.1-6 states:

> *The Combined License applicant is responsible to ensure an operating radiation monitor is mounted on any crane or fuel handling machine when it is handling fuel.*

The commitment was also captured as COL Action Item 9.1.6-6 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:

> *The COL applicant/holder will ensure that an operating radiation monitor is mounted on any crane or fuel handling machine when it is handling fuel.*

STD COL 9.1-6 states:

> *Plant procedures require that an operating radiation monitor is mounted on any machine when it is handling fuel. Refer to DCD Subsection 11.5.6.4, "Fuel Handling Area Criticality Monitors," for a discussion of augmented radiation monitoring during fuel handling operations.*

The NRC staff reviewed STD COL 9.1-6, which addresses COL Information Item 9.1-6 related to radiation monitoring included under Section 9.1.4 of the BLN COL FSAR. The proposed mounting of an operating radiation monitor on any crane or fuel handling machine during fuel handling is included under Section 9.1.4.3.8 of the BLN COL FSAR. The applicant committed to develop plant procedures that will specify that an operating radiation monitor be mounted on any fuel handling machine when it is handling fuel. DCD Section 11.5.6.4 specifies the need to augment area radiation monitoring during fuel handling operations by a portable radiation monitor on the machine handling fuel. The staff finds that with the addition of the portable radiation monitor to any fuel handling machine when it is handling fuel, the BLN COL FSAR meets the applicable requirements of 10 CFR Part 50, Appendix A, GDC 61 for the prevention of unacceptable radiation exposure.

The staff finds that the applicant has adequately addressed COL Information Item 9.1-6 which would ensure that an operating portable radiation monitor is mounted on any fuel handling machine in the LLHS when it is handling fuel.

<u>Resolution of Standard Content Open Item 9.1-2</u>

*To resolve **Open Item 9.1-2**, in a letter dated December 30, 2009, the applicant proposed a change to VEGP COL FSAR Section 9.1.4.4 in response to this open item instead of a revision to Table 1.8-202. The applicant proposed a revision to FSAR Section 9.1.4.4 to clarify that the LLHS, including system inspections, is implemented prior to receipt of fuel onsite. The staff finds this acceptable since the commitment provided will ensure that these procedures will be in place prior to fuel movement. Therefore, **Open Item 9.1-2** is resolved. Incorporation of the proposed revision in the VEGP COL FSAR is being tracked as **Confirmatory Item 9.1-2**.*

<u>Resolution of Standard Content Confirmatory Item 9.1-2</u>

Confirmatory Item 9.1-2 is an applicant commitment to revise its FSAR Section 9.1.4.4 to include an inspection of the LLHS prior to receipt of fuel. The *staff verified that the VEGP COL FSAR was appropriately revised. As a result, Confirmatory Item 9.1-2 is now closed.*

Correction of Error in the Standard Content Evaluation Text

The NRC staff identified an error in the text reproduced above from Section 9.1.4.4 of the BLN SER that requires correction. The BLN SER provides quoted material for COL Action Item 9.1.6-5, citing Appendix F of NUREG-1793 as the source. The source of the quoted material for COL Action Item 9.1.6-5 is in fact from Chapter 9 (Section 9.1.6) of NUREG-1793.

9.1.4.5 *Post Combined License Activities*

For the reasons discussed in the technical evaluation above, the following FSAR commitment is identified as the responsibility of the licensee:

- The light-load handling program, including system inspections, will be implemented prior to receipt of fuel onsite.

9.1.4.6 *Conclusion*

The NRC staff reviewed the application and checked the referenced DCD. The NRC staff's review confirmed that the applicant addressed the required information relating to the LLHS and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes, that the relevant information presented in the WLS COL FSAR is acceptable and meets the guidelines given in Section 9.1.4 of NUREG-0800. The staff based its conclusion on the following:

- STD COL 9.1-5 is acceptable because the staff finds that the relevant information in the WLS COL FSAR provided clarification that ISI of the LLHS is part of the plant inspection program for the LLHS, which is implemented through procedures.

- STD COL 9.1-6 is acceptable because the staff finds that the relevant information in the WLS COL FSAR meets the applicable requirements of 10 CFR Part 50, Appendix A, GDC 61.

9.1.5 Overhead Heavy Load Handling Systems (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.1.5, "Overhead Load Handling System")

9.1.5.1 *Introduction*

The overhead heavy-load handling system (OHLHS) is used to lift loads whose weight is greater than the combined weight of a single spent fuel assembly and its handling device. The principal equipment is the containment polar crane, equipment hatch hoist, maintenance hatch hoist, and the cask handling crane. The OHLHS is designed to ensure that inadvertent operations or equipment malfunctions, separately or in combination, will not cause a release of radioactivity, a criticality accident, an inability to cool fuel within the reactor vessel or SFP, or prevent safe shutdown of the reactor.

9.1.5.2 *Summary of Application*

Section 9.1 of the WLS COL FSAR, Revision 11, incorporates by reference Section 9.1 of the AP1000 DCD, Revision 19. Section 9.1 of the AP1000 DCD includes Section 9.1.5.

In addition, in WLS COL FSAR Section 9.1.5, the applicant provided the following:

Supplemental Information

- STD SUP 9.1-1

The applicant provided supplemental (SUP) information in Section 9.1.5.3, "Safety Evaluation," describing heavy-load lifts outside those already described in the AP1000 DCD.

- STD SUP 9.1-2

The applicant provided supplemental information in Section 9.1.5, "Overhead Heavy Load Handling Systems," describing key elements of the heavy-loads handling program and a quality assurance (QA) program.

- STD SUP 9.1-3

The applicant provided supplemental information in Section 9.1.5.5, "Load Handling Procedures," describing load handling operations for heavy loads in the vicinity of irradiated fuel and safe shutdown equipment.

AP1000 COL Information Items

- STD COL 9.1-5

The applicant provided additional information in STD COL 9.1-5 to address COL Information Item 9.1-5 (COL Action Item 9.1.6-5).

- STD COL 9.1-6

The applicant provided additional information in STD COL 9.1-6 to address COL Information Item 9.1-6 (COL Action Item 9.1.6-6).

9.1.5.3 *Regulatory Basis*

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the OHLHS are given in Section 9.1.5 of NUREG-0800.

The regulatory basis for acceptance of STD SUP 9.1-1, STD SUP 9.1-2 and STD SUP 9.1-3 addressing planned heavy-load lift programs include the following:

- GDC 4
- GDC 61
- NUREG-0612, "Control of Heavy Loads at Nuclear Power Plants"

The regulatory basis for acceptance of STD COL 9.1-5, addressing the ISI program for the OHLHS is based on GDC 4 and the guidelines of NUREG-0612, which references ANSI B30.2, "Overhead and Gantry Cranes"; ANSI N14.6, "Special Lifting Devices for Shipping Containers Weighing 10,000 Pounds or More," ASME NOG-1, "Rules for Construction of Overhead and Gantry Cranes (Top Running Bridge, Multiple Girder)"; and ANSI B30.9, "Slings."

The regulatory basis for acceptance of STD COL 9.1-6, addressing operating radiation monitor on any crane handling fuel is based on the requirements of GDC 61.

9.1.5.4 *Technical Evaluation*

The NRC staff reviewed Section 9.1.5 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to OHLHS. The results of the NRC staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5 to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.

- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the WLS COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the BLN Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from Section 9.1.5.4 of the VEGP SER:

Supplemental Information

- *STD SUP 9.1-1, STD SUP 9.1-2, and STD SUP 9.1-3*

The staff reviewed the information provided by the applicant for STD SUP 9.1-1. The applicant stated that it did not provide an itemized list of heavy load lifts outside the scope of heavy loads described in the AP1000 DCD because no such heavy load lifts are currently planned. The applicant provided a general description for addressing heavy load movements outside the planned scope if needed in the future. However, the applicant did not address all the program elements and detail listed in NUREG-0612 Section 5.1.1 and NUREG-0800 Section 9.1.5, nor did it provide a schedule for implementation of the heavy load handling program. A heavy load handling program that meets the guidelines of NUREG-0612 and NUREG-0800 Section 9.1.5, needs to be in place at a time before there is a possibility that a load drop could cause a release of radioactivity, a criticality accident, inability to cool fuel within the reactor vessel or spent fuel pool, or prevent safe shutdown of the reactor. The staff asked the applicant in RAI 9.1.5-1 to provide the program elements specified in NUREG-0612 Section 5.1.1 and NUREG-0800 Section 9.1.5, and a schedule for implementation.

In BLN COL FSAR, Revision 1, the applicant provided the missing and necessary information specified in NUREG-0612 Section 5.1.1 and NUREG-0800 Section 9.1.5. The applicant provided a description of the key elements of the heavy load handling system program in BLN COL FSAR Section 9.1.5. The key elements are: 1) Listing of heavy loads; 2) Listing of handling equipment; 3) Safe load paths definition, location and evaluation; 4) Procedures and maintenance manuals; 5) Inspection and testing; 6) Personnel qualification and training; and 7) Quality Assurance (QA) program to monitor and implement the heavy loads program. Also, the BLN COL FSAR, Revision 1 Section 9.1.5 describes the heavy loads handling system procedures. Because Section 9.1.5 of the BLN COL FSAR includes the key elements identified in NUREG-0612, the staff finds the aspects of RAI 9.1.5-1 regarding the key elements of the heavy loads program resolved. Therefore, the staff finds the applicant meets the applicable requirements of 10 CFR Part 50, Appendix A, GDC 4.

In its response to RAI 9.1.5-1, the applicant stated that details of the implementation milestones for the development of heavy load handling procedures and related engineering documents are not currently available, nor are the implementation milestones expected to be available until after a detailed construction schedule has been developed. The applicant stated that appropriate scheduling information will be provided, when available, to the NRC as necessary to support timely completion of inspection and audit functions. The applicant did not provide any schedule for when the heavy load handling program will be completed for the implementation of an approved heavy load handling *program (including OHLHS procedures). The applicant is asked to revise BLN COL FSAR Table 1.8-202 to commit in the BLN COL FSAR to implementing the heavy load handling program before receipt of fuel. This is **Open Item 9.1-3**.*

AP1000 COL Information Items

- *STD COL 9.1-5*

The applicant provided additional information in STD COL 9.1-5 to address COL Information Item 9.1-5. COL Information Item 9.1-5 states:

> *The Combined License applicant is responsible for a program for inservice inspection of the light load handling system as specified in subsection 9.1.4.4 and the overhead heavy load handling system in accordance with ANSI B30.2, ANSI B30.9, ANSI N14.6, and ASME NOG-1 as specified in subsection 9.1.5.4.*

The commitment was also captured as COL Action Item 9.1.6-5 in Chapter 9 of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:

> *The Combined License applicant is responsible for a program for inservice inspection of the light load handling system as specified in DCD Tier 2, Section 9.1.4.4 and the overhead heavy load handling system in accordance with ANSI B30.2, ANSI B30.9, ANSI N14.6, and ASME NOG-1 as specified in DCD Tier 2, Section 9.1.5.4.*

The staff reviewed STD COL 9.1-5, which addresses COL Information Item 9.1-5 on the plant inspection program for the OHLHS. The applicant stated that the inspection program for the OHLHS is implemented through procedures and reflect the manufacturer's recommendations and the recommendations of NUREG-0612. The staff asked the applicant in RAI 9.1.5-2 to provide a copy of the procedures for verification by the staff.

In its response to RAI 9.1.5-2, the applicant stated that a plant inspection program for the OHLHS will be created using the manufacturer's recommendations and will meet the requirements outlined in applicable industry standards. The staff confirmed that BLN COL FSAR Section 9.1.5.4 was revised to provide additional information related to the description of implementing procedures. On the basis of its review, the staff finds the applicant adequately addressed that the OHLHS plant inspection program procedures will follow the equipment manufacturer's recommendations and will meet the requirements in applicable industry standards. With the addition to BLN COL FSAR Section 9.1.5.4 of a descriptive list of the minimum elements required to be addressed in the overhead heavy load handling equipment plant inspection program procedures, in addition to the other guidelines specified in Section 9.1.5 of NUREG-0800, the staff finds the applicant meets the applicable requirements of 10 CFR Part 50, Appendix A, GDC 4.

In the RAI response, the applicant stated that the schedule for issuing the procedures that implement the plant inspection program for the OHLHS are not yet available. The applicant also stated that implementation milestones are not expected to be available until after a detailed construction schedule has been developed, but will be provided to the NRC when available to support timely completion of inspection and audit functions. Although the response to RAI 9.1.5-2 states that the plant inspection program schedule information will be provided when available, BLN COL FSAR Table 1.8-202 lists STD COL 9.1-5 as having been completed by the applicant. The staff notes that STD COL 9.1-5 has not been fully addressed. The applicant is asked to revise BLN COL FSAR Table 1.8-202 to commit in the BLN COL FSAR to implementing the plant inspection program for the OHLHS before receipt of fuel. This is ***Open Item 9.1-4****.*

- *STD COL 9.1-6*

The applicant provided additional information in STD COL 9.1-6 to address COL Information Item 9.1-6. COL Information Item 9.1-6 states:

> *The Combined License applicant is responsible to ensure an operating radiation monitor is mounted on any crane or fuel handling machine when it is handling fuel.*

The commitment was also captured as COL Action Item 9.1.6-6 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:

> *The COL applicant/holder will ensure that an operating radiation monitor is mounted on any crane or fuel handling machine when it is handling fuel.*

The NRC staff reviewed STD COL 9.1-6, which addresses COL Information Item 9.1-6 related to radiation monitoring included under Section 9.1.5 of the BLN COL FSAR. The proposed mounting of an operating radiation monitor on any crane or fuel handling machine during fuel handling is included under Section 9.1.5.3 of the BLN COL FSAR. The applicant committed to develop plant procedures that will specify that an operating radiation monitor be mounted on any fuel handling machine when it is handling fuel. DCD Section 11.5.6.4 specifies the need to augment area radiation monitoring during fuel handling operations by a portable radiation monitor on the machine handling fuel. The staff finds that with the addition of the portable radiation monitor to any fuel handling machine when it is handling fuel, the BLN COL FSAR meets the applicable requirements of 10 CFR Part 50, Appendix A, GDC 61 for the prevention of unacceptable radiation exposure.

The staff finds that the applicant has adequately addressed COL Information Item 9.1-6 which would ensure that an operating portable radiation monitor is mounted on any crane when it is handling fuel.

<u>Resolution of Standard Content Open Items 9.1-3 and 9.1-4</u>

*The VEGP applicant responded to **Open Items 9.1-3 and 9.1-4** in a letter dated December 30, 2009. The letter proposed a change to VEGP COL FSAR Section 9.1.5.4 in response to these open items instead of revising Table 1.8-202. The applicant proposed a revision to FSAR Section 9.1.5.4 to clarify that the OHLHS, including system inspections, will be implemented prior to receipt of fuel onsite. The staff finds this acceptable since the commitment provided will ensure that the procedures will be in place and the plant inspection program will be implemented for the OHLHS prior to fuel movement. Therefore, **Open Items 9.1-3 and 9.1-4** are resolved. Incorporation of the proposed revision in the FSAR is being tracked as **Confirmatory Item 9.1-3**.*

<u>Resolution of Standard Content Confirmatory Item 9.1-3</u>

Confirmatory Item 9.1-3 is an applicant commitment to revise its FSAR Section 9.1.5.4 to include an inspection of the OHLHS prior to receipt of fuel. The staff verified that the VEGP COL FSAR was appropriately revised. As a result, Confirmatory Item 9.1-3 is now closed.

9.1.5.5 *Post Combined License Activities*

For the reasons discussed in the technical evaluation above, the following FSAR commitment is identified as the responsibility of the licensee:

- The overhead heavy-load handling program, including system inspections, will be implemented prior to receipt of fuel onsite.

9.1.5.6 *Conclusion*

The NRC staff reviewed the application and checked the referenced DCD. The NRC staff's review confirmed that the applicant addressed the required information relating to OHLHS and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes, that the relevant information presented in the WLS COL FSAR is acceptable and meets the guidelines given in Section 9.1.5 of NUREG-0800. The staff based its conclusion on the following:

- STD SUP 9.1-1, STD SUP 9.1-2, and STD SUP 9.1-3 are acceptable because the staff finds that the applicant provided supplemental information in accordance with NUREG-0612, NUREG-0800 Section 9.1.5, and Regulatory Guide (RG) 1.206, "Combined License Applications for Nuclear Power Plants (LWR Edition)," Section C.I.9.1.5 guidance to describe the program and schedule for the implementation of the program governing heavy-load handling.

- STD COL 9.1-5 is acceptable because the staff finds that the relevant information in the WLS COL FSAR provided clarification that ISI of the OHLHS is part of the plant inspection program for the OHLHS, which is implemented through procedures.

- STD COL 9.1-6 is acceptable because the staff finds that the relevant information in the WLS COL FSAR meets the applicable requirements of 10 CFR Part 50, Appendix A, GDC 61.

9.2 Water Systems

9.2.1 Service Water System (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.2.1, "Station Service Water System (Open, Raw Water Cooling Systems)")

9.2.1.1 *Introduction*

The service water system (SWS) is a nonsafety-related system that supplies cooling water to remove heat from the nonsafety-related CCS heat exchangers in the turbine building. The SWS is arranged into two trains of components and piping. Each train includes one service water pump, one strainer, and a cooling tower cell as its heat sink. The heat sink for both trains is provided by a single cooling tower with two cells and a divided basin. Each train is capable of providing 100-percent of the required SWS flow for normal full power operation.

9.2.1.2 *Summary of Application*

As provided in Section 9.2 of the WLS COL FSAR, Revision 11, Section 9.2.1, "Service Water System," is incorporated by reference. However, the AP1000 standard design is for a single unit and the following item concerning multiple units is a site-specific consideration that needs to be addressed:

Potential SWS Cooling Tower Interactions:

> The AP1000 DCD was approved for use as a single unit. The applicant proposes to install two units, and potential interactions between the two SWS cooling towers were not considered in the original design and need to be addressed to assure adequate cooling capability for each unit.

In addition, in WLS COL FSAR Section 9.2.1, the applicant provided the following:

Supplemental Information

- WLS SUP 9.2-2

The applicant provided supplemental information in Section 9.2.1.2.2, "Component Description," by adding additional text to address the SWS cooling tower potential interactions.

9.2.1.3 *Regulatory Basis*

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

Although the SWS (including heat sink) is not safety-related, it supports the normal (defense-in-depth) capability of removing reactor and spent fuel decay heat, it is part of the first line of defense for reducing challenges to passive safety systems in the event of transients and plant upsets, and its cooling function is important for reducing shutdown risk when the reactor coolant system (RCS) is open (e.g., during mid-loop conditions). The risk importance of the SWS makes it subject to regulatory treatment of nonsafety-related systems (RTNSS) in accordance with the Commission's policy for passive reactor plant designs in SECY-94-084, "Policy and Technical Issues Associated with the Regulatory Treatment of Non-Safety Systems in Passive Plant Designs."

The NRC staff's evaluation of the SWS focuses primarily on confirming that the SWS is capable of performing its defense-in-depth and RTNSS functions; that it will not adversely impact safety-related structures, systems and components (SSCs); and that inspections, tests, analyses, and acceptance criteria (ITAAC), test program specifications, and RTNSS availability controls for the SWS are appropriate.

The regulatory basis for acceptance of WLS SUP 9.2-2, addressing the SWS cooling tower is the acceptance criteria in Sections 9.2.1 and 9.2.5 of NUREG-0800.

9.2.1.4 *Technical Evaluation*

The NRC staff reviewed Section 9.2.1 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the SWS. The results of the NRC staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

The staff reviewed the information in the WLS COL FSAR:

Supplemental Information

- WLS SUP 9.2-2

The applicant provided supplemental information in WLS COL FSAR Section 9.2.1.2.2 by adding additional text to address the SWS cooling tower potential interactions.

Potential SWS Cooling Tower Interactions:

The cooling capability of the SWS cooling towers for the WLS units can be adversely affected by interactions that exist between the station's cooling towers. Adverse interactions can occur due to localized atmospheric influences caused by siting and relative proximity considerations. Because this is not a factor for single cooling towers, it is not addressed by the AP1000 DCD. Therefore, the staff generated **RAI Letter #008 Question 9.2.1-1** and **RAI Letter #093 Question 9.2.1-8** requesting additional information for the applicant to address potential adverse interactions between the cooling towers for the two units and to describe any additional design provisions that are necessary, as appropriate.

The applicant provided responses for these two questions in two letters, dated September 26, 2008, and March 14, 2011. In its responses, the applicant stated that the effects on cooling capacity of the SWS mechanical draft cooling towers from interactions with the circulating water system (CWS) mechanical draft cooling towers at the WLS site have been considered.

The WLS has three Unit 1 CWS cooling towers, clustered in a triangular configuration, and located west-southwest of the Units 1 and 2 SWS cooling towers. A cluster of three Unit 2 CWS cooling towers is located east-northeast of the Units 1 and 2 SWS cooling towers. The CWS cooling towers are mechanical induced draft towers and their plumes are directed upward by their fans and the buoyant effect of warm air. Because the three CWS cooling towers of each unit are in close proximity to each other, the individual plumes combine to form a single plume for each unit. Only 50 percent of the heat removal capacity of the SWS cooling tower is required to maintain the required tower function, thus providing substantial margin to accommodate any potential for adverse effects on tower performance due to an interference condition. When an SWS cooling tower of one unit is operating at the highest heat loads, the CWS cooling tower of that unit would be operating at a much reduced heat load. Therefore, the potential for adverse impacts is confined to plume interactions between the CWS cooling towers of one unit and the SWS cooling tower of the adjacent unit. Interaction between the Unit 2 CWS cooling towers and the Unit 1 SWS cooling tower would require a wind direction from the east-northeast, which is not a prevailing wind direction for the site. Winds from the east-northeast direction occur at a yearly frequency of less than 6 percent. Since the natural tendency of the plume would be to rise and disperse at higher elevations, this wind direction would also have to coincide with meteorological conditions that would maintain the Unit 2 CWS cooling towers plume at ground level. Finally, this ground level plume from the Unit 2 CWS cooling towers would have to travel a distance of approximately 365 meters (1200 feet) and circumvent the Unit 2 turbine building to interact with the Unit 1 SWS cooling tower. Even with the assumption of a worst-case plume condition, independent of CWS cooling tower fan speed or the number of fans operating, there is a minimal potential for adverse impacts to the Unit 1 SWS cooling tower. Interaction between the Unit 1 CWS cooling tower and the Unit 2 SWS cooling towers has a lower probability. This plume interaction requires wind direction from the west-southwest, which occurs at a yearly frequency of less than 5 percent. In addition to the favorable wind and meteorological conditions, the Unit 1 CWS cooling towers plume would also be required to travel a distance of approximately 640 meters (2100 feet) and circumvent both the Units 1 and 2 turbine building structures to interact with the Unit 2 SWS cooling tower.

In addition, there is a minimal probability that an SWS cooling tower plume could travel to the vicinity of a SWS tower on an adjacent unit. Interfering structures in the path of the plume would provide ample opportunity for plume dispersion, greatly minimizing any adverse effect on tower performance. Due to the power block separation requirements for a two-unit facility (approximately 243 meters (800 feet) of separation between SWS cooling tower), the SWS cooling tower is in much closer proximity to the buildings and structures within its own unit than to those located in an adjacent unit. There are no site-specific conditions that could result in adverse impacts from air restriction. During conditions where the SWS cooling tower is subject to RTNSS requirements , the tower is only operating at 50 percent of its operational heat load, leaving a substantial margin available to accommodate site-specific adverse interactions, if they exist.

The maximum normal wet bulb temperature for the site is over 4 degrees less than the wet bulb temperature used to size the tower, creating additional margin.

Based on the information that was provided in the applicant's responses, the staff considers the applicant's resolution of this issue to be acceptable since all of the mechanical draft cooling tower interactions at WLS have been considered and that there will be minimal cooling tower interaction effects and the cooling tower interactions will not adversely affect the cooling capacity of the SWS since the cooling towers have at least 243 meters (800 feet) of building separation and the large structure, the turbine building, being placed between the cooling towers. Therefore, there is reasonable reassurance to conclude that any postulated site-specific performance degradation resulting from an interaction with a second unit would be minimal and would be readily accommodated by the design margins available to support RTNSS capability. **RAI Letter #008 Question 9.2.1-1** and **RAI Letter #093 Question 9.2.1-008** are resolved.

9.2.1.5 *Post Combined License Activities*

There are no post-COL activities related to this section.

9.2.1.6 *Conclusion*

Information that the applicant incorporated by reference was previously reviewed and approved by the NRC as documented in NUREG-1793, including Supplement 2. Consequently, this information was not included within the scope of this evaluation. Therefore, the staff's evaluation of the WLS COL application was limited to plant-specific considerations that were not included within the scope of the generic AP1000 DCD approval.

The staff evaluated the potential for adverse interactions between the SWS cooling towers and CWS cooling towers for the WLS units. Based on the results of this evaluation, the staff determined that the applicant's RAI response related to CWS mechanical draft cooling tower and SWS cooling tower interactions has been adequately resolved. Therefore, the staff concludes that the WLS SWS, as described in Section 9.2.1 of the WLS COL FSAR is acceptable.

9.2.2 Component Cooling Water System (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.2.2, "Cooling System for Reactor Auxiliaries (Closed Cooling Water Systems")

9.2.2.1 *Introduction*

The CCS provides a closed loop of cooling water for reactor system components, reactor shutdown equipment, ventilation equipment, and components of the emergency core cooling system.

Section 9.2 of the WLS COL FSAR, Revision 11, incorporates by reference, with no departures or supplements, Section 9.2.2, "Component Cooling Water System (CCS)," of Revision 19 of the AP 1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.[1] The NRC staff's review confirmed that there is no outstanding issue related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

9.2.3 Demineralized Water Treatment System

The demineralized water treatment system provides the required supply of reactor coolant purity water to the demineralized water transfer and storage system. This system does not perform any safety-related function or accident mitigation, and its failure would not reduce the safety of the plant.

Section 9.2 of the WLS COL FSAR, Revision 11, incorporates by reference, with no departures or supplements, Section 9.2.3, "Demineralized Water Treatment System," of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.[1] The NRC staff's review confirmed that there is no outstanding issue related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

9.2.4 Demineralized Water Transfer and Storage System

The demineralized water transfer and storage system supplies demineralized water to fill the condensate storage tank and to the plant systems that demand a demineralized water supply. This system has no safety-related function other than containment isolation, and its failure does not affect the ability of safety-related systems to perform their safety-related functions.

Section 9.2 of the WLS COL FSAR, Revision 11, incorporates by reference, with no departures or supplements, Section 9.2.4, "Demineralized Water Transfer and Storage System," of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.[1] The NRC staff's review confirmed that there is no outstanding issue related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

9.2.5 Potable Water System (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.2.4, "Potable and Sanitary Water Systems")

9.2.5.1 *Introduction*

The potable water system (PWS) supplies clean water from the raw water system (RWS) for domestic use and human consumption. The PWS has no safety-related functions other than to prevent in-leakage into the main control room envelope during main control room emergency habitability system (VES) operation. A loop seal in the safety-related PWS piping that penetrates the main control room envelope boundary prevents unfiltered air in-leakage into the main control room envelope

9.2.5.2 *Summary of Application*

Section 9.2 of the WLS COL FSAR, Revision 11, incorporates by reference Section 9.2 of the AP1000 DCD, Revision 19. Section 9.2 of the AP1000 DCD includes Section 9.2.5, "Potable

Water System," which addresses Section 9.2.4, "Potable and Sanitary Water Systems," of NUREG-0800.

In addition, in WLS COL FSAR Section 9.2.5, the applicant provided the following:

AP1000 COL Information Item

- WLS COL 9.2-1

The applicant provided additional information in WLS COL 9.2-1 to address COL Information Item 9.2-1 in WLS COL FSAR Sections 9.2.5.2.1, "General Description," 9.2.5.3, "System Operation, and 9.2.12.1,"Potable Water, by providing information concerning the source of water for the PWS.

9.2.5.3 *Regulatory Basis*

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the PWS are given in Section 9.2.4 of NUREG-0800.

The regulatory basis for the review of the COL information item is established in 10 CFR Part 50, Appendix A, GDC 60, "Control of Releases of Radioactive Materials to the Environment."

9.2.5.4 *Technical Evaluation*

The NRC staff reviewed Section 9.2.5 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the PWS. The results of the NRC staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

The staff reviewed the information in the WLS COL FSAR:

AP1000 COL Information Item

- WLS COL 9.2-1

The applicant provided additional information in WLS COL 9.2-1 to resolve COL Information Item 9.2-1. COL Information Item 9.2-1 states:

> The Combined License applicant will address the components of the potable water system outside of the power block, including supply source required to meet design pressure and capacity requirements, specific chemical selected for use as a biocide, and any storage requirements deemed necessary. A biocide such as sodium hypochlorite is recommended. Toxic gases such as chlorine are

not recommended. The impact of toxic gases on the main control room habitability is addressed in Section 6.4.

The NRC staff reviewed the resolution to COL Information Item 9.2-1 on the source of water for the potable water system included under Sections 9.2.5.2.1, 9.2.5.3, and 9.2.12.1 of the Lee COL FSAR. In these sections the applicant proposes to use the Draytonville Water District as the source of potable water. The water supply meets DCD Section 9.2.5 regarding pressure, capacity, and quality requirements. Because the applicant is using a municipal water supply, no biocide is necessary; therefore there is no impact of toxic gases on main control room habitability from this system. The staff finds this an acceptable resolution of COL Information Item 9.2-1 because the pressure, capacity, and quality requirements from the DCD are met. In DCD Revision 19, Westinghouse states that no interconnections exist between the PWS and any potentially radioactive system or any system using water for purposes other than domestic water service. The site specific information provided in WLS COL 9.2-1 is outside the power block and not potentially contaminated by radioactive water. Because no interconnections exist between the PWS and any potentially radioactive system, the staff finds that GDC 60 is satisfied, with respect to preventing contamination by radioactive water.

9.2.5.5 *Post Combined License Activities*

There are no post-COL activities related to this section.

9.2.5.6 *Conclusion*

The NRC staff reviewed the application and checked the referenced DCD. The NRC staff's review confirmed that the applicant addressed the required information relating to PWS, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the WLS COL FSAR is acceptable and meets the guidance in Section 9.2.4 of NUREG-0800. The staff based its conclusion on the following:

- WLS COL 9.2-1 is acceptable because the applicant has provided sufficient information on the source of water for the PWS to satisfy GDC 60, with respect to preventing contamination by radioactive water.

9.2.6 Sanitary Drains (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.2.4, "Potable and Sanitary Water Systems")

9.2.6.1 *Introduction*

The sanitary drain system collects sanitary wastes from plant restrooms and locker room facilities. The sanitary drainage system has no safety-related function other than main control room envelope isolation. Redundant safety-related isolation valves are provided in the vent line penetrating the main control room. Therefore, there are no single active failures that would prevent isolation of the main control room envelope. The system design ensures that there is no possibility for radioactive contamination of the sanitary drains.

9.2.6.2 *Summary of Application*

Section 9.2 of the WLS COL FSAR, Revision 11, incorporates by reference Section 9.2 of the AP1000 DCD, Revision 19. Section 9.2 of the AP1000 DCD includes Section 9.2.6, "Sanitary Drains," which addresses Section 9.2.4, "Potable and Sanitary Water Systems," of NUREG-0800.

In addition, in WLS COL FSAR Section 9.2.6, the applicant provided the following:

Departures

- WLS DEP 6.4-1

The applicant provided additional information in Section 9.2.6 of the WLS COL FSAR about WLS DEP 6.4-1 related to design changes affecting habitability of the main control room and changes to the calculated doses to control room operators. This information, as well as related WLS DEP 6.4-1 information appearing in other chapters of the FSAR, is reviewed in Section 21.2 of this SER.

Supplemental Information

- WLS SUP 9.2-1

The applicant provided supplemental information by adding text to the end of Section 9.2.6.2.1, "General Description," to state that the sanitary drainage systems (SDS) collects sanitary waste from plant restrooms and locker room facilities in the turbine building, auxiliary building, and annex building, and carries this waste off-site to Gaffney Board of Public works treatment plant where it is processed.

9.2.6.3 *Regulatory Basis*

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for WLS SUP 9.2-1 are given in Section 9.2.4 of NUREG-0800.

The regulatory basis for acceptance of the supplementary information is established in:

- GDC 60, as it relates to sanitary drains

9.2.6.4 *Technical Evaluation*

The NRC staff reviewed Section 9.2.6 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to sanitary drains. The results of the NRC staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

The staff reviewed the information in the WLS COL FSAR:

Supplemental Information

- WLS SUP 9.2-1

The NRC staff reviewed the location of the waste treatment plant included under Section 9.2.6.2.1 of the WLS COL FSAR. In Section 9.2.6.2.1 of the WLS COL FSAR, the applicant proposes the Gaffney Board of Public Works sewage treatment plant for the treatment of sanitary waste which is located Off-site. The AP1000 DCD states that there are no interconnections between the sanitary drainage system and systems having the potential for containing radioactive material, and the sanitary drainage system does not service facilities in radiologically controlled areas. Therefore, the staff finds the proposed location of the waste treatment plant acceptable as it does not affect compliance with GDC 60, with respect to preventing contamination by radioactive water.

9.2.6.5 *Post Combined License Activities*

There are no post-COL activities related to this section.

9.2.6.6 *Conclusion*

The NRC staff reviewed the application and checked the referenced DCD. The NRC staff's review confirmed that the applicant addressed the required information relating to sanitary drains, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the WLS COL FSAR is acceptable and meets the requirements of NRC regulations, and the acceptance criteria in NUREG-0800, Section 9.2.4. The staff based its conclusion on the following:

- WLS DEP 6.4-1, related to design changes affecting habitability of the main control room and changes to the calculated doses to control room operators, is reviewed and found acceptable by the staff in Section 21.2 of this SER.

- WLS SUP 9.2-1 is acceptable because the applicant has provided sufficient information on the location of the waste treatment plant to satisfy GDC 60, with respect to preventing contamination by radioactive water.

9.2.7 Central Chilled Water System (Related to RG 1.206 Section C.III.1, Chapter 9, C.I.9.2.2, "Cooling System for Reactor Auxiliaries (Closed Cooling Water Systems)")

The central chilled water system is a nonsafety system that provides chilled water to the cooling coils of the supply air handling units and unit coolers of several radiologically controlled areas of the plant.

Section 9.2 of the WLS COL FSAR, Revision 11, incorporates by reference, with no departures or supplements, Section 9.2.7, "Central Chilled Water System," of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review. The NRC staff's review confirmed that there is no outstanding issue related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the VEGP COL application are documented in NUREG-1793 and its supplements.

9.2.8 Turbine Building Closed Cooling Water System

9.2.8.1 *Introduction*

The turbine building closed cooling water system (TCS) is a nonsafety system that provides closed-loop cooling for the removal of heat from heat exchangers in the turbine building and rejects the heat to either the CWS or the RWS. The system consists of two 100-percent capacity pumps, three 50-percent capacity heat exchangers (connected in parallel), one surge tank, one chemical addition tank, and associated piping, valves, controls, and instrumentation. Backwashable strainers are provided upstream of each TCS heat exchanger. System piping is made of carbon steel, except that nonmetallic piping may be used in accordance with ASME B31.1, "Power Piping," if justified by evaluation.

9.2.8.2 *Summary of Application*

Section 9.2 of the WLS COL FSAR, Revision 11, incorporates by reference Section 9.2 of the AP1000 DCD, Revision 19. Section 9.2 of the DCD includes Section 9.2.8.

In addition, in WLS COL FSAR Section 9.2.8, the applicant provided the following:

<u>*Site-Specific Information Replacing Conceptual Design Information*</u>

- WLS CDI

The applicant provided additional information to replace conceptual design information (CDI) in the AP1000 DCD with site-specific information identifying the source of cooling water for the WLS TCS heat exchangers.

9.2.8.3 *Regulatory Basis*

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the TCS are given in Section 9.2.2 of NUREG-0800.

9.2.8.4 *Technical Evaluation*

The NRC staff reviewed Section 9.2.8 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the TCS. The results of the NRC staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

The staff reviewed the information in the WLS COL FSAR:

Site-Specific Information Replacing Conceptual Design Information

- WLS CDI

The AP1000 standard plant allows the use of either circulating water or raw water for removing heat from the TCS heat exchangers. The AP1000 DCD leaves it up to the COL applicant to specify a specific source of cooling water for plant-specific applications. The WLS design specifies the use of both circulating water and raw water for this purpose. This arrangement was reviewed and approved by the NRC during its evaluation of the AP1000 DCD. Consequently, the WLS design is consistent with the AP1000 licensing basis as approved by the staff, which includes conformance with NUREG-0800 Section 9.2.2 (as applicable). Therefore, the supplementary design information that was provided for the WLS TCS is acceptable.

The COL applicant modified FSAR Section 9.2.8.2.3, "System Operations - Startup," in Revision 1 to eliminate the provision that the CWS must be placed in operation prior to placing the TCS in operation. Based on the staff's review, this appeared to be an apparent departure from the description provided in the AP1000 DCD, but it was not recognized and evaluated as such. Therefore, in **RAI 038 Question 9.2.2-1**, the staff requested that the applicant revise FSAR Section 9.2.8.2.3 to address the need to properly address this change to the startup description provided in the AP1000 DCD Tier 2, Revision 16, Section 9.2.8.2.3. Based on the applicant's response, the applicant provided clarification on how the TCS system is to be placed in operation during startup. The FSAR markup states that after cooling water flow from the CWS, or RWS when applicable, is established but prior to the operation of systems that required turbine building closed cooling water flow, then the TCS is placed into operation. The staff considers the licensee's resolution of this issue to be acceptable since it clarifies the cooling water sources as either CWS or RWS. In addition, the staff verified this item is not considered a departure. The staff verified that the WLS COL FSAR markup that was provided with the applicant's RAI responses was added to Revision 1 of the COL; therefore, **Question 9.2.2-1** is resolved.

9.2.8.5 *Post Combined License Activities*

There are no post-COL activities related to this section.

9.2.8.6 *Conclusion*

The NRC staff reviewed the application and checked the referenced DCD. The NRC staff's review confirmed that the applicant addressed the required information relating to TCS, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the WLS COL FSAR is acceptable and meets the acceptance criteria given in Section 9.2.2 of NUREG-0800. The staff based its conclusion on the following:

- WLS CDI is acceptable because the design of the TCS meets the guidance in Section 9.2.2 of NUREG-0800, with respect to the source of cooling water for the removing heat from the TCS heat exchangers.

9.2.9 Waste Water System (Related to RG 1.206 Section C.III.1, Chapter 9, C.I.9.3.3, "Equipment and Floor Drainage System"

9.2.9.1 *Introduction*

The waste water system (WWS) has no safety-related function other than main control room envelope isolation. A normally closed safety-related isolation valve is provided in the drain line penetrating the main control room. The drain line is safety related up to the isolation valve to ensure that the main control room habitability pressure boundary is maintained. The waste water system collects and processes the waste water from the equipment and floor drains in the nonradioactive building areas during plant operations and outages. The waste water from the turbine building sumps flows to a waste water retention basin, if required, for settling of suspended solids and treatment before discharge. The waste water retention basin transfer pumps discharge the basin effluent to the blowdown sump prior to discharge to the Parr Reservoir via the plant outfall piping. The design of the system precludes inadvertent discharge of radioactively contaminated drainage

9.2.9.2 *Summary of Application*

Section 9.2 of the WLS COL FSAR, Revision 11, incorporates by reference Section 9.2 of the AP1000 DCD, Revision 19. Section 9.2 of the AP1000 DCD includes Section 9.2.9, "Waste Water System," which addresses Section 9.3.3, "Equipment and Floor Drainage System," of NUREG-0800.

In addition, in WLS COL FSAR Section 9.2, the applicant provided the following:

<u>*AP1000 COL Information Item*</u>

- WLS COL 9.2-2

The applicant provided additional information in WLS COL 9.2-2 to address COL Information Item 9.2-2, by including additional design information to the waste water retention basin portion of AP1000 DCD Section 9.2.9.2.2.

9.2.9.3 *Regulatory Basis*

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the WWS are given in Section 9.3.3 of NUREG-0800.

The regulatory basis for acceptance of the COL information item is established in:

- GDC 4
- GDC 60

9.2.9.4 *Technical Evaluation*

The NRC staff reviewed Section 9.2.9 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the WWS. The results of the NRC staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

The staff reviewed the information in the WLS COL FSAR:

<u>*AP1000 COL Information Item*</u>

- WLS COL 9.2-2

The applicant provided additional information in WLS COL 9.2-2 to resolve COL Information Item 9.2-2. COL Information Item 9.2-2 states:

> The Combined License applicant will address the final design and configuration of the plant waste water retention basins and associated discharge piping, including piping design pressure, basin transfer pump size, basin size, and location of the retention basins.

The NRC staff reviewed the resolution to WLS COL 9.2-2 with respect to the design of the plant waste water retention basin (WWRB) and associated components included under

Section 9.2.9.2.2, ”Component Description” of the WLS COL FSAR. To address WLS COL 9.2-2, details were provided for the location of the WWRB and routing configuration.

The waste water from the WWRB is discharged to the Ninety-Nine Islands on the Broad River through a common blowdown sump with inputs from the Unit 1 and 2 WWRB and CWS cooling tower blowdown. There is one WWRB per unit. The method for forwarding the waste water from the basin to the blowdown sump is by use of two transfer pumps.

In order to meet GDC 60, the applicant must demonstrate suitable control of the release of radioactive materials in liquid effluent. Upon review of WLS COL 9.2-2, the staff requested the applicant, in RAI 9.3.3-1, to provide a discussion on whether all site-specific potentially radioactive fluid draining into and downstream of the WWRB will be monitored prior to distribution or provide a justification for not providing radiation monitoring. The staff also requested that the applicant provide the additional details of the associated components (i.e., transfer pumps, size of basin, etc.) as requested in the COL item.

The applicant responded to RAI 9.3.3-1 in a letter dated May 4, 2010. The response provided detailed information on radiation monitoring, level instrumentation and components for the WWS. Each unit's WWRB is divided into two separate compartments, which allows one compartment to be out of service while the other compartment is available. Each WWRB is constructed such that its contents dissolved or suspended, do not penetrate the liner and leach into the ground. The configuration and size of the WWRB allows settling of solids larger than 10 microns, which may be suspended in the waste water stream. The applicant confirmed that the potentially contaminated fluids entering the WWRB from the turbine building sumps are monitored with a radiation monitor on the common discharge piping. As indicated in the RAI response, there is several effluent lines within the scope of the certified design that bypass this radiation monitor. These include the diesel fuel area sumps, SWS cooling tower blowdown, SWS strainer blowdown, and CWS strainer backwash. The RAI response clarified that these lines do not come in contact with radioactive sources or contain radiation monitoring prior to discharge into the WWRB. The applicant indicated that for WLS Units 1 and 2, there are no additional site–specific influent streams to the WWRB outside of those associated with the certified design. Waste water can also be sampled prior to discharge from the WWRB.

Two 100 percent capacity submersible type pumps send waste water from the WWRB to the common blowdown sump. The transfer pumps have 750 gallons per minute (gpm) capacity and the discharge piping has a design pressure of 150 pounds per square inch gauge (psig).

The blowdown sump is a concrete structure and is open to the atmosphere. The blowdown sump is located to the east of Units 1 and 2, outside the protected area. The blowdown sump, common to both WLS Units 1 and 2, receives input from the WWRB and mixes with high volume CWS stream. The RWS provides water for an alternate dilution source to the blowdown sump when the CWS blowdown is not sufficient or not available for that purpose. As discussed in WLS COL FSAR Section 9.2.11.4, the RWS comes directly from the make-up pond A intake and does not interact with any recognized radioactive sources.

The combined dilution flow gravity drains from the blowdown sump flows through an outfall pipe to the Ninety-Nine Islands dam on the Broad River. The blowdown sump outfall is sized to prevent sump overflow during maximum inlet flow to the sump. At the dam, the dilution flow is mixed with liquid radwaste effluent from each unit and discharged to the environment through a diffuser mounted on the upstream side of the dam. The elevation difference between the sump and the river prevents liquid radwaste cross-contamination of the blowdown sump. The liquid radwaste is monitored and sampled for radiation and is addressed in detail in WLS COL FSAR Section 11.2.

Based on the content in WLS COL FSAR Section 9.2.9 and the RAI 9.3.3-1 response, the staff concludes that the design of the WWS complies with GDC 60, with respect to control of radiation release to environment because as discussed above, the WWS does not normally interact with any potential radioactive sources and any influent streams with the potential to become contaminated are monitored.

To protect against flooding, the WWRB will be equipped with level instrumentation used to control the WWRB transfer pumps and to alarm when the basin level reaches a point where operator action is required. Each WWRB is located approximately 850 feet north of the associated power block. The normal WWRB water level in the basin is at or below grade. Site grading and the distance between the basins and the power block ensures that there will be no adverse impact on safety-related or RTNSS SSCs in the unlikely event of an overflow of the WWRB.

Waste water and blowdown effluent from the blowdown sump drains by gravity to the Broad River via the plant outfall piping. The blowdown sump outfall pipe is sized with adequate capacity to gravity drain the blowdown sump at the highest anticipated influent flow rate. Therefore, no level instrumentation is provided at the blowdown sump. The blowdown sump is located well away from the power block (approximately 1125 feet). Site drainage features ensure that there will be no impact on safety-related or RTNSS SSCs in the unlikely event of an overflow of the sump. Based on the content in WLS COL FSAR Section 9.2.9 and the RAI 9.3.3-1 response, the staff concludes that the design of the WWS complies with GDC 4, with respect to flood protection because the WWRB are designed with two 100-percent pumps controlling level by use of WWRB level instrumentation.

Based on the information provided in WLS COL FSAR Section 9.2.9 and in the response to RAI 9.3.3-1, the staff finds that the applicant has adequately addressed COL information item WLS COL 9.2-2. The staff finds that GDC 4 is met based on the WWS arrangement to prevent flooding that could adversely affect safety-related SSCs and GDC 60 is met based on the requirements for controlling the release of radioactive materials by preventing the inadvertent transfer of contaminated fluids to system portions for noncontaminated drainage. Therefore, RAI 9.3.3-1 is closed and incorporation of the proposed markup into a future revision of the WLS COL FSAR is identified as **Confirmatory Item 9.2-3**.

Resolution of Confirmatory Item 9.2-3

Confirmatory Item 9.2-3 is an applicant commitment to revise its FSAR to include the information proposed in their response to RAI 9.3.3-1. The staff verified that the WLS COL FSAR was appropriately revised. As a result, Confirmatory Item 9.2-3 is now closed.

9.2.9.5 *Post Combined License Activities*

There are no post-COL activities related to this section.

9.2.9.6 *Conclusion*

The NRC staff reviewed the application and checked the referenced DCD. The NRC staff's review confirmed that the applicant addressed the required information relating to the WWS, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that, the relevant information presented in the WLS COL FSAR is acceptable and meets the guidelines given in Section 9.3.3 of NUREG-0800. The staff based its conclusion on the following:

- WLS COL 9.2-2 is acceptable because the staff finds that the relevant information in the WLS COL FSAR meets the applicable requirements of GDC 4 and GDC 60.

9.2.10 Hot Water Heating System

The hot water heating system is a nonsafety-related system that supplies heated water to selected nonsafety-related air handling units and unit heater in the plant during cold weather operation, and to the containment recirculation fan coil units during plant outages in cold weather.

Section 9.2 of the WLS COL FSAR, Revision 11, incorporates by reference, with no departures or supplements, Section 9.2.10 of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.[1] The NRC staff's review confirmed that there is no outstanding issue related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

9.2.11 Raw Water System

9.2.11.1 *Introduction*

WLS COL FSAR Section 9.2.11, "Raw Water System," describes the RWS for WLS Units 1 and 2. The RWS is a nonsafety-related system that pumps water from the Broad River for use by the WLS units. The RWS supplies raw water for makeup to the CWS cooling tower basins, makeup for the SWS cooling tower basins, WWS alternate dilution flow, the demineralizer water treatment system (DTS), the fire protection system (FPS); and serves as an alternate source of cooling water for the TCS heat exchangers. The RWS also provides alternate sources of make-up water to the SWS cooling towers during a loss of offsite power from the secondary fire water storage tank clearwell, the clarified water subsystem, and the raw water supply subsystem. The RWS consists of the river water subsystem, the raw water supply subsystem (which includes make-up pond A), the make-up pond B subsystem, refill subsystem, make-up pond C system (offsite supply), clarifier subsystem, and the clarified water supply subsystem. The RWS is shared by the two WLS units.

Make-up pond A serves as a central repository for raw water and contains the intake structure for the station. During normal Broad River flow conditions, withdrawal from the river is used to maintain a normal level in make-up pond A and, if required, store water in make-up ponds B and C. When permit conditions limit withdrawal from the Broad River, withdrawal from make-up ponds B and C, and if allowed, the Broad River is used to maintain a normal level in make-up pond A. The water inventory required to support the power generation design basis is provided by the raw water supply subsystem and maintained in make-up pond A. The river water, refill, and make-up ponds B and C subsystems provide water storage and source diversity to adapt to Broad River flow conditions. Make-up pond A has a usable storage volume of 1200 acre-foot, which provides sufficient capacity to support a dual unit cooldown to cold shutdown conditions and maintain the station in this condition for longer than 7 days.

9.2.11.2 *Summary of Application*

Section 9.2.11 of the WLS COL FSAR provides information concerning the RWS design basis, system description, system operation, safety evaluation, tests and inspections, and instrumentation. The RWS was only vaguely referred to in the AP1000 DCD in relation to the CWS, SWS, DTS, and FPS, and a RWS section was not included in the AP1000 DCD for the NRC staff to evaluate. In addition, AP1000 DCD, Table 1.7-2, “AP1000 System Designators and System Diagrams,” indicates that the RWS is “wholly out of scope.” The RWS is needed in order to operate the WLS units and consequently, the applicant has provided a complete description of this system in the WLS COL FSAR.

In addition, in WLS COL FSAR Section 9.2.11, the applicant provided the following:

Tier 2 Departure

- STD DEP 1.1-1

The applicant proposed a Tier 2 departure (DEP) from the AP1000 DCD by adding a new Section 9.2.11, “Raw Water System” after DCD Section 9.2.10 and renumbering DCD Sections 9.2.11 and 9.2.12 as Sections 9.2.12 and 9.2.13, respectively.

Supplemental Information

- WLS SUP 9.2-4 - reference RAI response letter from Duke Energy dated May 15, 2009. This is supplemental description including FSAR sections addressing design basis, system description, component description, system operations, safety evaluation, testing and inspections, and instrumentation applications.

The applicant provided supplemental information by adding the new Section 9.2.11 after AP1000 DCD Section 9.2.10.

9.2.11.3 *Regulatory Basis*

In most cases, the regulatory bases for AP1000 systems are provided in NUREG-1793 and its supplements. However, because the RWS was not addressed in the AP1000 DCD, it was not evaluated by the staff in NUREG-1793 and a regulatory basis for this system was not established for the standard plant design. Consequently, the staff is unable to refer to

NUREG-1793 for the regulatory basis of the RWS and instead, the regulatory basis of the RWS for the WLS units is provided in this section.

The RWS pumps water from the Broad River for use in dissipating the heat necessary for normal power operation (among other things) and in this capacity, the RWS is somewhat similar to a CWS. Because large amounts of water are being pumped and stored by the RWS, flooding is a major consideration. The regulatory criteria that pertain to CWS are provided in NUREG-0800, Section 10.4.5, “Circulating Water System.” As specified in this section of NUREG-0800, the staff’s acceptance of the RWS is based upon compliance with GDC 4, by confirming that design provisions for minimizing the occurrence and accommodating the effects of discharging water that may result from RWS failures are adequate.

The RWS also provides makeup water for the SWS cooling tower basins and in this capacity supports the SWS and the nonsafety-related ultimate heat sink (UHS) functions. The regulatory criteria that pertain to the SWS and the UHS are provided in NUREG-0800, Section 9.2.1, “Station Service Water System,” and NUREG-0800, Section 9.2.5, “Ultimate Heat Sink,” respectively. As specified in these NUREG-0800 sections, the staff’s acceptance is based upon compliance with GDC 2, “Design Basis for Protection against Natural Phenomena.” The staff considers the RWS to be acceptable with respect to GDC 2 if it satisfies Position C.2 of RG 1.29, “Seismic Design Classification.” Position C.2 indicates that the design is acceptable if RWS failures do not adversely affect the control room occupants or safety-related SSCs.

9.2.11.4 *Technical Evaluation*

As discussed above in the Regulatory Basis section, the RWS was not specifically described for the AP1000 standard plant design and consequently, it was not evaluated by the staff in NUREG-1793. In addition, AP1000 DCD, Table 1.7-2, indicates that the RWS is “wholly out of scope.” The staff reviewed the information provided in Section 9.2.11 of the WLS COL FSAR, Revision 4 that describes the RWS for the WLS units, including the information provided by Figure 9.2-201, “Raw Water System,” through Figure 9.2-207. As discussed above, the staff’s evaluation in this section focuses primarily on RWS failure considerations and on the capability and reliability of the RWS to perform its cooldown function.

The following staff’s technical evaluation includes the Tier 2 departure and supplemental information addressed in Section 9.2.11.2 of this SER.

A. GDC 2, “Design Bases for Protection against Natural Phenomena”; RG 1.29, “Seismic Design Classification”; and GDC 4, “Environmental and Dynamic Effects Design Bases”

The staff’s review of the information in WLS COL Section 9.2.11 was to confirm that RWS failures will not adversely impact the control room occupants or adversely affect SSCs that are safety-related or designated for RTNSS. Although Section 9.2.11.1.1, “Safety Design Basis,” stated that failures of the RWS or its components will not affect the ability of safety-related systems to perform their intended functions, more detailed information was needed to adequately describe the consequences of RWS failures and to explain why safety-related SSCs are not affected. Likewise, additional information was needed to explain why a failure of the RWS will not adversely affect RTNSS systems and components or impact the control room occupants, or result in an unacceptable release of radioactive material to the environment. Because the applicant did not identify and address these considerations, the staff was unable to confirm compliance with GDC 2, GDC 4, and passive plant policy considerations. The staff issued RAI 9.2.1-1, dated September 23, 2008, asking the applicant to revise WLS COL FSAR Section 9.2.11 to address the impact of RWS failures accordingly, including development of plant-specific ITAAC and test program specifications as appropriate. The applicant's response to RAI 9.2.1-1, dated October 28, 2008, did not adequately address the question and subsequently, the staff expanded the question and issued supplemental RAI 9.2.1-5, dated January 28, 2009, to more fully address RWS failure considerations.

In its response, dated May 15, 2009, the applicant provided a detailed response to the GDC 2, GDC 4, ITAAC, and testing questions. In the response that follows, the applicant stated that failure of the RWS piping located in the yard and inside the turbine building were considered. In addition, the staff has determined that appropriate testing of the RWS was addressed in WLS COL FSAR Section 14.2.

> The potential failures of the RWS and the corresponding impact on SSCs that are safety-related or AP1000 equipment Class D are described below.
>
> Underground piping transfers water from the Broad River to the make-up ponds. The significant above ground portions of this piping are at the intake structures. This piping does not interface with Class D systems nor is it routed in close proximity to safety-related structures or Class D equipment. Underground piping from the make-up pond A intake structure supplies the water treatment equipment in the RWS clarifier subsystem, make-up to the CWS cooling towers, alternate dilution flow to the WWS and alternate make-up to the SWS. This piping is in relatively close proximity to the underground portions of the CWS, and a break in the RWS piping is bounded by a break in the CWS. As discussed in DCD Tier 2, Section 3.4.1.1.1, "Protection from External Flooding," a failure of the cooling tower or the SWS or the CWS piping under the yard could result in a potential flood source. The consequences of a failure in the yard would be enveloped by the analysis described in DCD Tier 2, Section 10.4.5, for failure of the CWS. Site grading will carry the water away from safety-related or important to safety SSCs.
>
> Underground piping from the RWS clarifier subsystem supplies the clarified water storage tank, where additional underground piping supplies the yard-located interface with the FPS, as well as the SWS, DTS and TCS interfaces located in the turbine building. This underground piping is also in close proximity to the underground portions of the CWS and is bounded by the analysis previously discussed.
>
> Short runs of RWS piping from the raw water supply and clarified water supply subsystems are routed inside the turbine building to provide normal and alternate supplies to SWS. Clarified water supply piping also supplies the interface points with DTS and TCS. The RWS to SWS interface is at the SWS make-up control valve V009 (refer to DCD Tier 2, Figure 9.2.1-1). The SWS piping is routed from the control valve to the top of the SWS cooling tower basin. There is an air gap between the piping discharge and the SWS cooling tower basin water level. This air gap ensures that any break in the raw water make-up flow path will not result in the draining of the SWS cooling tower basin by preventing backflow from the basin to the break. Therefore, any flooding will be from the RWS water that discharges through the break prior to securing the make-up supply. The RWS piping to DTS and TCS is on the 100'-0" elevation of the

turbine building (WLS Elevation 590') and the primary source of flooding in this scenario would be from the RWS water that discharges through a break prior to securing the clarified water supply subsystem. A break in the RWS piping to the SWS, DTS and TCS is bounded by a break in circulating water piping. As discussed in DCD Tier 2, Section 3.4.1.2.2.3, “Adjacent Structures Flooding Events,” the bounding flooding source inside the turbine building is a break in the circulating water piping. Flow from any postulated line breaks above elevation 100'-0" would flow down to elevation 100'-0" via floor gratings and stairwells and would run out of the building through a relief panel in the turbine building west wall. There is no safety-related equipment in the turbine building. The components cooling water and service water components on elevation 100'-0", which provide the RTNSS support for the RNS will remain functional following a flooding event in the turbine building since the pump motors and valve operators are above the flood level. Therefore, a failure of the RWS piping within the turbine building will not adversely impact any safety-related or important to safety SSCs.

The control room is located inside the AP1000 nuclear island. No RWS piping is located inside or outside in the vicinity of the nuclear island. Therefore, there are no RWS pipe breaks or flooding events which could impact the control room. Atmospheric releases of the pH adjustment and chlorination chemicals used in RWS treatment are bounded by the DCD Section 6.4 discussion, as the storage volume is much smaller than those used in the CWS treatment. All other chemicals used for RWS treatment are non-toxic, small in volume, and do not represent a hazard to the control room. Therefore, RWS flooding or postulated chemical releases will not adversely impact control room habitability.

Accidental releases of radioactive fluids in ground and surface waters are addressed in WLS COL FSAR Section 2.4.13. In accordance with this discussion, any radioactive fluids released from the AP1000 power block would follow the preferential path for groundwater movement. This flow path is generally northward towards the Broad River.

The RWS piping corridor between the intake on the Broad River and make-up pond A is the closest to the preferential groundwater flow path. This piping corridor is positioned above the water table and located approximately 600 to 2150 feet east of the preferential groundwater flow path. The remaining RWS underground piping corridors are located upgradient to the south and west of the preferential groundwater flow path. When the RWS system is in operation it is under positive pressure. Therefore, migration of any potential contamination from the power block to the piping is considered unlikely.

The RWS does not have the potential to be a flow path for radioactive fluids. The RWS operates at a higher system pressure than those systems that it directly interfaces with; therefore, in-leakage is not feasible when the system is in operation. During normal operations, the interfacing systems for RWS are CWS, WWS at the blowdown sump, SWS, FPS, DTS and TCS. None of these systems have interfaces with radioactive systems.

As discussed in WLS COL FSAR Section 9.2.11.3.5, “Raw Water Supply Subsystem,” the RWS supplies an alternate source of dilution water to the WWS for diluting the WLS effluent stream when the normal dilution source, CWS blowdown, is not available. This function is supported by routing branch lines from the raw water supply subsystem to the CWS blowdown sump. The blowdown sump is open to atmosphere and as shown on

> WLS COL FSAR Figure 1.1-202 is located on the east side of the site at an elevation approximately 60 feet above the Broad River. The CWS blowdown sump mixes CWS blowdown (and, if required, RWS) with discharge from WWS and the combined dilution flow gravity drains through an outfall pipe to the Ninety-Nine Islands dam on the Broad River. At the dam, the dilution flow is mixed with liquid radwaste effluent from each unit and discharged to the environment through a diffuser mounted on the upstream side of the dam. There are no valves on the outfall piping between the blowdown sump and the dam, so the elevation difference between the sump and the river prevents liquid radwaste cross-contamination of the blowdown sump. There is an air gap maintained between the RWS piping discharge into the sump and the sump level that provides additional assurance that cross-contamination is unlikely.

As described in WLS COL FSAR Section 14.2.9.4.24, “Raw Water System,” initial testing verifies that as installed components supply raw water to the CWS cooling tower basin, SWS cooling tower basin, FPS storage tanks, and other systems, as described in WLS COL FSAR Section 9.2.11. Testing shall consist of performance and functions of components and integrated systems.

The applicant’s response to RAI 9.2.1-5 was found acceptable based on the following evaluation. The staff determined failure of the RWS or its components will not affect the ability of any safety-related systems to perform their intended safety functions nor will it adversely impact any Class D systems. Postulated breaks in the RWS piping will not impact safety-related components because the RWS is not located in the vicinity of any safety-related equipment and the water from the postulated break will not reach any safety-related equipment, result in impact to the control room occupants, or result in a release of radioactivity to the environment. Testing of the RWS has been properly addressed, and the RWS instrumentation requirements have been satisfied. In addition, based on the staff’s review of the instrumentation application of the RWS as described in WLS COL FASR Section 9.2.11.7, the operators have sufficient indications of system alarms to identify component failures, such as traveling screens, strainers, and pumps. Since the RWS is not safety-related and its failure does not lead to the failure of any safety-related systems, the staff has concluded that the requirements of GDC 2 and GDC 4 have been satisfied; therefore, RAIs 9.2.1-1 and 9.2.1-5 are resolved.

B. Cold Shutdown

The RWS is relied upon for achieving and maintaining cold shutdown conditions, which is necessary for satisfying Technical Specification requirements. In particular, the RWS is relied upon for cooling the RCS from Mode 4 to Mode 5 conditions within 36 hours. The staff found that Section 9.2.11 did not provide a clearly defined design basis with respect to the RWS cooldown function, and the reliability and capability of the RWS to perform this function for the most limiting situations were not described and addressed in this regard. For example, the minimum RWS flow rate, water inventory, temperature limitations, and corresponding bases for providing SWS makeup for the two WLS units were not described. Also, the suitability of RWS materials for the plant-specific application and measures being implemented to resolve vulnerabilities and degradation mechanisms to assure RWS functionality over time were not addressed. Because the applicant did not adequately define and address RWS design-bases considerations with respect to its cooldown function, the staff was unable to confirm that the cooldown and policy considerations that apply to passive plant designs were satisfied. Therefore, in RAI 9.2.1-2, dated September 23, 2008, the staff asked the applicant to provide clarification. The applicant's response to RAI 9.2.1-2 dated October 28, 2008, did not adequately address the question and subsequently the staff expanded the question and issued supplemental RAI 9.2.1-6, dated January 28, 2009, to further fully address cold shutdown considerations.

In its response, dated May 15, 2009, the applicant stated that the RWS consists of several subsystems. Of these subsystems, only two supply water to support plant system functions during Modes 1 through 5. The clarified water supply subsystem supplies treated make-up, fill water to the DTS and FPS in both units, serve as the preferred make-up, and fill supply to the SWS. The raw water supply subsystem supplies untreated make-up and fill water to the CWS. The raw water supply subsystem also provides an assured make-up supply to SWS to ensure that the power generation design basis for SWS is maintained during abnormal conditions that could deplete the inventory in the clarified water supply subsystem.

This response specifically focuses on the clarified water supply and raw water supply subsystems interfaces with the SWS. This is because, as noted in the response to RAI 9.2.1-5, the other functions performed by the RWS do not have a direct interface with any other system identified within the AP1000, which is safety-related, designated for RTNSS, or designated as AP1000 Class D.

> The RWS clarified water supply and raw water supply subsystems provide a water fill/makeup interface with the SWS. The SWS has investment protection short-term availability controls as described in AP1000 DCD Table 16.3-2, which are applicable in Mode 5 with the RCS pressure boundary open, and in Mode 6 with the upper internals in place or cavity level less than full. Under these conditions, the SWS is directly providing active core cooling and, as noted in the response to RAI 9.2.1-5, was evaluated by Westinghouse and determined to meet the RTNSS criteria as documented in NUREG-1793 and Westinghouse Topical Report WCAP-15985, "AP1000 Implementation of the Regulatory Treatment of Nonsafety-Related System Process." Unlike the SWS, the RWS does not directly provide core cooling. As discussed in response to RAI 9.2.1-5, RWS support of the SWS cooling function was evaluated in WCAP-15985 and determined to not meet the RTNSS criteria and to not require investment protection short-term availability controls.
>
> In the unlikely event of a failure of the RWS to provide adequate make-up flow to the SWS cooling tower basins during the short time period in which the SWS is performing a RTNSS function as stated above, the remaining inventory in the service water cooling tower basins and the stored water, which is available in the upper region of the secondary fire water tank provide ample time (more than 24 hours) to restore the RWS make-up flow or take the procedural actions necessary to exit the conditions for applicability. Therefore, the RWS is not a RTNSS system or subject to investment protection short-term availability controls. However, as described below, the RWS is designed to be a highly reliable and robust system, capable of operating during a loss of normal alternating current (ac) power to provide RWS make-up flow under normal and abnormal conditions. Procedural controls, which provide for continued operation of the RWS or re-establishment of operations under off-normal conditions, will be in the operating procedures, where appropriate.

As described in AP1000 DCD Section 5.4.7.1.2.1, “Shutdown Heat Removal,” the RNS, in conjunction with its associated support systems, the CCS and the SWS, are used for shutdown heat removal. The RWS provides indirect support for this function by providing a source of make-up water to the SWS cooling tower basins to compensate for evaporation, drift, and blowdown. The RWS provides this make-up water to support the cooling requirements for the SWS. During a normal plant cooldown, the RNS and CCS reduce the temperature of the RCS from approximately 350 °Fahrenheit (F) to approximately 125 °F within 96 hours after shutdown. The RWS is designed to provide ample make-up flow to both units' cooling tower basins during these conditions using the clarified water supply pumps.

WLS COL FSAR Figure 2.4.1-202, “Water Balance Summary,” identifies the maximum make-up requirement for RWS to the SWSs in both units to be 1660 gpm (830 gpm per unit). This demand represents a design maximum make-up to the SWS cooling towers, occurring four hours after a simultaneous shutdown of both units, when the maximum SWS heat load is encountered at the beginning of cooldown. This flow rate is very conservative, as the decay heat load decreases during cooldown with an accompanying decrease in make-up requirements.

If cooldown to cold shutdown (Mode 5) is required within 36 hours to comply with a limiting condition for operation (LCO) in accordance with the Technical Specifications, heat will be transferred from the RCS via the steam generators to the main steam system for a longer period of time, allowing RNS to be placed in service at a lower temperature with lower decay heat levels. Because of the reduced RNS heat removal requirements associated with this cold shutdown sequence, the required RWS make-up flow to the SWS cooling towers is less than normal cooldown requirements.

For a loss of normal ac power scenario, Westinghouse AP1000 design data indicates an RWS flow of approximately 108 gpm will provide sufficient make-up to account for evaporation and drift losses from the SWS cooling tower following the first 28 hours of event initiation.

The clarified water supply subsystem is the normal make-up source for the SWS cooling towers in both units and the preferred source of water for the normal plant cooldown described in the power generation design basis. The clarified water storage tank, shared by both units, has a capacity of 2.7 million gallons. There are four clarified water supply pumps (two per unit) that take suction from the storage tank. Each pump has a design flow rate of 1500 gpm, so one pump can easily supply the maximum make-up requirements for the associated unit.

The raw water supply subsystem provides the assured make-up supply to the SWS to ensure that the power generation design basis for the SWS is maintained during abnormal conditions that could deplete the inventory in the clarified water supply subsystem. The inventory for the subsystem is make-up pond A, which has a useable storage volume of 1200 acre-foot and provides sufficient capacity to support a dual unit cooldown to cold shutdown conditions and maintain the station in this condition for longer than 7 days. There are six raw water supply pumps (three per unit) that take suction from make-up pond A. Each pump has a design flow rate of 15,000 gpm.

> The underground RWS piping will be high-density polyethylene (HDPE), which is not susceptible to corrosion or biological fouling and is designed to ASME B31.1; therefore, periodic inspections of the underground RWS piping are not required. Equipment that remains idle for extended periods of time (pumps, valves) will be operated periodically in accordance with vendor recommended maintenance practices.
>
> The lack of designation of the RWS as RTNSS or Class D indicates there is no performance requirement for the system in the event of a single active failure or during a loss of normal ac power. Nonetheless, the RWS is highly reliable based on its design, and a single failure of an active component in the RWS would not affect normal plant cooldown. Only one of the two clarified water supply pumps or one of the three raw water supply pumps are required to support make-up to the SWS cooling tower basins in each unit during all modes of SWS operation. Failure of an operating pump or electrically-operated valve in the make-up path to the SWS would not prevent the RWS from providing make-up to the cooling towers. The clarified water supply pumps are supplied from separate buses that are automatically loaded on the standby power supply during a loss of normal ac power. All RWS valves in the make-up to SWS are manual. Restoring make-up flow requires starting a pump from the control room. The raw water supply pumps are supplied by separate buses and two pumps in each unit are on buses that can be manually loaded on the standby power supply. If the clarified water supply subsystem is not available, operator actions will be taken to align the raw water supply subsystem as described in WLS COL FSAR Section 9.2.11.3.5. The water inventory in the SWS cooling tower basins provides adequate time to perform the manual actions needed to restore SWS make-up. The RWS, therefore, continues to maintain the capability to provide make-up water to the SWS cooling tower basins during loss of normal ac power events.
>
> The raw water screen wash pumps and traveling screen do not have backup power. The traveling screens are powered by the normal ac power system, which is backed by a standby power supply for occurrences of loss of normal ac power. RWS make-up requirements following a loss of normal ac power are a small fraction of the normal flow. In such condition, the intake screens act as passive screens.
>
> In the unlikely event that all RWS flow to the SWS cooling towers is lost, there is ample time to identify and correct the situation or to align alternate sources of water to provide that make-up flow, and the RWS is shown to not be a RTNSS system nor subject to investment protection short-term availability controls. It is also important to note that the RNS, CCS, SWS, nor RWS are required to establish and maintain the AP1000 plant in a safe shutdown condition, since passive safety-related systems perform that function. This is explicitly recognized throughout the AP1000 DCD and NUREG-1793.

The applicant’s response to RAI 9.2.1-6 was found acceptable based on the following evaluation. The staff finds that the RWS is designed with the provision of single failure since many of the raw water supply subsystem and clarified subsystem components can be supplied with backup power from the onsite diesel generators as necessary. During a loss of SWS make-up from the RWS supply subsystem or clarified water supply subsystem, make-up to the SWS is not required for 12 hours due to existing cooling tower basin inventory. After 12 hours, onsite make-up capacity from the fire protection storage tank is available for more than an additional 12 hours. In addition, the RWS is considered highly reliable and able to supply required water for the SWS for greater than 7 days due to the redundancies of pumps, strainers, screens, and screen wash components associated with make-up pond A. The raw water screen wash pumps and traveling screen do not have backup power; however, the staff finds the RWS make-up requirements following a loss of normal ac power are a small fraction of the normal flow. In such condition, the intake screens act as passive screens. This is acceptable because lower flow rates and limited duration reduce the potential for entrainment and impingement.

In addition, the staff finds the RWS underground material acceptable since buried HDPE will be designed and installed in accordance with industry Codes, such as ASME B31.1 and American Water Works Association (AWWA) C906, "Polyethylene (PE) Pressure Pipe and Fittings, 4 in (100mm) through 63 in (1,575mm), for Water Distribution and Transmission." This material is an industry proven material that is corrosion resistant inside and out, hydraulically smooth, and tends to resist buildup (bio-fouling) so the inner surface usually remains in this condition throughout the service life of the pipe. In addition, HDPE has a life expectancy of approximately 50 years. Ultraviolet protection is of no concern since the RWS HDPE piping will be buried. HDPE materials are well within the temperature and pressures ranges in which the RWS piping system will be exposed to during operations.

C. Regulatory Treatment of Non-Safety Related System (RTNSS)

The RWS supports the SWS cooling function by providing makeup water to the SWS cooling tower basins. The staff noted that while the SWS is designated for RTNSS during reduced reactor inventory conditions, the RWS is not needed to support the SWS cooling function when the reactor water inventory is reduced because RWS is not designated for RTNSS. However, there was no explanation in Section 9.2.11 as to why this was the case. Also, because the SWS cooling tower basins are very limited in their capacity, it was not clear why RWS makeup was not required for this situation. Therefore, the staff asked the applicant to explain this as part of RAI 9.2.1-2, dated September 23, 2008. The applicant's response to RAI 9.2.1-2, dated October 28, 2008, did not adequately address the question. Subsequently, the staff expanded the question and issued supplemental RAI 9.2.1-7, dated January 28, 2009, which asked the applicant to explain why RWS makeup is not needed during reduced reactor inventory conditions and in particular, to describe controls that will be implemented to ensure that assumptions remain valid.

In its response to RAI 9.2.1-7, dated May 15, 2009, the applicant referred to its RAI 9.2.1-6 response, which provided an explanation as to why the RWS is not designated as RTNSS and makeup from the RWS to the SWS cooling tower basins is not required during reduced reactor inventory conditions. The referenced RAI response also discusses that procedural control will be established to take the required actions to exit the conditions for applicability of the SWS as a RTNSS system, in the unlikely event of a failure to re-establish RWS makeup capability. Plant documentation, in the form of the system description for the RWS, will include the information addressed in the responses to RAI 9.2.1-6 and RAI 9.2.1-7.

In the response to RAI 9.2.1-6, the applicant also stated that the RWS does not have a direct interface with any other system identified within the AP1000, which is safety-related, designated for RTNSS, or designated as AP1000 Class D. The RWS provides a water fill/makeup function for the SWS, and the SWS has investment protection short-term availability controls as described in AP1000 DCD Table 16.3-2, "Investment Protection Short-Term Availability Controls," which are applicable in Mode 5 with the RCS pressure boundary open and in Mode 6 with the upper internals in place or cavity level less than full. Under these conditions, the SWS is directly providing active core cooling and was evaluated and determined to meet the RTNSS criteria as documented in NUREG-1793 and WCAP-15985. Unlike the SWS, the RWS does not directly provide core cooling and was evaluated in WCAP-15985 and determined to not meet the RTNSS criteria and to not require investment protection short-term availability controls. Neither the SWS nor the RWS are required to establish and maintain the AP1000 plant in a safe shutdown condition, since passive safety-related systems perform that function. This is explicitly recognized throughout the AP1000 DCD and NUREG-1793.

The applicant's response to RAI 9.2.1-6, also stated that in the unlikely event of a failure of the RWS to provide makeup flow to the SWS cooling tower basis during the short time period (as stated above) that SWS is performing a RTNSS function, the remaining inventory in the SWS cooling tower basins and water in the secondary fire tank will provide more than 24 hours to restore the RWS makeup flow or take procedural actions to exit the conditions for applicability.

In summary, the staff finds the applicant's response to RAI 9.2.1-7 acceptable because the NRC previously concluded in NUREG-1793 that the SWS meets the RTNSS criteria for provided active core cooling. The RWS does not directly provided core cooling. Therefore, the staff concludes the RWS need not be considered RTNSS and, RAIs 9.2.1-2, 9.2.1-6, and 9.2.1-7 are resolved and closed.

D. 10 CFR 20.1406, "Minimization of Contamination" Considerations

As specified by 10 CFR 20.1406, COL applicants are required to describe how facility design and procedures for operation will minimize the generation of radioactive waste and contamination of the facility and environment, and facilitate eventual plant decommissioning. Although the RWS has no interconnections with any systems that contain radioactive fluids, industry experience has shown that this alone may not be sufficient to prevent the RWS from becoming contaminated. For example, unplanned leaks or release of contaminated fluids as a result of component failures or transport, drainage problems in contaminated areas, and the migration of contamination through soils and other porous barriers over time have caused systems and areas of the plant that are not directly connected with contaminated systems to become contaminated. Also, because the RWS is used as a source of water for diluting liquid radwaste, this may create a potential for contaminating the RWS or for spreading contamination inadvertently. Therefore, the staff requested in RAI 9.2.1-3, dated September 23, 2008, that the applicant provide additional information to describe design provisions and other measures that will be implemented to satisfy the requirements specified by 10 CFR 20.1406, including measures that will be implemented to monitor the RWS for contamination and corrective actions that will be taken to eliminate any radioactive contamination that is identified (as appropriate). In a response dated October 26, 2008, it was stated that the RWS has no interconnection with systems that contain radioactive fluids. In addition, the applicant indicated that the groundwater monitoring program should minimize the possibility of contaminating the RWS from external subsurface sources. The applicant noted that the groundwater monitoring program is described in WLS COL FSAR Section 12AA.5.4.13, "Groundwater Monitoring Program." The staff's evaluation of the groundwater monitoring program is provided in the corresponding section of this SER. The staff considers the applicant's resolution of this issue to be acceptable, and RAI 9.2.1-3 is closed.

9.2.11.5 *Post Combined License Activities*

There are no post-COL activities related to this section.

9.2.11.6 *Conclusion*

The RWS was evaluated using the guidance referred to in the Regulatory Basis section as it pertains to these considerations and acceptability was based upon conformance with the NRC requirements and criteria that are specified in this regard.

The NRC staff has evaluated the RWS as described in WLS COL FSAR Section 9.2.11. The staff's evaluation focused primarily on confirming that: a) the RWS will not adversely affect safety-related SSCs, or impact the control room occupants; b) the RWS is capable of performing its intended function over the life of the plant; c) the RWS reliance for the support of SWS for achieving and maintaining cold shutdown conditions and RTNSS considerations; and d) the initial test program considerations have been adequately addressed and are appropriate. The RWS was evaluated using the guidance referred to in the regulatory basis section as it pertains to these considerations and acceptability was based upon conformance with the NRC requirements and criteria that are specified in this regard. Based upon the results of this evaluation, the staff concluded that the RWS, as described in WLS COL FSAR Section 9.2.11, is acceptable and all of the FSAR markups included in the above noted RAIs have been adequately incorporated into the FSAR.

9.3 <u>Process Auxiliaries</u>

9.3.1 Compressed and Instrument Air System (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.3.1, "Compressed Air Systems")

9.3.1.1 *Introduction*

The compressed and instrument air system delivers instrument air, service air, and high-pressure air. The instrument air subsystem provides high quality instrument air for plant use. The service air subsystem supplies plant breathing air. The high-pressure air subsystem produces air for high-pressure applications.

9.3.1.2 *Summary of Application*

Section 9.3 of the WLS COL FSAR, Revision 11, incorporates by reference Section 9.3 of the AP1000 DCD, Revision 19. Section 9.3 of the AP1000 DCD includes Section 9.3.1.

In addition, in WLS COL FSAR Section 9.3, the applicant provided the following:

<u>Departures</u>

- WLS DEP 6.4-2

The applicant provided additional information in Section 9.3.1.1.2 of the WLS COL FSAR about WLS DEP 6.4-2 related to design changes affecting how the temperature and humidity in the main control room are maintained within the limits for reliable human performance. This information, as well as related WLS DEP 6.4-2 information appearing in other chapters of the FSAR, is reviewed in Section 21.3 of this SER.

AP1000 COL Information Item

- STD COL 9.3-1

The applicant provided additional information in STD COL 9.3-1 to address COL Information Item 9.3-1 (COL Action Item 9.3.1-1).

9.3.1.3 *Regulatory Basis*

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the compressed and instrument air system are given in Section 9.3.1 of NUREG-0800.

The regulatory basis for STD COL 9.3-1 addressing Generic Safety Issue (GSI) 43, "Reliability of Air Systems," as part of training and procedures include the following:

- GDC 1, "Quality Standards and Records," as it relates to the reliability of safety-related equipment actuated or controlled by compressed air.

9.3.1.4 *Technical Evaluation*

The NRC staff reviewed Section 9.3.1 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the compressed and instrument air system. The results of the NRC staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside of the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5 to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.

- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the WLS COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the BLN Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from Section 9.3.1.4 of the VEGP SER:

> *<u>AP1000 COL Information Item</u>*
>
> - *STD COL 9.3-1 (COL Action Item 9.3.1-1), involving air systems (NUREG-0933, "Resolution of Generic Safety Issues," Issue 43)*
>
> *The NRC staff reviewed STD COL 9.3-1 related to COL Information Item 9.3-1. COL Information Item 9.3-1 states:*
>
>> *The Combined License applicant will address DCD 1.9.4.2.3, Issue 43 as part of training and procedures identified in section 13.5.*
>
> *The commitment was also captured as COL Action Item 9.3.1-1 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:*
>
>> *The COL applicant will address NUREG-0933, Issue 43 as part of training and procedures.*
>
> *The applicant proposed to resolve STD COL 9.3-1 by providing training and procedures for operations and maintenance of the instrument air subsystem and air operated valves. The methodology to develop system operating procedures, abnormal operating procedures, and alarm response procedures is reviewed in Section 13.5 of this SER. The training program for operators and maintenance personnel is reviewed in Section 13.2 of this SER. The applicant also stated that the compressed and instrument air system will be maintained and tested in accordance with the manufacturers' recommendations and procedures and that the system will be periodically tested to demonstrate conformance with the quality requirements of ANSI/ISA-7.3-1981.*
>
> *NUREG-0933, Issue 43 discusses that possible solutions for this issue, include better operator training, operator awareness of the importance of compress air systems, and periodic testing and inspection of the compressed air systems. The NRC staff reviewed the applicant's proposed resolution to STD COL 9.3-1 and determined that the BLN COL FSAR meets the guidance in NUREG-0933, Issue 43; therefore, the staff finds STD COL 9.3-1 resolved.*

9.3.1.5 *Post Combined License Activities*

There are no post-COL activities related to this section.

9.3.1.6 *Conclusion*

The NRC staff reviewed the application and checked the referenced DCD. The NRC staff's review confirmed that the applicant addressed the required information relating to compressed and instrument air system, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the WLS COL FSAR is acceptable and meets the guidelines given in Section 9.3.1 of NUREG-0800.

- WLS DEP 6.4-2, related to design changes affecting how the temperature and humidity in the main control room are maintained within the limits for reliable human performance, is reviewed and found acceptable by the staff in Section 21.3 of this SER.

- STD COL 9.3-1, the staff evaluated Issue 43, "Reliability of Air Systems," as part of the training and procedures in accordance with the requirements of GDC 1, as it relates to the impact of a failure of the compressed and instrument air system on safety-related SSCs. Based on the results of this evaluation, the WLS COL FSAR meets the guidance in NUREG-0933, Issue 43 and is acceptable.

9.3.2 Plant Gas System (Related to RG 1.206 Section C.III.1, Chapter 9, C.I.9.3.1, "Compressed Air Systems")

The plant gas system is a nonsafety-related system that supplies hydrogen, carbon dioxide, and nitrogen gasses to plant systems as required. Failure of the system does not compromise any safety-related system nor does it prevent safe reactor shutdown.

Section 9.3 of the WLS COL FSAR, Revision 11, incorporates by reference, with no departures or supplements, Section 9.3.2, "Plant Gas System," of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.[1] The NRC staff's review confirmed that there is no outstanding issue related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

9.3.3 Primary Sampling System (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.3.2, "Process and Postaccident Sampling Systems")

The primary sampling system is used to collect samples during normal operations and following an accident. The system collects for analysis samples from the reactor coolant, auxiliary primary process streams, and containment atmosphere. Both the normal operation and post accident requirements are carried out by this single system.

Section 9.3 of the WLS COL FSAR, Revision 11, incorporates by reference, with no departures or supplements, Section 9.3.3, “Primary Sampling System,” of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.[1] The NRC staff’s review confirmed that there is no outstanding issue related to this section. The results of the NRC staff’s technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

9.3.4 Secondary Sampling System (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.3.2, “Process and Postaccident Sampling Systems”)

The secondary sampling system delivers representative samples of fluids from secondary systems to sample analyzer packages. Continuous online secondary chemistry monitoring detects impurity ingress and provides early diagnosis of system chemistry excursions in the plant.

Section 9.3 of the WLS COL FSAR, Revision 11, incorporates by reference, with no departures or supplements, Section 9.3.4, “Secondary Sampling System,” of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.[1] The NRC staff’s review confirmed that there is no outstanding issue related to this section. The results of the NRC staff’s technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

9.3.5 Equipment and Floor Drainage Systems (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.3.3, “Equipment and Floor Drainage System”)

The equipment and floor drainage system collects liquid wastes from equipment and floor drains during normal operation, startup, shutdown, and refueling. The equipment and floor drainage system consists of two subsystems, radioactive waste drains and nonradioactive waste drains.

Section 9.3 of the WLS COL FSAR, Revision 11, incorporates by reference, with no departures or supplements, Section 9.3.5, “Equipment and Floor Drainage Systems,” of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.[1] The NRC staff’s review confirmed that there is no outstanding issue related to this section. The results of the NRC staff’s technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

9.3.6 Chemical and Volume Control System (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.3.4, “Chemical and Volume Control System (PWR) Including Boron Recovery System”)

The CVS maintains the required water inventory and quality in the RCS, provides pressurizer auxiliary spray, controls the boron neutron absorber concentration in the reactor coolant, provides a means for filling and pressure testing the RCS, controls the primary water chemistry and reduces coolant radioactivity level. Further, the system provides recycled coolant for demineralized water makeup for normal operation and provides borated makeup flow to the RCS in the event of some accidents, such as a small break loss-of-coolant accident.

Section 9.3 of the WLS COL FSAR, Revision 11, incorporates by reference, Section 9.3.6, “Chemical and Volume Control System,” of Revision 19 of the AP1000 DCD. In addition, in the WLS COL FSAR, the applicant provided the following:

Departures

- WLS DEP 7.3-1

The applicant provided additional information in Section 9.3.6 of the WLS COL FSAR about WLS DEP 7.3-1 related to required design changes for the PMS source range neutron flux doubling logic to comply with the requirements of IEEE Std. 603-1991, Clause 6.6. This information, as well as related WLS DEP 7.3-1 information appearing in other chapters of the FSAR, is reviewed in Section 21.5 of this SER.

The NRC staff reviewed Section 9.3.6 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this section. The NRC staff’s review confirmed that the applicant addressed the required information to satisfy the evaluation criteria. There is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the NRC staff’s technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

9.4 Air-Conditioning, Heating, Cooling, and Ventilation Systems

9.4.1 Nuclear Island Nonradioactive Ventilation System (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.4.1, “Control Room Area Ventilation System”)

9.4.1.1 *Introduction*

The VBS, in conjunction with the MCR emergency habitability system described in Section 6.4, provides a controlled environment for the comfort and safety of control room personnel and assures the operability of control room and nearby components during normal operating, anticipated operational transient, and design-basis accident conditions.

9.4.1.2 *Summary of Application*

Section 9.4 of the WLS COL FSAR, Revision 11, incorporates by reference Section 9.4 of the AP1000 DCD, Revision 19. Section 9.4 of the DCD includes Section 9.4.1, describing the VBS.

In addition, in WLS COL FSAR Sections 9.4.1, 9.4.1.4, and 9.4.12, the applicant provided the following:

Departures

- WLS DEP 6.4-1

The applicant provided additional information in Section 9.4.1 of the WLS COL FSAR about WLS DEP 6.4-1 related to design changes affecting habitability of the main control room and changes to the calculated doses to control room operators. This information, as well as related WLS DEP 6.4-1 information appearing in other chapters of the FSAR, is reviewed in Section 21.2 of this SER.

- WLS DEP 6.4-2

The applicant provided additional information in Section 9.4.1 of the WLS COL FSAR about WLS DEP 6.4-2 related to design changes affecting how the temperature and humidity in the main control room are maintained within the limits for reliable human performance. This information, as well as related WLS DEP 6.4-2 information appearing in other chapters of the FSAR, is reviewed in Section 21.3 of this SER.

AP1000 COL Information Items

- STD COL 9.4-1a

The applicant provided additional information in STD COL 9.4-1a to address the first part of COL Information Item 9.4-1 (COL Action Item 9.4.1-1), related to a program for inspections and testing applicable to the VBS.

In addition, in WLS COL FSAR Section 9.4.12, the applicant provided the following:

- WLS COL 9.4-1b

The applicant provided additional information in WLS COL 9.4-1b to address the second part of COL Information Item 9.4-1 (COL Action Item 6.4-3). The local toxic gas services are evaluated to determine the need for monitoring for control room habitability.

9.4.1.3 *Regulatory Basis*

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the VBS are given in Section 9.4.1 of NUREG-0800.

The applicable regulatory guidance for the VBS is as follows:

- RG 1.140, “Design, Inspection, and Testing Criteria for Air Filtration and Adsorption Units of Normal Atmosphere Cleanup Systems in Light-Water-Cooled Nuclear Power Plants,” Revision 2

9.4.1.4 *Technical Evaluation*

The NRC staff reviewed Section 9.4.1 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the VBS. The results of the NRC staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5 to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.

- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the WLS COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the BLN Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from Section 9.4.1.4 of the VEGP SER:

> *<u>AP1000 COL Information Items</u>*
>
> - *STD COL 9.4-1a*
>
> *The applicant provided additional information in STD COL 9.4-1a to resolve COL Information Item 9.4-1. COL Information Item 9.4-1a states:*
>
> > *The Combined License applicants referencing the AP1000 certified design will implement a program to maintain compliance with ASME AG-1, ASME N509, ASME N510 and Regulatory Guide 1.140 for portions of the nuclear island nonradioactive ventilation system and the containment air filtration system identified in subsection 9.4.1 and 9.4.7.*

The commitment was also captured as COL Action Item 9.4.1-1 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:

> *The COL applicant will develop a program to maintain operability of the nuclear island nonradioactive ventilation system and the containment air filtration system.*

The NRC staff reviewed STD COL 9.4-1a related to COL Action Item 9.4-1 included under Section 9.4.1.4 of the BLN COL FSAR. The NRC staff reviewed the resolution to STD COL 9.4-1a on the proposed implementation of a program to maintain compliance with industry standards and RGs for the VBS included under Section 9.4.1.4 and Section 9.4.12 of the BLN COL FSAR, and concludes that this item has been resolved for the VBS because the applicant has referenced the applicable regulatory guide and industry standards.

Correction of Error in the Standard Content Evaluation Text

The NRC staff identified an error in the text reproduced above from Section 9.4.1.4 of the BLN SER that requires correction. The BLN SER includes the following statement: "The NRC staff reviewed STD COL 9.4-1a related to COL Action Item 9.4-1 included under Section 9.4.1.4 of the BLN COL FSAR." COL Action Item 9.4-1 does not exist and should be replaced with COL Information Item 9.4-1.

- WLS COL 9.4-1b

The applicant provided additional information in WLS COL 9.4-1b to resolve the second part of COL Information Item 9.4-1. The second part of COL Information Item 9.4-1 states:

> The Combined License applicant will also provide a description of the [Main Control Room/Technical Support Center] MCR/TSC HVAC subsystem's recirculation mode during toxic emergencies, and how the subsystem equipment isolates and operates, as applicable, consistent with the toxic issues, including conformance with Regulatory Guide 1.78 to be addressed by the Combined License applicant as discussed in DCD subsection 6.4.7.

The commitment was also captured as COL Action Item 6.4-3 in Appendix F of NUREG-1793, which states:

> The COL applicant will determine the amount and location of possible sources of toxic chemicals in or near the plant and for seismic Category I Class 1E toxic gas monitoring, using methods discussed in RG 1.78.

The commitment was also captured as COL Action Item 9.4.1-1 in Appendix F of NUREG-1793, which states:

> The COL applicant will develop a program to maintain operability of the nuclear island nonradioactive ventilation system and the containment air filtration system.

The NRC staff review of WLS COL 9.4-1b is addressed in Section 6.4 of this SER.

9.4.1.5 *Post Combined License Activities*

There are no post-COL activities related to this section.

9.4.1.6 *Conclusion*

The NRC staff reviewed the application and checked the referenced DCD. The NRC staff's review confirmed that the applicant addressed the required information relating to the VBS, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

The applicant has provided sufficient information for satisfying Section 9.4.1 of NUREG-0800 and RG 1.140 related to the applicable inspection and testing standards. This addresses STD COL 9.4-1a for VBS. The staff based its conclusion on the following:

- WLS DEP 6.4-1, related to design changes affecting habitability of the main control room and changes to the calculated doses to control room operators, is reviewed and found acceptable by the staff in Section 21.2 of this SER.

- WLS DEP 6.4-2, related to design changes affecting how the temperature and humidity in the main control room are maintained within the limits for reliable human performance, is reviewed and found acceptable by the staff in Section 21.3 of this SER.

- STD COL 9.4-1a, related to a program for inspections and testing applicable to the VBS, is adequately addressed by the applicant and is resolved.

- WLS COL 9.4-1b, addressing the local toxic gas services are evaluated to determine the need for monitoring for control room habitability, is reviewed by the staff in Section 6.4 of this SER.

9.4.2 Annex/Auxiliary Buildings Nonradioactive HVAC System (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.4.3, "Auxiliary and Radwaste Area Ventilation System")

The annex/auxiliary building nonradioactive HVAC system maintains ventilation, permits personnel access, and controls the concentration of airborne radioactive material in the nonradioactive personnel and equipment areas, electrical equipment rooms, clean corridors, the ancillary diesel generator room and demineralized water deoxygenating room in the annex building, and the main steam isolation valve compartments, reactor trip switchgear rooms, and piping and electrical penetration areas.

Section 9.4.2 of the WLS COL FSAR, Revision 11, incorporates by reference, with no departures or supplements, Section 9.4.2, "Annex/Auxiliary Buildings Nonradioactive HVAC System," of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.[1] The NRC staff's review confirmed that there is no outstanding issue related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

9.4.3 Radiologically Controlled Area Ventilation System (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.4.2, "Spent Fuel Pool Area Ventilation System," and C.I.9.4.3, "Auxiliary and Radwaste Area Ventilation System")

The radiologically controlled area ventilation system maintains ventilation permits personnel access, and controls the concentration of airborne radioactive material in the fuel handling area, the radiologically controlled areas of the auxiliary and annex buildings.

Section 9.4 of the WLS COL FSAR, Revision 11, incorporates by reference, with no departures or supplements, Section 9.4.3, "Radiologically Controlled Area Ventilation System," of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.[1] The NRC staff's review confirmed that there is no outstanding issue related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

9.4.4 Balance-of-Plant Interface

This section is not applicable to AP1000.

9.4.5 Engineered Safety Features Ventilation System

This section is not applicable to AP1000.

9.4.6 Containment Recirculation Cooling System (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.4.5, "Engineered Safety Feature Ventilation System")

The containment recirculation cooling system provides a suitable and controlled environment for the containment building during normal plant operation and shutdown.

Section 9.4 of the WLS COL FSAR, Revision 11, incorporates by reference, with no departures or supplements, Section 9.4.6, "Containment Recirculation Cooling System", of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.[1] The NRC staff's review confirmed that there is no outstanding issue related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

9.4.7 Containment Air Filtration System (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.4.5, "Engineered Safety Feature Ventilation System")

9.4.7.1 *Introduction*

The containment air filtration system (VFS) serves no safety function, except containment isolation. The system conditions and filters outside air for the containment, the fuel handling area and the other radiologically controlled areas of the auxiliary and annex buildings, except for the hot machine shop and health physics areas, which are served by a separate ventilation system.

9.4.7.2 *Summary of Application*

Section 9.4 of the WLS COL FSAR, Revision 11, incorporates by reference Section 9.4 of the AP1000 DCD, Revision 19. Section 9.4 of the DCD includes Section 9.4.7, "Containment Air Filtration System," which addresses Section 9.4.5, "Engineered Safety Feature Ventilation System," of NUREG-0800.

In addition, in WLS COL FSAR Section 9.4.7.4, the applicant provided the following:

<u>*AP1000 COL Information Item*</u>

- STD COL 9.4-1a

The applicant provided additional information in STD COL 9.4-1a to address COL Information Item 9.4-1 related to a program for inspections and testing applicable to the VFS included under Section 9.4.7.4 of the WLS COL FSAR.

9.4.7.3 *Regulatory Basis*

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the VFS are given in Section 9.4.5 of NUREG-0800.

The applicable regulatory guidance for the VFS is as follows:

- RG 1.140

9.4.7.4 *Technical Evaluation*

The NRC staff reviewed Section 9.4.7 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the VFS. The results of the NRC staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5 to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.

- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the WLS COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the BLN Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from Section 9.4.7.4 of the VEGP SER:

> *AP1000 COL Information Item*
>
> - *STD COL 9.4-1a*
>
> *The applicant provided additional information in STD COL 9.4-1a to resolve COL Information Item 9.4-1. COL Information Item 9.4-1 states:*
>
> > *The Combined License applicants referencing the AP1000 certified design will implement a program to maintain compliance with ASME AG-1, ASME N509, ASME N510, and Regulatory Guide 1.140 for portions of the nuclear island nonradioactive ventilation system and the containment air filtration system identified in subsection 9.4.1 and 9.4.7. The Combined License applicant will also provide a description of the MCR/TSC HVAC subsystem's recirculation mode during toxic emergencies, and how the subsystem equipment isolates and operates, as applicable, consistent with the toxic issues, including conformance with Regulatory Guide 1.78, to be addressed by the Combined License applicant as discussed in DCD subsection 6.4.7.*
>
> *The commitment was also captured as COL Action Item 9.4.1-1 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:*
>
> > *The COL applicant will develop a program to maintain operability of the nuclear island nonradioactive ventilation system and the containment air filtration system.*
>
> *The NRC staff reviewed STD COL 9.4-1a related to COL Action Item 9.4-1 included under Section 9.4.7.4 of the BLN COL FSAR.*

The NRC staff reviewed the resolution to STD COL 9.4-1a on the proposed implementation of a program to maintain compliance with industry standards and RGs for the VFS included under Section 9.4.7.4 of the BLN COL FSAR, and concludes that this item has been resolved for the VFS because the applicant has appropriately referenced the applicable regulatory guide and industry standards.

Correction of Error in the Standard Content Evaluation Text

The NRC staff identified an error in the text reproduced above from Section 9.4.7.4 of the BLN SER that requires correction. The BLN SER includes the following statement: "The NRC staff reviewed STD COL 9.4-1a related to COL Action Item 9.4-1 included under Section 9.4.7.4 of the BLN COL FSAR." COL Action Item 9.4-1 does not exist and should be replaced with COL Information Item 9.4-1.

9.4.7.5 *Post Combined License Activities*

There are no post-COL activities related to this section.

9.4.7.6 *Conclusion*

The NRC staff reviewed the application and checked the referenced DCD. The NRC staff's review confirmed that the applicant addressed the required information relating to the VFS, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

In conclusion, the applicant has provided sufficient information for satisfying Section 9.4.7 of NUREG-0800 and RG 1.140 related to the applicable inspection and testing standards. This addresses STD COL 9.4-1a for the VFS.

9.4.8 Radwaste Building HVAC System

The radwaste building HVAC system serves the radwaste building, which includes the clean electrical/mechanical equipment room and the potentially contaminated HVAC equipment room, the packaged waste storage room, the waste accumulation room, and the mobile systems facility.

Section 9.4 of the WLS COL FSAR, Revision 11, incorporates by reference, with no departures or supplements, Section 9.4.8, "Radwaste Building HVAC System," of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.[1] The NRC staff's review confirmed that there is no outstanding issue related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

9.4.9 Turbine Building Ventilation System

The turbine building ventilation system operates during startup, shutdown, and normal plant operations. The system maintains acceptable air temperatures in the turbine building for equipment operation and for personnel working in the building.

Section 9.4 of the WLS COL FSAR, Revision 11, incorporates by reference, with no departures or supplements, Section 9.4.9, “Turbine Building Ventilation System,” of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.[1] The NRC staff’s review confirmed that there is no outstanding issue related to this section. The results of the NRC staff’s technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

9.4.10 Diesel Generator Building Heating and Ventilation System

The diesel generator building heating and ventilation system serves the standby diesel generator rooms, electrical equipment service modules, and diesel fuel oil day tank vaults in the diesel generator building and the two diesel oil transfer modules located in the yard near the fuel oil storage tanks. Local area heating and ventilation equipment is used to condition the air to the stairwell and security room.

Section 9.4 of the WLS COL FSAR, Revision 11, incorporates by reference, with no departures or supplements, Section 9.4.10, “Diesel Generator Building Heating and Ventilation System,” of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.[1] The NRC staff’s review confirmed that there is no outstanding issue related to this section. The results of the NRC staff’s technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

9.4.11 Health Physics and Hot Machine Shop HVAC System

The health physics and hot machine shop HVAC system serves the annex building stairwell, S02; the personnel decontamination area, frisking and monitoring facilities, containment access corridor, and health physics facilities on the 100′-0″ elevation of the annex building and the hot machine shop on the 107′-2″ elevation of the annex building.

Section 9.4 of the WLS COL FSAR, Revision 11, incorporates by reference, with no departures or supplements, Section 9.4.11, “Health Physics and Hot Machine Shop HVAC System,” of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.[1] The NRC staff’s review confirmed that there is no outstanding issue related to this section. The results of the NRC staff’s technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

9.5 Other Auxiliary Systems

9.5.1 Fire Protection System (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.5.1, Fire Protection Program)

9.5.1.1 *Introduction*

The FPS provides assurance, through a defense-in-depth philosophy, that the Commission's fire protection objectives are satisfied. These objectives are: 1) to prevent fires from starting; 2) to detect rapidly, control, and extinguish promptly those fires that do occur; and 3) to provide protection for SSCs important to safety so that a fire that is not promptly extinguished by the fire suppression activities will not prevent the safe shutdown of the plant. In addition, FPSs must be designed such that their failure or inadvertent operation does not adversely impact the ability of the SSCs important to safety to perform their safety functions. These objectives are stated in NUREG-0800, Section 9.5.1, "Fire Protection Program," and are identified as the Fire Protection Program goals and objectives in RG 1.189, "Fire Protection for Nuclear Power Plants."

9.5.1.2 *Summary of Application*

Section 9.5 of the WLS COL FSAR, Revision 11, incorporates by reference Section 9.5 of the AP1000 DCD, Revision 19. Section 9.5 of the AP1000 DCD includes Section 9.5.1.

In addition, in WLS COL FSAR Section 9.5.1, the applicant provided the following:

Departures

- WLS DEP 6.3-1

The applicant revised DCD Table 9.5.1-1, "AP1000 Fire Protection Program Compliance with BTP CMEB 9.5-1," Sheet 11 of 33, as new WLS COL FSAR Table 9.5.1-201, providing additional information about WLS DEP 6.3-1 related to quantifying the duration that the passive residual heat removal system heat exchanger can maintain safe shutdown conditions, changing the indefinite duration to greater than 14 days. This information, as well as related WLS DEP 6.3-1 information appearing in other chapters of the WLS COL FSAR, is reviewed in Section 21.1 of the SER.

- WLS DEP 18.8-1

The applicant provided this departure from the AP1000 DCD to address the relocation of the Operations Support Center (OSC). This departure is evaluated in this SER section and in Section 13.3 of this SER.

AP1000 COL Information Items

- STD COL 9.5-1 and STD COL 9.5-3

The applicant provided additional information in STD COL 9.5-1 and STD COL 9.5-3 to resolve COL Information Items 9.5-1 and 9.5-3 (COL Action Item 9.5.1-1(a) through 9.5.1-1(o)) by establishing the site-specific implementation of the fire protection program, including the organization, responsibility, qualification, and training for fire protection program personnel and fire brigade members in Section 9.5.1.8, “Fire Protection Program,” and in Appendix 9A of the WLS COL FSAR.

- STD COL 9.5-4

The applicant provided additional information in STD COL 9.5-4 to resolve COL Information Item 9.5-4 (COL Action Item 9.5.1-5) by establishing Table 9.5-201, “AP1000 Fire Protection Program Compliance with BTP CMEB 9.5-1,” and Table 9.5-202, “Exceptions to NFPA Standard Requirements,” of the WLS COL FSAR.

- STD COL 9.5-8

The applicant provided additional information in STD COL 9.5-8 to resolve COL Information Item 9.5-8 (COL Action Item 9.5.1-3) by establishing an administrative control procedure to address fire barrier breaches.

- STD COL 9.5-6

The applicant provided additional information in STD COL 9.5-6 to resolve COL Information Item 9.5-6 (COL Action Item 9.5.1-6) by specifying a preoperational testing program to verify field installed fire barriers are as tested, and to provide disposition for any deviation.

- WLS COL 9.5-2

The applicant provided additional information in WLS COL 9.5-2 to resolve COL Information Item 9.5-2 (COL Action Item 9.5.1-2) by providing site-specific fire hazard analysis of the yard areas and outlying buildings in WLS COL FSAR Appendix 9A, Section 9A.3.3.

Supplemental Information

- STD SUP 9.5-1

The applicant provided supplemental information in Section 9.5.1.2.1.3, “Fire Water Supply System,” by adding additional text to address the piping threads compatibility requirement between onsite hydrants, hose couplings, and standpipe risers and equipment used by the offsite fire department.

- WLS SUP 9.2-4

The applicant provided supplemental information in Section 9.5.1.2.1.3, “Fire Water Supply System,” by adding additional text to address the makeup water, which is provided to the fire water storage tanks by RWS as described in Section 9.2.11.

License Conditions

- Part 10, License Condition 3, Items C.2, D.1 and G.6

The applicant proposed a license condition in Part 10 of the WLS COL application addressing the Fire Protection Program implementation milestones.

- Part 10, License Condition 6

The applicant proposed a license condition in Part 10 of the WLS COL application to provide a schedule to support the NRC's inspection of operational programs, including the Fire Protection Program.

9.5.1.3 *Regulatory Basis*

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the FPS are given in Section 9.5.1 of NUREG-0800.

The regulatory basis and guidance documents for acceptance of STD COL 9.5-1, STD COL 9.5-3, STD COL 9.5-4, STD COL 9.5-6, STD COL 9.5-8, and WLS COL 9.5-2 includes the following:

- RG 1.189, "Fire Protection for Nuclear Power Plants"
- Branch Technical Position (BTP) CMEB 9.5-1, in NUREG-0800, Revision 3
- 10 CFR 50.48, "Fire Protection"

The regulatory guidance for acceptance of STD SUP 9.5-1 and WLS SUP 9.2-2 includes the following:

- RG 1.189

9.5.1.4 *Technical Evaluation*

The NRC staff reviewed Section 9.5.1 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the fire protection system. The results of the NRC staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5 to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.

- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the WLS COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the BLN Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced[2] from Section 9.5.1.4 of the VEGP SER:

> *<u>Supplemental Information</u>*
>
> - *STD SUP 9.5-1 provided supplemental information within Section 9.5.1.2.1.3, "Fire Water Supply System," addressing compatibility of piping threads with equipment used by the off-site fire department.*
>
> *The NRC staff reviewed the information on the compatibility of piping threads with off-site equipment included under Section 9.5.1.2.1.3 of the BLN COL, and determined that the applicant conforms to the guidance of RG 1.189. In accordance with the applicant's response to RAI 14.2-9, the requirement to verify fire equipment hose thread compatibility, or alternatively, an adequate supply of readily available thread adapters will be verified. This was added to the Initial Test Program outlined in Section 14.2 of the BLN COL FSAR.*
>
> *<u>AP1000 COL Information Items</u>*
>
> - *STD COL 9.5-1 (COL Action Item 9.5-1(a)), involving qualification requirements for the fire protection program*
>
> *The applicant provided additional information in STD COL 9.5-1 to resolve COL Information Item 9.5-1. COL Information Item 9.5-1 states:*
>
> > *The Combined License applicant will address qualification requirements for individuals responsible for development of the*

[2] Only the BLN SER text relevant to WLS is reproduced here. For example, the BLN SER included a discussion of BLN SUP 9.5-2 after the discussion of STD SUP 9.5-1. Since BLN SUP 9.5-2 does not apply to WLS, it was not reproduced here. Also, the discussion of WLS COL 9.5-2 (corresponds to BLN COL 9.5-2) was moved to the end of this technical evaluation section.

> *fire protection program, training of firefighting personnel, administrative procedures and controls governing the fire protection program during plant operation, and fire protection system maintenance.*

The commitment was also captured as COL Action Item 9.5-1(a) in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:

> *The COL applicant will establish a fire protection program at the facility for the protection of structures, systems, and components (SSCs) important to safety. The COL applicant will also establish the procedures, equipment, and personnel needed to implement the program.*

The NRC staff reviewed the resolution to STD COL 9.5-1 on the qualification requirements for the Fire Protection Program included under Section 9.5.1.6, Section 9.5.1.8, and Section 9.5.1.9 of the BLN COL application, and determined that the above sections provided adequate details to ensure conformance with the regulatory positions contained in RG 1.189 regarding the implementation of the BLN Fire Protection Program. Such details include personnel qualifications and training, organization and responsibilities, fire brigade training, etc.

- *STD COL 9.5-4 (COL Action Item 9.5.1-5), involving NFPA exceptions*

The applicant provided additional information in STD COL 9.5-4 to resolve COL Information Item 9.5-4. COL Information Item 9.5-4 states:

> *The Combined License applicant will address updating the list of NFPA exceptions in the plant-specific DCD, if necessary.*

The commitment was also captured as COL Action Item 9.5.1-5 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:

> *The COL applicant is responsible for ensuring that any deviations from the applicable National Fire Protection Association (NFPA) codes and standards in addition to those in the DCD are incorporated into the final safety analysis report (FSAR) with appropriate technical justification.*

The NRC staff reviewed the resolution to STD COL 9.5-4 under Section 9.5.1.8.1.1 and Section 9.5.1.9.4 of the BLN COL. The applicant provided for BLN COL FSAR Table 9.5-202, Exceptions to NFPA Standard Requirement, to document and justify deviations from applicable NFPA codes and standards in addition to those identified in the DCD. This provision satisfies FSER Action Item 9.5.1-5. The staff also reviewed the exception to NFPA 804 related to the intake structure as documented in Table 9.5-202 although NFPA 804 is not formally endorsed by the NRC as a regulatory guidance document. Since the exception and the provided justification are consistent with the *guidance of RG 1.189, the staff finds it acceptable. Based on the above, the staff concludes that FSER Action Item 9.5.1-5 is resolved.*

- *STD COL 9.5-8 (COL Action Item 9.5.1-3), establishing procedures to minimize risk for fire areas breached during maintenance*

The applicant provided additional information in STD COL 9.5-8 to resolve COL Information Item 9.5-7. COL Information Item 9.5-7 states:

> *The Combined License applicant will establish procedures to minimize risk when fire areas are breached during maintenance. These procedures will address a fire watch for fire areas breached during maintenance.*

The commitment was also captured as COL Action Item 9.5.1-3 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:

> *The COL applicant will establish procedures to address a fire watch for fire areas breached during maintenance.*

The NRC staff reviewed the resolution to STD COL 9.5-8 on the establishment of procedures to minimize risk for fire areas breached during maintenance included under Section 9.5.1.8.1.2 and Section 9.5.1.9.7 of the BLN COL, and determined that the applicant has adequately included a provision to have procedures and administrative controls in place, including fire watches, when fire barriers are breached.

- *STD COL 9.5-6 (COL Action Item 9.5.1-6), involving verification of field installed fire barriers, also designated as a COL information item*

The applicant provided additional information in STD COL 9.5-6 to resolve COL Information Item 9.5-6. COL Information Item 9.5-6 states:

> *The Combined License applicant will address the process for identifying deviations between the as-built installation of fire barriers and their tested configurations.*

The commitment was also captured as COL Action Item 9.5.1-6 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:

> *The COL applicant will establish the process for identifying deviations between the as-built installation of fire barriers and their tested configurations.*

The NRC staff reviewed the resolution to STD COL 9.5-6 under Section 9.5.1.8.6 and Section 9.5.1.9.6. The applicant provided that new installation or modification of fire barriers not part of the AP1000 DCD will be controlled through administrative procedures. These procedures impose inspection and testing requirements to ensure that the as-built fire barrier configurations match tested *configurations. These procedures also describe the process for identifying and dispositioning deviations. Based on the above, the staff concluded that FSER Action Item 9.5.1-6 is resolved.*

- *STD COL 9.5-3 (COL Action Items 9.5.1-1(b) through 9.5.1-1(o)), addressing regulatory conformance*

The applicant provided additional information in STD COL 9.5-3 to resolve COL Information Item 9.5-3. COL Information Item 9.5-3 states:

> *The Combined License applicant will address BTP CMEB 9.5-1 issues. The acronym 'WA' is the identifier in Table 9.5.1-1 for "will address."*

The commitment was also captured as COL Action Items 9.5.1-1(b) through 9.5.1-1(o) in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:

> *9.5.1-1(b) – The COL applicant will implement the fire protection program prior to receiving fuel onsite for fuel storage areas, and for the entire unit prior to reactor startup.*
>
> *9.5.1-1(c) – The COL applicant will establish administrative controls to maintain the performance of the fire protection system and personnel.*
>
> *9.5.1-1(d) – The COL applicant will establish a site fire brigade that is trained and equipped for fire fighting to ensure adequate manual fire fighting capability for all plant areas containing SSCs important to safety.*
>
> *9.5.1-1(e) – The COL applicant will establish a quality assurance (QA) program to ensure that the guidelines for the design, procurement, installation, and testing, as well as the administrative controls for fire protection systems are satisfied.*
>
> *9.5.1-1(f) – The COL applicant is responsible for the inspection and maintenance of fire doors, access to keys for the fire brigade, and the marking of exit routes.*
>
> *9.5.1-1(g) – The COL applicant is responsible for the collection and sampling of water drainage from areas that may contain radioactivity.*
>
> *9.5.1-1(h) – The COL applicant is responsible for controlling the use of compressed gases inside structures.*
>
> *9.5.1-1(i) – The COL applicant is responsible for the use of portable radio communication by the plant fire brigade.*

9.5.1-1(j) – The COL applicant is responsible for fire protection inside containment during refueling and maintenance.

9.5.1-1(k) – The COL applicant is responsible for controlling combustible materials in the remote shutdown workstation.

9.5.1-1(l) – The COL applicant is responsible for fire protection for cooling towers.

9.5.1-1(m) – The COL applicant is responsible for the proper storage of welding gas cylinders.

9.5.1-1(n) – The COL applicant is responsible for the proper storage of ion exchange resins.

9.5.1-1(o) – The COL applicant is responsible for the proper storage of hazardous chemicals.

The NRC staff reviewed the resolution to STD COL 9.5-3 provided in Section 9.5.1.8, Fire Protection Program, and Table 9.5-201 of the BLN COL application. The staff determined that the applicant has incorporated the appropriate portions of RG 1.189 into the BLN Fire Protection Program, pending some changes to be included in Revision 2 to the BLN COL FSAR. The applicant provided the following clarifications related to the BLN Fire Protection Program:

(1) The applicant confirmed that no operator manual actions outside of the Main Control Room are credited or required for post-fire safe shutdown.

(2) The applicant stated that the wireless telephone system is credited as the portable communication system used by the fire brigade. In the applicant's response to RAI 9.5.1-12, the wireless telephone system was confirmed to be designed with multiple antennas (repeaters) throughout the plant to maintain communication capability if individual repeater(s) are damaged from fire. Also, preoperational and periodic testing during fire drills will be performed to verify that the fire brigade portable communication system operates without excessive interference at different locations inside and outside the plant.

(3) In its response to RAI 9.5.1-9, the applicant stated that a housekeeping program is provided in order to maintain cleanliness and minimize fire hazards in the Main Control Room areas.

(4) In its response to RAI 9.5.1-14, the applicant stated that no probabilistic risk assessment (PRA) or fire modeling results will be credited to demonstrate acceptable fire hazards or post-fire safe shutdown capability for specific fire areas or scenarios.

(5) In its response to RAI 9.5.1-15, the applicant confirmed that the supply of reserve air is sufficient to provide at least 6 hours of additional breathing air for "each" of the 10 self-contained breathing apparatus (SCBA) units.

(6) In its response to RAI 9.5.1-16, the applicant proposed a change to BLN COL FSAR Section 9.5.1.8.6 to clarify that testing and inspection of fire protection systems are to be performed per NFPA 25 and NFPA 72 as appropriate. This is ***Confirmatory Item 9.5-1****.*

(7) In its response to RAI 9.5.1-17, the applicant confirmed that the design pressure of the High Pressure Air Subsystem that is used to recharge fire brigade's SCBAs is 4000 psig, and that 2216 psig SCBAs are used to ensure that the cylinders are adequately charged to provide an operating life of at least 30 minutes.

License Conditions

- *License Condition 3, addressing the Fire Protection Program implementation milestones*
- *License Condition 6, addressing the Fire Protection Program implementation schedule*

In Part 10 of the BLN COL FSAR, License Condition 3, "Operational Program Implementation," the applicant proposed a license condition for the implementation of operational programs as described in Table 13.4-201 of the FSAR. This license condition included implementation milestones for the Fire Protection Program, namely D.1 and G.6. Specifically:

- *Milestone D.1 states that the applicable portions of the Fire Protection Program will be implemented prior to initial receipt of fuel onsite.*
- *Milestone G.6 states that the Fire Protection Program will be implemented prior to initial fuel load.*

In Part 10 of the BLN COL FSAR, proposed License Condition 6, "Operational Program Readiness," the applicant states:

> *The licensee shall submit to the appropriate Director of the NRC, a schedule, no later than 12 months after issuance of the COL, that supports planning for and conduct of the NRC inspection of the operational programs listed in the operation program FSAR Table 13.4-201. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until either the operation programs in the FSAR table have been fully implemented or the plant has been placed in commercial service.*

Based on the above, the staff concludes that the applicant satisfied the documentation and implementation requirements for the Fire Protection Program in accordance with RG 1.189 by identifying and providing the implementation schedule for each of the operational program aspects of the Fire Protection Program.

<u>Correction of Error in the Standard Content Evaluation Text</u>

The NRC staff identified an error in the text reproduced above from Section 9.5.1.4 of the BLN SER that requires correction. The BLN SER includes the following statement: "The applicant provided additional information in STD COL 9.5-8 to resolve COL Information Item 9.5-7. COL Information Item 9.5-7 states:" The reference to COL Information Item 9.5-7 should be to COL Information Item 9.5-8.

<u>Resolution of Standard Content Confirmatory Item 9.5-1</u>

To resolve Confirmatory Item 9.5-1, the VEGP applicant revised FSAR Section 9.5.1.8.6 to clarify that procedures governing the inspection, testing, and maintenance of fire protection alarm and detection systems, and water-based suppression and supply systems, use the guidance of NFPA 72, "National Fire Alarm and Signaling Code," and NFPA 25, "Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems," as appropriate. NFPA 25 standard is also added to VEGP COL FSAR Section 9.5.5. The staff determined that these documentation changes satisfy the requirement of standard content Confirmatory Item 9.5-1; therefore Confirmatory Item 9.5-1 is resolved.

<u>Proposed License Condition 3, Item C.2</u>

The VEGP applicant proposed to add another implementation milestone associated with the Fire Protection System to License Condition 3. Specifically, the applicant added Milestone C.2, which states that the applicable portions of the Fire Protection Program will be implemented prior to initial receipt of byproduct, source, or special nuclear materials onsite (excluding Exempt Quantities as described in 10 CFR 30.18). The staff concludes that the applicant satisfied the documentation and implementation requirements for the Fire Protection Program in accordance with RG 1.189 by identifying and providing the implementation schedule for each of the operational program aspects of the Fire Protection Program.

- WLS SUP 9.2-4

The applicant provided supplemental information in Section 9.5.1.2.1.3, "Fire Water Supply System," by adding additional text to address the makeup water, which is provided to the fire water storage tanks by RWS as described in Section 9.2.11.

The applicant stated that the makeup water is filtered, treated, and monitored in the clarification process to prevent or control biofouling or microbiologically induced corrosion. The NRC Staff reviewed the information provided under Section 9.5.1.2.1.3 of the WLS COL regarding the sampling and chemical treatment of the fire water as needed and determined that the applicant conforms to the guidance of RG 1.189.

AP1000 COL Information Items

- WLS COL 9.5-2

The applicant provided additional information in WLS COL 9.5-2 to resolve COL Information Item 9.5-2. COL Information Item 9.5-2 states:

> The Combined License applicant will provide site-specific fire protection analysis information for the yard area, the administration building, and for other outlying buildings consistent with Appendix 9A.

The commitment was also captured as COL Action Item 9.5.1-2 in Appendix F of NUREG-1793, which states:

> The COL applicant will provide site-specific fire protection analysis information for the yard area, the administration building, and other outlying buildings.

The NRC staff reviewed the resolution to WLS COL 9.5-2 on the site-specific fire protection analysis information included under Section 9.5.1.9.2 and Section 9A.3.3 of the WLS COL FSAR, and determined that the yard area, administration building and other outlying areas are adequately described in accordance with RG 1.189 in the fire hazard analysis, which is, therefore, acceptable.

Resolution of VCS DEP 18.8-1

The AP1000 Annex Building does not contain any system or equipment credited for achieving and maintaining post-fire safe shutdown. As such, the relocation of the OSC in the Annex Building as prescribed in WLS DEP 18.8-1 has no adverse impact on the post-fire safe shutdown capability. Therefore, the staff concludes that the proposed departure, relative to post-fire safe shutdown capability, is acceptable.

Resolution of Site-Specific RAIs

In addition to the review of the standard content, the staff also reviewed WLS site-specific content and issued five site-specific RAIs.

In its response to site-specific RAI 9.5.1-1 related to the applicant specifically identifying the engineer in charge of fire protection as responsible for the fire brigade organization, the applicant revised FSAR Section 13.1.2.1.2.9 to state that the engineer in charge of fire protection is responsible for the fire brigade organization. Based on the above, the staff finds that this meets the guidance of RG 1.189 and, therefore, is acceptable.

In its response to site-specific RAI 9.5.1-2 related to the organizational responsibility and lines of communication needed for a successful fire protection program the applicant revised FSAR sections 13.1.1.2.10 and 13.1.1.3.2.2.3 to reflect that the engineer in charge of fire protection and the functional manager of emergency preparedness coordinate and communicate with each other to fulfill their individual fire protection related responsibilities. Based on the above, the staff finds the description of the lines of communications is in accordance with RG 1.189 and, therefore, is acceptable.

In its response to site-specific RAI 9.5.1-3 related to the qualifications of personnel in charge of the fire brigade drills the applicant revised FSAR section 13.1.1.2.10 to state that fire protection trainers are qualified to perform classroom instruction or practical training. Based on the above, the staff finds that this meets the guidance of RG1.189 and, therefore, is acceptable.

In its response to site-specific RAI 9.5.1-4 related to the filtering and treatment of fire water supplies to prevent or control biofouling or microbiologically induced corrosion of the fire water system the applicant revised FSAR Section 9.5.1.2.3 to add WLS SUP 9.2-2 to clarify how fire protection system makeup water quality is monitored and maintained. Additionally, the applicant stated that administrative controls will ensure that the makeup water supply to the fire water storage tanks will be monitored and treated such that the appropriate standards are maintained to prevent or control microbiologically induced corrosion which meets the guidance of RG 1.189. Based on the above, the staff finds that this meets the guidance of RG1.189 and, therefore, is acceptable.

In its response to site-specific RAI 9.5.1-5 related to the qualifications of the engineer in charge of fire protection, the applicant revised FSAR Section 13.1.2.1.2.9 to state that the engineer in charge of fire protection is trained and experienced in nuclear safety or has available personnel who are trained and experienced in nuclear plant safety. Based on the above, the staff finds that this meets the guidance of RG1.189 and, therefore, is acceptable.

9.5.1.5 *Post Combined License Activities*

The license condition language in this section has been clarified from previously considered language. In a letter dated March 22, 2016 (ADAMS Accession No. ML16084A099), the applicant did not identify any concerns with the clarified license condition language. The changes do not affect the staff's above analysis of the conditions, and therefore, for the reasons discussed in the technical evaluation section above, the staff finds the following license conditions acceptable:

- License Condition (9-2) – The licensee shall implement the Fire Protection Program or applicable portions thereof as described in the milestones below:
    1. The fire protection measures in accordance with Regulatory Guide (RG) 1.189 for designated storage building areas (including adjacent fire areas that could affect the storage area) implemented before initial receipt of byproduct or special nuclear materials that are not fuel (excluding exempt quantities as described in 10 CFR 30.18);
    2. The fire protection measures in accordance with RG 1.189 for areas containing new fuel (including adjacent areas where a fire could affect the new fuel) implemented before receipt of fuel onsite;
    3. All fire protection program features implemented before initial fuel load;

- License Condition (9-3) – No later than 12 months after issuance of the COL, the licensee shall submit to the Director of the NRO a schedule that supports planning for and conduct of NRC inspections of the FP Program. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until the FP Program has been fully implemented.

9.5.1.6 *Conclusion*

The NRC staff reviewed the application and checked the referenced DCD. The NRC staff's review confirmed that the applicant addressed the required information relating to the fire protection system, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the WLS COL FSAR is acceptable and meets the guidance in Section 9.5.1 of NUREG-0800 and RG 1.189. The staff based its conclusion on the following:

- WLS DEP 6.3-1, related to quantifying the duration that the passive residual heat removal system heat exchanger can maintain safe shutdown conditions, is reviewed and found acceptable by the staff in Section 21.1 of this SER.

- STD SUP 9.5-1, addressing compatibility of piping threads with equipment used by the offsite fire department is adequately addressed by the applicant and is resolved.

- STD COL 9.5-1, addressing the qualification and training requirements for the fire protection program at WLS is adequately addressed by the applicant and is resolved.

- STD COL 9.5-4, addressing the deviations from the applicable NFPA codes and standards and to those in the AP1000 DCD is also adequately addressed by the applicant and is resolved.

- STD COL 9.5-6, addressing the establishment of a process for identifying deviations between the as-built installation of fire barriers and their tested configurations is adequately addressed by the applicant and is resolved.

- STD COL 9.5-8, addressing establishment of procedures to minimize risk for fire areas breached during maintenance is adequately addressed by the applicant and is resolved.

- STD COL 9.5-3, addressing the site-specific implementation of the Fire Protection Program is adequately addressed by the applicant and is resolved.

- WLS COL 9.5-2, addressing the site-specific fire protection analysis information for the WLS yard areas and outlying buildings is adequately addressed by the applicant and is resolved.

- WLS DEP 18.8-1, addressing the relocation of the OSC relative to the post-fire safe shutdown capability, is adequately addressed by the applicant and is resolved.

- WLS SUP 9.2-4, addressing the makeup water, which is provided to the fire water storage tanks by RWS, is adequately addressed by the applicant and is resolved.

9.5.2 Communication System

9.5.2.1 *Introduction*

The communication system provides intra-plant communications and plant-to-offsite communications during normal, maintenance, transient, fire, and accident conditions, including loss of offsite power.

9.5.2.2 *Summary of Application*

Section 9.5 of the WLS COL FSAR, Revision 11, incorporates by reference Section 9.5 of the AP1000 DCD, Revision 19. Section 9.5 of the DCD includes Section 9.5.2.

In addition, in WLS COL FSAR Section 9.5.2, the applicant provided the following:

AP1000 COL Information Items

- WLS COL 9.5-9, involving offsite interfaces

The applicant provided additional information in WLS COL 9.5-9 to resolve COL Information Item 9.5-9 (COL Action Item 9.5.2-3).

- WLS COL 9.5-10, involving emergency offsite communications

The applicant provided additional information in WLS COL 9.5-10 to resolve COL Information Item 9.5-10 (COL Action Item 9.5.2-1).

- STD COL 9.5-11, involving security communications

The applicant provided additional information in STD COL 9.5-11 to resolve COL Information Item 9.5-11 (COL Action Item 9.5.2-2).

9.5.2.3 *Regulatory Basis*

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the communications system are given in Section 9.5.2 of NUREG-0800.

The regulatory basis for WLS COL 9.5-9, addressing interfaces to offsite locations, is based on:

- Appendix E to 10 CFR Part 50, Part IV.E(9), “Emergency Planning and Preparedness for Production and Utilization Facilities”

The regulatory basis for WLS COL 9.5-10, addressing the emergency offsite communication system, including the crisis management radio system, is based on:

- 10 CFR 50.47(b)(8), “Emergency plans”

The regulatory basis for STD COL 9.5-11, addressing the description of the security communication system is based on:

- 10 CFR 73.45(g)(4)(i), “Performance capabilities for fixed site physical protection systems”
- 10 CFR 73.46(f), “Fixed site physical protection systems, subsystems, components, and procedures”
- 10 CFR 73.55(e), “Requirements for physical protection of licensed activities in nuclear power reactors against radiological sabotage”
- 10 CFR 73.55(f) “Requirements for Physical Protection of Licensed Activities in Nuclear Power Reactors Against Radiological Sabotage”

9.5.2.4 *Technical Evaluation*

The NRC staff reviewed Section 9.5.2 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The NRC staff’s review confirmed that the information in the application and incorporated by reference addresses the required information relating to the communications system. The results of the NRC staff’s evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

In addition, in WLS COL FSAR Section 9.5.2, the applicant provided the following:

<u>*AP1000 COL Information Items*</u>

- WLS COL 9.5-9 (COL Action Item 9.5.2-3) Involving Offsite Interfaces

The applicant provided additional information in WLS COL 9.5-9 to resolve COL Information Item 9.5-9. COL Information Item 9.5-9 states:

> Combined License applicants referencing the AP1000 certified design will address interfaces to required offsite locations; this will include addressing the recommendations of BL-80-15 ([DCD] Reference 21) regarding loss of the emergency notification system due to a loss of offsite power.

The commitment was also captured as COL Action Item 9.5.2-3 in Appendix F of NUREG-1793, which states:

> The COL applicant will address interfaces to offsite locations; this will include addressing the recommendations of NRC Bulletin (BL) 80-15 regarding loss of the emergency notification system as a result of loss of offsite power.

The staff reviewed the resolution to the Lee COL Item 9.5-9 involving offsite interfaces included under Section 9.5.2.2.3.1 and Section 9.5.2.5.1 of the WLS COL FSAR. Section 9.5.2.2.3.1 of the WLS COL FSAR states that the primary means of communication between the station and the NRC is the Emergency Telephone System (ETS). The ETS provides a reliable communication link to the NRC Operations Center. The ETS provides voice and data communication between the station and the NRC headquarters. Calls using the ETS phones are connected directly to Duke's long distance provider over Duke's private, fiber-optic network. Onsite systems supporting the ETS phones are provided with diverse alternate or backup power sources with automatic transfer capability to maintain continuity of communication in the event the normal power source is lost. This aspect of the design is based on the applicant's stated adherence to the guidance provided by NRC Bulletin 80-15 in the FSAR.

In the event of an emergency at the station, notification and activation of the state, local and corporate emergency response network is established. This network requires communication interfaces between the station and the following offsite agencies:

- North Carolina State Emergency Operations Center
- South Carolina Warning Point
- Cherokee County Warning Point
- Cleveland County Warning Point
- York County Warning Point
- Duke Energy Emergency Operating Facility (EOF)

The applicant stated that the primary means of communication between the station and these offsite agencies is the Selective Signal System using Duke telecommunication interfaces to dedicated private lines leased from local telephone companies. The design of the selective signaling system utilizes exiting corporate telecommunications equipment so as to avoid calls being routed through the local telephone company switch. Onsite systems supporting the selective signaling system are provided with sufficient alternate or backup power sources having automatic transfer capability to maintain continuity of communication in the event the normal power source is lost, based upon guidance provided by NRC Bulletin 80-15. The secondary means of communication between the station and various offsite local, state and corporate agencies is provided by commercial telephone lines. The station radio system provides another alternative means of communication between the station and offsite agencies. Communications between the station and offsite radiological monitoring teams is by the radio system as well. The site radio system is powered by non-essential AC sources with built-in battery backups. As an alternative to ground-based communications, in the event of a natural disaster the Lee Station also maintains a satellite phone system. This phone system is portable, self-contained, and intended for use with communications with the NRC.

Appendix E to 10 CFR Part 50, Part IV.E (9) requires at least one onsite and one offsite communications system; each system shall have a backup power source. In addition, NRC Bulletin 80-15 states that the applicant should provide backup power sources for the ENS in case of loss-of-offsite power. With the design of the ETS, Selective Signaling System and radio system the applicant provided adequate means for onsite and offsite communications. In addition, the applicant states that the guidance of NRC Bulletin 80-15 regarding the backup power supplies has been incorporated into the design of the primary and backup power supplies for both onsite and offsite communications, which the staff finds acceptable. The applicant demonstrated sufficient means for onsite and offsite communications, with adequate backup power sources, to meet the requirements of Appendix E to 10 CFR Part 50, Part IV.E(9). Therefore, the staff concludes that COL Action Item 9.5.2-3 has been adequately addressed.

9.5.2.4.2 WLS COL Item 9.5-10 (COL Action Item 9.5.2-1) Involving Emergency Offsite Communications

The applicant provided additional information in WLS COL Item 9.5-10 to resolve COL Information Item 9.5-10. COL Information Item 9.5-10 states:

> "The emergency offsite communication system, including the crisis management radio system, will be addressed by the Combined License applicant."

The commitment was also captured as COL Action Item 9.5.2-1 in Appendix F of the NRC staff's FSER for the AP1000 FSAR (NUREG-1793), which states:

> "The COL applicant will provide a description of the emergency offsite communication system, including the crisis management radio system."

The staff reviewed the resolution to the Lee COL Item 9.5-10 on the emergency offsite communications included under Sections 9.5.2.2.3.2.1, 9.5.2.2.3.2.2, and 9.5.2.5.2 of the WLS FSAR. The ETS is the primary voice and data communication from the main control rooms and Technical Support Center (TSC) to the NRC. The minimum communications links provided for the primary onsite communication center include connections to the NRC ENS, the NRC Health Physics Network (HPN), the emergency response data system (ERDS), and dedicated phone lines for use by NRC personnel for dialing onsite and offsite locations. These dedicated phone lines include:

- Reactor safety counterpart link (RSCL),
- Protective measure counterpart link (PMCL)
- Management counterpart link (MCL)
- Operational center link (OCL)

The dedicated telephones in the ETS use Duke Energy fiber-optic lines to public long distance lines. The secondary means of communication between the station and the NRC are commercial telephone company lines. Sufficient backup or alternate power sources are provided with automatic transfer capability. The primary means of communication between the station and offsite agencies listed in Section 9.5.2.4.1 of this safety evaluation for emergency communication is the Selective Signaling System using private lease lines. The design utilizes existing corporate telecommunications equipment to complete calls without having to go through a local telephone company switch. Sufficient backup or alternate power sources are provided with automatic transfer capability. The secondary means for communication to these offsite agencies are commercial telephone lines.

FSAR Section 9.5.2.2.3.2.2 states that the plant radio system is also provided either through the Duke radio network or the local radio network provided by each offsite emergency agency.

Communication between the station, offsite radiological teams and the EOF can is provided by the radio system. 10 CFR 50.47(b)(8) requires that adequate emergency facilities and equipment to support the emergency response be provided and maintained. The staff finds the offsite communications systems described above and in Section 9.5.2.4.1 of this evaluation are adequate in providing emergency communications equipment and facilities and thus meet the requirements of 10 CFR 50.47(b)(8). The staff finds that the backup radio system adequately serves as the crisis management radio system, and thus the staff concludes that the COL Action Item 9.5.2-1 has been adequately addressed.

- STD COL 9.5-11 (COL Action Item 9.5.2-2) Involving Security Communications

The applicant provided additional information in STD COL 9.5-11 to resolve COL Information Item 9.5-11. COL Information Item 9.5-11 states:

> Specific details for the security communication system are as discussed in separate security documents referred to in Section 13.6.

The commitment was also captured as COL Action Item 9.5.2-2 in Appendix F of NUREG-1793, which states:

> The COL applicant will provide a description of the security communication system.

The staff's review of STD COL 9.5-11 related to security communications is documented in Section 13.6 of this SER.

9.5.2.5 *Post Combined License Activities*

There are no post-COL activities related to this section.

9.5.2.6 *Conclusion*

The NRC staff reviewed the application and checked the referenced DCD. The NRC staff’s review confirmed that the applicant addressed the required information relating to the communication system, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the NRC staff’s technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the WLS COL FSAR is acceptable and meets the guidelines given in Section 9.5.2 of NUREG-0800. The staff based its conclusion on the following:

- WLS COL 9.5-9 has been adequately addressed by the applicant in that the onsite and offsite communications interfaces meet the communications requirements of 10 CFR Part 50, Appendix E, Section IV.E(9). In addition, the staff finds the emergency diesel generator capable of providing backup power for the emergency notification system in case of loss of offsite power, and thus meets the guidance in NRC Bulletin 80-15.

- WLS COL 9.5-10 has been adequately addressed by the applicant in that the WLS emergency offsite communications system is capable of providing for notification of personnel and implementation of evacuation procedures in case of emergency and meets the requirements of 10 CFR 50.47(b)(8).

- STD COL 9.5-11, which involves security communications, is documented in Section 13.6 of this SER.

9.5.3 Plant Lighting System (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.5.3, "Lighting Systems")

The plant lighting system provides normal, emergency, panel, and security lighting. The normal lighting provides normal illumination during plant operating, maintenance, and test conditions. The emergency lighting provides illumination in areas where emergency operations are performed upon loss of normal lighting. The panel and security lighting is designed to provide the minimum illumination required.

Section 9.5 of the WLS COL FSAR, Revision 11, incorporates by reference, with no departures or supplements, Section 9.5.3, "Plant Lighting System," of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.[1] The NRC staff's review confirmed that there is no outstanding issue related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

9.5.4 Diesel Generator Fuel Oil System (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.5.4, "Diesel Generator Fuel Oil Storage and Transfer System)

9.5.4.1 *Introduction*

The standby diesel generator fuel oil system maintains the fuel oil system for the diesel engines that provide backup onsite power. This system includes all piping up to the connection to the engine interface, fuel oil storage tanks, fuel oil transfer pumps, day tanks, and the tank storage vaults.

9.5.4.2 *Summary of Application*

Section 9.5 of the WLS COL FSAR, Revision 11, incorporates by reference Section 9.5 of the AP1000 DCD, Revision 19. Section 9.5 of the AP1000 DCD includes Section 9.5.4.

In addition, in WLS COL FSAR Section 9.5.4.5.2, the applicant provided the following:

<u>*AP1000 COL Information Item*</u>

- STD COL 9.5-13

The applicant provided additional information in STD COL 9.5-13 to resolve fuel oil sampling and testing to protect against degradation.

9.5.4.3 *Regulatory Basis*

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the diesel generator fuel oil system are given in Section 9.5.4 of NUREG-0800.

9.5.4.4 *Technical Evaluation*

The NRC staff reviewed Section 9.5.4 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the diesel generator fuel oil system. The results of the NRC staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside of the scope of the DC and use this review in evaluating subsequent COL applications. To ensure the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5 to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.
- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the WLS COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the BLN Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from Section 9.5.4.4 of the VEGP SER:

> *<u>AP1000 COL Information Item</u>*
>
> - *STD COL 9.5-13*
>
> *The applicant provided additional information in STD COL 9.5-13 to resolve COL Information Item 9.5-13. COL Information Item 9.5-13 states:*
>
> > *Address the diesel fuel specifications grade and the fuel properties consistent with manufacturers' recommendations and the measures to protect against fuel degradation by a program of fuel sampling and testing.*
>
> *The commitment was also captured as COL Action Item 9.5.9-2 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:*
>
> > *The COL applicant will develop site-specific factors in the fuel oil storage tank installation specification to reduce the effects of sun heat input into the stored fuel, as well as the diesel fuel specifications grade and fuel properties consistent with manufacturers' recommendations, and will develop a program of fuel sampling and testing to protect against fuel degradation.*
>
> *Revision 17 of the DCD addressed the requirement for limiting heat input by specifying a white epoxy-urethane coating system. Therefore, this information is no longer required from COL applicants.*
>
> *The COL information in Revision 0 of the applicant's FSAR added Section 9.5.4.5.2, "Fuel Oil Quality." The new section addressed fuel quality as follows:*
>
> > *High fuel oil quality is provided by specification of the required grade and properties of the fuel oil for procurement, by testing of samples of new fuel oil prior to addition into the tanks, and by monitoring the fuel oil for contamination and degradation with periodic testing of samples from the storage tanks in accordance with manufacturer's recommendations.*
> >
> > *The fuel oil storage tanks are inspected at least once per 92 days to check for and remove accumulated water.*
> >
> > *The fuel oil quality is verified by sampling and testing from the storage tanks at least once per 92 days. New fuel oil is tested prior to its addition to the storage tanks to verify that the sample meets the following minimum requirements:*
> >
> > - *Water and sediment content of less than or equal to 0.05 volume percent.*

- *Kinematic viscosity at 40°C of greater than or equal to 1.0 mm2/s (1.9 centistokes), but less than or equal to 4.1 mm2/s (4.1 centistokes).*

- *Specific gravity as specified by the manufacturer at 16/16°C (60/60°F), or an API [American Petroleum Institute] gravity at 16°C (60°F), within limits established in accordance with manufacturer's recommendations.*

- *Tested impurity level of less than 2 mg of insolubles per 100 ml. The analysis is completed within 7 days after obtaining the sample, but may be performed after the addition of new oil.*

As a result of the staff's review of BLN COL FSAR Section 9.5.4.5.2, the staff identified two questions that were submitted to the applicant in RAIs.

In RAI 9.5.4-1(a), the staff requested that the applicant identify the controls in place to ensure the fuel oil quality program is implemented according to BLN COL FSAR Section 9.5.4.5.2. In response, the applicant stated that implementation of the fuel oil program according to the FSAR is ensured by the Quality Assurance Program Description (QAPD) described in Chapter 17 and Part 11 of the COL application. The applicant stated QAPD Part III, Section 1, contains quality controls for non-safety-related SSCs that would require and verify implementation of the fuel oil program based on the FSAR description. The staff reviewed the information provided and concludes the proposed quality control requirements can ensure implementation of the fuel oil program in accordance with the BLN COL FSAR.

In RAI 9.5.4-1(b), the staff requested that the applicant provide quality requirements for the periodic testing of stored fuel oil. Section 9.5.4.5.2 of the BLN COL stated that diesel fuel oil from the storage tanks is sampled and tested, but no requirements were listed. The application listed quality requirements that appeared to apply only to new fuel oil. In its response, the applicant proposed the following revised BLN COL FSAR Section 9.5.4.5.2:

> *The diesel fuel oil testing program requires testing both new fuel oil and stored fuel oil. High fuel oil quality is provided by specifying the use of ASTM [American Society for Testing and Materials] Grade 2D fuel oil with a sulfur content as specified by the engine manufacturer.*
>
> *A fuel sample is analyzed prior to addition of ASTM Grade 2D fuel oil to the storage tanks. The sample moisture content and particulate or color is verified per ASTM 4176. In addition, kinetic [sic] viscosity is tested to be within the limits specified in Table 1 of ASTM D975. The remaining critical parameters per Table 1 of ASTM D975 are verified compliant within 7 days.*

> *Fuel oil quality is verified by sample every 92 days to meet ASTM Grade 2D fuel oil criteria. The addition of fuel stabilizers and other conditioners is based on sample results.*
>
> *The fuel oil storage tanks are inspected on a monthly basis for the presence of water. Any accumulated water is to be removed.*

The staff reviewed this revision and finds it acceptable because it addresses both the new and stored fuel oil and the requirements are the manufacturer's specifications and the same ASTM standards applied to safety-related diesel generators. The staff also confirmed that the revised fuel oil testing program was included as shown above in Revision 1 of the BLN COL FSAR.

Correction of Error in the Standard Content Evaluation Text

*The NRC staff identified an error in the text reproduced above from Section 9.5.4.4 of the BLN SER that requires correction. The BLN SER includes the following statement: "In addition, kinetic [sic] viscosity is tested to be within the limits specified in Table 1 of the ASTM D975." The world "kinetic" should read as "kinematic." The staff feels this was a typographical error on the applicant's part because Table 1 of ASTM D975, which is the appropriate reference, specifies "kinematic viscosity." Therefore, the staff concludes that STD COL 9.5-13 has been resolved pending incorporation of the proposed revision in the VEGP COL FSAR, which is being tracked as **Confirmatory Item 9.5-3**.*

Resolution of Standard Content Confirmatory Item 9.5-3

Confirmatory Item 9.5-3 is an applicant commitment to revise its FSAR Section 9.5.4.4 to correct a typographical error. The staff verified that the VEGP COL FSAR was appropriately revised. As a result, Confirmatory Item 9.5-3 is now closed.

9.5.4.5 *Post Combined License Activities*

There are no post-COL activities related to this section.

9.5.4.6 *Conclusion*

The NRC staff reviewed the application and checked the referenced DCD. The NRC staff's review confirmed that the applicant addressed the required information relating to the standby diesel generator fuel oil system, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the WLS COL FSAR revision 4 is acceptable and meets the guidelines given in Section 9.5.4 of NUREG-0800. The staff based its conclusion on the following:

- STD COL 9.5-13 has been adequately addressed by the applicant in that it ensures that the manufacturers' recommendations using industry standards are met and provides a fuel sampling and testing program to protect against fuel degradation.

9.5.5 Standby Diesel Generator Cooling Water System (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.5.5, "Diesel Generator Cooling Water System")

Section 9.5.5 of the WLS COL FSAR, Revision 11, incorporates by reference, with no departures or supplements, Section 9.5.5, "Standby Diesel Generator Cooling Water System," of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.[1] The NRC staff's review confirmed that there is no outstanding issue related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

9.5.6 Standby Diesel Generator Starting Air System (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.5.6, "Diesel Generator Starting System")

Section 9.5.6 of the WLS COL FSAR, Revision 11, incorporates by reference, with no departures or supplements, Section 9.5.6, "Standby Diesel Generator Starting Air System," of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.[1] The NRC staff's review confirmed that there is no outstanding issue related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

9.5.7 Standby Diesel Generator Lubrication System (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.5.7, "Diesel Generator Lubrication System")

Section 9.5.7 of the WLS COL FSAR, Revision 11, incorporates by reference, with no departures or supplements, Section 9.5.7, "Standby Diesel Generator Lubrication System," of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.[1] The NRC staff's review confirmed that there is no outstanding issue related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

9.5.8 Standby Diesel Generator Combustion Air Intake and Exhaust System (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.5.8, "Diesel Generator Combustion Air Intake and Exhaust System")

Section 9.5.8 of the WLS COL FSAR, Revision 11, incorporates by reference, with no departures or supplements, Section 9.5.8, "Standby Diesel Generator Combustion Air Intake and Exhaust System," of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.[1] The NRC staff's review confirmed that there is no outstanding issue related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

10.0 STEAM AND POWER CONVERSION

10.1 Summary Description

10.1.1 Introduction

The steam and power conversion (S&PC) system is designed to convert heat energy from the reactor coolant system via the two main steam generators (SGs) and to convert it to electrical power in the turbine-generator (T-G). The main condenser deaerates the condensate and transfers heat that is not used in the cycle to the circulating water system (CWS). The regenerative turbine cycle heats the feedwater, and the main feedwater system returns it to the SG. This section also addresses the materials selection, fabrication, and fracture toughness of the American Society of Mechanical Engineers (ASME) Code Section III, Class 2 and Class 3 pressure boundary components of the steam and feedwater systems and also discusses material issues identified through operating experience.

10.1.2 Summary of Application

Section 10.1 of the William States Lee III Nuclear Station (WLS) combined license (COL) Final Safety Analysis Report (FSAR), Revision 11, incorporates by reference Section 10.1 of the AP1000 Design Control Document (DCD), Revision 19.

In addition, in WLS COL FSAR Section 10.1.3, the applicant provided the following:

AP1000 COL Information Item

- Standard (STD) COL 10.1-1

The applicant provided additional information in STD COL 10.1-1 to address COL Information Item 10.1-1, providing information related to the monitoring of flow-accelerated corrosion (FAC).

License Condition

- Part 10, License Condition 6, Operational Program Readiness

The applicant proposed a license condition to provide a schedule to support the U.S. Nuclear Regulatory Commission's (NRC) inspection of operational programs including the FAC program.

10.1.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793, "Final Safety Evaluation Report [FSER] Related to Certification of the AP1000 Standard Design."

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the FAC program are given in Section 10.3.6 of NUREG-0800, "Standard Review Plan for the Review of Safety Analysis Reports for Nuclear Power Plants (LWR Edition)."

The applicable regulatory guidance for STD COL 10.1-1 is as follows:

- Generic Letter (GL) 89-08, "Erosion/Corrosion-Induced Pipe Wall Thinning"

The staff notes that request for additional information (RAI) numbering was based on NUREG-0800, Section 10.3.6. The evaluation is presented in this section because the applicant provided information in Section 10.1.3 of the WLS COL FSAR.

10.1.4 Technical Evaluation

The NRC staff reviewed Section 10.1 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the S&PC summary description. The results of the NRC staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this safety evaluation report (SER) provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the design certification (DC) and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (Vogtle Electric Generating Plant (VEGP), Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.

- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the WLS COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the Bellefonte Nuclear Plant (BLN), Units 3 and 4 COL application.

[1] See Section 1.2.2 for a discussion of the staff's review related to verification of the scope of information to be included in a COL application that references a design certification (DC).

The following portion of this technical evaluation section is reproduced from Section 10.1.4 of the VEGP SER:

<u>AP1000 COL Information Item</u>

- *STD COL 10.1-1*

The applicant also provided information (STD COL 10.1-1) in BLN COL FSAR Section 10.1.3.1 to address a COL information item as described in AP1000 DCD Section 10.1.3. BLN COL FSAR Section 10.1.3.1, "Erosion-Corrosion Monitoring," describes general attributes of the applicant's program for monitoring and managing degradation (e.g., thinning) of piping and components susceptible to FAC, sometimes called erosion-corrosion.

In AP1000 DCD Section 10.1.3, Westinghouse identified a COL information item on FAC monitoring. The COL information item identified the need for a COL applicant to address the preparation of a FAC monitoring program for carbon steel portions of the S&PC systems that contain water or wet steam in order to address the concerns identified in GL 89-08. Similarly, in the NRC staff's FSER (NUREG-1793), Section 10.3.2, the staff identified COL Action Item 10.3.2-1 for the COL applicant to develop a FAC monitoring program to address industry guidelines and the concerns identified in GL 89-08.

The staff reviewed the information provided by the applicant in Section 10.1.3.1 of the BLN COL FSAR (STD COL 10.1-1) addressing a monitoring program for FAC. The staff also reviewed additional information provided in letters dated June 27, 2008 (ML081830410) and May 26, 2009 (ML091480012). In the letters, the applicant provided additional information requested by the staff about implementation of the FAC program during the plant construction phase, pre-service thickness measurements, and the basis for determining minimum allowable thickness.

In RAI 10.3.6-1, the staff requested that the applicant discuss its implementation schedule for the detailed FAC program (i.e., the FAC program activities that will be conducted during the plant construction phase and the schedule for those activities). This information was not provided in the application and was needed by the staff to make its reasonable assurance finding that the FAC concerns discussed in GL 89-08 are adequately addressed.

In RAI 10.3.6-2, the staff asked the applicant to confirm that its program for addressing and monitoring FAC will include pre-service thickness measurements of as-built components considered susceptible to FAC, and that these measurements will use grid locations and measurement methods most likely to be used for inservice inspection (ISI) according to industry guidelines. In addition, the staff requested that the applicant describe how the pre-service testing requirement was documented in the COL application.

In RAI 10.3.6-3, the staff asked the applicant to identify the industry guidelines or established procedures for determining the minimum allowable wall thickness at which components must be repaired or replaced.

In the June 27, 2008, letter, the applicant responded that susceptibility of piping and components to FAC will be evaluated prior to fuel load as design and as-built information becomes available, and those categorized as high risk for FAC failure will be evaluated for baseline testing prior to startup. For other piping, nominal dimensions may be used until baseline wall thickness is measured, but the applicant did not state when this will occur.

The applicant also proposed revising FSAR Section 10.1.3.1 by deleting the following sentence and replacing it with a paragraph that identifies a specific industry guideline (Electric Power Research Institute (EPRI) NSAC-202L) that contains more details about the approach to FAC monitoring.

> *In addition, the FAC monitoring program considers the information of Generic Letter 89-08 and industry guidelines.*

This revision addressed the staff's concern about the basis for determining the minimum allowable thickness because it references the industry guidance (EPRI NSAC-202L) that addresses the concerns in GL 89-08. The response also addressed the staff's concern about pre-service thickness testing because it affirms the need for pre-service testing, and because the application will reference the guidance of NSAC-202L. The response confirmed that the EPRI CHECWORKS computer program will be used for wall thickness evaluations. Based on operating experience, the staff considers the EPRI guidance document and CHECWORKS program an effective approach to managing FAC. However, the staff also identified open items on this topic as discussed below. The open items are related to information that must be either clarified or added to the COL application.

The response to RAI 10.3.6-1 described how susceptibility to FAC will be evaluated as the design and as-built information becomes available, and high-risk (of FAC) components will be evaluated for baseline testing prior to startup. The staff had the following concerns:

a) The applicant stated that piping and/or components with a high risk of FAC failure will be "evaluated for baseline testing prior to startup." This statement suggests baseline testing may not be performed on high-risk components.

b) The reference to piping and/or components "deemed to have a high risk of failure due to FAC" led the staff to question the extent to which FAC prevention was included in the plant design. Given that the plant has not yet been constructed and a predictive model such as CHECWORKS can estimate FAC rates, it is the staff's understanding that materials susceptible to FAC can be avoided where FAC is a potential degradation mechanism.

c) The applicant did not add the FAC program implementation schedule and construction phase activities to the COL application.

The response to RAI 10.3.6-2 and the associated COL application revisions include the terms "Pass 1 analysis" and "Pass 2 analysis." Since these are terms defined in EPRI NSAC-202L in the context of the CHECWORKS analysis program, reference to CHECWORKS needs to be addressed in the application.

The response to RAI 10.3.6-3 refers to "Systems Not Modeled components." Based on the context of this statement, the staff understands that this statement refers to "Susceptible Not Modeled lines," as discussed in EPRI NSAC-202L.

The applicant submitted a supplemental RAI response dated May 26, 2009 (ML091480012). In the revised responses to the RAIs the applicant clarified that the plant is designed to prevent FAC, and no piping/components are expected to have a high risk of FAC failure, but the possibility of a high-risk piping/component cannot be ruled out until the as-built design is analyzed. The response also clarified that baseline testing would be performed on all high-risk piping/components, and it corrected the wording to reference "Susceptible-Not-Modeled" lines. In the response to RAI 10.3.6-2 the applicant also proposed the following revision to FSAR Section 10.1.3.1:

> *In addition, the FAC monitoring program considers the information of Generic Letter 89-08, EPRI NSAC-202L-R3, and industry operating experience. The program requires a grid layout for obtaining consistent pipe thickness measurements when using Ultrasonic Test Techniques. The FAC program obtains actual thickness measurements for highly susceptible FAC locations for new lines as defined in EPRI NSAC-202L-R3. At a minimum, a CHECWORKS type Pass 1 Analysis is used for low susceptible FAC locations and a CHECWORKS type Pass 2 Analysis for highly susceptible FAC locations will be considered. To determine wear of piping and components where operating conditions are inconsistent or unknown the guidance provided in EPRI NSAC-202L is used to determine wear rates.*

The revised response to RAIs 10.3.6-1, 10.3.6-2, and 10.3.6-3 therefore addressed all of the concerns identified above, with the exception of identifying the program implementation schedule in the application. This is ***Open Item 10.1-1****. The staff identifies the FSAR revisions proposed by the applicant in its May 26, 2009 letter as* **Confirmatory Item 10.1-1***. Pending resolution of the open item and confirmatory item, the staff finds the COL information item on the FAC program addresses the concerns expressed in GL 89-08.*

Resolution of Standard Content Open Item 10.1-1

In a letter dated July 16, 2009, the VEGP applicant addressed Open Item 10.1-1 by proposing to include the FAC program as part of License Condition 6, "Operational Program Readiness." Specifically, the applicant stated that in a future application revision License Condition 6 will include the requirement to submit a FAC program implementation schedule, including the construction phase activities. The proposed license condition is consistent with SECY-05-0197, "Review of Operational Programs in a Combined License Application and Generic Emergency Planning Inspections, Tests, Analyses, and Acceptance Criteria." The staff verified that this change was incorporated into Revision 2 of the COL application. As a result, Open Item 10.1-1 is resolved.

Resolution of Standard Content Confirmatory Item 10.1-1

In a letter dated September 9, 2009, the BLN applicant revised the May 26, 2009, response to RAI 10.3.6-2 related to preservice inspection. The letter clarified that the CHECWORKS Pass 1 analysis (corrosion rates based on the plant model) would be performed for locations with both low and high FAC susceptibility. In addition, the response stated that the Pass 2 analysis (use of inspection data for model refinement, corrosion measurement, and trending) will be performed for high-susceptibility locations if warranted by the Pass 1 analysis. The original response stated that the Pass 2 analysis "will be considered" for high-susceptibility locations. The response includes the following revised wording in FSAR Section 10.1.3.1:

> *The FAC program obtains actual thickness measurements for highly susceptible FAC locations for new lines as defined in EPRI NSAC-202L-R3 (Reference 201). At a minimum, a CHECWORKS type Pass 1 analysis is used for low and highly susceptible FAC locations and a Pass 2 analysis is used for highly susceptible FAC locations when Pass 1 results warrant.*

The staff determined that this revised FSAR text is acceptable because it clarified how the plant predictive model is used to perform FAC analysis, and the approach conforms to the EPRI NSAC-202L guidelines. The VEGP applicant has endorsed the standard RAI responses, and has incorporated the associated changes into Revision 2 of the FSAR. The staff determined that the VEGP applicant has fully addressed all RAI responses, and as a result, Confirmatory Item 10.1-1 is now resolved.

10.1.5 Post Combined License Activities

For the reasons discussed in the technical evaluation section above, the staff finds the following license condition acceptable:

- License Condition (10-1) – Prior to initial fuel load, the licensee shall implement the flow accelerated corrosion (FAC) program including construction phase activities. No later than 12 months after issuance of the COL, the licensee shall submit to the Director of the Office of New Reactors (NRO) a schedule that supports planning for and conduct of NRC inspections of the FAC program implementation including construction phase activities. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until the FAC program has been fully implemented.

10.1.6 Conclusion

The NRC staff reviewed the application and checked the referenced DCD. The NRC staff's review confirmed that the applicant addressed the required information relating to FAC, and there is no outstanding information to be addressed in the WLS COL FSAR related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

The staff concludes that the information presented in the WLS COL FSAR is acceptable because it meets the acceptance criteria provided in Section 10.3.6 of NUREG-0800 and the guidance in GL 89-08. The staff based its conclusion on the following:

- STD COL 10.1-1, relating to the monitoring of the FAC program, is acceptable because it conforms to the acceptance criteria and guidelines provided under Section 10.3.6 of NUREG-0800 and GL 89-08.

10.2 <u>Turbine-Generator</u>

10.2.1 Introduction

The T-G includes the turbine generator system (TGS), associated equipment (including moisture separation), use of extraction steam for feedwater heating, and control functions. Details of TGS component construction materials are included in the AP1000 DCD. The T-G control and overspeed system is described in detail in the DCD; including redundancy and diversity of controls, types of control utilized, overspeed setpoints, and valve actions required for each set point. Because turbine rotors have large masses and rotate at relatively high speeds during normal reactor operation, failure of a rotor may cause excessive vibration of the turbine rotor assembly and result in the generation of high energy missiles. Measures taken by the applicant to ensure turbine rotor integrity and reduce the probability of turbine rotor failure are included in this section of the application.

10.2.2 Summary of Application

Section 10.2 of the WLS COL FSAR, Revision 11, incorporates by reference Section 10.2 of the AP1000 DCD, Revision 19. In addition, in WLS COL FSAR Section 10.2, the applicant provided the following:

Supplemental Information

- STD Supplement (SUP) 10.2-1

The applicant provided supplemental information in WLS COL FSAR Section 10.2.2, "System Description," which describes the probability of generating a turbine missile.

- STD SUP 10.2-2

In Revision 0 of the WLS COL FSAR, the applicant provided supplemental information regarding the main steam stop and control valves. This supplemental information was deleted in a later revision of the WLS COL FSAR; this is discussed in Section 10.2.4 (Technical Evaluation) of this SER.

- STD SUP 10.2-3

The applicant provided supplemental information in WLS COL FSAR Section 10.2.3.6, "Maintenance and Inspection Program Plan," which describes the ISI program for the turbine assembly.

- STD SUP 10.2-4

The applicant provided supplemental information in WLS COL FSAR Section 10.2.2, "System Description," which describes the turbine assembly preoperational and startup tests.

- STD SUP 10.2-5

The applicant provided supplemental information in WLS COL FSAR Section 10.2.3, "Turbine Rotor Integrity," which describes the turbine assembly operations and maintenance procedures.

AP1000 COL Information Item

- STD COL 10.2-1

The applicant provided additional information in STD COL 10.2-1, which states that a turbine maintenance and inspection program will be submitted to the NRC for review prior to initial fuel load. This addresses the COL information item in Section 10.2.6, "Combined License Information on Turbine Maintenance and Inspection," of the AP1000 DCD (COL Action Item 10.5-2).

License Condition

- License Condition 2, Item 10.2-1, relating to the turbine maintenance and inspection program

10.2.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for turbine rotor integrity are given in Sections 10.2 and 10.2.3 of NUREG-0800.

10.2.4 Technical Evaluation

The NRC staff reviewed Section 10.2 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the T-G. The results of the NRC staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.

- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the WLS COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the BLN Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from Section 10.2.4 of the VEGP SER:

<u>Supplemental Information</u>

- *STD SUP 10.2-1*

The applicant provided supplemental information as part of the BLN COL FSAR regarding the probability of generating a turbine missile. In FSAR Section 10.2.2, "System Description," the applicant stated that Section 3.5.1.3 addresses the probability of generation of a turbine missile for AP1000 plants in a side-by-side configuration. The staff's review of the acceptability of the probability of generating a turbine missile is documented in Section 3.5.1, "Missile Selection and Description," of this SER.

- *STD SUP 10.2-2*

In Revision 0 of the BLN COL FSAR, the applicant provided supplemental information regarding the frequency for exercising the main steam stop and control valves. However, the valve exercise frequency is specified in Revision 17 of the DCD, and therefore, this supplemental information is no longer necessary. In Revision 1 of BLN COL FSAR, this information is no longer provided.

- *STD SUP 10.2-3*

The applicant provided supplemental information as part of the BLN COL FSAR regarding the ISI program for the turbine assembly. The applicant added text to the end of Section 10.2.3.6 of the AP1000 DCD, Revision 17, to describe the breadth of the turbine assembly ISI program.

The NRC staff reviewed the standard supplemental information provided in STD SUP 10.2-3 regarding the text added to Section 10.2.3.6 related to the turbine assembly ISI program. The staff concludes that STD SUP 10.2-3 is acceptable because it is a statement of the scope of the turbine ISI program consistent with the acceptance criteria of Section 10.2.3 of NUREG-0800.

- *STD SUP 10.2-4*

The applicant provided supplemental information as part of the FSAR regarding the turbine assembly preoperational and startup tests. The NRC staff reviewed the standard supplemental information provided in STD SUP 10.2-4 regarding the text added to Section 10.2.2 related to the turbine assembly preoperational and startup testing. The staff determined that this additional information provides further clarity regarding the turbine system startup tests. This additional information does not affect the design aspects of the system or its regulatory basis.

- *STD SUP 10.2-5*

The applicant provided supplemental information as part of the BLN COL FSAR regarding turbine assembly operations and maintenance procedures. The *applicant added text to the end of Section 10.2.3 of the AP1000 DCD, Revision 17, to note that operations and maintenance procedures mitigate potential degradation mechanisms in the turbine rotor and buckets/blades. STD SUP 10.2-5 is a general statement about the purpose of operations and maintenance procedures and does not affect those procedures that are part of the staff's review of Section 10.2.3 of the DCD application.*

<u>AP1000 COL Information Item</u>

- *STD COL 10.2-1*

The applicant provided additional information (STD COL 10.2-1) in BLN COL FSAR Section 10.2.6, "Combined License Information on Turbine Maintenance and Inspection," to resolve a COL information item identified in AP1000 DCD, Section 10.2.6. STD COL 10.2-1 identifies the turbine maintenance and inspection program, plant-specific turbine rotor test data, and plant-specific calculated toughness curves as items that must be submitted by the COL holder to the NRC staff for review prior to fuel load.

The AP1000 COL information item identified in DCD Section 10.2.6 states:

> *The Combined License holder will submit to the NRC staff for review prior to fuel load and then implement a turbine maintenance and inspection program. The program will be consistent with the maintenance and inspection program plan activities and inspection intervals identified in Subsection 10.2.3.6. The Combined License holder will have available plant-specific turbine rotor test data and calculated toughness curves that support the material property assumptions in turbine rotor analysis after the fabrication of the turbine and prior to fuel load.*

BLN COL FSAR Section 10.2.6, "Combined License Information on Turbine Maintenance and Inspection," replaces Section 10.2.6 of the AP1000 DCD with the following:

> *A turbine maintenance and inspection program will be submitted to the NRC staff for review prior to fuel load. The program will be consistent with the maintenance and inspection program plan activities and inspection intervals identified in DCD Subsection 10.2.3.6. Plant-specific turbine rotor test data and calculated toughness curves that support the material property assumptions in the turbine rotor analysis will be available for review after fabrication of the turbine and prior to fuel load.*

The applicant proposed License Condition 2, Item 10.2-1 related to the above. The staff is currently reviewing Revision 17 of the DCD which contains the turbine maintenance and inspection program elements. License Condition 2 provides that the applicant will submit, prior to fuel load, its turbine maintenance *and inspection program for the as-built rotor, including its material properties. The staff finds this condition acceptable because the inspection program, updated with as-built information, will be submitted to verify consistency with the maintenance and inspection program plan activities and inspection intervals identified in Section 10.2.3.6 of the DCD.*

10.2.5 Post Combined License Activities

For the reasons discussed in the technical evaluation section above, the staff finds the following license condition acceptable:

- License Condition (10-2) – Prior to initial fuel load, the licensee shall implement a turbine maintenance and inspection program, which will be consistent with the maintenance and inspection program plan activities and inspection intervals identified in FSAR Section 10.2.3.6. No later than 12 months after issuance of the COL, the licensee shall submit to the Director of NRO a schedule that supports planning for and conduct of NRC inspections of the turbine maintenance and inspection program. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until the turbine maintenance and inspection program has been fully implemented.

10.2.6 Conclusion

The NRC staff reviewed the application and checked the referenced DCD. The NRC staff's review confirmed that the applicant addressed the required information relating to the T-G, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the WLS COL FSAR is acceptable and meets the acceptance criteria of Section 10.2 of NUREG-0800. The staff based its conclusions on the following:

- STD SUP 10.2-1, related to the probability of generating a turbine missile, is reviewed by the staff in Section 3.5.1, "Missile Selection and Description," of this SER.

- STD SUP 10.2-2, related to frequency for exercising the main steam stop and control valves, was deleted in Revision 1 of the WLS COL FSAR.

- STD SUP 10.2-3, related to the ISI program for the turbine assembly, is acceptable to the staff because the description of the ISI program is consistent with Section 10.2.3 of NUREG-0800.

- STD SUP 10.2-4, relating to the turbine assembly preoperational and startup tests, is acceptable to the staff because the proposed valve testing is consistent with the guidance in Section 10.2 of NUREG-0800.

- STD SUP 10.2-5, relating to mitigation of potential degradation mechanisms for the turbine rotor and buckets/blades, is acceptable to the staff because it is a general statement about the purpose of operations and maintenance procedures and does not affect those procedures that are part of the staff's review of Section 10.2.3 of the DCD application.

- STD COL 10.2-1, relating to the turbine maintenance and inspection program, is acceptable to the staff because the applicant proposed a license condition that appropriately addresses this information item.

10.3 Main Steam Supply System

10.3.1 Introduction

The main steam supply system (MSSS) transports the steam generated by the nuclear steam supply system to the S&PC system and various safety-related and nonsafety-related auxiliaries. Portions of the MSSS may be used as part of the heat sink that removes heat from the reactor facility during certain operations. The MSSS for the pressurized-water reactor (PWR) plant extends from the connections to the secondary sides of the SGs up to and including the turbine stop valves.

10.3.2 Summary of Application

Section 10.3 of the WLS COL FSAR, Revision 11, incorporates by reference Section 10.3 of the AP1000 DCD, Revision 19.

In addition, in WLS COL FSAR Section 10.3, the applicant provided the following:

Supplemental Information

- STD SUP 10.3-1

The applicant provided supplemental information in WLS COL FSAR Section 10.3.2.2.1, "Main Steam Piping," which addresses operations and maintenance procedures.

- STD SUP 10.3-2

The applicant provided supplemental information in WLS COL FSAR Section 10.3.5.4, "Chemical Addition," related to secondary-side water chemistry.

- STD SUP 10.3-3

The applicant provided supplemental information in WLS COL FSAR Section 10.3.6.2, "Material Selection and Fabrication," which addresses intergranular stress corrosion cracking (IGSCC).

10.3.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the MSSS are given in Sections 10.3.1 and 10.3.6 of NUREG-0800.

The applicable regulatory requirements and guidance for STD SUP 10.3-1, STD SUP 10.3-2, and STD SUP 10.3-3 are as follows:

- General Design Criterion (GDC) 4, "Environmental and Dynamic Effects Design Bases"
- Regulatory Guide (RG) 1.37, Revision 1, "Quality Assurance Requirements for Cleaning of Fluid Systems and Associated Components of Water-Cooled Nuclear Power Plants"
- Branch Technical Position (BTP) 5-1, "Monitoring of Secondary Side Water Chemistry in PWR Steam Generators"

The regulatory basis for acceptance of the supplemental information on controls to prevent stress-corrosion cracking of stainless steels and nickel alloys is the quality assurance requirements in Appendix B, "Quality assurance criteria for nuclear power plants and fuel reprocessing plants," of Title 10 of the *Code of Federal Regulations* (10 CFR) Part 50, "Domestic licensing of production and utilization facilities," and the guidance in RG 1.37, as they relate to quality assurance requirements for the design, fabrication, and construction of safety-related structures, systems, and components (SSCs).

10.3.4 Technical Evaluation

The NRC staff reviewed Section 10.3 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the MSSS. The results of the NRC staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.

- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the WLS COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the BLN Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from Section 10.3.4 of the VEGP SER:

> *Supplemental Information*
>
> - *STD SUP 10.3-1*
>
> *The applicant provided additional information as part of the BLN COL FSAR regarding operations and maintenance procedures. The applicant added text to Section 10.3.2.2.1 of the AP1000 DCD, Revision 17, to address steam hammer and relief valve discharge reaction loads.*
>
> *The NRC staff reviewed the standard supplemental information provided in STD SUP 10.3-1 regarding the text added to Section 10.3.2.2.1 related to MSSS operations and maintenance procedures.*
>
> *During its review of Revision 0 of the BLN COL FSAR, the staff did not find any further details regarding these procedures. Therefore, the staff raised a concern regarding the adequacy of these procedures. Also, Section 10.3 of NUREG-0800, "MAIN STEAM SUPPLY SYSTEM," Item II, related to GDC 4, describes that the main steam system should adequately consider water (steam) hammer and relief valve discharge loads to assure that system safety functions can be performed and should assure that operating and maintenance procedures include adequate precautions to prevent water (steam) hammer and relief valve loads. In order to ensure the adequacy of the MSSS and its agreement with the NUREG-0800 criteria, the staff requested the key elements of the procedures for staff's review in RAI 10.3-1.*
>
> *In its response, dated July 21, 2008, concerning precluding or mitigating water hammer events, the applicant identified that good operating practice and operating experience including, but not limited to Institute of Nuclear Power Operations (INPO) significant event reports and significant operating event reports, NRC information notices and bulletins, and other industry operating experience information are programmatically integrated into the AP1000 Operations Procedure development. The applicant also stated that specific operating experience to preclude or mitigate water hammer is included in this*

population of operating experience. In addition, the applicant explained that the AP1000 has been designed to prevent or minimize steam and water hammer. The applicant stated that BLN COL FSAR Section 10.3.2.2.1 will be revised to include additional precautions, when appropriate, to minimize the potential for steam and water hammer.

With respect to the relief valve discharge loads, in its response, the applicant explained that Westinghouse addressed these loads for main steam safety valves in the AP1000 DCD, Section 10.3.2.2.2, "Main Steam Safety Valves," which BLN incorporated by reference with no departures and supplements. Further, the applicant stated that as described in NUREG-0927, Revision 1, "Evaluation of Water Hammer Occurrence in Nuclear Power Plants," preventive measures for relief valve loading are addressed by design. Therefore, the applicant stated that the COL application Part 2, BLN COL FSAR Section 10.3.2.2.1 will be revised to remove the associated procedure precautions as related to the relief valve discharge reaction loading. In addition, Section 10.3.2.2.1 will be revised to state that operations and maintenance procedures include precautions, when appropriate, to minimize the potential for steam and water hammer. The applicant listed several precautionary items, such as: prevention of rapid valve motion, process for avoiding voids and flashing in water-filled lines and venting these lines, process for avoiding introduction of water into steam lines and proper warm-up and drainage of these lines, and effects of valve alignments on line conditions.

Based on its review, the staff finds the applicant's response acceptable because a detailed list of the procedural precautions (identified above) is provided and included as a proposed revision to COL application Part 2, BLN COL FSAR Section 10.3.2.2.1. The staff reviewed the precautions and compared them to the industry experience and staff guidance, and finds that they adequately address steam and water hammer. Therefore, the staff agrees that the deletion of the relief valve discharge reaction load occurrences from BLN COL FSAR Section 10.3.2.2.1 is acceptable, because its discussion was already identified in the AP1000 DCD Section 10.3.2.2.1. In BLN COL FSAR Section 10.3.2.2.1, Revision 1, the applicant revised STD SUP 10.3-1 as indicated above in its response to RAI 10.3-1. Therefore, the staff's concern in RAI 10.3-1 is resolved.

- *STD SUP 10.3-2*

The applicant provided additional information as part of the BLN COL FSAR regarding the secondary chemistry. In FSAR Section 10.3.5.4, "Chemical Addition," the applicant proposed adding the following at the end of DCD Subsection 10.3.5.4:

> *Alkaline chemistry supports maintaining iodine compounds in their nonvolatile form. When iodine is in its elemental form, it is volatile and free to react with organic compounds to create organic iodine compounds, which are not assumed to remain in solution. It is noted that no significant level of organic compounds is expected in*

> *the secondary system. The secondary water chemistry, thus, does not directly impact the radioactive iodine partition coefficients.*

The staff reviewed the secondary water chemistry under Section 10.4.6 of this SER and found it acceptable with respect to the EPRI PWR Secondary Water Chemistry Guidelines. As discussed in Section 10.4.6, the staff considers application of the guidance of the EPRI PWR Secondary Water Chemistry Guidelines, and a programmatic commitment to use these guidelines, to be an acceptable method for the applicant to ensure compliance with GDC 14 as it relates to ensuring the integrity of the reactor coolant boundary (specifically, as the secondary water chemistry program ensures the integrity of the SG tubing). As the applicant stated in STD SUP 10.3-2, the secondary water chemistry does not directly impact the iodine partition coefficients. In addition, radioactive iodine is not a consideration in the EPRI Secondary Water Chemistry Guidelines. The staff finds that STD SUP 10.3-2 is a statement of fact that does not affect the staff's review. The management of radioactive compounds, including iodine, is addressed by the staff in Chapter 11.

- *STD SUP 10.3-3*

The applicant provided additional information as part of the BLN COL FSAR regarding IGSCC. The applicant added text to the end of Section 10.3.6.2 "Material Selection and Fabrication" of the AP1000 DCD, Revision 17, to include providing the necessary controls to minimize the susceptibility of components made of stainless steel and nickel-based materials to IGSCC. The applicant proposed adding the following at the end of DCD Section 10.3.6.2:

> *Appropriate operations and maintenance procedures provide the necessary controls during operation to minimize the susceptibility of components made of stainless steel and nickel-based materials to IGSCC by controlling chemicals that are used on system components.*

The staff finds the supplemental information, addressing IGSCC concerns related to stainless steels and nickel-base alloys, acceptable because the AP1000 DCD meets the technical guidelines specified in RG 1.37. In addition, the staff notes that these materials are not proposed for use in the main steam and feedwater piping systems at BLN Units 3 and 4.

<u>*Correction of Error in the Standard Content Evaluation Text*</u>

The NRC staff identified an error in the text reproduced above from the BLN SER, Section 10.3.4, that requires correction. The BLN SER states that the staff reviewed the secondary water chemistry in Section 10.4.6 of the SER. Secondary water chemistry is actually reviewed in Section 10.4.7 of the SER.

10.3.5 Post Combined License Activities

There are no post-COL activities related to this section.

10.3.6 Conclusion

The NRC staff reviewed the application and checked the referenced DCD. The NRC staff's review confirmed that the applicant addressed the required information relating to MSSS, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the WLS COL FSAR is acceptable and meets the requirements of Appendix A to 10 CFR Part 50, GDC 4, 10 CFR 52.79, "Contents of applications; technical information in final safety analysis report," and conforms to the guidance in Sections 10.3 and 10.3.6 of NUREG-0800, BTP 5-1, and RG 1.37. The staff based its conclusions on the following:

- STD SUP 10.3-1, relating to operations and maintenance procedures, is acceptable because the applicant provided sufficient information to satisfy GDC 4 as related to MSSS design considering the water (steam) hammer effects on the safety-related SSCs.

- STD SUP 10.3-2, relating to secondary chemistry, is a statement of fact that does not affect the staff's review.

- STD SUP 10.3-3, relating to IGSCC, is acceptable to the staff because the AP1000 DCD meets the technical guidelines specified in RG 1.37.

10.4 Other Features of Steam and Power Conversion System

10.4.1 Main Condensers

During normal operation, the main condenser receives, condenses and deaerates exhaust steam from the main turbine and the turbine bypass system whenever the turbine bypass system is operated. The main condenser is also a collection point for other steam cycle miscellaneous drains and vents.

Section 10.4 of the WLS COL FSAR, Revision 11, incorporates by reference, with no departures or supplements, Section 10.4.1 of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.[1] The NRC staff's review confirmed that there is no outstanding issue related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

10.4.2 Main Condenser Evacuation System

10.4.2.1 *Introduction*

Main condenser evacuation is performed by the condenser air removal system. The system removes noncondensable gases and air from the main condenser during plant startup, cooldown, and normal operation. This action is performed by liquid ring vacuum pumps.

10.4.2.2 *Summary of Application*

Section 10.4 of the WLS COL FSAR, Revision 11, incorporates by reference Section 10.4 of the AP1000 DCD, Revision 19. Section 10.4 of the DCD includes Section 10.4.2.2.

In addition, in WLS COL FSAR Section 10.4.2.2, the applicant provided the following:

<u>*Site-Specific Information Replacing Conceptual Design Information*</u>

- WLS CDI

The applicant provided additional information to replace conceptual design information (CDI) in WLS COL FSAR Section 10.4.2.2.1, "General Description," which describes the plant-specific cooling water source for the vacuum pump seal water heat exchangers.

The applicant also provided additional information to replace CDI in WLS COL FSAR Section 10.4.2.2.2, "Component Description," which describes the plant-specific tube side water flow in the seal water heat exchangers.

10.4.2.3 *Regulatory Basis*

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

Additional regulatory basis is Appendix A to 10 CFR Part 50 and GDC 60, "Control of Releases of Radioactive Materials to the Environment."

Acceptance criteria associated with the relevant requirements of the Commission regulations for the main condenser evacuation system are given in Section 10.4.2 of NUREG-0800.

10.4.2.4 *Technical Evaluation*

The NRC staff reviewed Section 10.4.2 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the main condenser evacuation system. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

The staff reviewed the following WLS plant-specific design information that replaces the CDI identified in the AP1000 DCD:

Site-Specific Information Replacing Conceptual Design Information

- WLS CDI

The WLS plant-specific design information was annotated as "WLS CDI" in WLS COL FSAR Section 10.4.2.2. In this section, the applicant replaced bracketed (conceptual design) text in Sections 10.4.2.2.1, "General Description," and 10.4.2.2.2, "Component Description," of the AP1000 DCD to provide specific information regarding the sources of cooling water for the vacuum pump seal water heat exchangers.

The WLS CDI in WLS COL FSAR Section 10.4.2.2.1 is related to the CWS and raw water system (RWS) supplying cooling water for the main condenser vacuum pump seal water heat exchangers. The WLS CDI in FSAR Section 10.4.2.2.2 clarifies that the seal water flows through the shell side of the seal water heat exchanger and CWS water flows through the tube side. Based on its review, the staff concludes that this WLS plant-specific design information will have no adverse effects on the capability of the main condenser evacuation system, CWS, or RWS and associated equipment. Also, the staff concludes that adding this WLS plant-specific design information will not affect the functions of any safety-related equipment, components, or systems of the plant. The staff accepts these revisions as stated, because the information provided in this WLS CDI meets the acceptance criteria in Section 10.4.2 of NUREG-0800, and therefore, meets GDC 60 as it relates to the main condenser evacuation system design for the control of releases of radioactive materials to the environment.

10.4.2.5 *Post Combined License Activities*

There are no post-COL activities related to this section.

10.4.2.6 *Conclusion*

The NRC staff reviewed the application and checked the referenced DCD. The NRC staff's review confirmed that the applicant addressed the required information relating to the main condenser evacuation system, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the WLS COL FSAR is acceptable and meets the acceptance criteria of Section 10.4.2 of NUREG-0800 and the requirements of GDC 60. The staff based its conclusions on the following:

- WLS CDI, relating to WLS COL FSAR Section 10.4.2.2.1, "General Description," concerning cooling water source for the vacuum pump seal water heat exchanger, is acceptable to the staff because it meets GDC 60 for the control of releases of radioactive materials to the environment.

- WLS CDI, relating to WLS COL FSAR Section 10.4.2.2.2, "Component Description," concerning the tube side water flow in the seal water heat exchangers, is acceptable to the staff because it meets GDC 60 for the control of releases of radioactive materials to the environment.

10.4.3 Gland Sealing System (Related to RG 1.206, Section C.III.1, Chapter 10, C.I.10.4.3, "Turbine Gland Sealing System")

The gland seal system prevents the escape of steam from the turbine shaft, turbine casing penetrations, and valve stems. The gland seal system also prevents air in-leakage through sub-atmospheric turbine glands. The system provides a source of sealing steam to the annulus space where the turbine and large steam valve shafts penetrate the turbine casings.

Section 10.4 of the WLS COL FSAR, Revision 11, incorporates by reference, with no departures or supplements, Section 10.4.3 of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.[1] The NRC staff's review confirmed that there is no outstanding issue related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

10.4.4 Turbine Bypass System

The turbine bypass system provides the capability to discharge main steam from the steam generators directly to the main condenser, which minimizes load transient effects on the nuclear steam supply system. The turbine bypass system is designed to discharge a certain percentage of rated main steam flow directly to the main condenser, bypassing the turbine. The system is also used to discharge main steam during reactor hot standby and cooldown operations.

Section 10.4 of the WLS COL FSAR, Revision 11, incorporates by reference, with no departures or supplements, Section 10.4.4 of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.[1] The NRC staff's review confirmed that there is no outstanding issue related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

10.4.5 Circulating Water System

10.4.5.1 *Introduction*

The CWS removes waste heat from the main condenser. This waste heat is subsequently transferred to the power cycle heat sink. The CWS provides a continuous supply of cooling water to the main condenser to remove the heat rejected by the turbine cycle and auxiliary systems.

10.4.5.2 *Summary of Application*

Section 10.4 of the WLS COL FSAR, Revision 11, incorporates by reference Section 10.4 of the AP1000 DCD, Revision 19. Section 10.4 of the DCD includes Section 10.4.5.

In addition, in WLS COL FSAR Section 10.4.5, the applicant provided the following:

AP1000 COL Information Item

- WLS COL 10.4-1

The applicant provided additional information related to the CWS design parameters in WLS COL 10.4-1 to resolve the COL information item in Section 10.4.12.1 of the AP1000 DCD (COL Action Item 10.5-3).

Site-Specific Information Replacing Conceptual Design Information

- WLS CDI

The applicant provided additional information to replace CDI in WLS COL FSAR Section 10.4.5, which describes the following various aspects of the site-specific CWS:

- Power generation design basis
- General description
- Component description
- System operation
- Tests and inspections
- Instrumentation applications

10.4.5.3 *Regulatory Basis*

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the regulatory basis for acceptance of COL Information Item 10.4-1 (COL Action Item 10.5-3) is established in GDC 4, as it relates to design provisions provided to accommodate the effects of discharging water that may result from a failure of a component or piping in the CWS.

In accordance with Section 10.4.5 of NUREG-0800, the requirements of GDC 4 are met when the CWS design includes provisions to accommodate the effects of discharging water that may result from a failure of a component or piping in the CWS. Means should be provided to prevent or detect and control flooding of safety-related areas so that the intended safety function of a system or component will not be precluded due to leakage from the CWS. Malfunction or a failure of a component or piping of the CWS, including an expansion joint, should not have unacceptable adverse effects on the functional performance capabilities of safety-related systems or components.

10.4.5.4 *Technical Evaluation*

The NRC staff reviewed Section 10.4.5 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the CWS. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

The staff reviewed the information in the WLS COL FSAR and the applicant's responses to the staff RAIs, and provides its evaluation as described below:

<u>*AP1000 COL Information Items*</u>

- WLS COL 10.4-1

In WLS COL FSAR Section 10.4.5, the applicant provided additional information in WLS COL 10.4-1 to resolve the COL information item in Section 10.4.12.1, "Circulating Water System," of the AP1000 DCD, which states:

> The Combined License applicant will address the final configuration of the plant circulating water system including piping design pressure, the cooling tower or other site-specific heat sink.
>
> As applicable, the Combined License applicant will address the acceptable Langelier or Stability Index range, the specific chemical selected for use in the CWS water chemistry control, pH adjuster, corrosion inhibiter, scale inhibiter, dispersant, algaecide and biocide applications reflecting potential variations in site water chemistry and in micro macro biological life forms. A biocide such as sodium hypochlorite is recommended. Toxic gases such as chlorine are not recommended. The impact of toxic gases on the main control room habitability is addressed in Section 6.4. The Combined License applicant will also be responsible for the design, routing, and disposition requirements associated with the main condenser waterbox drains.

This item was also captured as COL Action Item 10.5-3 in Appendix F of NUREG-1793:

> The COL applicant is responsible for the site-specific configuration of the plant circulating water system (including piping design pressure), the cooling tower, or other site-specific heat sink.

The applicant addressed the above COL information item of the AP1000 DCD in WLS COL FSAR Sections 10.4.5.2.1, "General Description"; 10.4.5.2.2, "Component Description"; and 10.4.5.5, "Instrumentation Applications"; by providing additional information concerning CWS heat sink capability, design parameters, cooling towers, waterbox drains, and CWS water chemistry control. The staff reviewed the applicant's information in these FSAR sections.

In WLS COL FSAR Section 10.4.5.2.1, the applicant described the WLS site-specific CWS. The CWS and the cooling towers provide a heat sink for waste heat exhausted from the main steam turbine. Also, to address COL Information Item 10.4-1 of the AP1000 DCD, the applicant provided WLS-specific design parameters in WLS COL FSAR Table 10.4-202, "Design Parameters for Major Circulating Water System Components." These design parameters in the FSAR Table 10.4-202 are compatible with those in the DCD Table 10.4.5-1, "Design Parameters for Major Circulating Water System Components." WLS FSAR Section 10.4.5.2.2, describes that the maximum pressure of the CWS, including piping, valves, condenser water boxes, and tube bundles, is 90 psig. According to the DCD Table 10.4.1-1, "Main Condenser Design," the water box pressure is also 90 psig. Since the WLS CWS design parameters, including the waterbox design pressure, are compatible with those of the DCD, the staff finds the design parameters and design pressure of the WLS CWS are acceptable.

With respect to maintaining the CWS water chemistry, in FSAR Section 10.4.5.2.2, "Component Description," the applicant provided information on the chemical treatment program for the CWS. The applicant stated that the design of the WLS chemical treatment program is based on experience gained from the operation of the Catawba Nuclear Station (CNS), which is also operated by the applicant. The applicant further stated that based on a similarity of the water chemistry produced by the two water sheds and the similarity in the construction of the cooling towers, CNS was used as a model for the design of the chemical treatment program for the CWS at WLS. Accordingly, as in the CNS, WLS would utilize oxidizing chemistry (e.g., sodium hypochloride, sodium bromide, etc.) for the control of bio-fouling and the growth of algae, sulphuric acid for pH adjustment, and a polyacrylate as a silt dispersant. The applicant stated no need for corrosion and scale inhibitors based on the materials of construction of the CWS and the constituency of the dissolved and suspended solids in the Broad River from where the WLS station would draw water. Also, in Section 10.4.5.2.2, the applicant stated that specific chemicals used within the system are determined by the site water conditions and are monitored by plant chemistry personnel. Additionally, in FSAR Section 10.4.5.5, the applicant stated that circulating water chemistry is controlled by cooling tower blowdown via regulating the blowdown valve, and chemical addition to an acceptable Stability Index range of approximately 6 to 7. The staff finds that the applicant satisfactorily addressed the site-specific chemicals selected for use in CWS water chemistry control as required by the DCD.

In Revision 5 of WLS FSAR Section 10.4.5.2.2, the applicant stated that the condenser water box drains allow the condenser to be drained to the turbine building sumps. According to AP1000 DCD Section 9.2.9.2.1, "General Description," these turbine building sumps are equipped with radiation monitors at the sump pump discharge piping, which trip the pump, and provide an alarm upon detection of radioactivity in the discharge water. The staff finds the routing of the WLS condenser water drains acceptable because they flow to the turbine building sump which is equipped to monitor the radioactivity in the discharge water.

The staff reviewed the information provided in the above WLS COL FSAR sections and finds that the applicant addressed the final configuration of the CWS as specified in the COL Information Item 10.4-1. The staff also finds that the design piping pressures of the WLS CWS are consistent with the design pressures of the conceptual (nonsite-specific) design of the AP1000 CWS, and are, therefore, acceptable.

The staff's evaluation of the CWS final configuration is addressed below under the CDI discussions.

Site-Specific Information Replacing Conceptual Design Information

- WLS CDI

The applicant provided WLS site-specific design information as part of the FSAR to replace the CDI in the AP1000 DCD regarding the CWS. The applicant replaced bracketed text throughout Section 10.4.5 of the AP1000 DCD to provide site-specific CWS power generation design basis information, general CWS description, component description, system operation, tests and inspections, and instrumentation applications. The staff reviewed the WLS CDIs provided throughout WLS COL FSAR Section 10.4.5, including the Revision 5 updates related to the CWS system, and the following provides the staff's evaluation of these CDIs in the application.

In WLS COL FSAR Sections 10.4.5.1, "Design Bases," and 10.4.5.2, "System Description," the applicant provided a description of its CWS system configuration. The CWS is a nonsafety-related system. The CWS supplies cooling water to remove heat from the main condensers, the turbine building closed cooling water system heat exchangers and the condenser vacuum pump seal water heat exchangers under varying conditions of power plant loading and design weather conditions.

In WLS COL FSAR Section 10.4.5.2.1, "General Description," the applicant provided site-specific design information in that the WLS CWS consists of four 33-1/3 percent capacity circulating water pumps, two mechanical draft cooling towers, and associated piping, valves, and instrumentation. Three pumps are normally operating with one pump on standby. In Section 10.4.5.2.2, "Component Description," the applicant states that each pump has a discharge motor operated butterfly valve and stop logs for suction isolation. This permits isolation of each pump for maintenance.

In WLS COL FSAR Section 10.4.5.2.2, "Component Description," the applicant provided WLS-specific design information regarding the CWS major components, such as circulating water pumps, cooling tower, cooling tower makeup and blowdown, and piping and valves, to address the configuration of the CWS. The applicant states that the two mechanical draft cooling towers are round counter-flow type cooling towers with an impingement-type drift eliminator system, and a bypass system. The applicant further states that each cooling tower has a diameter of approximately 360 feet and a height of 85 feet). Also, the cooling towers are designed to cool the circulating water to 88 °F with a hot water inlet temperature of 113 °F. These conceptual design temperatures are consistent with the DCD design parameters for major CWS components found in DCD Table 10.4.5-1, and therefore acceptable to the staff.

Regarding external flooding considerations, the staff could not find any further details regarding the location and proximity of the mechanical draft cooling towers with respect to the plant and safety-related equipment. Therefore, the staff raised a concern regarding the effects of the cooling tower failure on the nearby safety-related equipment and structures of the plant. To complete its review, the staff requested the applicant in WLS RAI 10.04.05-2, to provide clarification and/or additional information to ensure that failure of these towers will not affect the structures, systems and components (SSCs) that perform or support a safety function.

In response to WLS RAI 10.04.05-2, dated September 10, 2008, the applicant revised the FSAR Section 10.4.5.2.2, third paragraph under "Cooling Towers," to read as follows:

The cooling tower basins serve as storage for the circulating water inventory and allow bypassing of the cooling tower during cold weather operations. The cooling tower nearest to the Unit 1 safety-related structures, systems and components (SSCs) is located over 700 ft. west of the Unit 1 auxiliary building. The cooling tower nearest to the Unit 2 safety-related SSCs is located over 600 ft. east of the Unit 2 containment building.

In Revision 5 of WLS COL FSAR, the applicant further revised the this section to include a statement that the cooling tower basins are below grade such that a basin failure will not result in migration of water across the site. It further stated that the site is graded to direct surface water flow away from the nuclear islands and that a break in the cooling tower basin or the associated CWS piping will not have an adverse effect on safety-related SSCs resulting from external plant flooding. The grading of the site combined with the location and below-grade elevation of the cooling tower basins and the associated CWS piping will preclude adverse interactions with safety-related SSCs. The staff finds the applicant's response to RAI 10.04.05-2 acceptable, since the design provisions of the WLS CWS with respect to external flooding meet the requirements of GDC 4 criteria, as described in SRP Section 10.4.5. Therefore, the staff's concern regarding the external flooding due to failure of the cooling towers and its associated piping is resolved, and RAI 10.04.05-2 is closed.

Regarding internal flooding, in WLS COL FSAR Section 10.4.5.2.3, "System Operation," the applicant refers to text from the AP1000 DCD, stating: "The effects of flooding due to a circulating water system failure, such as the rupture of an expansion joint, will not result in detrimental effects on safety-related equipment since there is no safety-related equipment in the turbine building and the base slab of the turbine building is located at grade elevation. Water from a system rupture will run out of the building through a relief panel in the turbine building west wall before the level could rise high enough to cause damage. Site grading will carry the water away from safety-related buildings." The staff finds that a malfunction or a failure of a component or piping of the CWS, including an expansion joint, will not have unacceptable adverse effects on the functional performance capabilities of safety-related systems or components for the reasons noted above. Therefore, the GDC 4 requirements have been satisfied since the flooding that results from failure of the CWS does not adversely impact any safety-related SSCs.

Further, the staff finds that the CWS cooling tower makeup is provided by the RWS, described in WLS COL FSAR Section 9.2.11, "Raw Water System." Makeup to and blowdown from the CWS is controlled by the makeup and blowdown control valves. The evaluation of RWS capabilities is provided in Section 9.2.11 of this SER.

The underground portions of the CWS piping are constructed of prestressed concrete pressure piping. The remainder of the piping is carbon steel and is coated internally with a corrosion-resistant compound. As indicated earlier, the condenser water box drains allow the condenser to be drained to the turbine building sump. Motor-operated butterfly valves are provided in each of the circulating water lines at their inlet to allow the condenser to be drained to the cooling tower basin. Control valves provide regulation of cooling tower makeup. The circulating water system is designed to withstand the maximum operating discharge pressure of the circulating water pumps. The piping design pressure is 621 kPa (90 psig), which is in accordance with the DCD value, and therefore acceptable.

In WLS COL FSAR Section 10.4.5.2.3, "System Operation," the applicant stated that if the circulating water pumps, the cooling tower, or the circulating water piping malfunction and the condenser is not available to adequately support unit operation, cooldown of the reactor may be accomplished by using the power-operated atmospheric steam relief valves or safety valves rather than the turbine bypass system. The staff finds that this alternate cooldown method is acceptable, because the turbine bypass system will not function during accident conditions and the CWS is not required for safe shutdown following an accident. Further, the applicant stated that circulating water flow to the cooling towers can be diverted directly to the basins, bypassing the cooling towers' internals, by opening the bypass valves during plant startup or partial load or to maintain CWS temperatures above 40 °F (4.4 °C). The staff finds that these provisions of the site-specific CWS design meet the requirements of GDC 4, as described in NUREG-0800, Section 10.4.5.

In WLS COL FSAR Section 10.4.5.5, "Instrumentation Application," the applicant identifies the configuration and function of the CWS pressure, temperature and level instrumentation at the WLS site. Also, the motor operated valve at each pump discharge is interlocked with the pump, so that the pump trips if the discharge valve fails to reach the full-open position shortly after starting the pump.

Based on its review of the information provided by the applicant, the staff concludes that the site-specific design of the WLS CWS (WLS CDI) provided in the WLS COL FSAR sections above adequately addresses the information that was specified in the AP1000 DCD.

10.4.5.5 *Post Combined License Activities*

There are no post-COL activities related to this section.

10.4.5.6 *Conclusion*

The NRC staff reviewed the application and checked the referenced DCD. The NRC staff's review confirmed that the applicant addressed the required information relating to the CWS, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

In addition, WLS CDI involving the CWS is adequately addressed by the applicant. The staff concludes that the relevant information presented in the WLS COL FSAR and the applicant's RAI responses are acceptable and meet the acceptance criteria of Section 10.4.5 of NUREG-0800 and the requirements of GDC 4. The staff based its conclusions on the following:

- WLS COL 10.4-1, relating to the final configuration of the circulating water, is acceptable to the staff because the applicant addressed the site-specific design, the chemicals and control and maintenance of the CWS chemistry, in order to be consistent with AP1000 DCD.

- WLS CDI, relating to various aspects of the CWS, is acceptable to the staff because failure of the site-specific CWS design does not adversely impact any safety-related SSCs.

10.4.6 Condensate Polishing System (Related to RG 1.206, Section C.III.1, Chapter 10, C.I.10.4.6, "Condensate Cleanup System")

The condensate polishing system can be used to remove corrosion products and ionic impurities from the condensate system during plant startup, hot standby, power operation with abnormal secondary cycle chemistry, safe shutdown, and cold shutdown operations.

Section 10.4 of the WLS COL FSAR, Revision 11, incorporates by reference, with no departures or supplements, Section 10.4.6 of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.[1] The NRC staff's review confirmed that there is no outstanding issue related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

10.4.7 Condensate and Feedwater System

10.4.7.1 *Introduction*

The condensate and feedwater system provides feedwater at the required temperature, pressure, and flow rate to the SGs. Condensate is pumped from the main condenser hot well by the condensate pumps, passes through the low-pressure feedwater heaters to the feedwater pumps, and then is pumped through the high-pressure feedwater heaters to the SGs.

10.4.7.2 *Summary of Application*

Section 10.4 of the WLS COL FSAR, Revision 11, incorporates by reference Section 10.4 of the AP1000 DCD, Revision 19. Section 10.4 of the DCD includes Section 10.4.7.

In addition, in WLS COL FSAR Section 10.4.7.2.1, the applicant provided the following:

AP1000 COL Information Item

- WLS COL 10.4-2

The applicant provided additional information in WLS COL 10.4-2 to address the COL information item in Section 10.4.12.2, "Condensate, Feedwater and Auxiliary Steam System Chemistry Control," of the AP1000 DCD (COL Action Item 10.5-4).

Supplemental Information

- STD SUP 10.4-1

The applicant provided supplemental information in WLS COL FSAR Section 10.4.7.2.1, “General Description,” which addresses operations and maintenance procedures.

- STD SUP 10.4-2

The applicant provided supplemental information, which states that the EPRI Secondary Water Chemistry Guidelines will be used for guidance on selection of pH control agents and pH optimization as described in Nuclear Energy Institute (NEI) 97-06, “Steam Generator Program Guidelines.”

10.4.7.3 *Regulatory Basis*

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the regulatory basis for acceptance of the COL information item and STD SUP 10.4-2 is GDC 14-Reactor coolant pressure boundary, as it relates to ensuring the integrity of the reactor coolant pressure boundary (specifically as the secondary water chemistry program ensures the integrity of the SG tubing). The applicable acceptance criteria for meeting GDC 14 are found in NUREG-0800 Sections 10.4.6 and 5.4.2.1, including BTP 5-1. The regulatory basis for acceptance of STD SUP 10.4-1 is established in GDC 4, insofar as it requires that the dynamic effects associated with possible fluid flow instabilities (e.g., water hammers) during normal plant operation, as well as during upset or accident conditions be considered, and that SSCs important to safety be designed to accommodate the effects of, and be compatible with the environmental conditions associated with normal operation, maintenance, testing, and postulated accidents.

GDC 4 can be complied with by meeting the relevant acceptance criteria specified in Section 10.4.7 of NUREG-0800, “Condensate and Feedwater System.” In regard to fluid instabilities, the requirements of GDC 4, as related to protecting SSCs against the dynamic effects associated with possible fluid flow instabilities (e.g., water hammers) during normal plant operation, as well as during upset or accident conditions can be met by: (1) meeting the guidance in BTP 10-2, “Design Guidelines for Avoiding Water Hammers in Steam Generators,” for reducing the potential for water hammers in SGs; and (2) meeting the guidance related to feedwater-control-induced water hammer. Guidance for water hammer prevention and mitigation is given in NUREG-0927, Revision 1, “Evaluation of Water Hammer Occurrences in Nuclear Power Plants.”

10.4.7.4 *Technical Evaluation*

The NRC staff reviewed Section 10.4.7 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The NRC staff’s review confirmed that the information in the application and incorporated by reference addresses the required information relating to the condensate and feedwater system. The results of the NRC staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.

- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the WLS COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the BLN Units 3 and 4 COL application.

The staff reviewed the information in the WLS COL FSAR:

AP1000 COL Information Item

- WLS COL 10.4-2

In WLS COL FSAR Section 10.4.7.2.1, the applicant provided additional information in WLS COL 10.4-2 to address the COL information item in Section 10.4.12.2, "Condensate, Feedwater and Auxiliary Steam System Chemistry Control," of the AP1000 DCD, which states:

> The Combined License applicant will address the oxygen scavenging agent and pH adjuster selection for the turbine island chemical feed system.

The commitment was also captured as COL Action Item 10.5-4 in Appendix F of NUREG-1793:

> The COL applicant is responsible for chemistry control of the condensate, feedwater, and auxiliary steam system.

The WLS COL FSAR modified Section 10.4.7.2.1 of the AP1000 DCD, to state:

> The oxygen scavenger agents are hydrazine and carbohydrazide. The pH control agents are dimethylamine and methoxypropylamine.

The NRC staff reviewed the resolution to WLS COL 10.4-2 regarding the text added to Section 10.4.7.2.1, related to condensate, feedwater, and auxiliary steam system chemistry control.

The description of the secondary water chemistry control program is addressed in the AP1000 DCD, Section 10.3.5. Consistency with industry guidelines was addressed in the AP1000 DCD, Section 10.3.5.5, which stated that action taken when chemistry parameters are outside normal operating ranges will, in general, be consistent with action levels described in Reference 1 (“PWR Secondary Water Chemistry Guidelines,” EPRI technical report (TR) TR-102134-R5, March 2000). However, the AP1000 DCD does not specify the oxygen scavenger or pH control chemicals to be used. This is to be addressed by COL Information Item 10.4-2 of the AP1000 DCD.

Revision 6 of the EPRI Secondary Water Chemistry Guidelines (EPRI Guidelines), which is the latest published version of these guidelines, does not require a specific oxygen scavenging agent. However, the guidelines do note that hydrazine and carbohydrazide are the most commonly used oxygen scavenger for PWR secondary systems and are generally recognized as effective for this purpose. Therefore, the staff finds the identified oxygen scavenger agents are consistent with the EPRI guidelines.

For pH control, the EPRI secondary water chemistry guidelines do not require specific amines. Section 3.3.1 of the EPRI Guidelines recommends a plant-specific amine be selected based on a number of factors. Section 3.3.1 of the EPRI Guidelines lists several amines that have been used or are being used in PWR plants as pH control agents, including dimethylamine and methoxypropylamine. Section 3.3.1.2 of the EPRI Guidelines states that if implementing advanced amine treatment, a site-specific materials compatibility review will be necessary to ensure that components, particularly elastomers, are compatible with the amine. The EPRI Guidelines, in Table 5-4, “Recirculating Steam Generator Power Operation (≥30% Reactor Power) Feedwater Sample,” refer to several other EPRI reports for guidance for optimization of the pH in conjunction with the amine selected. The applicant did not explicitly describe how the selected amine was qualified, or how the pH will be optimized in conjunction with the selected amines.

Although the applicant did not explicitly describe how the selected amines were qualified, STD SUP 10.4-2 ensures that the qualification of the chosen oxygen scavenging and pH control chemicals will be consistent with the EPRI PWR Secondary Water Chemistry Guidelines. (See evaluation of STD SUP 10.4-2 below under evaluation of supplemental information).

The staff finds the pH control and oxygen scavenger chemical acceptable because the proposed chemicals will be qualified and the resulting pH optimized following the guidance of the EPRI PWR Secondary Water Chemistry Guidelines, which is referenced in NUREG-0800 as acceptable guidance to ensure that the secondary water chemistry program meets GDC 14. On the basis of the information provided by the applicant and the acceptance criteria in BTP 5-1, the staff concludes that the proposed secondary chemistry that uses hydrazine and carbohydrazide, and dimethylamine and methoxypropylamine is acceptable.

The following portion of this technical evaluation section is reproduced from Section 10.4.7.4 of the VEGP SER:

Supplemental Information

- *STD SUP 10.4-1*

The applicant provided supplemental information as part of the BLN COL FSAR regarding operations and maintenance procedures. The applicant added the following text to the end of Section 10.4.7.2.1 of the AP1000 DCD, Revision 17*:*

Operations and maintenance procedures include appropriate precautions to avoid steam/water hammer occurrences.

The NRC staff reviewed the standard supplemental information provided in STD SUP 10.4-1 regarding the text added to Section 10.4.7.2.1 related to operations and maintenance procedures.

In Section 10.4.7 of NUREG-0800, Acceptance Criteria 2, provides acceptable methods of compliance with the requirements in GDC 4, as it applies to fluid flow instabilities, (e.g., water hammer). Criteria 2B, "Meeting the guidance related to feedwater-control-induced water hammer," states that guidance for water hammer and mitigation is found in NUREG-0927. The supplemental information added to the BLN COL FSAR states that operations and maintenance procedures include appropriate precautions to avoid steam/water hammer occurrences; however, the supplemental information being proposed by the applicant did not identify what type of precautions included in the procedures minimize the potential for water hammer occurrences. In order to ensure that the procedures adequately address water hammer prevention and mitigation, the staff requested in RAI 10.4-7-1, in a letter dated June 3, 2008, that the applicant provide a more detailed statement concerning the use of operations and maintenance procedures, including information on what specific elements in the procedures (i.e., venting) will result in reduced potential of water hammer occurrences.

In its response, dated July 17, 2008, concerning reducing the potential for water hammer events, the applicant identified that they programmatically integrate into the AP1000 Operations Procedure development good operating practice and operating experience including, but not limited to, Institute of Nuclear Power Operations (INPO) significant event reports and significant operating event reports, NRC information notices and bulletins, and other industry operating experience information. Further, the applicant explained that specific operating experience to preclude or mitigate water hammer is included in this population of operating experience. In addition, the applicant explained that the AP1000 has been designed to prevent or minimize steam and water hammer. The applicant *agreed to revise the procedure elements in BLN COL FSAR Section 10.4.7.2.1, and described in STD SUP 10.4-1, to include additional precautions to minimize the potential for steam and water hammer.*

The revised STD SUP 10.4-1, in BLN COL FSAR Section 10.4.7.2.1 now reads as follows:

> *Operations and maintenance procedures include precautions, when appropriate, to minimize the potential for steam and water hammer, including:*
>
> - *Prevention of rapid valve motion.*
> - *Process for avoiding introduction of voids into water-filled lines and components.*
> - *Proper filling and venting of water-filled lines and components.*
> - *Process for avoiding introduction of steam or heated water that can flash into water-filled lines and components.*
> - *Cautions for introduction of water into steam-filled lines or components.*
> - *Proper warmup of steam-filled lines.*
> - *Proper drainage of steam-filled lines.*
> - *The effects of valve alignments on line conditions.*

Based on its review, the staff finds the applicant's response acceptable because a detailed list of the procedural precautions that would reduce or minimize the occurrence of water hammer was provided and included as a proposed revision to the COL application, Part 2, BLN COL FSAR Section 10.4.7.2.1. Further, the staff reviewed the precautions and compared them to the industry experience and staff guidance in accordance with Section 10.4.7 of NUREG-0800 and BTP 10-2. The staff finds that the applicant has adequately addressed the steam and water hammer. Therefore, the staff's concern described in RAI 10.4.7-1 is resolved.

- *STD SUP 10.4-2*

The applicant provided supplemental information explaining that the EPRI PWR Secondary Water Chemistry Guidelines will be used for guidance on selection of pH control agents and pH optimization as described in NEI 97-06.

EPRI documents provide detailed guidelines for both qualification of the selected pH control chemicals and the optimization of the secondary pH. While the staff does not review or accept the EPRI PWR Secondary Water Chemistry Guidelines through a safety evaluation, these guidelines are recognized as representing the industry consensus on best practices in water chemistry control and have been proven to be effective via many years of successful operating experience. As such, the staff finds the application of the guidance of the EPRI PWR Secondary Water Chemistry Guidelines, and a programmatic commitment to use these guidelines, to be an acceptable method for the applicant to ensure compliance with GDC 14. As discussed in a Federal Register (FR) notice, dated March 2, 2005, 70 FR 10298, the reference to NEI 97-06 and the associated water chemistry guidelines provide reasonable assurance that steam generator tube integrity will be maintained.

10.4.7.5 *Post Combined License Activities*

There are no post-COL activities related to this section.

10.4.7.6 *Conclusion*

The NRC staff reviewed the application and checked the referenced DCD. The NRC staff's review confirmed that the applicant addressed the required information relating to the condensate and feedwater system, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the WLS COL FSAR is acceptable and meets the requirements of GDC 4 and GDC 14 and the guidance in Sections 10.4.6, 10.4.7, and 5.4.2.1 of NUREG-0800, NUREG-0927, BTP 5-1, and BTP 10-2. The staff based its conclusions on the following:

- WLS COL 10.4-2 and STD SUP 10.4-2, relating to the condensate, feedwater, and auxiliary system chemistry control program, are in accordance with EPRI PWR Secondary Water Chemistry Guidelines, which is referenced in NUREG-0800 Sections 10.4.6 and 5.4.2.1, including BTP 5-1 of NUREG-0800. Meeting these guidelines ensures that GDC 14 is met with respect to integrity of the reactor coolant pressure boundary, specifically as the secondary water chemistry program ensures the integrity of the SG tubing.

- STD SUP 10.4-1, relating to operations and maintenance, is acceptable to the staff because the applicant has provided a detailed list of the procedural precautions that are consistent with Section 10.4.7 of NUREG-0800 and the BTP 10-2 acceptance criteria.

10.4.8 Steam Generator Blowdown System (Related to RG 1.206, Section C.III.1, Chapter 10, C.I.10.4.8, “Steam Generator Blowdown System (PWR)”)

The SG blowdown system assists in maintaining acceptable secondary coolant water chemistry during normal operation and during anticipated operational occurrences, such as main condenser inleakage or primary to secondary SG tube leakage. It does this by processing water from each SG and removing impurities.

Section 10.4 of the WLS COL FSAR, Revision 11, incorporates by reference, with no departures or supplements, Section 10.4.8 of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.[1] The NRC staff’s review confirmed that there is no outstanding issue related to this section. The results of the NRC staff’s technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

10.4.9 Startup Feedwater System

The startup feedwater system provides a supply of feedwater to the SGs during plant startup, hot standby and shutdown conditions, and during transients in the event of main feedwater system unavailability. The startup feedwater system is composed of components from the AP1000 main and startup feedwater system and SG system.

Section 10.4 of the WLS COL FSAR, Revision 11, incorporates by reference, with no departures or supplements, Section 10.4.9 of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.[1] The NRC staff’s review confirmed that there is no outstanding issue related to this section. The results of the NRC staff’s technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

10.4.10 Auxiliary Steam System

The auxiliary steam system provides the steam required for plant use during startup, shutdown, and normal operation. Steam is supplied from either the auxiliary boiler or the main steam system.

Section 10.4 of the WLS COL FSAR, Revision 11, incorporates by reference, with no departures or supplements, Section 10.4.10 of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.[1] The NRC staff’s review confirmed that there is no outstanding issue related to this section. The results of the NRC staff’s technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

10.4.11 Turbine Island Chemical Feed

The turbine island chemical feed system injects required chemicals into the condensate, feedwater, auxiliary steam, service water, and demineralized water treatment. Chemical feed system components are located in the turbine building.

Section 10.4 of the WLS COL FSAR, Revision 11, incorporates by reference, with no departures or supplements, Section 10.4.11 of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.[1] The NRC staff's review confirmed that there is no outstanding issue related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

10.4.12 Combined License Information

Section 10.4.12 of the WLS COL FSAR, Revision 11, incorporates by reference Section 10.4.12, "Combined License Information," of Revision 19 of the AP1000 DCD. The NRC staff reviewed Section 10.4.12 of the WLS COL FSAR and checked the referenced DCD to ensure the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1]

The applicant addressed COL Information Items 10.4-1, 10.4-2, and 10.4-3. These items are discussed and evaluated in Sections 10.4.5, 10.4.7, and 9.2.5 of this SER, respectively.

11 RADIOACTIVE WASTE MANAGEMENT

The radioactive waste management systems are designed to control, collect, handle, process, store, and dispose of liquid, gaseous, and solid wastes that may contain radioactive materials. The systems include the instrumentation used to monitor and control the release of radioactive effluents and wastes and are designed for normal operation (including refueling; purging; fuel handling and storage; radioactive material handling, processing, use, storage, and disposal; maintenance; routine operational surveillance; in-service inspection (ISI); and calibration), and anticipated operational occurrences (AOOs).

11.1 Source Terms

The radioactive source terms are used to identify the potential dose to members of the public and plant employees as a result of plant operation. This includes consideration of parameters used to determine the concentration of each radionuclide in the reactor coolant, fraction of fission product activity released to the reactor coolant, and concentrations of all non-fission product radionuclide in the reactor coolant. Gaseous and liquid waste sources are considered in the evaluation of effluent releases.

Section 11.1 of the William States Lee III Nuclear Station (WLS) combined license (COL) Final Safety Analysis Report (FSAR), Revision 11, incorporates by reference, Section 11.1, “Source Terms,” of the AP1000 Design Control Document (DCD), Revision 19. In addition, in the WLS COL FSAR, the applicant provided the following:

Departures

- WLS DEP 6.4-1

The applicant provided additional information in Section 11.1 of the WLS COL FSAR about WLS DEP 6.4-1 related to design changes affecting habitability of the main control room and changes to the calculated doses to control room operators. This information, as well as related WLS DEP 6.4-1 information appearing in other chapters of the FSAR, is reviewed in Section 21.2 of this safety evaluation report (SER).

The U.S. Nuclear Regulatory Commission (NRC) staff (the staff) reviewed Section 11.1 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this section.[1] The NRC staff’s review confirmed that there is no outstanding issue related to this section. The results of the NRC staff’s technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793, “Final Safety Evaluation Report Related to Certification of the AP1000 Standard Design,” and its supplements.

---

[1] See Section 1.2.2 of this SER for a discussion of the staff’s review related to verification of the scope of information to be included in a COL application that references a design certification (DC).

11.2 Liquid Waste Management Systems

11.2.1 Introduction

The liquid waste management system (LWMS) is designed to control, collect, process, handle, store, and dispose of liquid radioactive waste generated as the result of normal operation, including anticipated operational occurrences.

11.2.2 Summary of Application

Section 11.2 of the WLS COL FSAR, Revision 11, incorporates by reference Section 11.2 of the AP1000 DCD, Revision 19.

In addition, in WLS COL FSAR Section 11.2, the applicant provided the following:

AP1000 COL Information Items

- STD COL 11.2-1

The applicant provided additional information in Standard (STD) COL 11.2-1 to resolve COL Information Item 11.2-1 (COL Action Item 11.2-1). The additional information addresses the use of mobile or temporary equipment to process liquid effluents in WLS COL FSAR Section 11.2.1.2.5.2.

- STD COL 11.2-2

The applicant provided additional information in STD COL 11.2-2 regarding liquid radwaste cost-benefit analysis methodology.

- WLS COL 11.2-1 and WLS COL 13.5-1

The applicant provided additional information in WLS COL 11.2-1 and WLS COL 13.5-1 to ensure that the total inventory of radioactivity contained in waste processing equipment, skid-mounted systems, and in-process waste located in the Radwaste Building is limited in accordance with RG 1.143, Revision 2. This information is provided to resolve STD COL 11.2-1.

- WLS COL 11.2-2

The applicant provided additional information in WLS COL 11.2-2 to resolve COL Information Item 11.2-2 (COL Action Item 11.2-2). The additional information addresses the dilution factors used for dose calculations and the cost-benefit analysis of population doses in WLS COL FSAR Sections 11.2.3.3 and 11.2.3.5.

- WLS COL 2.4-5 and WLS COL 15.7-1

WLS COL FSAR Section 11.2 does not identify WLS COL 2.4-5 and WLS COL 15.7-1 as COL information items applicable to Section 11.2. However, WLS COL 2.4-5 and WLS COL 15.7-1 provide information regarding a postulated liquid waste tank failure, which is evaluated by the staff as part of liquid waste management. Therefore, WLS COL 2.4-5 and WLS COL 15.7-1 are evaluated in Section 11.2.4 of this SER. In WLS COL FSAR Section 2.4.13, the applicant performed the consequence analysis of a postulated liquid waste tank failure to address COL Information Items 2.4-5 and 15.7-1.

- WLS COL 11.5-3

The applicant provided additional information in WLS COL 11.5-3 to resolve COL Information Item 11.5-3 (COL Action Item 11.5-3). The additional information addresses compliance with Title 10 of the *Code of Federal Regulations* (10 CFR) Part 50, "Domestic Licensing of Production and Utilization Facilities," Appendix I, "Numerical Guides for Design Objectives and Limiting Conditions for Operation to Meet the Criterion 'As Low as is Reasonably Achievable' for Radioactive Material in Light-Water-Cooled Nuclear Power Reactor Effluents," Section II.A in WLS COL FSAR Section 11.2.3.5.

Supplemental Information

- STD SUP 11.2-1

The applicant added in WLS COL FSAR Section 11.2.3.6 supplemental (SUP) information to address the quality assurance (QA) program to be applied to the LWMS.

- STD SUP 11.2-2

The applicant added supplemental information in WLS COL FSAR Section 11.2.3 to address the liquid effluent site interface parameter.

- WLS SUP 11.2-3

The applicant added supplemental information in WLS COL FSAR Section 11.2.1.2.4 regarding the exterior radwaste discharge piping.

License Condition

- Part 10, License Condition, "Radwaste Building Radioactivity Limits"

WLS COL application, Part 10, Section 13, "Radwaste Building Radioactivity Limits," states that prior to initial fuel load, the licensee shall develop, implement, and maintain procedural controls limiting radionuclide inventory in each of the Radwaste Building Monitor Tanks, and separately in each of up to three Radwaste Building mobile radwaste processing systems to below A2 quantities for radionuclides specified in Appendix A to 10 CFR Part 71 (Tables A-1 and A-3), as described in FSAR Section 13.5.2.2.5. The procedures shall also ensure that any additional equipment located in the RWB is limited to the A_2 quantities and that the total cumulative radioactive inventory contained in unpackaged wastes (including liquid waste, wet waste, solid waste, gaseous waste, activated or contaminated metals and components, and contaminated waste present at any time in the Radwaste Building) is limited so that an unmitigated release, occurring over a 2 hour time period, would not result in a dose of greater than 500 millirem at the protected area boundary or an unmitigated exposure, occurring over a 2 hour time period, would not result in a dose of greater than 5 rem to site personnel located 10 feet from the total cumulative radioactive inventory.

11.2.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the regulatory basis for acceptance of the supplementary information on the LWMS is established in:

- 10 CFR 20.1301(e), as it relates to compliance with 40 CFR 190, "Environmental Radiation Protection Standards for Nuclear Power Operations"
- 10 CFR 20.1302, "Compliance with Dose Limits for Individual Members of the Public"
- 10 CFR 20.1406, "Minimization of Contamination"
- 10 CFR Part 50, Appendix A, "General Design Criteria for Nuclear Power Plants," General Design Criterion (GDC) 60, "Control of Releases of Radioactive Materials to the Environment"
- 10 CFR Part 50, Appendix A, GDC 61, "Fuel Storage and Handling and Radioactivity Control"
- 10 CFR Part 50, Appendix I, Sections II.A and II.D as it relates to liquid effluent dose objectives and associated cost-benefit analysis
- 10 CFR 50.34a, "Design Objectives for Equipment to Control Releases of Radioactive Material in Effluents—Nuclear Power Reactors"
- 10 CFR 52.80(a), as it relates to those inspections, tests, analysis that the licensee shall perform, and the necessary acceptance criteria that are necessary to show the facility shall be constructed and operated in conformity with the COL
- Title 40 of the *Code of Federal Regulations* (40 CFR) Part 190, "Environmental Radiation Protection Standards for Nuclear Power Operations"

Guidance for accepting the supplementary information on the LWMS is in:

- The codes and standards listed in Table 1 of Regulatory Guide (RG) 1.143, "Design Guidance for Radioactive Waste Management Systems, Structures, and Components Installed in Light-Water-Cooled Nuclear Power Plants," Revision 2
- Regulatory Position C.1.1 of RG 1.143, Revision 2
- RG 1.109, "Calculation of Annual Doses to Man from Routine Releases of Reactor Effluents for the Purpose of Evaluating Compliance with 10 CFR Part 50, Appendix I," Revision 1
- RG 1.110, "Cost-Benefit Analysis for Radwaste Systems for Light-Water-Cooled Nuclear Power Reactors"

- RG 1.113, “Estimating Aquatic Dispersion of Effluents from Accidental and Routine Reactor Releases for the Purpose of Implementing Appendix I,” Revision 1

- RG 4.21, “Minimization of Contamination and Radioactive Waste Generation: Life-Cycle Planning”

The acceptance criteria associated with the LWMS are given in Section 11.2 of NUREG-0800, “Standard Review Plan for the Review of Safety Analysis Reports for Nuclear Power Plants (LWR Edition),” and NUREG-0800, Section 2.4.13, Acceptance Criterion No. 5, including Branch Technical Position (BTP) 11-6, referencing the March 2007 Standard Review Plan (SRP).

11.2.4 Technical Evaluation

The staff reviewed Section 11.2 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The staff’s review confirmed that the information in the application and incorporated by reference addresses the required information relating to the LWMS. The results of the staff’s evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

The staff’s review of this application included the following COL information and supplementary items:

- STD COL 11.2-1, Processing of Liquid Waste by Mobile Equipment

- STD COL 11.2-2, Liquid Radwaste Cost-Benefit Analysis Methodology

- WLS COL 11.2-1, Radwaste Building Source Term Inventories

- WLS COL 13.5-1, Radioactive Waste Management Procedures

- WLS COL 11.2-2, Cost-benefit Analysis of Population Doses

- WLS COL 2.4-5, Accidental Release of Liquid Effluents into Groundwater and Surface Water

- WLS COL 15.7-1, Consequences of Tank Failure

- WLS COL 11.5-3, Individual Dose Limits in 10 CFR Part 50, Appendix I

- STD SUP 11.2-1, Quality Assurance

- WLS SUP 11.2-2, Interface Requirements

- WLS SUP 11.2-3, Exterior Radwaste Discharge Piping

In addition to the above items, the staff reviewed the entire section against Section 11.2 of NUREG-0800 to determine if the information in WLS COL FSAR Section 11.2 met the regulatory requirements in the regulations stated above (SER Section 11.2.3) and the

NUREG-0800 acceptance criteria. The relevant NUREG-0800 acceptance criteria are as follows:

- The LWMS should have the capability to meet the dose design objectives and include provisions to treat liquid radioactive wastes such that the following is true:

    A. The calculated annual total quantity of all radioactive materials released from each reactor at the site to unrestricted areas will not result in an estimated annual dose or dose commitment from liquid effluents for any individual in an unrestricted area from all pathways of exposure in excess of 0.03 millisievert (mSv) (3 millirem (mrem)) to the total body or 0.1 mSv (10 mrem) to any organ. RG 1.109, RG 1.112, and RG 1.113 provide acceptable methods for performing this analysis.

    B. In addition to A above, the LWMS should include all items of reasonably demonstrated technology that, when added to the system sequentially and in order of diminishing cost-benefit return for a favorable cost-benefit ratio, can effect reductions in doses to the population reasonably expected to be within 80 kilometers (km) (50 miles (mi)) of the reactor. RG 1.110 provides an acceptable method for performing this analysis.

    C. The concentrations of radioactive materials in liquid effluents released to unrestricted areas should not exceed the concentration limits in Table 2, Column 2 of Appendix B, "Annual Limits on Intake (ALIs) and Derived Air Concentrations (DACs) of Radionuclides for Occupational Exposure; Effluent Concentrations; Concentrations for Release to Sewerage" to 10 CFR Part 20, "Standards for Protection Against Radiation."

- The LWMS should be designed to meet the anticipated processing requirements of the plant. Adequate capacity should be provided to process liquid wastes during periods when major processing equipment may be down for maintenance (single failures) and during periods of excessive waste generation. Systems that have adequate capacity to process the anticipated wastes and that are capable of operating within the design objectives during normal operation, including anticipated operational occurrences, are acceptable. To meet these processing demands, interconnections between subsystems, redundant equipment, mobile equipment, and reserve storage capacity will be considered.

- System designs should describe features that will minimize, to the extent practicable, contamination of the facility and environment; facilitate eventual decommissioning; and minimize, to the extent practicable, the generation of radioactive waste, in accordance with the guidelines of RG 1.143, for liquids and liquid wastes produced during normal operation and anticipated operational occurrences, and the requirements of 10 CFR 20.1406. These system design features should be provided in the FSAR or the COL application to the extent that they are not addressed in a referenced certified design or design certification (DC) application.

- BTP 11-6, as it relates to the assessment of a potential release of radioactive liquids following the postulated failure of a tank and its components, located outside of containment, and impacts of the release of radioactive materials at the nearest potable water supply, located in an unrestricted area, for direct human consumption or indirectly through animals, crops, and food processing.

Section 1.2.3 of this SER provides a discussion of the strategy used by the staff to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (Vogtle Electric Generating Plant (VEGP) Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from requests for additional information (RAIs).
- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and finds the evaluation performed for the standard content to be directly applicable to the WLS COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) contains evaluation material from the SER for the Bellefonte Nuclear Plant (BLN), Units 3 and 4 COL application.

AP1000 COL Information Items

The following portion of this technical evaluation section is reproduced from Section 11.2.4 of the VEGP SER:

> *The following portion of this technical evaluation section is reproduced from Section 11.2.4 of the BLN SER:*
>
> - STD COL 11.2-1
>
> *The applicant provided additional information in STD COL 11.2-1 to resolve COL Information Item 11.2-1. COL Information Item 11.2-1 states:*
>
> > *The Combined License applicant will discuss how any mobile or temporary equipment used for storing or processing liquid radwaste conforms to Regulatory Guide 1.143. For example, this includes discussion of equipment containing radioactive liquid radwaste in the non-seismic Radwaste Building.*

The commitment was also captured in COL Action Item 11.2-1 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:

> *The COL applicant will provide information on how any mobile or temporary equipment used for storing or processing liquid radwaste conforms to RG 1.143.*

The applicant provided information in BLN COL FSAR Section 11.2.1.2.5.2 that addresses how any mobile or temporary equipment that will be used for storing or processing liquid radwaste conforms to RG 1.143. For example, this includes discussion of equipment containing radioactive liquid radwaste in the non-seismic Radwaste Building. The staff issued Request for Additional Information (RAI) 11.2-5 to clarify some of the language used in the COL concerning the extent of compliance with RG 1.143 for the temporary and mobile equipment. The applicant responded to this RAI by proposing a revision to the BLN COL FSAR text to clearly state that the applicable requirements in RG 1.143 pertain to mobile and temporary equipment.

The NRC staff reviewed the resolution of COL Information Item 11.2-1 related to the use of mobile or temporary equipment included under Section 11.2 of the BLN COL FSAR and found that the applicant's commitments for installing and operating mobile systems meets the acceptance criteria in Section 11.2 of

NUREG-0800 and RG 1.143. The NRC staff verified that Revision 1 of the BLN COL FSAR (STD COL 11.2-1) adequately incorporates the above. As a result, RAI 11.2-5 is closed.

- *STD COL 11.2-2*

The discussion of VEGP COL 11.2-2 addresses the site-specific cost-benefit analysis performed to address the requirements of 10 CFR Part 50, Appendix I, regarding population doses due to liquid effluents. The applicant provided additional information in STD COL 11.2-2 to resolve COL Information Item 11.2-2 with regard to the cost-benefit analysis methodology.

The NRC staff reviewed the resolution of COL Information Item 11.2-2 related to the cost-benefit analysis methodology described in VEGP FSAR Section 11.2.3.5.1 and concluded that the methodology used for the analysis was consistent with the guidance of RG 1.110 and was, therefore, acceptable.

- WLS COL 11.2-1 and WLS COL 13.5-1

For the staff's evaluations of WLS COL 11.2-1 and WLS COL 13.5-1, the staff applied the design centered review approach discussed in Section 1.2.3 of this SER. Under this approach, the staff performed a single review where multiple COL applicants submitted identical information. In this case, the reference COL is the Levy Nuclear Plant (LNP) Units 1 and 2, and the WLS COL is a subsequent COL.

The following portion of this technical evaluation section is reproduced from Section 11.2.4 of the LNP SER:

While BLN RAI 11.2-5 and COL FSAR Section 11.2.1.2.5.2 address mobile and temporary processing equipment, neither the response to BLN RAI 11.2-5 or information already contained in this FSAR section included a discussion of how the cumulative source term inventories of all relevant radioactive materials present in the Radwaste Building, including that in mobile or temporary equipment, conforms with the RG 1.143, Revision 2 dose acceptance criteria. Specifically, Regulatory Position C.5.1 of RG 1.143, Revision 2 states, "for a given structure housing radwaste processing systems or components, if the total design basis unmitigated radiological release (considering the maximum inventory) at the boundary of the unprotected area is greater than 500 millirem per year or the maximum unmitigated exposure to site personnel within the protected area is greater than 5 rem per year, the external structures are classified as RW-IIa." Since the AP1000 Radwaste Building is classified as RW-IIc (a classification less stringent than RW-IIa), the inventories of radioactive materials in this building should be managed and controlled in a way that will not result in these dose criteria being exceeded.

After reviewing the response to BLN RAI 11.2-5 and the FSAR information addressing COL information item 11.2-1, the staff issued RAI 11.02-4 requesting that the applicant provide information related to the types and quantities of radioactive material within the Radwaste Building and describing how the unmitigated dose criteria to a worker and members of the public will be met, given the guidance and acceptance criteria of RG 1.143, Revision 2.

In the response to RAI 11.02-4, dated February 11, 2013, the applicant indicated that there will be three primary types of radioactive waste within the Radwaste Building. The three types of waste are; 1) liquid waste stored within the three 15,000 gallon monitor tanks, 2) waste associated with liquid mobile waste processing systems which may be utilized within the Radwaste Building, and 3) solid wastes and wastes which have been packaged and are ready for shipment.

The applicant provided information explaining how operational programs and procedures will ensure that the RG 1.143, Revision 2 dose criteria are not exceeded from the monitor tanks and mobile equipment. In this context, waste that is packaged and ready for shipment is not within the scope of RG 1.143, Revision 2. In its response, the applicant assumed that monitor tanks and a mobile skid-mounted processing system located in the radwaste building have the same radionuclide distributions and inventories as the effluent holdup tank listed in FSAR Table 2.4.13-202, normalized to the 10 CFR Part 71, Appendix A, A_2 limit (with A_2 quantities being calculated using 10 CFR Part 71, Appendix A information). The total radioactivity in a mobile skid-mounted processing equipment was assumed to be analogous to the radioactivity that would be contained in a demineralizer used for the same functional purpose. Using conservative assumptions, the applicant calculated dose rates that were less than the unmitigated release and exposure acceptance criteria of RG 1.143, Revision 2. In addition, the applicant provided a proposed FSAR markup and license condition requiring that procedures be developed, prior to fuel load, limiting the amount of radioactive materials in each of the monitor tanks and in the mobile processing equipment to below the 10 CFR Part 71 A_2 quantities.

While this response partially resolved the staff's technical and regulatory concerns, the effluent holdup tank radioactive source term, provided in FSAR Table 2.4.13-202, used in developing the A_2 quantities for the monitor tanks and mobile equipment was based on a fuel failure rate of 0.125 percent. While this fuel failure rate assumption is acceptable for complying with SRP Section 11.2, BTP 11-6, for the purposes of RG 1.143 the design basis failed fuel fraction of 0.25 percent should have been used instead, consistent with the guidance provided in SRP Section 12.2. In addition, while RG 1.143, Revision 2 indicates that the total building inventory should be considered in accordance with Regulatory Position C.5.1, it was unclear if the applicant was considering the cumulative source term of all components typically used in a mobile processing skid and if the cumulative source term from up to three mobile skids were being considered to support waste processing operations. AP1000 DCD, FSAR Chapter 11, indicates that three mobile skids may be present at any one time in the Radwaste Building. Also, the staff was concerned that pre-processed or unpackaged waste may be present in the Radwaste Building, such as contaminated equipment or components or waste previously transferred from mobile equipment, and were potentially not being considered in the response and proposed FSAR markup and license condition. Finally, the staff determined that additional information should be provided in response to COL Information Items 11.2-1 and 11.4-1 since the responses to the COL items did not fully address how waste associated with mobile equipment or unpackaged waste would be controlled in complying with the safety classification assigned to the Radwaste Building. As a result, the staff closed RAI 11.02-4 and issued supplementary RAI 11.02-5 to resolve the above concerns and request additional information related to the response to COL Information Items 11.2-1 and 11.4-1 and conformance with RG 1.143, Revision 2, acceptance criteria.

In the initial response to RAI 11.02-5, dated April 26, 2013, the applicant revised the source term for an individual monitor tanks using the RCS source term and radionuclide concentrations described in FSAR Table 2.4.13-202 and DCD Table 11.1-2. This source term is based on the design basis defective fuel fraction of 0.25 percent. This source term was normalized to the 10 CFR Part 71, Appendix A, A_2 limit and is provided in Table 1 of the response. This source term was also used in calculating doses from each mobile waste processing skid, as each skid is also being limited to an inventory corresponding the 10 CFR Part 71, A_2 quantities. In addition, the applicant indicated that the source term assigned to each mobile skid was calculated assuming that the entire source term is contained in a demineralizer as a conservative approach in calculating doses. Using these source terms, the applicant recalculated the cumulative dose rate to a worker and member of the public from an unmitigated release. The applicant calculated a dose of 87 mrem to a member of the public at the protected area boundary using conservative assumptions. The dose to a worker was calculated to be 2,230 mrem at a distance of 10 feet from multiple radioactive sources in the building. However, the applicant did not provide the basis for the 10-foot distance in its analysis.

As a further commitment, the applicant updated FSAR Section 13.5.2.2.5 and proposed to revise operational procedures to include a provision requiring that spent filtration and adsorption media transferred from mobile radwaste *processing systems be transferred and packaged for offsite shipment prior to placing the mobile radwaste processing system back into service. This provision is necessary to ensure that the total cumulative inventory of unpackaged waste in the RWB is not exceeded. Finally, the applicant updated its response to COL items 11.2-1 and 11.4-1 (FSAR Sections 11.2.1.2.5.2 and 11.4.6) and the proposed license condition, with new information, providing additional detail as to how the quantity of radioactive materials in the Radwaste Building will be controlled in ensuring that RG 1.143, Revision 2 dose acceptance criteria are met. However, even with the new information, staff determined that the proposed revision to the FSAR and new license condition did not provided sufficient information to ensure conformance with RG 1.143, Revision 2. Specifically, the applicant did not provide sufficient technical justification for the 10 foot distance used to calculate the unmitigated dose to a worker, and the proposed FSAR language and license condition did not ensure that all forms of unpackaged radioactive material in the Radwaste Building would be controlled during the operation of the plant.*

Consequently, the staff requested that the applicant address these concerns, and the applicant provided an updated revision to the response on July 1, 2013. In this response, the proposed FSAR markups were revised to include additional provisions to ensure that the total cumulative inventory of all unpackaged radioactive materials in the Radwaste Building would be limited to the unmitigated release and exposure criteria specified in RG 1.143, Revision 2. In addition, the applicant justified the assumed 10-foot distance in calculating the unmitigated dose to workers. The applicant explained that operator work stations and low dose rate waiting areas are typically no closer than 10 feet from the major sources of radioactivity located in the Radwaste Building. While the applicant provided a revised license condition in their response, the staff suggested specific revisions to the license condition to ensure that operational procedures limit all unpackaged waste in the Radwaste Building to the RG 1.143, Revision 2 dose acceptance criteria..

On August 23, 2013, the applicant provided a revised response to RAI 11.05-2 modifying the proposed license condition wording in LNP COL application, Part 10, License Conditions and ITAAC, and in Section 13, "Radwaste Building Radioactivity Limits" of the LNP FSAR, to ensure that operational procedures limit all unpackaged waste in the Radwaste Building to the RG 1.143, Revision 2 dose acceptance criteria, as suggested by the staff. In addition, the applicant proposed revised FSAR language in the response, but the proposed FSAR language was not entirely consistent with the proposed license condition. Finally, in a September 12, 2013, response (ML13259A147), the applicant proposed to revise the FSAR wording to make it consistent with the proposed license condition. The proposed FSAR wording and license condition ensure that the cumulative inventory of all unpackaged waste will be controlled in accordance with RG 1.143, Revision 2.

In summary, the applicant provided additional information in FSAR Sections 11.2.1.2.5.2, 11.4.6, and 13.5.2.2.5 which fully address COL Information Items 11.2-1 and 11.4-1 (a parallel discussion related to the resolution of COL Information Item 11.4-1 is provided in SER Section 11.4.4, below). Specifically, *the applicant committed to the implementation of operational procedures that will ensure that the quantity of radioactive materials associated with each of the three monitoring tanks, in each of up to three mobile processing systems, and in any additional equipment located in the Radwaste Building, containing unpackaged waste, are limited to less than the 10 CFR Part 71, A_2 quantities. In addition, the applicant's procedures ensure that the total cumulative inventory of all unpackaged waste in the Radwaste Building (including the waste in the monitoring tanks, mobile processing systems, and any additional equipment, as well as any other unpackaged waste in the Radwaste Building) is limited consistent with the RG 1.143, Revision 2 dose acceptance criteria, given the safety classification RW-IIc assigned to the Radwaste Building. Finally, the revised license condition and FSAR language ensure that the applicant's procedures will conform with RG 1.143, Revision 2. Therefore, the September 12, 2013, response to RAI 11.02-5, including the proposed license condition, is acceptable. In addition, the response fully and adequately addresses COL Information Items 11.2-1 and 11.4-1. The staff confirmed that FSAR Sections 11.2.1.2.5.2, 11.4.6, and 13.5.2.2.5 were updated in accordance with the language in the September 12, 2013 letter.*

- WLS COL 11.2-2

The applicant provided additional information in WLS COL 11.2-2 to resolve COL Information Item 11.2-2, which states:

> The analysis performed to determine offsite dose due to liquid effluents is based upon the AP1000 generic site parameters included in Chapter 1 and Tables 11.2-5 and 11.2-6. The Combined License [COL] applicant will provide a site specific cost-benefit analysis to address the requirements of 10 CFR 50, Appendix I, regarding population doses due to liquid effluents.

The commitment was also captured as COL Action Item 11.2-2 in Appendix F of NUREG-1793, which states:

> The applicant will provide a site-specific cost-benefit analysis to demonstrate compliance with 10 CFR Part 50, Appendix I, regarding population doses due to liquid effluents.

The staff reviewed the resolution of COL Information Item 11.2-2 related to the cost-benefit analysis included under Section 11.2.3.5.2 of the WLS COL FSAR and issued RAI 13, Question 11.02-1. This RAI stated that the applicant needed to provide a detailed and plant-specific cost-benefit analysis. The applicant provided this analysis in a December 11, 2008, response to the RAI.

The results of the applicant's analysis showed that the lowest-cost option for liquid radwaste treatment system augments is a 20 gallons per minute (gpm) cartridge filter at $11,140 per year, which yields a threshold value of 11.14 person-rem total body or thyroid dose from liquid effluents. For AP1000 sites with population dose estimates less than 11.14 person-rem total body or thyroid dose from liquid effluents, no further cost-benefit analysis is needed to demonstrate compliance with 10 CFR Part 50, Appendix I, Section II.D. The total body (0.296 person-rem) and thyroid (0.393 person-rem) population doses provided by the applicant in WLS COL FSAR Table 11.2-204 are a small fraction of the threshold dose of

11.14 person-rem. Thus, the applicant concluded that the LWMS meets the as low as reasonably achievable (ALARA) requirements and requires no augments.

The staff performed an independent assessment using the population doses calculated by the staff (see following section) and the guidance in RG 1.110 and came to the same conclusion. As a result, the staff considers RAI 13, Question 11.02-1 closed and COL Information Item 11.2-2 resolved.

- WLS COL 2.4-5 and WLS COL 15.7-1

The applicant provided additional information in WLS COL 2.4-5 and WLS COL 15.7-1 to resolve COL Information Items 2.4-5 and 15.7-1.

COL Information Item 2.4-5 states:

> Combined License applicants referencing the AP1000 certified design will address site-specific information on the ability of the ground and surface water to disperse, dilute, or concentrate accidental releases of liquid effluents. Effects of these releases on existing and known future use of surface water resources will also be addressed.

The commitment was also captured as COL Action Item 2.4.1-1 in Appendix F of NUREG-1793, which states:

> The COL applicant will provide site specific information on the ability of the ground and surface water to disperse, dilute, or concentrate accidental releases of liquid effluents. The COL applicant will also address the effects of such releases on existing and known future use of surface water resources.

COL Information Item 15.7-1 states:

> Combined License applicants referencing the AP1000 certified design will perform an analysis of the consequences of potential release of radioactivity to the environment due to a liquid tank failure as outlined in Subsection 15.7.3.

The commitment was also captured as COL Action Item 15.3.8-1 in Appendix F of NUREG-1793, which states:

> The COL applicant will perform a site-specific analysis of the consequences of a potential release of radioactivity to the environment as a result of a liquid tank failure.

Section 2.4.13 of the WLS COL FSAR addresses accidental release of liquid effluents into ground and surface water. The applicant postulated a release of the contents of the effluent hold-up tank (or hold-up tank). BTP 11-6 provides guidance in assessing potential release of radioactive liquids at the nearest potable water supply located in an unrestricted area. BTP 11-6 further states the evaluation of the release should consider the use of water for direct human consumption or indirectly through animals (livestock watering), crops (agricultural irrigation), and food processing (water as an ingredient).

Evaluations performed by the applicant determined that the hold-up tanks have the greatest potential radionuclide inventory of all waste effluent system tanks. Spent resin storage tanks were considered by the applicant, but were excluded because most of the activity is bound to the spent resins and have minimal free water in them. Tanks inside the containment building were not considered because the containment building is a Seismic Category I structure. Other tanks were considered such as the monitor tanks, the hold-up tanks, and the chemical waste tank. The hold-up tanks were found to have the highest potential radioactivity concentration and highest volume. Based on groundwater flow directions shown on WLS COL FSAR Figure 2.4.12-204, Sheet 8, Unit 2 was analyzed because its tanks are nearer the points of exposure, which are Hold-Up Pond A and the Broad River. The contents spilled from the tank were assumed to enter the groundwater instantaneously. The source term developed by the applicant is as follows:

- Tritium source term concentration is 1.0 microcuries per gram taken from AP1000 DCD Table 11.1-8
- Corrosion product source terms Cr-51, Mn-54, Mn-56, Fe-55, Fe-59, Co-58, and Co-60 taken from AP1000 DCD Table 11.1-2
- Other radionuclide source terms taken from AP1000 DCD Table 11.1-2, multiplied by 0.12/0.25 to adjust the radionuclide concentrations to the required 0.12 percent failed fuel fraction outlined in BTP 11-6

The applicable regulatory acceptance criteria for a liquid waste tank failure is that the postulated failure would not result in radionuclide concentrations in excess of 10 CFR Part 20, Appendix B, Table 2, Column 2 values (effluent concentration limit ((ECL)) values) at the nearest source of potable water, where the ECL radionuclide concentrations correspond to a calculated dose of 50 mrem per year from the drinking water pathway. The applicant provided an analysis for compliance with 10 CFR Part 20, in Section 2.4.13. Compliance was demonstrated by calculating concentration/ECL ratios for all the radionuclides expected to enter the Broad River. The nearest potable surface water supply was in the Broad River. All the ratios for the location were determined to be less than one. In addition, the applicant demonstrated compliance with the requirement that the sum of the individual ratios of nuclide concentration to its ECL must be less than unity. The result of this calculation was that the sum of the ratios was 0.1 for the Broad River. The calculation is conservative in that no credit is taken for dilution of radionuclides in the Broad River caused by water flow and that the radionuclides are assumed to remain in the Broad River near groundwater discharge point for a period of 1 year.

The applicant's initial application did not include an analysis of pathways of exposure other than drinking water. The staff concluded that the analysis should also have discussed other applicable pathways, such as fish and crop irrigation. These pathways of exposure may concentrate radionuclide levels, leading to potentially higher dose contributions. In a December 3, 2008, response to RAI 34, Question 02.04.13-2, the applicant evaluated potential doses from the fish and irrigated foods pathways for the liquid tank failure analysis. Using RESRAD-OFFSITE dose methodology, the applicant calculated hypothetical doses to members of the public of 0.071 mrem/year from fish consumption and 0.244 mrem/year from irrigated crops consumption. The staff reviewed the applicant's analysis and performed an independent evaluation of the fish and irrigated crop pathways. These evaluations are presented below.

The staff applied the dose calculational methodology of RG 1.109, using the applicant's conservatively evaluated maximum concentration of radionuclides in the Broad River assuming no additional dilution in the river. Using this methodology, the staff calculated hypothetical doses of 0.14 mrem/year for fish consumption and 0.043 mrem/year for irrigated crops ingestion. These doses are sufficiently consistent with those calculated by the applicant to constitute independent confirmation, with differences attributable to modeling assumptions.

As the above analyses for fish and irrigated crop ingestion show, doses resulting from the failure of a waste hold-up tank would be a small fraction of the established regulatory limit. The sum of the fish consumption and irrigated vegetable pathways with the drinking water pathway yields a hypothetical maximum individual dose of approximately 5 mrem assuming a full year exposure time. This total is a small fraction of the 50 mrem/year dose criterion for the liquid tank failure analysis.

Based on the above evaluations and the applicant's analysis in the WLS COL FSAR, the staff finds potential doses to members of the public resulting from an accidental release of liquid effluents meets Acceptance Criterion No. 5 in NUREG-0800 and the referenced BTP 11-6; therefore, the staff considers RAI 34, Question 02.04.13-2 closed and COL Information Items 2.4-5 and 15.7-1 resolved. A complete evaluation at the point of the dose receptor is presented in SER Section 2.4.13, "Accidental Releases of Radioactive Liquid Effluents in Ground and Surface Waters."

- WLS COL 11.5-3

The applicant provided additional information in WLS COL 11.5-3 to resolve the COL responsibilities as set forth in Section 11.5.7 of the AP1000 DCD, which states:

> The Combined License applicant is responsible for addressing the 10 CFR Part 50, Appendix I, Sections II.A and II.D guidelines for maximally exposed offsite individual doses and population doses via liquid and gaseous effluents.

The commitment was also captured as COL Action Item 11.5-3 in Appendix F of NUREG-1793, which states:

> The COL applicant is responsible for addressing the guidelines of Appendix I to 10 CFR Part 50, as they relate to maximally exposed offsite individual doses and population doses attributable to liquid and gaseous effluents.

In WLS COL FSAR Section 11.2.3.5, the applicant discussed the methods used to assure that individual and estimated population doses are maintained ALARA in accordance with 10 CFR Part 50, Appendix I (this information is also applicable to WLS COL FSAR Sections 11.3.3.4 and 11.4).

The staff reviewed the applicant's response to WLS COL 11.5-3 related to compliance with 10 CFR Part 50, Appendix I, Sections II.A and II.D and issued RAI 13, Questions 11.02-3 and 11.02-4. In RAI 13, Question 11.02-3, the staff requested that the applicant provide the details of the individual and population dose analysis. In RAI 13, Question 11.02-4, the staff questioned the applicant's assumption concerning the elimination of the irrigation exposure pathway.

In a December 11, 2008, response to RAI, Questions 11.02-3 and 11.02-4, the applicant provided a description of the required model assumptions and input parameters needed to run LADTAP II computer codes and justification for excluding the irrigation exposure pathway to calculate doses.

Using radiological exposure models based on RG 1.109 and the LADTAP II computer program (NUREG/CR-4013, "LADTAP II - Technical Reference and User Guide," April 1986), the applicant calculated the estimated doses to a hypothetical maximally exposed individual (MEI) of the public and to the population within 80 km (50 mi) from the postulated liquid effluents discharged.

WLS COL FSAR Tables 11.2-201 and 11.2-202 include liquid pathway parameters used as input to the dose calculation, including discharge flow rate, site-specific dilution factors, transit-times to receptors, consumption factors for fish and water, and recreational usage data for the Broad River. The analysis assumed a completely mixed impoundment model to calculate dilution of the radioactive effluent by the Broad River. Given the proximity of the discharge structure to the Ninety-Nine Islands Hydroelectric Dam, which impounds the "run-of-the-river" Ninety-Nine Islands Reservoir, the diffusion characteristics of the discharge piping and the river flow velocity, the staff viewed the mixing model as a discharge into the river fully mixing with the river flow. The downstream exposure pathways would then effectively see a dilution of 189.4 (ratio of flow rate through the dam divided by liquid effluent discharge flow rate). The result for both individual and population doses were the same as in the applicant's analysis. WLS COL FSAR Tables 11.2-203 and 11.2-204 list the liquid pathway doses to the MEI and surrounding population, respectively.

The applicant calculated a maximum individual annual dose (per unit) to the adult total body of 6.09E-04 mSv (0.0609 mrem) and a maximum annual individual dose (per unit) to the child liver of 7.75E-04 mSv (0.0775 mrem). The applicant compared the MEI doses with the 10 CFR Part 50, Appendix I, Section II.A criteria and showed the doses to be well below the limits of 3 mrem to the total body and 10 mrem to any organ.

The calculated annual population doses listed in WLS COL FSAR Table 11.2-204 are 2.96E-03 person-Sv (0.296 person-rem) to the total body (per unit), and 3.93E-03 person-Sv (0.393 person-rem) to the thyroid (per unit). The applicant uses the population doses in the cost-benefit analysis previously described in this report.

In the response to RAI 13, Question 11.02-3, the applicant explained the derivation of values used for population water use, sport fish harvest, commercial fish harvest, and recreational time spent on the river. The staff reviewed the derivation of these values and found them to be reasonable upper bound estimates. Consequently, the staff used the applicant's values in its independent dose estimation.

In the response to RAI 13, Question 11.02-4, the applicant stated that consumption of most of an individual's annual intake of vegetables from a vegetable garden irrigated with public water was not regarded as either a pathway that fell within a reasonable deviation from the average for the population, or a pathway unique to the WLS site that was likely to contribute a dose increment equal to or greater than 10 percent of the total from all pathways considered in RG 1.109. Therefore, individual use of public water for garden irrigation was not considered in the determination of doses to the public from routine release of liquid reactor effluents from WLS Units 1 and 2. The applicant then provided a conservative dose analysis that concluded that the calculated individual dose associated with the irrigated, individual garden pathway contributes just 2 percent of the total body dose due to all liquid effluent pathways. The population dose did not include crop irrigation since it was not found to occur in the vicinity of the WLS site. Since the calculated dose does not have the potential to contribute 10 percent or more to individual or population doses, the applicant did not consider this pathway to be significant given the guidance of RG 1.109. The staff evaluated this response and concurred that this pathway is not significant. Therefore, the staff finds that the doses to the MEI and population associated with consuming vegetables watered by public drinking water are not included in the dose analyses.

The staff performed an independent assessment using the LADTAP II computer code and compared results to the applicant's and the Appendix I criteria. The modeling assumptions used by the staff for the MEI and population dose calculations, as shown in Table 11.2-1 of this SER, were consistent with the applicant's. Modeling parameter values, as shown in Table 11.2-2 of this SER, were also consistent with the applicant's. The results of the staff's calculations were consistent with those of the applicant.

Table 11.2-3 of this SER compares the resulting dose estimates between the applicant's analysis and the 10 CFR Part 50, Appendix I criteria. This table shows that all doses are below the Appendix I criteria. The staff concludes that the applicant has provided a bounding assessment demonstrating its capability to comply with the regulatory requirements in 10 CFR Part 20 and 10 CFR Part 50, Appendix I and, therefore, considers COL Information Item 11.5-3 resolved.

Based on the above evaluation, RAIs 11.2-3 and 11.2-4 are closed.

Supplemental Information

The following portion of this technical evaluation section is reproduced from Section 11.2.4 of the VEGP SER:

> *The following portion of this technical evaluation section is reproduced from Section 11.2.4 of the BLN SER:*
>
> - *STD SUP 11.2-1*
>
> *The applicant provided supplemental information in BLN COL FSAR Section 11.2.3.6, "Quality Assurance," addressing the quality assurance program to be applied to the liquid waste system and stated that the program complies with the guidance presented in RG 1.143.*
>
> *The NRC staff reviewed this supplemental quality assurance information included in BLN COL FSAR Section 11.2.3.6 and finds that this supplemental statement commits the applicant to the regulatory positions in RG 1.143 related to quality assurance and is acceptable.*

- WLS SUP 11.2-2

The applicant stated that the only liquid effluent site interface parameter outside the Westinghouse scope is the release point to the Broad River. The staff finds this statement correct because the release point to the environment of liquid radioactive effluent is site-specific and to the Broad River.

- WLS SUP 11.2-3

The applicant provided supplemental information in WLS SUP 11.2-3 related to the exterior radwaste discharge piping. The information stated that the exterior radwaste discharge piping is enclosed within a guard pipe and monitored for leakage and that liquid radwaste effluent will be discharged to the Broad River with plant discharge.

This item is related to 10 CFR 20.1406 and is addressed in Section 12.3 of this SER.

License Condition

The applicant proposed the following license condition:

> Prior to initial fuel load, the licensee shall develop, implement, and maintain procedural controls limiting radionuclide inventory in each of the Radwaste Building Monitor Tanks, and separately in each of up to three (3) Radwaste Building mobile radwaste processing systems to below A2 quantities for radionuclides specified in Appendix A to 10 CFR Part 71 (Tables A-1 and A-3), as described in FSAR Section 13.5.2.2.5. The procedures shall also ensure that any additional equipment located in the RWB is limited to the A_2 quantities and that the total cumulative radioactive inventory contained in unpackaged wastes (including liquid waste, wet waste, solid waste, gaseous waste, activated or contaminated metals and components, and contaminated waste present at any time in the Radwaste Building) is limited so that an unmitigated release, occurring over a 2-hour time period, would not result in a dose of greater than 500 millirem at the protected area boundary or an unmitigated exposure, occurring over a 2 hour time period, would not result in a dose of greater than 5 rem to site personnel located 10 feet from the total cumulative radioactive inventory.

The evaluation of this license condition is discussed above in the evaluation of WLS COL 11.2-1 and WLS COL 13.5-1.

Demonstrating Compliance with 10 CFR 20.1301(e)

Pursuant to 10 CFR 20.1301(e), the NRC-licensed facilities must comply with the U.S. Environmental Protection Agency's (EPA) generally applicable environmental radiation standards of 40 CFR Part 190 for facilities that are part of the fuel cycle. The EPA annual dose limits are 0.25 mSv (25 mrem) to the whole body, 0.75 mSv (75 mrem) to the thyroid, and 0.25 mSv (25 mrem) to any other organ. Meeting the requirements of 10 CFR 20.1301(e) requires the consideration of all potential sources of external radiation and radioactivity, including liquid and gaseous effluents and external radiation exposures from buildings, storage tanks, radioactive waste storage areas, and N-16 skyshine from boiling-water reactor (BWR) turbine buildings. The EPA standards apply to the entire site or facility, whether it has single or multiple units.

The staff's review of the WLS COL FSAR revealed that the applicant did not provide any information demonstrating compliance with 10 CFR 20.1301(e). Therefore, in RAI 13, Question 11.02-2, the staff requested that the applicant demonstrate compliance with the EPA standard.

The applicant provided the demonstration by summing the annual individual liquid and gaseous effluent doses for WLS Units 1 and 2. In a December 11, 2008, response to RAI 13, Question 11.02-2, the applicant listed the results in WLS COL FSAR Table 11.2-206. Table 11.2-4 of this SER lists these dose summations and compares them to the dose requirements in 40 CFR Part 190. The expected doses are below the EPA limits, therefore, the staff finds that the requirement of 10 CFR 20.1301(e) is met. The staff verified that Table 11.2-206 has been incorporated in the WLS COL FSAR. Accordingly, the staff considers RAI 13, Question 11.02-2 resolved.

Demonstrating Compliance with 10 CFR 20.1302

Pursuant to 10 CFR 20.1302, the annual average concentration of radioactive material released in liquid effluents at the boundary of the unrestricted area must not exceed the values specified in 10 CFR Part 20, Appendix B, Table 2. The applicant demonstrated compliance with this requirement by referencing the AP1000 DCD. AP1000 DCD Section 11.2.3.4 shows that even at the Technical Specification limit for percent failed fuel defects, the nominal blowdown flow provides sufficient dilution to ensure that the expected effluent release concentrations will be less than those specified in 10 CFR Part 20, Appendix B, Table 2 including the provisions of Appendix B, Table 2, footnote 4 for radionuclide mixtures.

In NUREG-1793, the staff evaluated and accepted the conclusions of Section 11.2.3.4 of the AP1000 DCD. Based on this acceptance, the staff concludes that the applicant complies with 10 CFR 20.1302.

Demonstrating Compliance with 10 CFR 20.1406

Pursuant to 10 CFR 20.1406, the applicant must provide a description of how facility design and procedures for operation will minimize, to the extent practicable, contamination of the facility and the environment; facilitate eventual decommissioning; and minimize, to the extent practicable, the generation of radioactive waste. The staff finds that the applicant demonstrated compliance with this requirement by incorporating by reference the design descriptions provided in the AP1000 DCD and providing the description of operating programs in WLS COL FSAR Sections 12.3 and 12.5. The staff's evaluation and conclusion pertaining to compliance with 10 CFR 20.1406 are included in Section 12.3 of this SER.

Demonstrating Compliance with 10 CFR Part 50, Appendix I

Pursuant to 10 CFR Part 50, Appendix I, Sections II.A and II.D, the applicant is responsible for addressing the requirements for dose objectives in controlling doses to a hypothetical maximally exposed member of the public and populations living near the proposed nuclear power plant. The requirements define dose objectives for liquid effluents, and require a cost-benefit analysis in justifying installed processing and treatment equipment of the LWMS, including any augmentation to the design in complying with 10 CFR Part 50, Appendix I. The staff finds that the applicant has demonstrated compliance with 10 CFR Part 50, Appendix I, Section II.A and II.D requirements by performing the required cost-benefit analysis through WLS COL 11.2-2, and performed the require dose compliance through WLS COL 11.5-3. The staff independently verified the results of the cost-benefit analysis and compliance with the dose objectives and finds that the applicant is in compliance with 10 CFR Part 50, Appendix I, Sections II.A and II.D. See Tables 11.2-1, 11.2-2, and 11.2-3 of this SER for a list of parameters and the dose comparison to the limits specified in the discussion above.

Table 11.2-1 Comparison of Important Modeling Assumptions

Pathways and Parameters	Application	NRC Staff's Analysis
Drinking water pathway for maximally exposed individual (MEI) and population	Yes	Yes
Fish ingestion pathway for MEI and population	Yes	Yes
Recreational use of river for MEI and population	Yes	Yes
Irrigation pathway for the MEI	No	No
Surface Water Dilution Model	Completely mixed impoundment	Fully mixed with river flow

Table 11.2-2 Modeling Parameter Values*

Parameter	Value	Basis
Annual radionuclide release (Ci/yr)	Multiple values	AP1000 DCD Table 11.2-7
Effluent discharge rate (cfs)	13.4	WLS COL FSAR Table 11.2-202
Annual average river flow for the MEI doses (cfs)	2,538	WLS COL FSAR Table 11.2-201
Dilution factors	1	WLS COL FSAR Table 11.2-202
Transit time (hr)	14.2 hr for drinking water 0 for other	WLS COL FSAR Table 11.2-202
Reconcentration model**	Complete mixing	WLS COL FSAR Table 11.2-201

* The staff used LADTAP II default values for parameters not listed in the table

** The staff assumed full mixing with the river rather than an impoundment model

11.2.5 Post Combined License Activities

For the reasons discussed in the technical evaluation section above, the staff finds the following license condition acceptable:

- License Condition (11-1) – Before initial fuel load, the licensee shall develop, implement, and maintain procedural controls limiting radionuclide inventory in each of the Radwaste Building Monitor Tanks, and separately in each of up to three (3) Radwaste Building mobile radwaste processing systems to below A2 quantities for radionuclides specified in Appendix A to 10 CFR Part 71 (Tables A-1 and A-3), as described in FSAR Subsection 13.5.2.2.5. The procedures shall also ensure that any additional equipment located in the RWB is limited to below A2 quantities and that the total cumulative radioactive inventory contained in unpackaged wastes (including liquid waste, wet waste, solid waste, gaseous waste, activated or contaminated metals and components, and contaminated waste present at any time in the Radwaste Building) is limited so that an unmitigated release, occurring over a two hour time period, would not result in a dose of greater than 500 millirem at the protected area boundary or an unmitigated exposure, occurring over a two hour time period, would not result in a dose of greater than 5 rem to site personnel located 10 feet from the total cumulative radioactive inventory.

11.2.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant addressed the required information relating to the LWMS, and that there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

In addition, the staff evaluated the additional COL information (STD COL 11.2-1, STD COL 11.2-2, WLS COL 11.2-1, WLS COL 13.5-1, WLS COL 11.2-2, WLS COL 11.5-3, and STD SUP 11.2-1, WLS COL 2.4-5, WLS COL 15.7-1, WLS SUP 11.2-2, WLS SUP 11.2-3) in the application against the relevant NRC regulations, acceptance criteria defined in NUREG-0800, Section 11.2, and other NRC regulatory guides. The applicant has satisfactorily addressed all RAIs related to Section 11.2.

The staff verified that the applicant had provided sufficient information and that the review and calculations support the conclusions that follow. The staff concludes that the LWMS (as a permanently installed system or in combination with mobile systems) includes the equipment necessary to control releases of radioactive materials in liquid effluents in accordance with GDC 60 and 61 of Appendix A to 10 CFR Part 50 and the requirements of 10 CFR 50.34a. Therefore, the staff concludes that the design of the LWMS is acceptable and meets the requirements of 10 CFR 20.1301(e), 10 CFR 20.1302, 10 CFR 20.1406, 10 CFR 50.34a, GDC 60 and 61, and Appendix I to 10 CFR Part 50.

11.3 Gaseous Waste Management System

11.3.1 Introduction

The gaseous waste management system (GWMS) is designed to control, collect, process, handle, store, and dispose of gaseous radioactive waste generated as the result of normal operation, including anticipated operational occurrences.

11.3.2 Summary of Application

Section 11.3 of the WLS COL FSAR, Revision 11, incorporates by reference Section 11.3 of the AP1000 DCD, Revision 19.

In addition, in WLS COL FSAR Section 11.3, the applicant provided the following:

<u>AP1000 COL Information Items</u>

- STD COL 11.3-1

The applicant provided additional information in STD COL 11.3-1 to resolve COL Information Item 11.3-1 (COL Action Item 11.3-1) regarding gaseous radwaste cost-benefit analysis methodology.

- WLS COL 11.3-1

The applicant provided additional information in WLS COL 11.3-1 to resolve COL Information Item 11.3-1 (COL Action Item 11.3-1). The additional information addresses the estimated doses to the public from the gaseous waste system and the associated cost-benefit analysis in WLS COL FSAR Section 11.3.3.4.

- WLS COL 11.5-3

The applicant provided additional information in WLS COL 11.5-3 to resolve COL Information Item 11.5-3 (COL Action Item 11.5-3). The additional information addresses compliance with 10 CFR Part 50, Appendix I, Sections II.B and II.C related to operation of the gaseous waste system in WLS COL FSAR Section 11.3.3.4.

<u>Supplemental Information</u>

- STD SUP 11.3-1

The applicant added supplemental information in WLS COL FSAR Section 11.3.3.6 to address the QA program to be applied to the GWMS.

- STD SUP 11.3-2

The applicant added supplemental information in WLS COL FSAR Section 11.3.3 to address the gaseous effluent site interface parameter.

11.3.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the regulatory basis for acceptance of the supplementary information on the GWMS is established in:

- 10 CFR 20.1301(e), as it relates to compliance with 40 CFR Part 190
- 10 CFR 20.1302, “Compliance with dose limits for individual members of the public”
- 10 CFR 20.1406, “Minimization of contamination”
- 10 CFR Part 50, Appendix A, “General Design Criteria for Nuclear Power Plants,” GDC 3, “Fire protection”

- 10 CFR Part 50, Appendix A, “General Design Criteria for Nuclear Power Plants,” GDC 60, “Control of releases of radioactive materials to the environment”
- 10 CFR Part 50, Appendix A, “General Design Criteria for Nuclear Power Plants,” GDC 61, “Fuel storage and handling and radioactivity control”
- 10 CFR Part 50, Appendix I, Sections II.B, II.C and II.D as it relates to gaseous effluent dose objectives and associated cost-benefit analysis
- 10 CFR 50.34a, “Design objectives for equipment to control releases of radioactive material in effluents – nuclear power reactors”
- 10 CFR 52.80(a), as it relates to those inspections, tests, and analyses that the licensee shall perform, and the acceptance criteria that are necessary to show the facility shall be constructed and operated in conformity with the COL.

Guidance for meeting these requirements is in the following:

- Regulatory Position C.2 of RG 1.143, Revision 2
- RG 1.109, Revision 1
- RG 1.110
- RG 1.111, “Methods for Estimating Atmospheric Transport and Dispersion of Gaseous Effluents in Routine Releases from Light-Water-Cooled Nuclear Power Reactors,” Revision 1
- RG 4.21

The acceptance criteria associated with the GWMS are given in Section 11.3 of NUREG-0800, including BTP 11-5.

11.3.4 Technical Evaluation

The staff reviewed Section 11.3 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The staff’s review confirmed that the information in the application and incorporated by reference addresses the required information relating to the GWMS. The results of the staff’s evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

The staff’s review of this application included the following COL information and supplementary items:

- STD COL 11.3-1, Gaseous Radwaste Cost-Benefit Analysis Methodology
- WLS COL 11.3-1, Cost-Benefit Analysis of Population Doses
- WLS COL 11.5-3, 10 CFR Part 50, Appendix I, Sections II.B and II.C

- STD SUP 11.3-1, Supplemental Information on Quality Assurance

- STD SUP 11.3-2, Supplemental Information on Gaseous Effluent Site Interface Parameters

In addition to the above items, the staff reviewed the entire section against Section 11.3 of NUREG-0800 to determine if the information in WLS COL FSAR Section 11.3 met the regulatory requirements in the regulations stated above (Section 11.3.3 of this SER) and NUREG-0800 acceptance criteria. The relevant NUREG-0800 acceptance criteria are as follows:

- The GWMS should have the capability to meet the dose design objectives and should include provisions to treat gaseous radioactive wastes, such that the following is true:

    A. The calculated annual total quantity of all radioactive materials released from each reactor to the atmosphere will not result in an estimated annual external dose from gaseous effluents to any individual in unrestricted areas in excess of 0.05 mSv (5 mrem) to the total body or 0.15 mSv (15 mrem) to the skin. RGs 1.109 and 1.111 provide acceptable methods for performing this analysis.

    B. The calculated annual total quantity of radioactive materials released from each reactor to the atmosphere will not result in an estimated annual air dose from gaseous effluents at any location near ground level which could be occupied by individuals in unrestricted areas in excess of 0.01 centiGray (cGy) (10 millirads (mrad)) for gamma radiation or 0.02 cGy (20 mrad) for beta radiation. RG 1.109 and RG 1.111 provide acceptable methods for performing this analysis.

    C. The calculated annual total quantity of radioiodines, carbon-14, tritium, and all radioactive materials in particulate form released from each reactor at the site in effluents to the atmosphere will not result in an estimated annual dose or dose commitment from such releases for any individual in an unrestricted area from all pathways of exposure in excess of 0.15 mSv (15 mrem) to any organ. RG 1.109 and RG 1.111 provide acceptable methods for performing this analysis.

    D. In addition to A, B, and C, above, the GWMS should include all items of reasonably demonstrated technology that, when added to the system sequentially and in order of diminishing cost-benefit return, for a favorable cost-benefit ratio, can effect reductions in dose to the population reasonably expected to be within 80 km (50 mi) of the reactor. RG 1.110 provides an acceptable method for performing this analysis.

    E. The concentrations of radioactive materials in gaseous effluents released to an unrestricted area should not exceed the limits specified in 10 CFR Part 20, Appendix B, Table 2, Column 1.

    F. The regulatory position in RG 1.143 is met, as it relates to the definition of the boundary of the GWMS, beginning at the interface from plant systems to the point of controlled discharges to the environment as defined in the Offsite Dose Calculation Manual (ODCM), or at the point of storage in holdup tanks or decay beds for gaseous wastes produced during normal operation and anticipated operational occurrences.

- System designs should describe features that will minimize, to the extent practicable, contamination of the facility and environment; facilitate eventual decommissioning; and minimize, to the extent practicable, the generation of radioactive waste in accordance with RG 1.143, for gaseous wastes produced during normal operation and anticipated operational occurrences, and the requirements of 10 CFR 20.1406 or the DC application, update in the SAR, or the COL application to the extent not addressed in a referenced certified design.

- BTP 11-5, as it relates to potential releases of radioactive materials (noble gases) as a result of postulated leakage or failure of a waste gas storage tank or off-gas charcoal delay bed.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.

- The staff verified that the site-specific differences were not relevant.

The staff completed its review and finds the evaluation performed for the standard content to be directly applicable to the WLS COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) contains evaluation material from the SER for the BLN Units 3 and 4 COL application.

AP1000 COL Information Items

The following portion of this technical evaluation section is reproduced from Section 11.2.4 of the VEGP SER:

- *STD COL 11.3-1*

The discussion of VEGP COL 11.3-1 addresses the site-specific cost-benefit analysis performed to address the requirements of 10 CFR Part 50, Appendix I, regarding population doses due to gaseous effluents. The applicant provided additional information in STD COL 11.3-1 to resolve COL Information Item 11.3-1 with regard to the cost-benefit analysis methodology.

The NRC staff reviewed the resolution of COL Information Item 11.3-1 related to the cost-benefit analysis methodology described in VEGP FSAR Section 11.3.3.4 *and concluded that the methodology used for the analysis was consistent with the guidance of RG 1.110 and was, therefore, acceptable.*

- WLS COL 11.3-1

The applicant provided additional information in WLS COL 11.3-1 to resolve COL Information Item 11.3-1, which states:

> The analysis performed to determine offsite dose due to gaseous effluents is based upon the AP1000 generic site parameters included in Chapter 1 and DCD Tables 11.3-1, 11.3-2 and 11.3-4. The Combined License applicant will provide a site specific cost-benefit analysis to demonstrate compliance with 10 CFR 50, Appendix I, regarding population doses due to gaseous effluents.

The commitment was also captured as COL Action Item 11.5-3 in Appendix F of NUREG-1793, which states:

> The COL applicant will provide a site-specific cost-benefit analysis to demonstrate compliance with 10 CFR 50, Appendix I, regarding population doses due to gaseous effluents.

The staff reviewed the resolution of COL Information Item 11.3-1 related to the cost-benefit analysis included under Sections 11.3.3.4.2 and 11.3.5.1 of the WLS COL FSAR and issued RAI 14, Question 11.03-1 because the Nuclear Energy Institute (NEI) Template 07-11, "Generic FSAR Template Guidance for Cost-Benefit Analysis for Radwaste Systems for Light-Water-Cooled Nuclear Power Reactors," cited by Duke Energy Carolinas, LLC had been withdrawn by NEI from further consideration. In RAI 14, Question 11.03-1, the staff requested that the applicant provide a detailed and plant-specific cost-benefit analysis.

In response to RAI 14, Question 11.03-1, the applicant performed a site-specific analysis to determine whether the offsite dose due to gaseous effluents is bounded by the AP1000 site parameters included in Chapter 1 and Tables 11.3-1, 11.3-2 and 11.3-4 of the AP1000 DCD. The applicant discussed the site-specific cost-benefit analysis in WLS COL FSAR Section 11.3.3.4 to address the requirements of 10 CFR Part 50, Appendix I, Section II.D, regarding population doses due to gaseous effluents. The dose and dose rate to man was calculated using the GASPAR II computer code, which is based on the methodology presented in RG 1.109. On December 20, 2012, the applicant submitted updates to calculations for the cost-benefit analysis in which the staff evaluated the results in conjunction with the results provided before. These updates are due to the change in location of the nuclear island for applicant's site where the relocation of Lee Unit 1 is 15.24 m (50 feet) east and 20.12 m (66 feet) south and Unit 2 was moved 20.12 m (66 feet) south from the original placement. This movement changed the distances to receptor locations of various MEI locations for the gaseous effluents and updated meteorological data caused changes to the cost-benefit analysis. The applicant's analysis showed that the lowest-cost option for gaseous radwaste treatment system augments is the steam generator flash tank vents to the main condenser at $6,320 per year. The population doses, 6.32 person-rem total body per reactor and 9.80 person-rem thyroid per reactor, are given in the WLS COL FSAR Table 11.3-204. Assuming 100 percent efficiency of this augment, the resulting cost per person-rem is determined by dividing the cost of the augment by the population dose, or $1,264 per person-rem total body ($6,320/5.00 person-rem). The cost per person-rem for thyroid, $9,800 (or 9.80 person-rem), exceed the cost value for total body, $6,800 (or 6.80 person-rem), so only augments for which the total annual costs is below $9,800 require further analysis by the applicant.

The applicant's further analysis of the population thyroid dose examined a number of potential gaseous radwaste treatment system augments based on their estimated 9.80 person-rem/year thyroid dose (and, therefore, those augments with a "Total Annual Cost" of less than $9,800). In order of decreasing total annual cost (TAC), the applicant evaluated:

- Pressurized-water reactor (PWR) air ejector charcoal/high efficiency particulate air (HEPA) filtration unit with a TAC of $9,140, which would have to remove at least 9.14 of the 9.80 person-rem (thyroid) to be cost-beneficial. The applicant stated that based on the system design, no radio-iodine is released through the condenser air removal (off-gas) system design; therefore, this augment does not affect the radio-iodine discharged by the plant which accounts for 4.85 person-rem in the thyroid population dose. Since it would be impossible to achieve the necessary dose reduction, this augment is not cost-beneficial because it exceeds the cost-benefit ratio of Section II.D of 10 CFR Part 50, Appendix I.

- Three ton charcoal absorber with a TAC of $8,770, which would have to remove at least 8.77 of the 9.80 person-rem (thyroid) to be cost-beneficial. It is assumed that this augment would be appended to the gaseous radwaste system where it would increase the delay time of noble gases exiting the existing activated carbon delay beds. The applicant stated that no radio-iodine is released through the gaseous radwaste system; therefore, this augment does not affect the radio-iodine discharged by the plant, which accounts for 4.85 person-rem in the thyroid population dose. Since it would be impossible to achieve the necessary dose reduction, this augment is not cost-beneficial because it exceeds the cost-benefit ratio of 10 CFR Part 50, Appendix I, Section II D.

- Main condenser vacuum pump charcoal/HEPA filtration systems with a TAC of $7,690, which would have to remove at least 7.69 of the 9.80 person-rem (thyroid) to be cost-beneficial. The applicant stated that based on the system design, no radio-iodine is released through the condenser air removal system; therefore, this augment does not affect the radio-iodine discharged by the plant which accounts for 4.85 person-rem in the thyroid population dose. Since it would be impossible to achieve the necessary dose reduction, this augment is not cost-beneficial because it exceeds the cost-benefit ratio of 10 CFR Part 50, Appendix I, Section II D.

- 1,000 cubic feet per minute (cfm) charcoal/HEPA filtration systems with a TAC of $7,580, which would have to remove at least 7.58 of the 9.80 person-rem (thyroid) to be cost-beneficial. The applicant stated that even assuming that this rather small capacity augment could be placed in the ventilation system at some point that would eliminate all radio-iodine and particulate releases, it would not be effective in reducing the noble gas releases, the carbon-14 release, or the airborne tritium release, all of which account for 4.67 person-rem in the thyroid population dose. Since it would be impossible to achieve the necessary dose reduction, this augment is not cost-beneficial because it exceeds the cost-benefit ratio of 10 CFR Part 50, Appendix I, Section II D.

- 600 ft^3 gas decay tank with a TAC of $7,460, which would have to remove at least 7.46 of the 9.80 person-rem (thyroid) to be cost-beneficial. This augment would be part of a conventional high pressure waste gas holding system. The applicant stated that based on the system design, no radio-iodine is released through this system; therefore, this augment does not affect the radio-iodine discharged by the plant, which accounts for 4.85 person-rem in the thyroid population dose. Since it would be impossible to achieve the necessary dose reduction, this augment is not cost-beneficial because it exceeds the cost-benefit ratio of 10 CFR Part 50, Appendix I, Section II D.

- Steam generator flash tank vent to main condenser with a TAC of $6,320, which would have to remove at least 6.32 of the 9.80 person-rem (thyroid) to be cost-beneficial. Addition of this augment presumes that the design already includes a steam generator flash tank; the augment being evaluated is the installation of vent piping and instrumentation from the tank to the main condenser. However, the system design does not include a steam generator flash tank; therefore, the TAC of $6,320 is underestimated. Additionally, the AP1000 design includes steam generator blowdown heat exchangers that provide cooling of the blowdown fluid and prevent flashing prior to the blowdown flow entering the main condenser. Therefore, this augment would not provide any additional dose reduction, and this augment is not cost-beneficial because it exceeds the cost-benefit ratio of 10 CFR Part 50, Appendix I, Section II D.

Based on the above evaluation, the applicant concluded that none of the radwaste augments are cost-beneficial in reducing the annual thyroid dose from gaseous effluents for WLS. A summary of the population dose break down by source can be found in Table 11.3-1 of this SER and a comparison of the application's and the staff's analysis for derived population dose results is found in Table 11.3-3 of this SER.

The staff reviewed this evaluation, including the evaluation due to the movement of the nuclear island, and concurred with its results. Thus, the staff concluded that the GWMS meets ALARA requirements and requires no augments. Therefore, the staff considers COL Information Item 11.3-1 resolved. Accordingly, the staff considers RAI 14, Question 11.03-1 resolved.

- WLS COL 11.5-3

The applicant provided additional information in WLS COL 11.5-3 to resolve COL Information Item 11.5-3, which states:

> The Combined License applicant is responsible for addressing the 10 CFR 50, Appendix I guidelines for maximally exposed offsite individual doses and population doses via liquid and gaseous effluents.

The commitment was also captured in COL Action Item 11.5-3 in Appendix F of NUREG-1793, which states:

> The COL applicant is responsible for addressing the guidelines of Appendix I to 10 CFR Part 50, as they relate to maximally exposed offsite individual doses and population doses attributable to liquid and gaseous effluents.

The staff reviewed the resolution of COL Information Item 11.5-3 related to the compliance with 10 CFR Part 50, Appendix I as presented in Section 11.3.3.4 of the WLS COL FSAR. In RAI 14 and RAI 109, Questions 11.03-2 and 11.03-4, respectively, and in RAI 110, Question 02.03.05-6(b), the staff requested that the applicant provide the details of the individual and population dose analyses. RAI 109, Question 11.03-4 and RAI 110, Question 02.03.05-6(b) were asked as part of the updated calculations that were provided to the staff as part of the applicant's updated submittal, which was submitted on December 20, 2012. As discussed before, the updates are due to the change in location of the nuclear island for the applicant's site. This movement changed the distances to receptor locations of various MEI locations for the gaseous effluents and caused changes to the calculated MEI doses while also having the gaseous effluent results being adjusted due to updated meteorological data.

In a May 2, 2013, response to RAI 14, Question 11.03-2, the applicant provided an evaluation of the impacts from gaseous effluent releases by considering the probable pathways to individuals and populations near the proposed new units. The applicant estimated the total-body and organ dose to the MEI from the gaseous effluent release pathways, and also calculated a collective total body and organ dose for the population within 80 km (50 mi) of the WLS site. The estimates of the maximum doses to the public are based on the AP1000 reactor's normal operational effluent releases, as discussed in the AP1000 DCD. The applicant evaluated the impact of these doses by comparing them to applicable regulatory limits.

If built, the postulated two new units at the WLS site would release gaseous effluents into the atmosphere. The applicant calculated doses for several airborne pathways, including direct exposure to a radioactive plume, direct exposure to radioactivity deposited on the ground, inhalation of airborne radioactivity and ingestion of contaminated agricultural products including, vegetables, milk, and meat. The applicant assumed that the MEI consumes both cow and goat's milk, while the population consumes only cow's milk.

In the response to RAI 14, Question 11.03-2, the applicant provided a description of all required model assumptions and input parameters needed to run the GASPAR II computer code. Using radiological exposure models based on RG 1.109, Revision 1 and the GASPAR II computer program (NUREG/CR-4653, "GASPAR II - Technical Reference and User Guide," March 1987), the applicant calculated the estimated doses to a hypothetical MEI of the public and to the population within 80 km (50 mi) from the postulated gaseous effluents discharged.

In an August 8, 2013, response to RAI 109, Question 11.03-4, the applicant provided clarification on dose results and the methodology used to meet compliance by making changes to the application. The applicant first made WLS COL FSAR Table 11.3-205 consistent with WLS COL FSAR Table 11.3-202 and added a clarifying footnote to Table 11.3-205 to clarify the pathways and adopted parameters in deriving the dose results. Clarifying footnotes were also added to WLS COL FSAR Tables 11.3-206 and 11.3-207 to show consistency and clarity with the NRC methodology described in RG 1.109 and revised dose results. The staff evaluated the response to RAI 109, Question 11.03-4 and agrees with the changes. The staff has confirmed the changes as a result of this RAI have been made and the staff also confirms through confirmatory calculations that the dose calculations the applicant has updated to the tables described in this response are consistent with the staff's request. As a result, the staff considers RAI 109, Question 11.03-4 resolved.

WLS COL FSAR Tables 2.3.5-287, 2.3.5-290, 2.3.5-291, and 2.3-292 include all the atmospheric dispersion and deposition factors used by the applicant to calculate individual and population doses. WLS COL FSAR Table 11.3-201 includes gaseous pathway parameters used as input to the dose calculation, including population data, and site-specific agricultural usage information. The applicant provided justifications for these parameter values in the response to RAI 14, Question 11.03-2. WLS COL FSAR Tables 11.3-202 and 11.3-204 list the gaseous pathway doses to the MEI and surrounding population, respectively. In RAI 110, Question 02.03.05-6(b), the staff requested that the applicant clarify the use of the Exclusion

Area Boundary (EAB) and the Site Boundary as the limiting boundary in the dose calculations. The applicant had previously used the EAB as the limiting boundary for MEI doses. The staff concluded that the applicant would need to create a new set of Site Boundary atmospheric dispersion values in order to adequately meet the dose objectives presented in 10 CFR Part 50, Appendix I. Specifically, referring to the section that states applicants need to provide sufficient information to show that the calculated annual dose at any location near ground level that could be occupied by individuals in unrestricted areas is below the limits specified in 10 CFR Part 50, Appendix I.

In a September 30, 2013, response to RAI 110, Question 02.03.05-6(b), the applicant provided updates to WLS COL FSAR Table 2.3-289 to add the Site Boundary Location for Units 1 and 2. This update then reflected changes to the dose calculations in WLS COL FSAR Section 11.3. Changes to WLS COL FSAR Section 11.3 are reflected in both the text and WLS COL FSAR Tables 11.2-206, 11.3-202, 11.3-203, 11.3-205, 11.3-206, and 11.3-207. The change to site boundary as the limiting boundary causes changes to the plume, ground and inhalation pathway doses, where the previously mentioned tables are all affected by this change and are reflected in the discussion of the dose results below. The analysis for staff's long-term atmospheric dispersion factors is found in WLS COL FSAR Chapter 2.3.5, "Long Term Diffusion Estimates."

The applicant calculated the gaseous pathway doses to the MEI. The results show for the worst-case location outside the exclusion boundary a gamma annual air dose of 0.00773 milliGray (mGy) or 0.773 mrad, a beta annual air dose of 0.0325 mGy or 3.25 mrad; a total annual body dose of 0.00732 mSv or .732 mrem and an annual skin dose of 0.0490 mSv or 4.90 mrem. Table 11.3-205 of the WLS COL FSAR was added, which lists the maximum annual organ dose (thyroid) of 0.0921 mSv or 9.21 mrem for the infant.

The calculated annual population doses listed in WLS COL FSAR Table 11.3-204 are 0.0500 person-Sv (5.00 person-rem) to the total body, and 0.0980 person-Sv (9.80 person-rem) to the thyroid. The applicant used the population doses in the cost-benefit analysis described in the WLS COL FSAR and evaluated in this SER.

The staff performed an independent assessment using the GASPAR II computer code and compared its results to the applicant's and the 10 CFR Part 50, Appendix I criteria. The staff notes that the modeling assumptions used and parameter values used were consistent with the applicant's.

In the response to RAI 14, Question 11.03-2, the applicant explained the derivation of values used for agricultural and usage parameters including the total production of vegetables, milk, and meat in the 8 km (5mi) area around the site. The staff evaluated and verified the derivation of these values and found them to be reasonable upper bound estimates. Consequently, the staff used the applicant's agricultural and usage values listed in WLS COL FSAR Table 11.3-201 for the dose estimation.

The staff evaluated and agreed with the approach taken by the applicant to calculate maximum annual individual doses from gaseous effluents. Using this same approach, the staff verified the individual doses in the WLS COL FSAR by independently running the GASPAR II computer code with the applicant's parameter values. Table 11.3-2 in this SER compares the resulting dose estimates from the applicant's analyses with the 10 CFR Part 50, Appendix I criteria. All doses are below the 10 CFR Part 50, Appendix I, Section II.B and II.C criteria.

The staff evaluated and agreed with the approach taken by the applicant to calculate population doses from gaseous effluents. Using this same approach, the staff evaluated the population doses in the WLS COL FSAR by independently running the GASPAR II computer code with the applicant's parameter values. The applicant then used these doses in a cost-benefit analysis for augments to the GWMS. Table 11.3-3 in this SER summarizes the results of the applicant's and staff's analysis of population doses. The staff has reviewed the application and confirms the changes made by the applicant in the FSAR. The staff considers RAI 14, Question 11.03-2 resolved. The staff considers RAI 110, Question 02.03.05-6(b) resolved.

The staff concluded that the information provided by the applicant for WLS COL 11.5-3 is acceptable. The staff finds that the applicant provided a bounding assessment demonstrating its capability to comply with the individual dose criteria in 10 CFR Part 20 and 10 CFR Part 50, Appendix I. In addition, the staff finds the applicant's calculation of the population dose to be appropriate for use in assessing the cost-benefit requirements in 10 CFR Part 50, Appendix I. Therefore, the staff considers COL Information Item 11.5-3 resolved.

Supplemental Information

The following portion of this technical evaluation section is reproduced from Section 11.3.4 of the VEGP SER:

> *The following portion of this technical evaluation section is reproduced from Section 11.3.4 of the BLN SER:*
>
> - *STD SUP 11.3-1*
>
> *The applicant provided supplemental information in BLN COL FSAR Section 11.3.3.6, "Quality Assurance," addressing the quality assurance program to be applied to the gaseous waste system and stated that the program complies with the guidance presented in RG 1.143.*
>
> *The NRC staff reviewed this supplemental quality assurance information included in BLN COL FSAR Section 11.3.3.6 and finds that this supplemental statement commits the applicant to the regulatory positions in RG 1.143 related to quality assurance and is acceptable.*

The following portion of this technical evaluation section is reproduced from Section 11.3.4 of the VEGP SER:

> - *STD SUP 11.3-2*
>
> *The applicant provided additional information in VEGP COL FSAR Section 11.3.3 to address gaseous effluent site interface parameters. The applicant stated that there are no gaseous effluent site interface parameters outside the Westinghouse scope. The staff finds this statement true because all gaseous effluent release points are through the main gas vent and the turbine building exhaust and are part of the certified design.*

<u>Postulated Radioactive Release Due to a Waste Gas Leak or Failure</u>

NUREG-0800, Section 11.3, acceptance criteria and BTP 11-5 require the staff to evaluate the results of a postulated radioactive release resulting from a leakage or failure of a waste gas storage tank or offgas charcoal delay bed. The waste gas system is part of the radioactive GWMS and information on the system is considered as part of the design information required by 10 CFR 50.34a.

The AP1000 DCD and NUREG-1793 addressed the results of this analysis. In response to RAI SRP11.3-CHPB-02 covering AP1000 DCD, Revision 17, Westinghouse detailed the results of this analysis for inclusion in the next revision of the DCD. The staff found this analysis acceptable and that it encompassed the site-specific parameters for the VEGP site. Once the staff confirms the inclusion of the failure analysis in a future revision of the AP1000 DCD and the incorporation by reference of that DCD revision by the VEGP applicant, the staff will consider this item closed for the VEGP COL FSAR. This is considered ***Confirmatory Item 11.3-1****.*

<u>Resolution of Standard Content Confirmatory Item 11.3-1</u>

Confirmatory Item 11.3-1 is a commitment by the applicant to incorporate changes, by reference, proposed by Westinghouse to Section 11.3.3.4 of the AP1000 DCD to include the results of the postulated radioactive release resulting from a leakage or failure of a waste gas storage tank or offgas charcoal delay bed. The staff verified that the applicant has incorporated the AP1000 DCD Revision 18 that includes the above changes. As a result, Confirmatory Item 11.3-1 is now closed.

<u>Demonstrating Compliance with 10 CFR 20.1301(e)</u>

The staff discusses compliance with 10 CFR 20.1301(e) in Section 11.2.4 of this SER.

<u>Demonstrating Compliance with 10 CFR 20.1302</u>

The annual average concentration of radioactive material released in gaseous effluents at the boundary of the unrestricted area must not exceed the values specified in Table 2 of Appendix B to 10 CFR Part 20. The applicant demonstrated compliance with this requirement by referencing the AP1000 DCD. Section 11.3.3.5 of the DCD shows that even at the Technical Specification limit for percent failed fuel defects, the site provides sufficient atmospheric dilution to ensure that the expected effluent release concentrations will be less than those specified in Table 2 of Appendix B to 10 CFR Part 20.

In NUREG-1793, the staff evaluated and accepted the conclusions of Section 11.3.3.5 of the DCD. Based on this acceptance, the staff concludes that the applicant complies with 10 CFR 20.1302.

Demonstrating Compliance with 10 CFR 20.1406

The staff discusses compliance with 10 CFR 20.1406 in Section 11.2.4 of this SER.

In addition, the staff confirmed that the limiting site boundary χ/Q, 1.5E-5 is bounded by the AP1000 DCD limiting χ/Q, 2.0E-5 to support the demonstration of compliance with 10 CFR 20.1302 and 10 CFR Part 20 Appendix B, Table 2, Footnote 4.

Demonstrating Compliance with 10 CFR Part 50, Appendix I

Pursuant to 10 CFR Part 50, Appendix I, Sections II.B, II.C, and II.D, the applicant is responsible for addressing the requirements for dose objectives in controlling doses to a hypothetical maximally exposed member of the public and populations living near the proposed nuclear power plant. The requirements define dose objectives for gaseous effluents, and require a cost-benefit analysis in justifying installed processing and treatment equipment of the GWMS, including any augmentation to the design in complying with 10 CFR Part 50, Appendix I. The staff notes that the applicant has demonstrated compliance with 10 CFR Part 50, Appendix I, Sections II.B, II.C, and II.D requirements by performing the required cost-benefit analysis through WLS COL 11.3-1, and performed the require dose compliance through WLS COL 11.5-3. The staff independently verified the results of the cost-benefit analysis and compliance with the dose objectives and finds that the applicant is in compliance with 10 CFR Part 50, Appendix I, Sections II.B, II.C, and II.D.

Table 11.3-1 Population Doses Breakdown by Source

Source	Total Body (person-rem)	% of Total	Thyroid (person-rem)	% of Total
Noble Gases	1.45E+00	29%	1.45E+00	14.8%
Iodine	1.00E-2	0.02%	4.85E+00	49.5%
Particulates	3.16E-01	6.32%	2.74E-01	2.8%
C-14	2.45E+00	49.0%	2.45E+00	25.0%
H-3	7.7E-01	15.4%	7.70E-01	7.9%
Total	5.00E+00	100%	9.80E+00	100%

11.3.5 Post Combined License Activities

There are no post COL activities related to this section.

11.3.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant addressed the required information relating to the GWMS. There is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

In addition, the staff evaluated the additional COL information (STD COL 11.3-1, WLS COL 11.3-1, WLS COL 11.5-3, STD SUP 11.3-1 and STD SUP 11.3-2) in the application against the relevant regulations, acceptance criteria defined in NUREG-0800, Section 11.3, and other NRC regulatory guides. The staff finds that the applicant has satisfactorily addressed all RAIs related to NUREG-0800, Section 11.3 including those related to the relocation of the nuclear island.

In other areas of the evaluation of the GWMS, the staff verified that the applicant had provided sufficient information and that the review and calculations support the conclusion that the GWMS includes the equipment necessary to control releases of radioactive materials in gaseous effluents in accordance with GDC 3, GDC 60, and GDC 61 of 10 CFR Part 50, Appendix A and the requirements of 10 CFR 50.34a. The staff finds that the applicant meets the requirements in GDC 3 by conforming to the guidance in BTP 11-5. The staff finds that the applicant meets the requirements in GDC 60 and GDC 61 by demonstrating compliance with 10 CFR Part 50, Appendix I. The staff also concludes that the design of the GWMS meets the requirements of 10 CFR 20.1301(e), 10 CFR 20.1302, 10 CFR 20.1406, 10 CFR 50.34a, GDC 3, 60 and 61, and 10 CFR Part 50, Appendix I.

11.4 Solid Waste Management (Related to RG 1.206, Section C.III.1, Chapter 11, C.I.11.4, "Solid Waste Management System")

11.4.1 Introduction

The solid waste management system (SWMS) is designed to collect and accumulate spent ion exchange resins and deep-bed filtration media, spent filter cartridges, dry active wastes, and mixed wastes generated from normal plant operation, including anticipated operational occurrences. Processing and packaging of wastes are by mobile systems and the packaged waste is stored in the auxiliary and radwaste buildings until it is shipped offsite to a licensed disposal facility.

11.4.2 Summary of Application

Section 11.4 of the WLS COL FSAR, Revision 11, incorporates by reference Section 11.4 of the AP1000 DCD, Revision 19.

In addition, in WLS COL FSAR Section 11.4, the applicant provided the following:

AP1000 COL Information Items

- STD COL 11.4-1

The applicant added supplemental information in WLS COL FSAR Section 11.4.5 to address how the solid radwaste system complies with the guidance in RG 1.143. STD SUP 11.4-1 also addresses the processes to be followed to ship waste that complies with 10 CFR 61.55, "Waste classification," and 10 CFR 61.56, "Waste characteristics," in WLS COL FSAR Section 11.4.6.1.

License Condition

- Part 10, License Condition 3, Operational Program Implementation

WLS COL FSAR Section 13.4, Table 13.4-201, "Operational Programs Required by NRC Regulations," identifies one entry under Item 9, the Process Control Program (PCP), as a program required to be implemented by a milestone. In accordance with License Condition 3, this program is to be implemented prior to initial fuel load.

- Part 10, License Condition 6, Operational Program Readiness

The applicant proposed a license condition to provide a schedule to support NRC inspection of operational programs including the PCP.

11.4.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the regulatory basis for acceptance of the supplemental information on the SWMS is established in the requirements and guidelines of several codes and standards. These include the following:

- 10 CFR Part 20, "Standards for Protection against Radiation"
- 10 CFR Part 50, "Domestic Licensing of Production and Utilization Facilities"
- 10 CFR 52.79, "Contents of Applications; Technical Information in Final Safety Analysis Report"
- 10 CFR Part 71, "Packaging and Transportation of Radioactive Material"
- 49 CFR Part 173, "Shippers—General Requirements for Shipments and Packagings"
- State regulations and disposal site waste form requirements for burial at a low level waste disposal site that is licensed in accordance with 10 CFR Part 61 or equivalent State regulations
- RG 1.1.43, Revision 2, Table 1 and Regulatory Positions C.3.2 and C.3.3

The acceptance criteria associated with the SWMS are given in NUREG-0800, Section 11.4, including BTP 11-3.

11.4.4 Technical Evaluation

The staff reviewed Section 11.4 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the SWMS. The results of the staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

The staff's review of this application included the following COL information item and supplemental information:

- STD COL 11.4-1, Solid Waste Management System Process Control Program

- STD SUP 11.4-1, Quality Assurance

In addition to the above items, the staff reviewed the entire section against NUREG-0800, Section 11.4, to determine if the information in WLS COL FSAR Section 11.4 met the regulatory requirements in the regulations stated above (Section 11.4.3 of this SER) and NUREG-0800 acceptance criteria. The relevant NUREG-0800 acceptance criteria are as follows:

- All effluent releases (gaseous and liquid) associated with the operation (normal and anticipated operational occurrences) of the SWMS will comply with 10 CFR Part 20 and RG 1.143, as they relate to the definition of the boundary of the SWMS beginning at the interface from plant systems, including multiunit stations, to the points of controlled liquid and gaseous effluent discharges to the environment or designated onsite storage locations, as defined in the PCP and ODCM.

- Operational Programs. For COL reviews, the description of the operational program and proposed implementation milestone for the PCP aspect of the Process and Effluent Monitoring and Sampling Program are reviewed in accordance with 10 CFR 20.1301, 10 CFR 20.1302, 10 CFR 50.34a, 10 CFR 50.36a, and 10 CFR Part 50, Appendix I, Sections II and IV. Its implementation is required by a license condition detailed in FSAR Section 13.4.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.

- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and finds the evaluation performed for the standard content to be directly applicable to the WLS COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) contains evaluation material from the SER for the BLN Units 3 and 4 COL application.

Although the staff concluded that the evaluation performed for the standard content is directly applicable to the WLS COL application, there is a difference in how the WLS applicant addressed STD COL 11.4-1 and how the VEGP applicant addressed this review item. This difference is evaluated by the staff below, following the standard content material for STD COL 11.4-1.

The following portion of this technical evaluation section is reproduced from Section 11.4.4 of the VEGP SER:

> *<u>AP1000 COL Information Items</u>*
>
> *The following portion of this technical evaluation section is reproduced from Section 11.4.4 of the BLN SER:*
>
> - *STD COL 11.4-1*
>
> *The applicant provided additional information in STD COL 11.4-1 to resolve COL Information Item 11.4-1. COL Information Item 11.4-1 states:*
>
>> *The Combined License applicant will develop a process control program in compliance with 10 CFR Sections 61.55 and 61.56 for wet solid wastes and 10 CFR Part 71 and DOT [Department of Transportation] regulations for both wet and dry solid wastes. Process control programs will also be provided by vendors providing mobile or portable processing or storage systems. It will be the plant operator's responsibility to assure that the vendors have appropriate process control programs for the scope of work being contracted at any particular time. The process control program will identify the operating procedures for storing or processing wet solid wastes. The mobile systems process control program will include a discussion of conformance to Regulatory Guide 1.143, Generic Letter GL-80-009, and Generic Letter GL-81-039 and, information of equipment containing wet solid wastes in the non-seismic Radwaste Building. In the event additional onsite storage facilities are a part of Combined License plans, this program will include a discussion of conformance to Generic Letter GL-81-038.*
>
> *The commitment was also captured as COL Action Item 11.4-1 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:*
>
>> *The COL applicant will develop a process control program for both wet and dry solid wastes.*
>
> *In BLN COL FSAR Section 11.4.6, the applicant addressed this COL information item. The applicant adopted NEI [Nuclear Energy Institute] 07-10*[A]*, "FSAR Template Guidance for Process Control Program (PCP) Description." The PCP describes the administrative and operational controls used for the solidification of liquid or wet solid waste and the dewatering of wet solid waste. It provides the necessary controls such that the final disposal waste product meets applicable federal regulations (10 CFR Parts 20, 50, 61, 71 and 49 CFR Part 173), state regulations, and disposal site waste form requirements for burial at a low level waste disposal site licensed in accordance with 10 CFR Part 61. Waste processing equipment and services may be provided by the plant or by third-party vendors. In a letter dated January 8, 2009, (ML082910077), the NRC accepted NEI 07-10*[A]*, Revision 3. Specifically, the NRC staff indicated that for COL applications NEI 07-10*[A]*, Revision 3, provides an acceptable template for*

assuring that the administrative and operational controls for waste processing, processing parameters, and surveillance requirements within the scope of the PCP will meet the requirements of 10 CFR 52.79. In a letter dated April 23, 2009 (ML091170073), the applicant proposed to revise BLN FSAR Section 11.4 to incorporate the approved NEI 07-10[A] *Revision 3. Since the BLN COL FSAR Section 11.4 has not adopted the approved version of the NEI Template, this is **Confirmatory Item 11.4-1.** Each process used meets the applicable requirements of the PCP. BLN COL FSAR Table 13.4-201 provides milestones for PCP implementation and is acceptable.*

*In STD COL 11.4-1, the applicant states that "no additional onsite radwaste storage is required beyond that described in the DCD." The applicant should explain why this statement is included or should remove it. In section 11.4 of NUREG-1793, the staff stated that if a need for onsite storage of low-level waste has been identified beyond that provided in AP1000 Standard Design because of unavailability of offsite storage, the applicant should submit the details of any proposed onsite storage facility to the NRC. The applicant needs to provide any arrangements for offsite storage for low-level waste or to submit plans for onsite storage. This is identified as **Open Item 11.4-1**.*

The following portion of this technical evaluation section is reproduced from Section 11.4.4 of the VEGP SER:

Resolution of Standard Content Confirmatory Item 11.4-1

To address Confirmatory Item 11.4-1 in the BLN SER with open items, the applicant updated VEGP FSAR Section 11.4.6 to indicate adoption of the NRC-approved version of NEI 07-10A. VEGP adoption of this template effectively resolves Confirmatory Item 11.4-1.

Resolution of Standard Content Open Item 11.4-1

To address Open Item 11.4-1 in the BLN SER with open items, the applicant updated VEGP FSAR Section 11.4 with information supporting the statement that no additional onsite radwaste storage was required beyond that described in the DCD. This additional information is in VEGP COL 11.4-1 and VEGP SUP 11.4-1 and is evaluated below.

Evaluation of Site-specific Information for STD COL 11.4-1

Regarding the Resolution of Standard Content Open Item 11.4-1, the staff does not consider the open item relevant to the WLS COL application because the applicant has available offsite disposal of all types of low-level radioactive waste through its membership in the Atlantic Compact. Therefore, an update of the WLS COL FSAR is not necessary to resolve this item.

The following portion of this technical evaluation section is reproduced from Section 11.4.4 of the VEGP SER:

<u>Supplemental Information</u>

The following portion of this technical evaluation section is reproduced from Section 11.4.4 of the BLN SER:

- *STD SUP 11.4-1*

The applicant provided supplemental information in Section 11.4.5 of the BLN COL FSAR to describe the QA program applicable to design, construction, installation and testing provisions of the solid radwaste system. This QA program is established by procedures and complies with the guidance presented in RG 1.143.

In BLN FSAR Section 11.4.6, the applicant also added a description of procedures relating to waste shipments, waste stream processing, verifying waste as non-radioactive, periodic system maintenance, personnel training, and document revision, clearing with third party vendors. The staff reviewed the descriptions and found them to be comprehensive and acceptable.

The NRC staff reviewed the supplemental information provided in STD SUP 11.4-1 related to the QA program for the solid radwaste system included under Section 11.4.4 of the BLN COL FSAR and finds that this supplemental statement commits the applicant to the regulatory positions in RG 1.143 related to quality assurance.

<u>License Conditions</u>

- *Part 10, License Condition 3, Operational Program Implementation*

VEGP COL FSAR Section 11.4.6 describes the process control program. VEGP COL FSAR Table 13.4-201 provides the milestone (prior to initial fuel load) for implementation of the process control program and is acceptable as described in the staff's SER related to NEI 07-10.

- *Part 10, License Condition 6, Operational Program Readiness*

The applicant proposed a license condition to provide a schedule to support NRC inspection of operational programs including the process control program. The proposed license condition is consistent with the policy established in SECY-05-0197 and is acceptable.

<u>Compliance with 10 CFR Part 50 Appendix I Design Criteria</u>

The design of the SWMS described in the AP1000 DCD has no release points directly to the environment. Compliance with Appendix I ALARA criteria is strictly based on the releases from the LWMS and GWMS and not the SWMS.

11.4.5 Post Combined License Activities

For the reasons discussed in the technical evaluation section above, the staff finds the following two license conditions acceptable:

- License Condition (11-2) – Before initial fuel load, the licensee shall implement an operational program for process and effluent monitoring and sampling. The program shall include the subprogram and documents for a Process Control Program.

- License Condition (11-3) – No later than 12 months after issuance of the COL, the licensee shall submit to the Director of the Office of New Reactors (NRO) a schedule that supports planning for and conduct of NRC inspections of the operational program for process and effluent monitoring and sampling (including process control program). The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until the operational program for process and effluent monitoring and sampling (including process control program) has been fully implemented.

11.4.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant addressed the required information relating to the SWMS and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

In addition, the staff evaluated the additional COL information (STD COL 11.4-1 and STD SUP 11.4-1) in the application against the relevant NRC regulations, acceptance criteria in NUREG-0800, Section 11.4, and other NRC regulatory guides.

Based on the evaluation above, the staff finds that the applicant's means for handling radioactive solid waste during normal operations, including AOOs are consistent with GDC 60. In accordance with 10 CFR 52.79(a)(3), the staff also finds that the applicant has provided sufficient information regarding the kinds and quantities of radioactive materials expected to be produced in the operation of the facility and the means for controlling and limiting radioactive effluents and exposures within the limits set forth in 10 CFR Part 20. The staff verified that the applicant has provided sufficient information and that the review supports the conclusion that the design and operation of the SWMS is acceptable and meets the requirements of GDC 61 of 10 CFR Part 50, Appendix A; 10 CFR 50.34a, 10 CFR 20.1301(e), 10 CFR 20.1406, and 10 CFR Part 50, Appendix I, and 10 CFR Parts 61 and 71.

11.5 Radiation Monitoring (Related to RG 1.206, Section C.III.1, Chapter 11, C.I.11.5, "Process and Effluent Radiological Monitoring and Sampling Systems")

11.5.1 Introduction

The radiation monitoring systems are used to monitor liquid and gaseous process streams and effluents from the LWMS, GWMS, and SWMS. The radiation monitoring systems include subsystems used to collect process and effluent samples during normal operation and AOO's, and under post-accident conditions.

11.5.2 Summary of Application

Section 11.5 of the WLS COL FSAR, Revision 11, incorporates by reference Section 11.5 of the AP1000 DCD, Revision 19.

In addition, in WLS COL FSAR Section 11.5, the applicant provided the following:

Departure

- WLS DEP 6.4-1

The applicant provided additional information in Section 11.5 of the WLS COL FSAR about WLS DEP 6.4-1 related to design changes affecting habitability of the main control room and changes to the calculated doses to control room operators. This information, as well as related WLS DEP 6.4-1 information appearing in other chapters of the FSAR, is reviewed in Section 21.2 of this SER.

AP1000 COL Information Items

- STD COL 11.5-1

The applicant provided additional information in STD COL 11.5-1 to resolve COL Information Item 11.5-1 (COL Action Item 11.5-1). The information addresses the ODCM.

- STD COL 11.5-2

The applicant provided additional information in STD COL 11.5-2 to resolve COL Information Item 11.5-2 (COL Action Item 11.5-2). The information provides programmatic aspects of the effluent monitoring and sampling program.

- WLS COL 11.5-2

The applicant provided additional information in WLS COL 11.5-2 to add language to WLS COL FSAR Section 11.5.3 addressing extension of the existing Duke Energy program for QA of radioactive effluent and environmental monitoring to apply to WLS Units 1 and 2.

- WLS COL 11.5-3

The applicant provided additional information in WLS COL 11.5-3 to resolve COL Information Item 11.5-3 (COL Action Item 11.5-3). The information relates to the 10 CFR Part 50, Appendix I guidelines.

License Conditions

- Part 10, License Condition 3, Operational Program Implementation, Item G.3

WLS COL FSAR Section 13.4, Table 13.4-201, “Operational Programs Required by NRC Regulations,” identifies three entries under Item 9, “Process and Effluent Monitoring and Sampling Program,” as follows: (1) Radiological Effluent Technical Specifications/Standard Radiological Effluent Controls; (2) ODCM; and (3) Radiological Environmental Monitoring program, as programs identified in FSAR Section 11.5 required to be implemented by a milestone. In accordance with License Condition 3, Item G.3, these programs are to be implemented prior to initial fuel load.

- Part 10, License Condition 6, Operational Program Readiness

The applicant proposed a license condition to provide a schedule to support NRC inspection of operational programs including the Radiological Effluent Technical Specifications/Standard Radiological Effluent Controls; the ODCM; and the Radiological Environmental Monitoring program.

11.5.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the regulatory basis for acceptance of the supplementary information on radiation monitoring addressed in COL Information Items 11.5-1, 11.5-2, and 11.5-3 is established in the requirements and guidelines of the following:

- 10 CFR Part 50, Appendix A, GDC 64, “Monitoring Radioactivity Releases”
- 10 CFR Part 20, “Standards for Protection against Radiation Material”
- 10 CFR Part 50, “Domestic Licensing of Production and Utilization Facilities
- 10 CFR Part 52,, “Licenses, Certifications, and Approvals for Nuclear Power Plants”
- 10 CFR Part 61, “Licensing Requirements for Land Disposal of Radioactive Waste”
- 10 CFR Part 71, “Packaging and Transportation of Radioactive Material”
- American National Standards Institute/Health Physics Society (ANSI/HPS) N13.1, “Sampling and Monitoring Releases of Airborne Radioactive Substances from the Stacks and Ducts of Nuclear Facilities”
- ANSI N42.18, “Specification and Performance of On-Site Instrumentation for Continuously Monitoring Radioactivity in Effluents”
- RG 1.21, “Measuring, Evaluating, and Reporting Radioactive Material in Liquid and Gaseous Effluents and Solid Waste,” Revision 2
- RG 4.15, “Quality Assurance for Radiological Monitoring Programs (Inception through Normal Operations to License Termination) – Effluent Streams and the Environment,” Revision 2

The applicable acceptance criteria associated with the radiation monitoring system are given in NUREG-0800, Section 11.5.

11.5.4 Technical Evaluation

The staff reviewed Section 11.5 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic[1]. The staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the radiation monitoring system. The results of the staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

The staff reviewed the following information in the WLS COL FSAR:

AP1000 COL Information Items

- STD COL 11.5-1, "Plant Offsite Dose Calculation Manual (ODCM)"
- STD COL 11.5-2, Programmatic Aspects of the Effluent Monitoring and Sampling Program
- WLS COL 11.5-2 adds language to WLS COL FSAR Section 11.5.3 addressing extension of the existing Duke Energy program for QA of radioactive effluent and environmental monitoring to apply to WLS Units 1 and 2.
- WLS COL 11.5-3, 10 CFR Part 50, Appendix I Guidelines

In addition to the above items, the staff reviewed the entire section against NUREG-0800, Section 11.5, to determine if the information in WLS COL FSAR Section 11.5 met the regulatory requirements in the regulations stated above (SER Section 11.5.3) and NUREG-0800 acceptance criteria. The relevant NUREG-0800 acceptance criteria are as follows:

- Provisions should be made to ensure representative sampling from radioactive process streams and tank contents. Recirculation pumps for liquid waste tanks (collection or sample test tanks) should be capable of recirculating at a rate of not less than two tank volumes in 8 hours. For gaseous and liquid process stream samples, provisions should be made for purging sampling lines and for reducing the plate-out of radioactive materials in sample lines. Provisions for gaseous sampling from ducts and stacks should be consistent with ANSI/HPS N13.1-1999.
- For COL reviews, the description of the operational program and proposed implementation milestone for the radiological effluent technical specification/standard radiological effluent control, ODCM and Radiological Environmental Monitoring Program aspects of the Process and Effluent Monitoring and Sampling Program are reviewed in accordance with 10 CFR 20.1301, 10 CFR 20.1302, 10 CFR 50.34a, 10 CFR 50.36a, and 10 CFR Part 50, Appendix I, Sections II and IV. Its implementation is required by a license condition.

Section 1.2.3 of this SER provides a discussion of the strategy used by the staff to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP

Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.

- The staff verified that the site-specific differences were not relevant.

The staff completed its review and finds the evaluation performed for the standard content to be directly applicable to the WLS COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) contains evaluation material from the SER for the BLN Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from Section 11.5.4 of the VEGP SER:

> *<u>AP1000 COL Information Items</u>*
>
> *The following portion of this technical evaluation section is reproduced from Section 11.5.4 of the BLN SER:*
>
> - *STD COL 11.5-1*
>
> *The applicant provided additional information in STD COL 11.5-1 to resolve COL Information Item 11.5-1. COL Information Item 11.5-1 states:*
>
> > *The Combined License applicant will develop an offsite dose calculation manual that contains the methodology and parameters used for calculation of offsite doses resulting from gaseous and liquid effluents. The Combined License applicant will address operational setpoints for the radiation monitors and address programs for monitoring and controlling the release of radioactive material to the environment, which eliminates the potential for unmonitored and uncontrolled release. The offsite dose calculation manual will include planned discharge flow rates.*
>
> *This commitment was also captured as COL Action Item 11.5-1 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:*
>
> > *The COL applicant will develop an offsite dose calculation manual that contains the methodology and parameters used to calculate offsite doses resulting from gaseous and liquid effluents.*
>
> *In BLN COL FSAR Section 11.5.7, the applicant adopts NEI 07-09*[A]*, "FSAR Template Guidance for Offsite Dose Calculation Manual (ODCM) Program*

Description." The ODCM program description contains: (1) the methodology and parameters used for calculating doses resulting from liquid and gaseous effluents; (2) operational setpoints, including planned discharge rates, for radiation monitors and monitoring programs; and (3) the limitations on operation of the radwaste systems, including functional capability of monitoring instruments, concentrations of effluents, sampling, analysis, 10 CFR Part 50, Appendix I dose and dose commitments and reporting. In a letter dated January 27, 2009 (ML083530745), the NRC accepted NEI 07-09, Revision 4. Specifically, the NRC indicated that for COL applications, NEI 07-09[A]*, Revision 4 provides an acceptable template assuring that the ODCM program meets applicable NRC regulations and guidance. In a letter dated April 23, 2009 (ML091170073), the applicant proposed to revise BLN COL FSAR Section 11.5 to incorporate the approved NEI 07-09*[A]*, Revision 4. Since the BLN COL FSAR Section 11.5 has not adopted the approved version of the NEI Template, this is* ***Confirmatory Item 11.5-1****. BLN COL FSAR Table 13.4-201 provides milestones for ODCM implementation. This section also addresses Plant Interface Item 11.4, "requirements for offsite sampling and monitoring of effluent concentrations." The staff finds the applicant's consideration of Plant Interface Item 11.4 to be acceptable based on a review of the ODCM program (NEI 07-09*[A]*). The NRC staff reviewed the resolution of STD COL 11.5-1 related to the ODCM included under Section 11.5.7 of the BLN COL FSAR and considers it adequately addressed in NEI 07-09*[A].

The following portion of this technical evaluation section is reproduced from Section 11.5.4 of the VEGP SER:

<u>Resolution of Standard Content Confirmatory Item 11.5-1</u>

To address Confirmatory Item 11.5-1, the applicant updated the VEGP FSAR Section 11.5.7 to indicate adoption of the NRC-approved version of NEI 07-09A. VEGP adoption of this template effectively resolves Confirmatory Item 11.5-1.

The following portion of this technical evaluation section is reproduced from Section 11.5.4 of the BLN SER:

- *STD COL 11.5-2*

The applicant provided additional information in STD COL 11.5-2 to resolve COL Information Item 11.5-2 (COL Action Item 11.5-2). COL Information Item 11.5-2 states:

> *The Combined License applicant is responsible for the site-specific and program aspects of the process and effluent monitoring and sampling in accordance with ANSI N13.1 and RGs 1.21 and 4.15.*

The commitment was also captured as COL Action Item 11.5-2 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:

> *The COL applicant is responsible for ensuring that the process and effluent monitoring and sampling program at its site conforms to the guidelines of ANSI N13.1-1969, RG 1.21, and RG 4.15.*

In BLN COL FSAR Sections 11.5.1.2, 11.5.2.4, 11.5.4, 11.5.4.1, 11.5.4.2 and 11.5.6.5, the applicant described the programmatic aspects of the effluent monitoring and sampling program. In addition, the applicant provided in BLN COL 11.5-2 specific language regarding the applicant's extension of the existing TVA program for quality assurance of radiological effluent and environmental monitoring which is based on RG 4.15, Revision 1, instead of the most current Revision 2. To maintain consistency, the applicant proposes to apply the same program to BLN Units 3 and 4.

The NRC staff reviewed the resolution of BLN COL 11.5-2 related to the effluent monitoring and sampling program included under Sections 11.5.1.2, 11.5.2.4, 11.5.3, 11.5.4, 11.5.4.1, 11.5.4.2 and 11.5.6.5 of the BLN COL FSAR and considers it adequately addressed in NEI 07-09[A]*.*

- WLS COL 11.5-2

In WLS COL 11.5-2, the applicant extended the existing Duke Energy QA program, including RG 4.15, Revision 1R1, for effluent and environmental monitoring to Units 1 and 2. By using the current program, which is based on RG 4.15, Revision 1 instead of Revision 2, the applicant will also avoid confusion and the potential for error because the program for the existing and planned units will share the same equipment and personnel. Therefore, the staff finds the use of RG 4.15, Revision 1 acceptable and considers COL Information Item 11.5-2 resolved.

- WLS COL 11.5-3

The applicant provided additional information in WLS COL 11.5-3 to resolve COL Information Item 11.5-3, which states:

> The Combined License applicant is responsible for addressing the 10 CFR 50, Appendix I guidelines for maximally exposed offsite individual doses and population doses via liquid and gaseous effluents.

The commitment was also captured as COL Action Item 11.5-3 in Appendix F of NUREG-1793, which states:

> The COL applicant is responsible for addressing the guidelines of Appendix I to 10 CFR Part 50, as they relate to maximally exposed offsite individual doses and population doses attributable to liquid and gaseous effluents.

The applicant addressed this COL item by adding information to WLS COL FSAR Sections 11.2.3.5 and 11.3.3.4 for liquid and gaseous effluents, respectively.

The staff reviewed the resolution of WLS COL 11.5-3 related to compliance with 10 CFR Part 50, Appendix I, as discussed in Sections 11.2.4 and 11.3.4 of this report, and considers it adequately addressed.

The following portion of this technical evaluation section is reproduced from Section 11.5.4 of the VEGP SER:

> *The following portion of this technical evaluation section is reproduced from Section 11.5.4 of the BLN SER:*
>
> *<u>Section 11.5.4.2, Representative Sampling</u>*
>
> *In this section, the applicant describes how it will take representative samples for analysis. Based on the staff's review, the staff issued RAIs 11.5-1 and 11.5-2. RAI 11.5-1 requested clarification about the use of ANSI/HPS N13.1-1999. RAI 11.5-2 requested more information concerning how the applicant ensures representative liquid effluent and environmental sampling.*
>
> *In response to RAI 11.5-1, the applicant revised its commitment to use the 1999 standard. Because the applicant made no changes to the certified design, it removed the commitment to use ANSI/HPS N13.1-1999, and committed to ANSI N13.1-1969 to be consistent with the AP1000 certified design. ANSI withdrew the 1969 standard and replaced it with ANSI/HPS N13.1-1999 because the approach taken in the 1969 standard did not provide assurance that the sample in the effluent vent would be representative. The 1999 standard differs significantly from the earlier version in that it is now performance based. NUREG-0800 Section 11.5 (2007) uses the 1999 standard as acceptance criteria. The staff is pursuing this issue through the DC because it deals with the design of the sampling systems for radioactive gas streams.* [While AP1000 DCD FSAR Rev. 19, Tier 2, Section 11.5 (p.11.5-1 and 11.5-18) still refers to ANSI N13.1-1969, the DCD has incorporated some of the provisions of the ANSI/HPS N13.1-1999 standard. Specifically, AP1000 DCD FSAR Tier 2, Section 11.5.2.3.3 (p.11.5-10 and 11.5-11) summarize key aspects of the ANSI/HPS N13.1-1999 standard. The staff found this approach acceptable.]
>
> *The applicant provided a response to RAI 11.5-2 and the staff finds the response acceptable. The response provided a more detailed description of how the applicant will assure that liquid samples will be representative. The applicant committed to follow the recommendations in ANSI N42.18 and RG 1.21. In addition, the applicant provided more operational descriptions for composite sampling. The NRC staff verified that Revision 1 of the BLN COL FSAR adequately addressed the above. As a result, RAI 11.5-2 is closed.*

The following portion of this technical evaluation section is reproduced from Section 11.5.4 of the VEGP SER:

> *<u>License Condition</u>*
>
> - *Part 10, License Condition 3, Operational Program Implementation, Item G.3*
>
> *VEGP COL FSAR Section 11.5.3 describes effluent monitoring and sampling and Section 11.5.7 describes the offsite dose calculation manual. License Condition 3, Item G.3 requires the licensee to implement the "Process and Effluent Monitoring and Sampling" program prior to initial fuel load. VEGP COL*

FSAR Section 13.4, Table 13.4-201, "Operational Programs Required by NRC Regulations," identifies three entries under Item 9, "Process and Effluent Monitoring and Sampling Program," as follows: (1) Radiological Effluent Technical Specifications/Standard Radiological Effluent Controls, (2) Offsite Dose Calculation Manual; and (3) Radiological Environmental Monitoring program, as programs identified in FSAR Section 11.5 required to be implemented by a milestone. The ODCM includes the Radiological Effluent Technical Specifications/Standard Radiological Effluent Controls and the Radiological Environmental Monitoring program. In accordance with License Condition 3, Item G.3, these programs are to be implemented prior to initial fuel load. VEGP COL FSAR Table 13.4-201 provides the milestones (prior to initial fuel load) for implementation of these elements of the Process and Effluent Monitoring and Sampling Program and is acceptable as described in the staff's SER related to NEI 07-09.

- *Part 10, License Condition 6, Operational Program Readiness*

The applicant proposed a license condition to provide a schedule to support NRC inspection of operational programs including the ODCM, effluent technical specifications, and the radiological environmental monitoring program. The proposed license condition is consistent with the policy established in SECY-05-0197 and is acceptable.

11.5.5 Post Combined License Activities

For the reasons discussed in the technical evaluation section above, the staff finds the following two license conditions acceptable:

- License Condition (11-4) – Before initial fuel load, the licensee shall implement an operational program for process and effluent monitoring and sampling. The program shall include the following subprograms and documents:

    a. Radiological Effluent Technical Specifications/Standard Radiological Effluent Controls

    b. Offsite Dose Calculation Manual

    c. Radiological Environmental Monitoring Program

- License Condition (11-5) – No later than 12 months after issuance of the COL, the licensee shall submit to the Director of NRO a schedule that supports planning for and conduct of NRC inspections of the operational program for process and effluent monitoring and sampling (including Radiological Effluent Technical Specifications/Standard Radiological Effluent Controls, Offsite Dose Calculation Manual, and Radiological Environmental Monitoring Program). The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until the above operational program has been fully implemented.

11.5.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant addressed the required information relating to the radiation monitoring system, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

In addition, the staff evaluated the additional COL information (STD COL 11.5-1, STD COL 11.5-2, WLS COL 11.5-2, and WLS COL 11.5-3) in the application against the relevant NRC regulations, acceptance criteria defined in NUREG-0800, Section 11.5, and other NRC regulatory guides. The staff concludes that the applicant has satisfactorily addressed all RAIs related to Section 11.5.

WLS DEP 6.4-1, related to design changes affecting habitability of the main control room and changes to the calculated doses to control room operators, is reviewed and found acceptable by the staff in Section 21.2 of this SER.

The staff verified that the applicant has provided sufficient information and that the review supports the conclusion that the process and effluent radiological monitoring and sampling systems are sufficient to comply with applicable portions of GDC 64 of 10 CFR Part 50, Appendix A; applicable requirements of 10 CFR Parts 20, 50 and 52; ANSI/HPS N13.1-1999, ANSI N42.18, RGs 1.21 and 4.15, and applicable acceptance criteria in NUREG-0800, Section 11.5.

12 RADIATION PROTECTION

This chapter provides information on radiation protection methods and estimated occupational radiation exposures (OREs) of operating and construction personnel during normal operations (including refueling; purging; fuel handling and storage; radioactive material handling, processing, use, storage, and disposal; maintenance; routine operational surveillance; in-service inspection (ISI); and calibration), and anticipated operational occurrences (AOOs). Specifically, this chapter provides information on facility and equipment design, planning and procedures programs, and techniques and practices employed by the applicant to meet the radiation protection standards set forth in Title 10 of the *Code of Federal Regulations* (10 CFR) Part 20, “Standards for protection against radiation,” and to be consistent with the guidance given in the appropriate regulatory guides (RGs), where the practices set forth in such guides are used to implement the U.S. Nuclear Regulatory Commission (NRC) regulations.

12.1 Assuring That Occupational Radiation Exposures Are As Low As Is Reasonably Achievable

12.1.1 Introduction

Section 12.1 addresses policy and design considerations to ensure that the ORE to personnel will be kept as low as is reasonably achievable (ALARA). The ALARA program is addressed in this section and in Appendix 12AA of the William States Lee III Nuclear Station (WLS) combined license (COL) Final Safety Analysis Report (FSAR).

12.1.2 Summary of Application

WLS COL FSAR, Revision 11, Section 12.1 incorporates by reference AP1000 Design Control Document (DCD), Revision 19, Section 12.1.

In addition, in WLS COL FSAR Section 12.1, the applicant provided the following:

AP1000 COL Information Items

- STD COL 12.1-1

The applicant provided additional information in Standard (STD) COL 12.1-1 to resolve COL Information Item 12.1-1 (COL Action Item 12.2.1-1) that addresses ALARA and operational policies and conforms to regulatory guides. The applicant incorporated information complying with Nuclear Energy Institute (NEI) 07-08A, “Generic FSAR Template Guidance for Ensuring That Occupational Radiation Exposures Are As Low As Is Reasonably Achievable (ALARA),” into WLS COL FSAR Section 12.1 and NEI 07-03A, “Generic FSAR Template Guidance for Radiation Protection Program Description,” in Appendix 12AA. The applicant also provided the site specific information in their FSAR, in addition to that required by NEI 07-08A, Section 12.1.2, specifying that the applicant’s quality assurance criteria are described in Part III of the Quality Assurance Program Description discussed in WLS COL FSAR Section 17.

Supplemental Information

- STD Supplemental (SUP) 12.1-1

The applicant provided information addressing equipment layout to be added at the end of AP1000 DCD Section 12.1.2.4.

12.1.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793, "Final Safety Evaluation Report Related to Certification of the AP1000 Standard Design," and its supplements. The regulatory requirements and acceptance criteria associated with the relevant requirements of NRC regulations for the ALARA program are given in NUREG-0800, "Standard Review Plan for the Review of Safety Analysis Reports for Nuclear Power Plants (LWR Edition)," Section 12.1.

The applicable regulatory requirements and guidance for STD COL 12.1-1 and STD SUP 12.1-1 are as follows:

- 10 CFR Part 20, "Standards for Protection against Radiation"
- 10 CFR 20.1101, "Radiation Protection Programs"
- 10 CFR 19.12, "Instructions to Workers"
- RG 1.8, "Qualification and Training of Personnel for Nuclear Power Plants," Revision 3
- RG 1.33, "Quality Assurance Program Requirements (Operation)," Revision 2
- RG 1.97, "Criteria for Accident Monitoring Instrumentation for Nuclear Power Plants," Revision 4
- RG 8.8, "Information Relevant to Ensuring that Occupational Radiation Exposures at Nuclear Power Stations Will Be as Low as is Reasonably Achievable," Revision 3
- RG 8.10, "Operating Philosophy for Maintaining Occupational Radiation Exposures as Low as is Reasonably Achievable," Revision 1-R
- NUREG-1736, "Consolidated Guidance: 10 CFR Part 20 – Standards for Protection Against Radiation"

12.1.4 Technical Evaluation

The NRC staff (the staff) reviewed WLS COL FSAR Section 12.1 and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The staff's review confirmed that the information in the WLS COL application and incorporated by reference addresses the required information relating to ensuring that the ORE to personnel will be kept ALARA. The results of the staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this report provides a discussion of the strategy used by the staff to perform one technical review for each standard issue outside the scope of the design certification (DC) and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application, Vogtle Electric Generating Plant (VEGP) Units 3 and 4, were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5 to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from requests for additional information (RAIs).

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed and that those changes were actualized in the WLS COL FSAR.

- The staff verified that the site-specific differences, if any, did not adversely affect any previous relevant evaluation or conclusion.

The staff completed its review and concluded that the evaluation performed for the standard content is directly applicable to the WLS COL application. This standard content material is identified in this report by use of italicized, double-indented formatting. Section 1.2.3 of this report provides an explanation of why the standard content material from the Vogtle (VEGP) reference COL application SER contains evaluation material from the Bellefonte Nuclear Plant (BLN), Units 3 and 4 COL application SER.

The following portion of this technical evaluation section is reproduced from VEGP SER Section 12.1.4:

> *The following portion of this technical evaluation section is reproduced from Section 12.1.4 of the BLN SER.*

---

[1] See Section 1.2.2 of this report for a discussion of the staff's review related to verification of the scope of information to be included in a COL application that references a design certification (DC).

AP1000 COL Information Item

- *STD COL 12.1-1*

The applicant provided additional information in STD COL 12.1-1, related to ALARA and Operational Policies, to resolve COL Information Item 12.1-1. COL Information Item 12.1-1 states:

> *Operational considerations of ALARA, as well as operational policies and continued compliance with 10 CFR 20 and RGs 1.8, 8.8, and 8.10, will be addressed by the Combined Operating License applicant. In addition, the Combined Operating License applicant will address operational considerations of the Standard Review Plan to the level of detail provided in RG 1.70. RGs that will be addressed include: 8.2, 8.7, 8.9, 8.13, 8.15, 8.20, 8.25, 8.26, 8.27, 8.28, 8.29, 8.34, 8.35, 8.36, and 8.38.*

The commitment was also captured as COL Action Item 12.2.1-1 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:

> *The COL applicant will review all plant procedures and modification plans that involve personnel radiation exposure to ensure that the ALARA policy is applied. In addition, a COL applicant referencing the AP1000 certified design will address operational ALARA concerns and will submit an operational ALARA policy which conforms to the requirements of 10 CFR Part 20 and the recommendations of Revision 2 to RG 1.8, RG 8.8, and Revision 1-R to RG 8.10.*

In response to COL Action Item 12.2.1-1 in the BLN COL FSAR (Revision 1) as STD COL 12.1-1:

> *This section incorporates by reference [Nuclear Energy Institute] NEI 07-08, "Generic FSAR Template Guidance for Ensuring That Occupational Radiation Exposures Are As Low As Is Reasonably Achievable (ALARA)," Revision 2, which is currently under review by the NRC staff. See Table 1.6-201. ALARA practices are developed in a phased milestone approach as part of the procedures necessary to support the Radiation Protection Program. Table 13.4-201 describes the major milestones for ALARA procedures development and implementation.*

STD COL 12.1-1 includes a commitment to the use of a "Generic FSAR Template Guidance for Ensuring That Occupational Radiation Exposures Are as Low as Is Reasonably Achievable (ALARA)," as an operational program document, based on draft NEI Template 07-08, Revision 2. The NEI template presents the functional elements of an ALARA program, which, if met, would demonstrate compliance with 10 CFR 20.1101 and 10 CFR 19.12. Accordingly, BLN FSAR Section 12.1, STD COL 12.1-1 needs to be updated as to its commitment to the final NEI ALARA template if it is accepted by the NRC staff.

Therefore, the staff cannot find the applicant's reference to the NEI 07-08 template to be acceptable until the staff completes its review of this template as a method to meet the regulatory requirements of an ALARA program, and the BLN FSAR is updated to reference the final version of this template. This is identified as Open Item 12.1-1.

The NRC staff review finds that BLN FSAR Section 12.1 and Appendix 12AA describe programs and procedures that ensure ORE will be ALARA in accordance with the training requirements in 10 CFR 19.12 and the ALARA provisions of 10 CFR 20.1101(b). The ALARA policy will be described, displayed, and implemented in accordance with the provisions of RG 8.8 (Regulatory Position C.1) and RG 8.10 (Regulatory Position C.1) and NUREG-1736, as it relates to maintaining doses ALARA.

According to BLN FSAR Appendix 12AA, NEI 07-03, NEI 07-08, and Chapter 13, "Conduct of Operations," specific individual(s) will be designated and assigned responsibility and authority for implementing ALARA policy at the BLN site. The Functional Manager in charge of Radiation Protection and the Radiation Protection staff periodically will review, update, and modify as appropriate, plant design features and changes, as well as all operating and maintenance features, using exposure data and experience gained from operating nuclear power plants to ensure that occupational exposures will be kept ALARA in accordance with RG 8.8 guidance.

Using the guidance of Section 12.1 of NUREG-0800, the staff finds BLN FSAR Section 12.1 and Appendix 12AA are in accordance with the ALARA provisions of 10 CFR 20.1101(b) and RG 8.8 (Regulatory Position C.2) and will include incorporation of measures for reducing the need for time spent in radiological areas; measures to control access to radiological areas; measures to reduce the production, distribution, and retention of activated corrosion products throughout the primary system; measures for assuring that ORE during decommissioning will be ALARA; reviews of design modifications by competent radiation protection personnel; instructions to engineers regarding ALARA design; experience from operating plants and past designs; and continuing facility design reviews.

Using the guidance of Section 12.1 of NUREG-0800, the staff finds that BLN COL FSAR Section 12.1 and Appendix 12AA describe an acceptable program to develop plans and procedures in accordance with RGs 1.33, 1.8, 8.8, and 8.10 that can incorporate the experiences obtained from facility operation into facility and equipment design and operations planning and that will implement specific exposure control techniques.

Initially, it was not clear to the NRC staff when the appropriate ALARA program and planning procedures would be implemented as described in the proposed License Conditions (Part 10 of the BLN, Units 3 and 4 COL application). Therefore, the staff issued request for additional information (RAI) 12.1-1. In a letter dated September 22, 2008, the applicant stated that ALARA focused procedures are developed in conjunction with the Radiation Protection Program (RPP) and thus will follow the RPP milestones for implementation found in FSAR

Table 13.4-201. The applicant stated that FSAR Section 12.1, STD COL 12.1-1 text will be updated as to its commitment to the final ALARA program implementation. The NRC staff finds the RAI response acceptable because it clearly identified that ALARA practices will be in place at the same time as the RPP. The NRC staff verified that Revision 1 of the BLN COL FSAR adequately incorporates the above. As a result, RAI 12.1-1 is closed. For a discussion related to the proposed license condition related to the RPP, which includes ALARA practices, refer to SER Section 12.5.5.

In accordance with 10 CFR 20.1101(b), the staff finds that overall facility operations, as well as the RPP as described in BLN COL FSAR Section 12.5, Appendix 12AA, and NEI 07-03 will integrate the procedures necessary to ensure that radiation doses are ALARA, including work scheduling, work planning, design modifications, and radiological considerations. Operating and maintenance personnel will follow specific plans and procedures to ensure that goals related to keeping exposures ALARA are achieved in the operation of the plant. Engineering controls for the protection of personnel will be optimized. Operations involving high person-sievert (person-rem) exposures will be carefully preplanned and carried out by personnel who are well trained in radiation protection and using proper equipment. During maintenance activities, in radiological areas, personnel will be monitored for exposure to radiation and contamination. Their radiation exposures will be reviewed and used to make changes in future job procedures and techniques.

The BLN FSAR states that COL information item, STD COL 12.1-1 is addressed in NEI 07-08, and Appendix 12AA of the BLN COL FSAR, which references NEI 07-03. The staff has reviewed the current version of NEI 07-03 and NEI 07-08 with respect to compliance with RG 1.8. The NEI 07-03 template states that the Radiation Protection Manager, Radiation Protection Technicians, and Radiation Protection Supervisory and Technical Staff will be trained and qualified in accordance with the guidance of RG 1.8. In a letter dated March 18, 2009 (ML090510379), the NRC accepted NEI 07-03, Revision 7. Specifically, the NRC staff indicated that for COL applications, NEI 07-03, Revision 7 provides an acceptable template for assuring that the RPP meets the applicable NRC regulations and guidance. Since the BLN COL FSAR has not yet adopted the approved version of the NEI template, this is identified as Confirmatory Item 12.1-1. At present, the NRC has not accepted NEI-07-08 as an acceptable template to be used by the COL applicants. As a result, this is identified as ***Open Item 12.1-1.***

Supplemental Information

- *STD SUP 12.1-1*

The applicant added the following text to the end of Section 12.1.2.3, "Facility Layout General Design Considerations for ALARA," of the DCD included in the DC amendment:

A video record of the equipment layout in areas where radiation fields are expected to be high following operations may be used to assist in ALARA planning and to facilitate decommissioning.

The NRC staff acknowledges STD SUP 12.1-1 as a statement of fact not requiring NRC review.

The following portion of this technical evaluation section is reproduced from VEGP SER Section 12.1.4:

Resolution of Standard Content Open Item 12.1-1 and Confirmatory Item 12.1-1

The NRC staff compared the VEGP and BLN COL applications and found them to be essentially identical, with two exceptions: first, the application material under STD COL 12.1-1 in Section 12.1 of the VEGP application references NEI 07-08A and the application material under STD COL 12.1-1 in Section 12.1 of the BLN application references NEI 07-08, Revision 2; and second, the VEGP FSAR Appendix 12AA references NEI 07-03A and the BLN FSAR Appendix 12AA references Revision 3 of NEI 07-03. Regarding these exceptions, the differing material associated with STD COL 12.1-1 in the VEGP FSAR is associated with adopting NEI 07-08A and NEI 07-03A, which are evaluated below as part of resolving Open Item 12.1-1 and Confirmatory Item 12.1-1.

In a letter from NEI to NRC dated October 29, 2009, NEI submitted NEI 07-08A to the NRC, which is the version of NEI 07-08 that has been accepted by the NRC. Accordingly, Open Item 12.1-1 is resolved for VEGP.

Confirmatory Item 12.1-1 is resolved for VEGP because the applicant has adopted the approved version of NEI 07-03, i.e., NEI 07-03A, (see paragraph below).

In Revision 2 of the VEGP COL FSAR, the applicant modified parts of FSAR Chapter 12, Appendix 12.AA that relate to STD COL 12.1-1. Specifically, in the FSAR, Revision 2, NEI 07-03A, is referenced. Accordingly, because NEI 07-03A is the approved version of NEI 07-03, the above conclusions regarding Confirmatory Item 12.1-1 are not affected by the changes to Revision 2 of the FSAR. One other change is the modification of a reference at the end of Appendix 12AA where the reference to RG 1.97 is changed from Revision 4 to Revision 3. The staff found the change acceptable, since Revision 3 provides for a more comprehensive version of the RG and also provides for portable radiation monitoring equipment. Revision 4 of RG 1.97 indicates that partial implementation is not recommended.

12.1.5 Post Combined License Activities

The post COL activities related to ALARA practices (part of the radiation protection program (RPP)) are discussed in Section 12.5.5 of this report.

12.1.6 Conclusion

The staff reviewed the WLS COL application and checked the referenced DCD. The staff's review confirmed that the applicant addressed the required information relating to ALARA, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

The staff concludes that the relevant information presented in the WLS COL FSAR is acceptable based on meeting the relevant acceptance criteria provided in NUREG-0800, Section 12.1. The staff based its conclusion on the following:

- STD COL 12.1-1, relating to ALARA and operational policies and compliance with relevant regulatory guidance, is acceptable because the applicant incorporates approved references NEI 07-03A and NEI 07-08A into the WLS COL FSAR and meets the applicable regulatory requirements and guidance specified in Sections 12.1.3 and 12.1.4 of this report.

- STD SUP 12.1-1, relating to the use of video recording of equipment layout in areas where radiation fields are expected to be high, is acceptable because it is a statement of fact not requiring NRC approval.

12.2 Radiation Sources

12.2.1 Introduction

This section addresses the issues related to contained radiation sources and airborne radioactive material sources during normal operations, AOOs, and accident conditions affecting in-plant radiation protection.

12.2.2 Summary of Application

WLS COL FSAR, Revision 11, Section 12.2 incorporates by reference AP1000 DCD, Revision 19, Section 12.2. In addition, in WLS COL FSAR Section 12.2, the applicant provided the following:

Departures

- WLS DEP 6.4-1

The applicant provided additional information in Section 12.2 of the WLS COL FSAR about WLS DEP 6.4-1 related to design changes affecting habitability of the main control room and changes to the calculated doses to control room operators. This information, as well as related

WLS DEP 6.4-1 information appearing in other chapters of the FSAR, is reviewed in Section 21.2 of this SER.

AP1000 COL Information Item

- STD COL 12.2-1

The applicant provided additional information in STD COL 12.2-1 to resolve COL Information Item 12.2-1 (COL Action Item 12.3.1-1) that addresses miscellaneous sources.

12.2.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements. The regulatory requirements and acceptance criteria associated with the relevant requirements of NRC regulations for the radiation sources are given in NUREG-0800, Section 12.2.

The applicable regulatory requirements for STD COL 12.2-1 are as follows:

- 10 CFR 20.1801, "Security of stored material"
- 10 CFR 20.1802, "Control of material not in storage"
- 10 CFR Part 50, "Domestic licensing of production and utilization facilities," Appendix A, "General Design Criteria for Nuclear Power Plants," General Design Criteria (GDC) 61, "Fuel Storage and Handling and Radioactivity Control"

12.2.4 Technical Evaluation

The staff reviewed WLS COL FSAR Section 12.2 of the application and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to radiation sources. The results of the staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this report provides a discussion of the strategy used by the staff to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP) SER were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews.

- The staff compared the VEGP COL FSAR, Revision 5 to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed and that those changes were actualized in the WLS COL FSAR.

- The staff verified that the site-specific differences, if any, did not adversely affect any previous relevant evaluation or conclusion.

The staff completed its review and concluded that the evaluation performed for the standard content to be directly applicable to the WLS COL application. This standard content material is identified in this report by use of italicized, double-indented formatting. Section 1.2.3 of this report provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) SER contains evaluation material from the SER for the BLN Units 3 and 4 COL application SER.

The following portion of this technical evaluation section is reproduced from VEGP SER Section 12.2.4:

> *The following portion of this technical evaluation section is reproduced from Section 12.2.4 of the BLN SER:*
>
> *<u>AP1000 COL Information Item</u>*
>
> - *STD COL 12.2-1*
>
> *The applicant provided additional information in STD COL 12.2-1, related to miscellaneous sources, to resolve COL Information Item 12.2-1. COL Information Item 12.1-1 states:*
>
> > *The Combined License applicant will address any additional contained radiation sources not identified in subsection 12.2.1, including radiation sources used for instrument calibration or radiography.*
>
> *The same commitment was also captured as COL Action Item 12.3.1-1 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793).*
>
> *The applicant provided additional information in the BLN COL FSAR to address the plant STD COL 12.2-1 dealing with miscellaneous sources. The applicant stated that licensed sources containing byproduct, source and special nuclear material that warrant shielding consideration will meet the applicable requirements of 10 CFR Parts 20, 30, 31, 32, 33, 34, 40, 50 and 70. The applicant indicated that there are byproducts and source materials with known isotopes and activity manufactured for the purpose of measuring, checking, calibrating, or controlling processes quantitatively or qualitatively. Accordingly, written procedures will be established and implemented that address procurement, receipt, inventory, labeling, leak testing, surveillance, control, transfer, disposal, storage, issuance and use of these radioactive sources. Also, the applicant indicated that sources maintained on-site for instrument calibration purposes will be shielded while in storage to keep personnel exposure ALARA.*

The regulatory requirements cited in the above paragraph address the requirements applicable to sources that would likely be used in conjunction with construction, preoperational, and initial testing. The applicant will implement the practices for radioactive material control as described in NEI 07-03, Section 12.5.4.10, "Radioactive Material Control." In a letter dated March 18, 2009 (ML090510379), the NRC accepted NEI 07-03, Revision 7. Specifically, the NRC staff indicated that for COL applications, NEI 07-03, Revision 7 provides an acceptable template for assuring that the RPP meets the applicable NRC regulations and guidance. Since the BLN FSAR has not adopted the approved version of the NEI template, this is identified as Confirmatory Item 12.1-1.

The staff concludes that the information provided by the applicant with respect to radiation sources is acceptable and meets the requirements of 10 CFR Sections 20.1801 and 20.1802 and GDC 61. This conclusion is based on the applicant's commitment to the NEI 07-03 administrative controls to meet the regulatory requirements. These controls apply to the additional contained radiation sources discussed in the COL item. The staff notes that its review did not encompass the entire set of regulatory requirements cited by the applicant (10 CFR Parts 20, 30, 31, 32, 33, 34, 40, 50 and 70), since the staff's review is focused on radiation protection requirements on sources used in conjunction with the RPP.

The following portion of this technical evaluation section is reproduced from VEGP SER Section 12.2.4:

Resolution of Standard Content Confirmatory Item 12.1-1

The NRC staff compared the VEGP and BLN COL applications regarding STD COL 12.2-1, and found them to be essentially identical, with the exception that VEGP FSAR Appendix 12AA references NEI 07-03A, whereas, the BLN FSAR references NEI 07-03, Revision 3. As indicated in Section 12.1.4 above, Confirmatory Item 12.1-1, is resolved for VEGP because the applicant has adopted the approved version of NEI 07-03, which is now designated as NEI 07-03A.

12.2.5 Post Combined License Activities

There are no post COL activities related to this section.

12.2.6 Conclusion

The staff reviewed the WLS COL application and checked the referenced DCD. The staff's review confirmed that the applicant addressed the required information relating to radiation sources, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements. The staff concludes that the relevant information presented in the WLS COL

FSAR is acceptable based on the relevant acceptance criteria provided in NUREG-0800, Section 12.2. The staff based its conclusion on the following:

- WLS DEP 6.4-1, related to design changes affecting habitability of the main control room and changes to the calculated doses to control room operators, is reviewed and found acceptable by the staff in Section 21.2 of this SER.

- The staff finds that STD COL 12.2-1, which addresses miscellaneous sources, is acceptable because the applicant has incorporated the approved reference NEI 07-03A into the WLS COL FSAR and meets the requirements of 10 CFR 20.1801, 10 CFR 20.1802, and GDC 61.

12.3 Radiation Protection Design Features

WLS COL FSAR Section 12.3, "Radiation Protection Design Features" and the following Section 12.4, "Dose Assessment," are treated as separate sections in this report (as well as in the AP1000 DCD). However, these two sections are listed as a single section, Section 12.3-12.4, "Radiation Protection Design Features," in NUREG-0800, with the material discussed under "Dose Assessment" included at the end of Section 12.3-12.4.

12.3.1 Introduction

This section addresses the issues related to radiation protection equipment and design features used to ensure that OREs are ALARA. The staff review takes into account design dose rates, AOOs, and accident conditions. Issues considered by the staff include the facility design features, shielding, ventilation, area radiation and airborne radioactivity monitoring instrumentation, and dose assessment.

12.3.2 Summary of Application

WLS COL FSAR, Revision 11, Section 12.3 incorporates by reference AP1000 DCD, Revision 19, Section 12.3. The WLS COL FSAR Section 12.3, provided the following additional information:

Departures

- WLS DEP 6.4-1

The applicant provided additional information in Section 12.3 of the WLS COL FSAR about WLS DEP 6.4-1 related to design changes affecting habitability of the main control room and changes to the calculated doses to control room operators. This information, as well as related WLS DEP 6.4-1 information appearing in other chapters of the FSAR, is reviewed in Section 21.2 of this SER.

- WLS DEP 18.8-1

The applicant described the following portion of the Tier 2 departure (DEP) from the AP1000 DCD related to the radiation design protection features. The applicant proposed revising several DCD figures in WLS COL FSAR Section 12.3 to reflect the relocation of the Operations Support Center (OSC). Other aspects of this Tier 2 departure are evaluated in Sections 12.5, 13.3, and 18.8 of this report.

AP1000 COL Information Items

- STD COL 12.3-1

The applicant provided additional information in STD COL 12.3-1 to resolve COL Information Item 12.3-1 (COL Action Item 12.4.2-1) that addresses the administrative controls for use of the design features provided to control access to radiological restricted areas.

- STD COL 12.3-2

The applicant provided additional information in STD COL 12.3-2 to resolve COL Information Item 12.3-2 (COL Action Item 12.4.4-1) that addresses the criteria and methods for obtaining representative measurement of radiological conditions, including airborne radioactivity concentrations in work areas.

- STD COL 12.3-3

The applicant provided additional information in STD COL 12.3-3 to resolve COL Information Item 12.3-3 that addresses the groundwater monitoring program beyond the normal radioactive effluent monitoring program.

- STD COL 12.3-4

The applicant provided additional information in STD COL 12.3-4 to resolve COL Information Item 12.3-4 that addresses the program to ensure documentation of operational events deemed to be of interest for decommissioning.

Supplemental Information

- WLS SUP 11.2-3

In a September 20, 2011, letter, the applicant provided supplemental information in WLS COL FSAR Section 11.2.1.2.4. The supplemental information added to this WLS COL FSAR section clarifies the locations of radwaste monitoring and describes the features of the exterior liquid radwaste system discharge pipeline incorporated to minimize leakage to the environment. This section also states that the diluted liquid radwaste effluent will be discharged to the Broad River.

12.3.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements. The regulatory requirements and acceptance criteria associated with the relevant requirements of NRC regulations for the radiation protection design features are given in NUREG-0800, Section 12.3-12.4.

The applicable regulatory requirements and guidance for STD COL 12.3-1 are as follows:

- 10 CFR Part 20
- RG 1.8, Revision 3
- RG 8.9, “Acceptable Concepts, Models, Equations, and Assumptions for a Bioassay Program,” Revision 1
- RG 8.38, “Control of Access to High and Very High Radiation Areas in Nuclear Power Plants,” Revision 1
- NUREG-1736

The applicable regulatory requirements and guidance for STD COL 12.3-2 are as follows:

- 10 CFR Part 19, “Notices, instructions and reports to workers: inspection and investigations”
- 10 CFR Part 20
- 10 CFR Part 50, “Domestic Licensing of Production and Utilization Facilities”
- NUREG-0737, ”Clarification of TMI Action Plan Requirements,” Item III.D.3.3
- RG 1.8, Revision 3
- RG 8.2, “Guide for Administrative Practices in Radiation Monitoring,” Revision 0
- RG 8.8, Revision 3
- RG 8.10, Revision 1-R
- RG 1.21, “Measuring, Evaluating, and Reporting Radioactivity in Solid Wastes and Releases of Radioactive Materials in Liquid and Gaseous Effluents from Light-Water-Cooled Nuclear Power Plants,” Revision 1, Appendix A, “Measuring Radioactive Materials in Liquid and Gaseous Effluents and Solid Waste”
- RG 1.97, Revision 4

The applicable regulatory requirements and guidance for STD COL 12.3-3 and STD COL 12.3-4 are as follows:

- 10 CFR 20.1406, “Minimization of contamination”
- 10 CFR 50.75, “Reporting and recordkeeping for decommissioning planning”
- RG 4.21, “Minimization of Contamination and Radioactive Waste Generation: Life Cycle Planning,” Revision 0

12.3.4 Technical Evaluation

The staff reviewed WLS COL FSAR Section 12.3 and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to radiation protection design features. The results of the staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this report provides a discussion of the strategy used by the staff to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the VEGP reference COL application SER were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed and that those changes were actualized in the WLS COL FSAR.

- The staff verified that the site-specific differences, if any, did not adversely affect any previous relevant evaluation or conclusion.

The staff completed its review and finds the evaluation performed for the standard content to be directly applicable to the WLS COL application. This standard content material is identified in this report by use of italicized, double-indented formatting. Section 1.2.3 of this report provides an explanation of why the standard content material from the VEGP reference COL application SER contains evaluation material from the BLN Units 3 and 4 COL application SER. Any confirmatory items in the standard content material retain the numbers assigned in the VEGP SER. Confirmatory items that are first identified in this report have a WLS designation (e.g., WLS Confirmatory Item 12.3-1).

Departures

- WLS DEP 18.8-1

The location of the WLS Units 1 and 2 OSC differs from the location described in the AP1000 DCD. In the AP1000 DCD description, the OSC is located in the same room as the ALARA Briefing Room in the Annex Building. For WLS Units 1 and 2, the OSC has been relocated to where the DCD states that the TSC will be located. At WLS, the TSC, in turn, has been relocated to the basement of the Maintenance Support Building, which is separate from the Unit 1 and 2 Nuclear Islands. The staff finds the applicant's proposed revision to several DCD figures to reflect the relocation of the OSC is acceptable because the location of the OSC does not have an impact on the radiation protection facilities design.

The evaluation of the effect of the OSC relocation is addressed in Section 12.5 of this report for the health physics (HP) facilities, in Section 13.3 of this report for emergency preparedness, and in Section 18.8 of this report for the human system interface design.

The following portion of this technical evaluation section is reproduced from VEGP SER Section 12.3.4:

> *The following portion of this technical evaluation section is reproduced from Section 12.3.4 of the BLN SER:*
>
> *AP1000 COL Information Items*
>
> - *STD COL 12.3-1*
>
> *The applicant provided additional information in STD COL 12.3-1, related to the administrative controls for radiological protection, to resolve COL Information Item 12.3-1. COL Information Item 12.3-1 states:*
>
> > *The Combined License applicant will address the administrative controls for use of the design features provided to control access to radiologically restricted areas, including potentially very high radiation areas, such as the fuel transfer tube during refueling operations and to the reactor cavity.*
>
> *The commitment was also captured as COL Action Item 12.4.2-1 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:*
>
> > *The COL applicant will address the administrative controls for use of the design features provided to control access to radiologically restricted areas, including potentially very high radiation areas, such as the reactor cavity and the fuel transfer canal during refueling operations. The hatch to the spent fuel transfer canal will be treated as an entrance to a very high radiation area under 10 CFR Part 20 and will be locked during spent fuel transfer operations.*
>
> *The applicant addressed this STD COL item in BLN COL FSAR, Appendix 12AA. This appendix incorporates by reference NEI 07-03, Revision 7* [sic]*. The NEI template directs COL applicants to describe the site-specific plant information for areas requiring administrative controls for very high radiation areas. To supplement NEI 07-03, Section 12.5.4.4, "Access Control," the applicant provided additional measures in Appendix 12AA for access controls such as signs, locks, plant manager (or designee) approval for entry, and radiation protection personnel accompaniment and exposure control for entry into very high radiation areas. The applicant also stated that a closed circuit television system may be installed in high radiation areas to allow remote monitoring of individuals entering high radiation areas by personnel qualified in radiation protection procedures.*

The COL applicant will apply the administrative controls for the use of the design features to control access to very high radiation areas, such as the fuel transfer tube during refueling and to the reactor cavity during operations, and other radiologically restricted areas to comply with 10 CFR Sections 20.1601 and 20.1602 The opening of the fuel transfer hatch is administratively controlled, treated as an entrance to a very high radiation area, and is in place during spent fuel transfer operation.

The staff finds the applicant's approach meets the requirements of 10 CFR Sections 20.1601 and 20.1602, and is consistent with RG 8.38, Regulatory Position C1 and C3, which will ensure that an individual is unable to gain unauthorized or inadvertent access to such areas.

In a letter dated March 18, 2009 (ML090510379), the NRC accepted NEI 07-03, Revision 7. Specifically, the NRC staff indicated that for COL applications, NEI 07-03, Revision 7 provides an acceptable template for assuring that the RPP meets the applicable NRC regulations and guidance. Since the BLN FSAR has not adopted the approved version of the NEI template, this is identified as Confirmatory Item 12.1-1.

The NRC staff reviewed STD COL 12.3-1 dealing with administrative controls for radiological protection, using the text added in Appendix 12AA. The BLN COL FSAR Appendix 12AA, incorporates by reference NEI 07-03.

In Appendix 12AA, the applicant has taken exception to NEI 07-03, Section 12.5 to not conform to the guidance of the following regulatory guides:

- *RG 8.20, "Applications for Bioassay for I-125 and I-131"*
- *RG 8.26* [sic]*, "Bioassay at Uranium Mills"*
- *RG 8.32, "Criteria for Establishing a Tritium Bioassay Program"*

The guidance documents were identified as outdated regulatory guidance in NUREG-1736, Consolidated Guidance: 10 CFR Part 20, "Standards for Protection Against Radiation," October 2001. NUREG-1736 describes that in conjunction with 10 CFR 20.1502(b), which requires licensees to monitor for likely intakes; 10 CFR 20.1204(a) and (b) prescribe how information obtained through monitoring is to be used when assessing exposures to workers from intakes. The NUREG recommends that licensees (and therefore applicants) consider the methods described in RG 8.9, "Acceptable Concepts, Models, Equations, and Assumptions for a Bioassay Program," for estimating intakes of radionuclides and determining the frequency of bioassay measurements. RG 8.9 provides updated methods and guidance that was previously contained in positions of the three RGs above. The applicant's commitment to RG 8.9 is sufficient to assure proper monitoring for intake of radionuclides.

In BLN COL FSAR, Appendix 12AA, the applicant took exception to the first paragraph of NEI 07-03, Section 12.5.2 to describe the equivalent key radiological protection positions for the BLN site. The description of *organizational positions with specific radiation protection responsibilities is in BLN COL FSAR Section 13.1. BLN COL FSAR Section 13.1, "Organizational Structure of the Applicant," provides specific radiation protection responsibilities for key positions within the plant organization and the plant organization overall. Managers and supervisors within the plant operating organization are responsible for establishing goals and expectations for their organization and to reinforce behaviors that promote radiation protection. BLN COL FSAR Section 13.1.1, "Management and Technical Support Organization," and Section 13.1.2, "Operating Organization," provide the responsibilities of the organizations and positions to assure that radiological safety goals and expectations are adhered to.*

The staff finds that the applicant's exception to NEI 07-03, Section 12.5.2 is acceptable because BLN COL FSAR Section 13.1 provides the key radiological safety responsibilities and organization consistent with RG 1.8.

The following portion of this technical evaluation section is reproduced from VEGP SER Section 12.3.4:

Correction of Errors in the Standard Content Evaluation Text

The NRC staff identified an error in the text reproduced above from the BLN SER, Section 12.3.4, that requires correction. The BLN SER states that Appendix 12AA of the BLN COL FSAR incorporates by reference NEI 07-03, Revision 7. The appendix actually incorporates by reference NEI 07-03, Revision 3. The NRC staff also identified an error in the text reproduced above from the BLN SER, Section 12.3.4 regarding the reference to RG 8.22, which was incorrectly referred to as RG 8.26.

Resolution of Standard Content Confirmatory Item 12.1-1

The NRC staff compared the VEGP and BLN COL applications regarding STD COL 12.3-1, and found them to be essentially identical, with the exception that VEGP FSAR Appendix 12AA references NEI 07-03A and BLN FSAR Appendix 12AA references Revision 3 of NEI 07-03. Additional clarifying information has been added to the VEGP FSAR regarding STD COL 12.3-1, which is discussed below. As indicated in Section 12.1.4 above, Confirmatory Item 12.1-1, is resolved for VEGP because the applicant has adopted the approved version of NEI 07-03, which is now designated as NEI 07-03A.

In addition, changes have been made in Revision 2 of the VEGP FSAR Chapter 12 that relate to STD COL 12.3-1. The changes are as follows:

1. *A new Table 12AA-201 has been added to Appendix 12AA that provides information concerning access to very high radiation areas (VHRA). The table provides VHRA locations, DCD cross references, radiation sources in the locations and other conditions and restrictions.*

2. *In FSAR Appendix 12AA, new text was added to Section 12.5.4.4 of NEI 07-03A. The text references new Table 12AA-201 and describes the*

> *information in it, discusses removal of the primary sources of radiation from the VHRA areas, and discusses verification walk downs of VHRA to ensure consistency with RG 8.38. In addition to the changes to Appendix 12AA discussed above, the applicant has also added text to Section 12.5.4 regarding the possible use of closed circuit television system to allow remote monitoring of individuals entering high radiation areas.*

These items (i.e., the addition of the table, reference to it and discussion of walk downs, and the closed circuit television system) are acceptable because they provide additional clarity and site-specific information regarding controls to VHRAs and more completely describe features that address STD COL 12.3-1.

The following portion of this technical evaluation section is reproduced from Section 12.3.4 of the BLN SER.

- *STD COL 12.3-2*

The applicant provided additional information in STD COL 12.3-2, related to the criteria and methods for radiological protection, to resolve COL Information Item 12.3-2. COL Information Item 12.3-2 states:

> *The Combined License applicant will address the criteria and methods for obtaining representative measurement of radiological conditions, including airborne radioactivity concentrations in work areas. The Combined License applicant will also address the use of portable instruments, and the associated training and procedures, to accurately determine the airborne iodine concentration in areas within the facility where plant personnel may be present during an accident.*

The same commitment was also captured as COL Action Item 12.4.4-1 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793).

The staff reviewed STD COL 12.3-2, dealing with criteria and methods for radiological protection. In BLN COL FSAR Section 12.3.4, the applicant presented the procedure detailing the criteria and methods for obtaining representative measurement of radiological conditions, including in-plant airborne radioactivity concentrations in accordance with applicable portions of 10 CFR Part 20 and consistent with the guidance in RGs 1.21, Appendix A, 8.2, 8.8, and 8.10.

The applicant also discussed the surveillance requirements and the frequency of scheduled surveillance that are consistent with the operational philosophy in RG 8.10. In Section 12.3.4, "Area Radiation and Airborne Radioactivity Monitoring Instrumentation," the applicant described the typical survey frequencies and varieties of surveys. The surveys described in general terms include radiation, contamination, airborne radioactivity, and job coverage surveys for occupational radiation workers during normal and off-normal conditions.

Appendix 12AA also describes qualification and training criteria for site personnel consistent with the guidance in RG 1.8 and as described in FSAR Chapter 13. Section 13.2, "Training," incorporates NEI 06-13A, "Template for an Industry Training Program Description." NEI 06-13A, Section 1.2.7, provides training for the use of survey instruments, use of analytical equipment, radiation protection procedures and emergency plan procedures.

The applicant discussed a portable iodine monitoring system used to determine the airborne iodine concentration in areas where plant personnel may be present routinely and during an accident which meets the guidance of NUREG-0737, Item III.D.3.3 and complies with 10 CFR Part 50, Appendix A. The applicant will incorporate the use of this sampling system into the emergency plan implementing procedures.

The NRC staff reviewed BLN COL FSAR Section 12.3.4 and Appendix 12AA, dealing with standards applied to the calibration and maintenance of portable radiation survey instruments. The applicant describes Area and Airborne Radioactivity Monitoring Instrumentation in BLN COL FSAR Section 12.3.4 and also in Section 14.2.9.4.27, "Portable Personnel Monitors and Radiation Survey Instruments."

The portable personnel monitor and radiation survey instrument testing verifies that the devices operate in accordance with their intended function in support of the RPP as described in Chapter 12. The applicant stated as a prerequisite that the monitors, instruments and certified test sources are on site. The applicant also stated that the general test method and acceptance criteria for the monitors and instruments would be source checked and tested in accordance with the manufactures' recommendations. The NRC staff determined that additional information should be provided in addition to the use of manufacturers' recommendations. Additional standards such as American National Standards Institute (ANSI) N42.17A-1989, as it relates to the accuracy and overall performance of portable survey instruments, and ANSI N323A-1997, as it relates to the calibration and maintenance of portable radiation survey instruments should be provided. In response to RAI 12.3-12.4-5, in a letter from the applicant, dated September 22, 2008; the applicant stated that it intends to revise the BLN COL FSAR to include maintenance and calibration of survey instruments and to update the version of the ANSI standard in a future revision of the COL application. The NRC staff finds that Revision 1 of the BLN COL FSAR adequately addresses the above. As a result, RAI 12.3-12.4-5 is closed.

- *STD COL 12.3-3*

The applicant provided additional information in STD COL 12.3-3, related to the groundwater monitoring program, to resolve COL Information Item 12.3-3. COL Information Item 12.3-3 states:

> *The Combined License applicant will establish a groundwater monitoring program beyond the normal radioactive effluent monitoring program. If and as necessary to support this*

groundwater monitoring program, the Combined License applicant will install groundwater monitoring wells during the plant construction process. Areas of the site to be specifically considered in this groundwater monitoring program are as follows:

- *West of the auxiliary building in the area of the fuel transfer canal*
- *West and south of the radwaste building*
- *East of the auxiliary building rail bay and the radwaste building truck doors*

The applicant added text in BLN COL FSAR Appendix 12AA, Section 12AA.5.4.14 to the information incorporated from NEI 07-03 regarding the groundwater monitoring program.

The applicant stated that a groundwater monitoring program beyond the normal radioactive effluent monitoring program will be developed, if, and as necessary to support this groundwater monitoring program, design features will be installed during the plant construction process. The applicant discussed areas of the site to be specifically considered in this groundwater monitoring program.

The NRC staff evaluated the applicant's groundwater monitoring program to the criteria in 10 CFR 20.1406. 10 CFR 20.1406 requires the applicant to provide a description of how facility design and procedures for operation will minimize, to the extent practicable, contamination of the facility and the environment; facilitate eventual decommissioning; and minimize, to the extent practicable, the generation of radioactive waste. The regulatory guidance which describes an acceptable method for meeting the regulation was published in June 2008, RG 4.21, Revision 0, "Minimization of Contamination and Radioactive Waste Generation: Life Cycle Planning."

The groundwater monitoring program as described in BLN COL FSAR Appendix 12AA included some implementation considerations, but the program lacked a description of the key components of the program such as, types and periodicity of routine samples, threshold activity to be detected, actions to be taken upon detection, and quality assurance practices to be used to ensure reasonable assurance of prompt identification of leakage into the groundwater (RAI 12.3-12.4-1 and RAI 12.3-12.4-2).

The applicant stated in a letter dated September 22, 2008, that it will adopt the NEI 08-08, "Generic FSAR Template Guidance for Life Cycle Minimization of Contamination," Revision 0 template. If approved by the NRC, the applicant will provide additional description of site specific design features and procedures for operation that minimize contamination of the facility, site, and environment. NEI 08-08 is currently under staff review. This is identified as Open Item 12.3-1.

As described in Section 11.2.1 2.4 of the AP1000 DCD, Revision 17, the exterior monitored liquid effluent discharge pipe is engineered to preclude leakage by

> *either enclosure within a guard pipe and leakage monitoring, or is accessible for visual inspection in total from the Radwaste Building to the licensed release point for dilution and discharge. No valves, vacuum breakers, or other fittings are incorporated outside of buildings. In a supplemental response dated December 16, 2008, to RAI 12.3-12.4-1, the applicant provided a proposed revision to the BLN COL FSAR to describe the site-specific design of the external radioactive waste discharge line. The staff agrees with the applicant that the site-specific design will minimize the potential for undetected leakage from this discharge to the environment at a non-licensed release point, and complies with 10 CFR 20.1406. The proposed change to the BLN COL FSAR is acceptable subject to a formal revision to the BLN COL FSAR. Accordingly, this is identified as Confirmatory Item 12.3-1.*

The following portion of this technical evaluation section is reproduced from VEGP SER Section 12.3.4:

> *Resolution of Standard Content Open Item 12.3-1*
>
> *Revision 2 of the FSAR references NEI 08-08A, which is the version of NEI 08-08 that has been accepted by NRC. Accordingly, Open Item 12.3-1 is resolved for VEGP.*
>
> *Resolution of Standard Content Confirmatory Item 12.3-1*
>
> *The NRC staff verified that Section 11.2.1.2.4 of the VEGP FSAR was updated to include the information identified in BLN Confirmatory Item 12.3-1; therefore, Confirmatory Item 12.3-1 is resolved for VEGP*.

Supplemental Information

- WLS SUP 11.2-3

The radwaste discharge piping, described above, runs from the auxiliary building to the radwaste building and then out of the radwaste building to the licensed release point for dilution and discharge. The last paragraph of the standard content evaluation of STD COL 12.3-3, reproduced from BLN SER Section 12.3.4 above, provides the staff's evaluation of the exterior radwaste discharge piping for BLN. In a May 22, 2009, letter to NRC, the WLS applicant endorsed BNL's response to BLN RAI 12.3-12.4-1.

Although the WLS applicant described the above mentioned portions of the radwaste discharge piping in WLS COL FSAR Section 11.2, the applicant did not initially provide a description of the site-specific design portions of the external radioactive waste discharge line in the WLS COL FSAR. In a September 20, 2011, letter, the applicant provided supplemental information in WLS COL FSAR Section 11.2.1.2.4 regarding site-specific design features of the external radioactive waste discharge line. In WLS SUP 11.2-3, the applicant stated that the exterior liquid radwaste system discharge pipe from the Radwaste Building for each unit (Units 1 and 2) is stainless steel and is enclosed within a high-density polyethylene (HDPE) guard pipe. The annular space between the liquid radwaste discharge pipe and the guard pipe is monitored for leakage at low points along the path to comply with the requirements of 10 CFR 20.1406. No valves or vacuum breakers are incorporated in exterior radwaste discharge pipe. The HDPE guard pipe surrounding the radwaste discharge pipe is continuous up to the underground pit on the western bank of the Broad River where the liquid radwaste pipe ties into the outfall pipe. It is at this point that the liquid radwaste effluent from the liquid radwaste pipe is diluted by the high volume circulating water system blowdown stream from the outfall pipe to meet the release limits of 10 CFR Part 20, Appendix B, "Annual Limits on Intake (ALIs) and Derived Air Concentrations (DACs) of Radionuclides for Occupational Exposure; Effluent Concentrations; Concentrations for Release to Sewage," Table II, Column 2. The underground pit where this mixing takes place is monitored for leakage to comply with the requirements of 10 CFR 20.1406. The resulting diluted flow will be discharged to the Broad River via a submerged multi-port diffuser on the Ninety-Nine Islands Dam spillway.

RG 4.21 states that applicants should strive to minimize leaks and spills, provide containment in areas where such events might occur, and provide for detection that supports timely assessment and appropriate response. In accordance with the guidance of RG 4.21, and to comply with the requirements of 10 CFR 20.1406, the applicant will provide monitoring points to facilitate manual sampling for leakage from the liquid radwaste system discharge pipeline. NEI 08-08A, "Generic FSAR Template Guidance for Life Cycle Minimization of Contamination," states that the COL applicant should establish an on-site ground water monitoring program to ensure timely detection of inadvertent radiological releases to the ground water. In accordance with NEI 08-08A, the applicant has modified its radiation protection program described in WLS COL FSAR Section 12AA to include a description of a groundwater monitoring program. This groundwater monitoring program will include a network of wells to ensure timely detection of inadvertent radiological releases to the groundwater.

The staff finds that the design features of the site-specific design portions of the external radioactive waste discharge line, which are described in WLS SUP 11.2-3, will minimize the potential for undetected leakage from this discharge to the environment in accordance with the guidance of RG 4.21. On the basis of the staff's review of the information provided in WLS SUP 11.2-3, the staff concludes that the discharge piping design features and implementation of the groundwater monitoring program meet the requirements of 10 CFR 20.1406 for minimizing the potential for the contamination of the environment and finds WLS SUP 11.2-3 acceptable.

The following portion of this technical evaluation section is reproduced from Section 12.3.4 of the VEGP SER.

> *The following portion of this technical evaluation section is reproduced from Section 12.3.4 of the BLN SER.*
>
> - *STD COL 12.3-4*
>
> *The applicant provided additional information in STD COL 12.3-4, related to the record of operational events of interest for decommissioning, to resolve COL Information Item 12.3-4. COL Information Item 12.3-4 states:*
>
> > *The Combined License applicant will establish a program to ensure documentation of operational events deemed to be of interest for decommissioning, beyond that required by*

10 CFR 50.75. This or another program will include remediation of any leaks that have the potential to contaminate groundwater.

The applicant added text in Appendix 12AA, Section 12AA.5.4.15 to the information incorporated from NEI 07-03 dealing with a record of operational events of interest for decommissioning. The applicant discussed procedures established to document the operational events that are deemed of interest for decommissioning, beyond that required by 10 CFR 50.75. These documented operational events assist in developing a historical assessment of the nuclear facilities, thereby reducing time, effort, and hazards to personnel during decommissioning planning. This documentation will include identification of the remediation of any leaks, which have the potential to contaminate groundwater. The procedures that govern retention of these records, and the records themselves, should specify the retention period required to assure availability when they may be required (e.g., life of facility plus 30 years). The NRC staff requested in RAI 12.3-12.4-3 that the applicant include the operational and design COL information items that fully meet the objectives of RG 4.21, Revision 0 and hence the requirements of 10 CFR 20.1406, 'Minimization of Contamination."

In response to the RAI, in a letter dated September 22, 2008, the applicant stated that it intended to adopt NEI 08-08. This document is intended to provide the description of additional site procedures for decommissioning records which will demonstrate compliance with 10 CFR 20.1406. This is identified as Open Item 12.3-1.

The following portion of this technical evaluation section is reproduced from VEGP SER Section 12.3.4:

<u>Resolution of Standard Content Open Item 12.3-1</u>

Revision 2 of the FSAR references NEI 08-08A, which is the version of NEI 08-08 that has been accepted by NRC. Accordingly, Open Item 12.3-1 is resolved for VEGP.

12.3.5 Post Combined License Activities

There are no post COL activities related to this section.

12.3.6 Conclusion

The staff reviewed the WLS COL application and checked the referenced DCD. The staff's review confirmed that the applicant addressed the required information relating to the radiation protection design features, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements. In addition, the staff concludes that the relevant information presented in the WLS COL FSAR is acceptable. The staff based its conclusion on the relevant acceptance criteria provided in NUREG-0800, Section 12.3-12.4 and on the following:

- WLS DEP 6.4-1, related to design changes affecting habitability of the main control room and changes to the calculated doses to control room operators, is reviewed and found acceptable by the staff in Section 21.2 of this SER.

- WLS DEP 18.8-1, which the applicant proposed to relocate the OSC from the location described in the AP1000 DCD, Section 12.5.2.2, is acceptable from a radiation protection design features perspective. The location of the OSC does not have an impact on the radiation protection facilities design. The ALARA briefing room remains as stated in the ASP1000 DCD, so there is no impact on radiation protection facilities, programs or functions.

- STD COL 12.3-1, which addresses the administrative controls for use of the design features provided to control access to radiological restricted areas, is acceptable because the applicant has incorporated the approved reference NEI 07-03A into the WLS COL FSAR and meets the applicable regulatory requirements and guidance specified in Sections 12.3.3 and 12.3.4 of this report.

- STD COL 12.3-2, which addresses the criteria and methods for obtaining representative measurement of radiological conditions, including airborne radioactivity concentrations in work areas, is acceptable because the applicant has demonstrated compliance with the applicable regulatory requirements and guidance specified in Sections 12.3.3 and 12.3.4 of this report.

- STD COL 12.3-3 and WLS SUP 11.2-3, which address the groundwater monitoring program beyond the normal radioactive effluent monitoring program, are acceptable because the applicant has incorporated the approved reference NEI 08-08A into the WLS COL FSAR in order to demonstrate compliance with the applicable regulatory requirements and guidance specified in Sections 12.3.3 and 12.3.4 of this report.

- STD COL 12.3-4, which addresses the program to ensure documentation of operational events deemed to be of interest for decommissioning, is acceptable because the applicant has incorporated the approved reference NEI 08-08A into the WLS COL FSAR and meets the applicable regulatory requirements and guidance specified in Sections 12.3.3 and 12.3.4 of this report.

12.4 Dose Assessment

12.4.1 Introduction

This section of the report addresses the issues related to estimating the annual personnel doses associated with operation, normal maintenance, radwaste handling, refueling, ISI and special maintenance (e.g., maintenance that goes beyond routine scheduled maintenance, modification of equipment to upgrade the plant, and repairs to failed components), and construction.

12.4.2 Summary of Application

WLS COL FSAR, Revision 11, Section 12.4 incorporates by reference AP1000 DCD, Revision 19, Section 12.4. In addition, in WLS COL FSAR Section 12.4, the applicant provided the following:

Supplemental Information

- WLS SUP 12.4-1

The applicant provided site-specific supplemental information to address dose to construction workers by adding new sections after AP1000 DCD Section 12.4.1.8.

- STD SUP 12.4-1

The applicant provided supplemental information regarding conduct of radiological surveys in unrestricted and controlled areas and for radioactive materials in effluents discharged to unrestricted and controlled areas.

12.4.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements. In addition, the regulatory requirements and acceptance criteria associated with the relevant requirements of NRC regulations for the dose assessment are given in NUREG-0800, Section 12.4.

The applicable regulatory requirements for WLS SUP 12.4-1 and STD SUP 12.4-1 are as follows:

- 10 CFR 20.1101
- 10 CFR 20.1301, “Dose limits for individual members of the public”
- 10 CFR 20.1302, “Compliance with dose limits for individual members of the public”

12.4.4 Technical Evaluation

The staff reviewed WLS COL FSAR Section 12.4 and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The staff’s review confirmed that the information in the application and incorporated by reference addresses the required information relating to dose assessment. The results of the staff’s evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this report provides a discussion of the strategy used by the staff to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff’s findings on standard content that were documented in the VEGP reference COL application SER were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5 to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed and that those changes were actualized in the WLS COL FSAR.

- The staff verified that the site-specific differences, if any, did not adversely affect any relevant evaluation of conclusion.

The staff completed its review and finds the evaluation performed for the standard content to be directly applicable to the WLS COL application. This standard content material is identified in this report by use of italicized, double-indented formatting.

Supplemental Information

- WLS SUP 12.4-1

The applicant provided supplemental information regarding dose to construction workers in WLS COL FSAR Section 12.4.1.9 (comprised of Sections 12.4.1.9.1 through 12.4.1.9.6), "Dose to Construction Workers." The first section, 12.4.1.9.1, "Site Layout," describes the site layout as depicted in WLS COL FSAR Figure 2.1-201.

WLS COL FSAR Section 12.4.1.9.2, "Radiation Sources," identifies the sources of radiation that would be encountered by construction workers. Since there are currently no operating units on the site, construction workers are not exposed to any radiation sources other than background radiation until WLS Unit 1 becomes operational. At that time, construction workers would potentially receive radiation exposures from direct radiation, gaseous effluents, and liquid effluents from the operation of WLS Unit 1. As stated in AP1000 DCD Section 12.4.2, direct radiation from the WLS Unit 1 containment and other plant buildings is negligible. In addition, there is no direct dose contribution from the refueling water since the refueling water is stored inside the containment instead of in an outside storage tank.

WLS COL FSAR Section 12.4.1.9.3, "Construction Worker Dose Estimates," includes the assumptions and bases used to calculate the annual construction worker exposure estimates. The applicant used the XOQDOQ computer code (discussed in NRC's NUREG/CR-2919, "XOQDOQ: Computer Program for the Meteorological Evaluation of Routine Effluent Releases at Nuclear Power Stations") to determine the X/Q and D/Q values for the nearest location along the Unit 1 protected area fence in each direction as well as for the point on the Unit 2 shield building closest to Unit 1. The Unit 2 shield building is the principal construction area for Unit 2 workers. The applicant then used the NRC-accepted GASPAR computer code to estimate the gaseous effluent dose contribution from the operation of Unit 1 to Unit 2 construction workers. The applicant summed the individual dose contributions from external exposure to contaminated ground, external exposure to noble gas radionuclides in the airborne plume, and internal exposures from the inhalation of air in arriving at a maximum annual estimated dose contribution of 2.9 (micro Sieverts (µSv)) (0.29 mrem) to Unit 2 construction workers from the gaseous effluents from Unit 1. The calculated dose from routine gaseous effluents is to a construction worker at the point on the Unit 2 shield building closest to Unit 1. The staff performed an independent assessment of the construction worker exposure resulting from the Unit 1 gaseous effluent releases. The result of the staff's evaluation supported the applicant's conclusion regarding its conservative assessment of the construction worker dose from Unit 1 gaseous effluents.

In a December 20, 2012, letter, the applicant notified the NRC of a design change to the physical locations of the WLS Nuclear Islands. The WLS Unit 1 Nuclear Island is shifted 20 m (66 ft) south and 15 m (50 ft) east from the original location. The WLS Unit 2 Nuclear Island is shifted 20 m (66 ft) south. These changes resulted in a change in the relative distances between the two units as well as a change in the downwind distances to the construction worker locations. On the basis of these changes, the applicant calculated revised X/Q and D/Q values and then used the GASPAR computer code to estimate the revised gaseous effluent dose contributions from the operation of Unit 1 to Unit 2 construction workers. The revised annual estimated gaseous dose contribution to a Unit 2 worker at the nearest point of the Unit 2 shield building increased from 2.9 µSv (0.29 mrem) to 3.97 µSv (0.397 mrem), based on the relocation of the units. The applicant determined that the hourly dose due to routine gaseous effluents would occur where the highest dose rates could be expected, at the southeast sector of the Unit 1 fence line. Assuming the worker remains at this location on the fence line for all working hours of the entire year, the applicant estimated that the worker would receive 53.7 µSv (5.37 mrem) in a year. This would equate to a maximum dose in any one hour of 0.0285 µSv (2.85xE-3 mrem). The staff performed an independent assessment to verify the acceptability of these revised worker dose assessments from Unit 1 gaseous effluents.

Any potential dose contribution to Unit 2 construction workers from liquid effluents would be from construction performed to tie in the Unit 2 liquid effluent discharge and blowdown piping to the Unit 1 liquid effluent discharge and blowdown piping. The applicant stated, however, that any work done to tie in the Unit 2 discharge/blowdown piping after Unit 1 is operating will be performed under the Unit 1 radiation protection program. In addition, since the potable water for the site is provided by the Draytonville Water District, which is upstream of the WLS site, there will be no construction worker exposure from this pathway. Therefore, the applicant stated that there will be no dose contribution to Unit 2 construction workers from liquid effluents from the operation of Unit 1.

In WLS COL FSAR Section 12.4.1.9.4, "Compliance with Dose Regulations," the applicant stated that construction workers are classified as members of the public and identifies the regulatory requirements that are applicable to their exposures. Since Unit 2 construction workers are considered to be members of the general public, they are limited by 10 CFR 20.1301 and 10 CFR 20.1302 to 1 mSv (100 mrem) total effective dose equivalent (TEDE) in a year and less than 0.02 mSv (2 mrem) in any one hour, respectively. As stated above, the dose contribution to Unit 2 construction workers from both direct dose and liquid effluents would be negligible. Therefore, the applicant stated that the only dose contributions to Unit 2 construction workers from the operation of Unit 1 would be from gaseous effluents. Based on a construction worker exposure time of 2080 hours per year, the applicant estimates that Unit 2 construction workers would receive an annual dose of 3.97 µSv (0.397 mrem) TEDE from the operation of Unit 1. This is well below the 10 CFR 20.1301 annual dose limit of 1 mSv (100 mrem) TEDE to a member of the general public. The applicant's maximum hourly dose estimate to a construction worker of 0.0285 µSv (2.85×10^{-3} mrem) in any hour is also well below the 10 CFR 20.1302 dose limit of 0.02 mSv (2 mrem) in any one hour to a member of the general public. Once Unit 1 is operational, Unit 1 personnel will conduct radiological surveys in the unrestricted and controlled area and radiological surveys for radioactive materials in effluent discharged to unrestricted and controlled areas to ensure that the annual doses to Unit 2 construction workers do not exceed the 10 CFR 20.1301 dose limits to members of the general public.

WLS COL FSAR Section 12.4.1.9.5, “Collective Doses to Lee Nuclear Station Unit 2 Workers,” identifies the collective annual exposure estimate for WLS Unit 2 construction workers. Using the estimated annual construction worker dose of 3.79 µSv (0.379 mrem) and a maximum estimated construction workforce of 2100 persons, the applicant calculated a total annual construction worker collective dose of 8.34 person-mSv (0.834 person-rem).

In summary, the staff independently evaluated the construction worker doses and concluded that the applicant’s dose assessment, as listed in WLS COL FSAR Table 12.4-201, meets regulatory requirements. Therefore, the staff concluded that the information provided in WSL COL FSAR Table 12.4-201, regarding the dose to construction workers, in WLS COL FSAR Section 12.4.1.9, is acceptable.

The following portion of this technical evaluation section is reproduced from VEGP SER Section 12.4.4:

- *STD SUP 12.4-1*

The applicant provided supplemental information regarding conduct of radiological surveys in unrestricted and controlled areas and for radioactive materials in effluents discharged to unrestricted and controlled areas. The supplemental text states that these surveys are conducted by the operating unit for the purposes of implementing 10 CFR 20.1302 and to demonstrate compliance with the standards of 10 CFR 20.1301 for construction workers. This text is acceptable because it is consistent with applicable regulatory requirements. The staff confirmed that the VEGP COL FSAR was appropriately revised, and Open Item 12.4 1 is, therefore, closed.

A portion of the standard technical evaluation from the VEGP COL SER is not included above. The staff determined that the omitted portion was not relevant to WLS.

12.4.5 Post Combined License Activities

There are no post COL activities related to this section.

12.4.6 Conclusion

The staff reviewed the WLS COL application and checked the referenced DCD. The staff’s review confirmed that the applicant addressed the required information relating to dose assessment, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the staff’s technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements. In addition, the staff concludes that the relevant information presented in the WLS COL FSAR is acceptable based on the relevant acceptance criteria provided in NUREG-0800, Section 12.3-12.4. The staff based its conclusion on the following:

- WLS SUP 12.4-1, which provides supplemental information to address dose to construction workers, is acceptable because the applicant has demonstrated compliance with applicable requirements of 10 CFR 20.1101; 10 CFR 20.1301; 10 CFR 20.1302; and the applicable acceptance criteria provided in NUREG-0800, Section 12.3-12.4.

- STD SUP 12.4-1, which provides supplemental information regarding conduct of radiological surveys in unrestricted and controlled areas and for radioactive materials in effluents discharged to unrestricted and controlled areas, is acceptable because the applicant has demonstrated compliance with applicable requirements of 10 CFR 20.1301 and 10 CFR 20.1302.

12.5 Health Physics Facilities Design

12.5.1 Introduction

This section of the WLS COL FSAR addresses the objectives and design of the HP facilities. The HP facilities are designed to (1) provide the capability for administrative control of the activities of plant personnel to limit personnel exposure to radiation and radioactive materials ALARA and within the requirements of 10 CFR Part 20, and (2) provide the capability for administrative control of effluent releases from the plant to maintain the releases ALARA and within the limits of 10 CFR Part 20 and the plant Technical Specifications.

12.5.2 Summary of Application

WLS COL FSAR, Revision 11, Section 12.5 incorporates by reference AP1000 DCD, Revision 19, Section 12.5. In WLS COL FSAR Section 12.5, the applicant provided the following:

Departures

- WLS DEP 18.8-1

The applicant described the following Tier 2 departure from the AP1000 DCD. The AP1000 DCD states that the ALARA briefing room and Operations Support Center (OSC) share the same location in the Annex Building. The applicant proposed to move the OSC from the location identified in the AP1000 DCD to a location described in the Emergency Plan and revise AP1000 DCD Section 12.5.2.2 to exclude the reference to the OSC.

AP1000 COL Information Item

- STD COL 12.5-1

The applicant provided additional information in STD COL 12.5-1 to resolve COL Information Item 12.5-1 (COL Action Item 12.6-1), which addresses the RPP description.

License Conditions

- Part 10, License Conditions and ITAAC, 3, “Operational Program Implementation,” License Conditions C, “Receipt of Materials,” Item C.1, D, “Fuel Receipt,” Item D.2, G, “Fuel Loading,” Item G.4, and K, “Waste Shipment,” Item K.1
- Part 10, License Condition 6, “Operational Program Readiness”

The applicant proposed a license condition to provide a schedule to support NRC inspection of operational programs including the RPP.

12.5.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements. In addition, the acceptance criteria associated with the relevant requirements of NRC regulations for the HP facilities’ design are given in NUREG-0800, Section 12.5.

The applicable regulatory requirements and guidance for STD COL 12.5-1 are as follows:

- 10 CFR Part 20
- RG 8.2, Revision 0
- RG 8.4, “Direct Reading and Indirect Reading Pocket Dosimeters,” Revision 0
- RG 8.6, “Standard Test Procedures for Geiger-Muller Counters,” Revision 0
- RG 8.8, Revision 3
- RG 8.9, Revision 1
- RG 8.10, Revision 1-R
- RG 8.28, “Audible Alarm Dosimeters,” Revision 0
- NUREG-1736

The applicable regulatory requirement for License Condition 3, Items C.1, D.2, G.4, and K.1 is 10 CFR 20.1101.

12.5.4 Technical Evaluation

The staff reviewed WLS COL FSAR Section 12.5 and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The staff’s review confirmed that the information in the application and incorporated by reference addresses the required information relating to the HP facilities design. The results of the staff’s evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this report provides a discussion of the strategy used by the staff to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5 to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed and that those changes were actualized in the WLS COL FSAR.

- The staff verified that the site-specific differences, if any, did not adversely affect any previous relevant evaluation or conclusion.

The staff completed its review and finds the evaluation performed for the standard content to be directly applicable to the WLS COL application. This standard content material is identified in this report by use of italicized, double-indented formatting. Section 1.2.3 of this report provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) contains evaluation material from the SER for the BLN Units 3 and 4 COL application.

Departures

- WLS DEP 18.8-1

Since the location of the WLS Units 1 and 2 OSC differs from the OSC location described in the AP1000 DCD, the applicant proposes to eliminate the reference to the OSC that appears in the first sentence of AP1000 DCD, Section 12.5.2.2. Therefore, the applicant proposes to revise the text in the first sentence of DCD Subsection 12.5.2.2 to read: "The ALARA briefing room is located off the main corridor immediately beyond the main entry to the annex building." This departure is acceptable insofar as the HP facility design is concerned because the location of the OSC does not have an impact on the radiation protection facilities design. The location of the ALARA briefing room remains as stated in the AP1000 DCD, so there is no impact on radiation protection facilities, programs or functions. The staff's evaluation of the effect of the OSC relocation on emergency preparedness is addressed in Section 13-3 of this report and on the human system interface design is addressed in Section 18.8 of this report.

The following portion of this technical evaluation section is reproduced from VEGP SER Section 12.5.4:

> *The following portion of this technical evaluation section is reproduced from Section 12.5.4 of the BLN SER:*
>
> *AP1000 COL Information Item*
>
> - *STD COL 12.5-1*

The applicant provided additional information in STD COL 12.5-1, addressing the RPP description, to resolve COL Information Item 12.5-1. COL Information Item 12.5-1 states:

> *The Combined License applicant will address the organization and procedures used for adequate radiological protection and to provide methods so that personnel radiation exposures will be maintained ALARA.*

The same commitment was also captured as COL Action Item 12.6-1 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793). The applicant stated that STD COL 12.5-1 is addressed in Appendix 12AA of the BLN COL FSAR. This appendix incorporates by reference NEI 07-03, Revision 3. The applicant described revisions to NEI 07-03 and supplemental information in Appendix 12AA of the BLN COL FSAR. The staff evaluated the revised text and supplemental information provided in conjunction with the referenced NEI 07-03, Revision 3 template. These revisions and supplements address STD COL Items 12.1-1, 12.3-1, 12.3-3, 12.3-4, and 12.5-1. The applicant's proposed revisions and supplements are:

1. *Specific organizational positions were described in Chapter 13 of BLN COL FSAR; and Sections 12.5.2.1 through 12.5.2.5 are not incorporated in Appendix 12AA.*

2. *Facilities, as described in general terms in NEI 07-03, Revision 3 are not incorporated in BLN COL FSAR Appendix 12AA; facilities, instrumentation, and equipment are described in DCD Section 12.5.2.*

3. *Supplemental information was provided for NEI 07-03, Section 12.5.3.3 to describe compliance with 10 CFR 20.1703(b) and 10 CFR 20.1705 when National Institute for Occupational Safety and Health (U.S. Public Health Service) tested and certified respiratory protection equipment is not used.*

4. *The following headings and associated material that are described in general terms in NEI 07-03, Revision 3 are not incorporated in Appendix 12AA. Radwaste Handling, Spent Fuel Handling, Normal Operation, and Sampling are described in DCD Section 12.5.3.*

5. *Supplemental information was provided for NEI 07-03, Section 12.5.4.4* [sic] *to describe the use of a closed circuit television system to allow remote monitoring for high radiation areas access.*

6. *Supplemental information was provided for NEI 07-03, Section 12.5.4.4 to describe access control measures for very high radiation areas. Locations and radiological controls of the radiation zones are described on plant diagrams in DCD Section 12.5.3.*

7. *Appendix 12AA revised NEI 07-03, Section 12.5.4.7 to clarify the location of the COL applicant's management policy, organizational responsibility*

authorities for implementing an effective ALARA program, and the establishment and implementation of radiation protection.

8. *The applicant revised the second bullet of NEI 07-03, Section 12.5.4.7 II to require that the functional manager in charge of radiation protection be responsible for defining the value for "Significant exposures" and the associated activities within written procedures. The example value described in NEI 07-03 includes activities that are estimated to involve greater than 1 person-rem of collective dose.*

9. *The COL applicant added text after the last bullet of NEI 07-03, Section 12.5.4.8 to adopt NEI 08-08 that is currently under review by the NRC staff.*

10. *The COL applicant added information to NEI 07-03, Section 12AA.5.4.14 and Section 12AA.5.4.15* [sic] *to adopt NEI 08-08 that is currently under review by the NRC staff.*

The applicant describes the exceptions and supplemental information to NEI 07-03 that reference additional design and site-specific information necessary to clearly identify the source of the information addressed in the RPP as described in Appendix 12AA. The applicant's description provides sufficient detailed information supporting the exceptions or revisions such that the information described provides clear direction as to organizational structure, facilities, management policy for ALARA, and where the threshold for significant with exposures will be described. The NRC staff agrees that the applicant's exceptions to NEI 07-03, noted above are acceptable because these exceptions and the supplemental information satisfy the regulatory requirements of 10 CFR 20.1106 (b), the acceptance criteria of Sections 12.1 and 12.5 of NUREG-0800 and the regulatory guidance in RG 8.8, Position C.1.b, RG 8.9, and RG 8.10, Positions C.1.a, and C.2.

The applicant added Appendix 12AA, "Appendix 12AA, Radiation Protection Program Description," after Section 12.5 of the DCD. In this appendix the applicant incorporates by reference NEI 07-03, Revision 3. The applicant indicated that Table 13.4-201 provides milestones for radiation protection operational program implementation.

The NRC staff reviewed STD COL 12.5-1 dealing with the RPP description in BLN COL FSAR Appendix 12AA. The additional controls described in STD COL 12.5-1 are consistent with the discussion in NUREG-1736 regarding Bioassay programs for personnel monitoring and are consistent with the applicant's commitment to RG 8.9. The staff reviewed the threshold for determining significant exposures. The applicant stated that the functional manager in charge of radiation protection determines the threshold within procedures. Initially, the staff did not consider that the applicant exercised sufficient control related to maintaining ALARA (RAI 12.5-1).

In response to RAI 12.5-1, in a letter dated September 22, 2008, the applicant provided additional information that the final NEI 07-03 template (Revision 7) would be incorporated without departure concerning significant exposures. In a letter dated March 18, 2009 (ML090510379), the NRC accepted NEI 07-03, Revision 7. Specifically, the NRC staff indicated that for COL applications, NEI 07-03, Revision 7 provides an acceptable template for assuring that the RPP meets the applicable regulations and guidance. Since the BLN COL FSAR has not yet adopted the approved version of the NEI template, this is identified as Confirmatory Item 12.1-1.

The NRC staff reviewed Revision 0 of the BLN COL FSAR Appendix 1AA, which listed the applicant's conformance with radiation protection related RGs. The applicant stated that it will conform in general to RG 8.28, "Audible Alarm Dosimeters," Revision 0, dated August 1981, and specifically stated that it conforms to ANSI N13.7-1981, which was reaffirmed in 1992. ANSI N13.7-1983 is the "American National Standard for Radiation Protection-Photographic Film Dosimeters Criteria for Performance." RG 8.28, Revision 0, endorsed ANSI N13.27-1981, "Performance Specifications for Pocket-Sized Alarming Dosimeters/Ratemeters." This discrepancy was identified in RAI 1-10. In response to RAI 1-10, the applicant stated that BLN COL FSAR Appendix 1AA would be revised to the correct reference of the ANSI standard in a future revision of the BLN COL FSAR. The NRC staff verified that Revision 1 of the BLN COL FSAR adequately addresses the proposed change. As a result, RAI 1-10 is closed.

The following portion of this technical evaluation section is reproduced from VEGP SER Section 12.5.4:

The staff notes that the VEGP FSAR has not been updated to correct the discrepancy identified in RAI 1-10 regarding the reference to ANSI N13.27-1981. Revision 2 of the VEGP FSAR currently references the incorrect standard, ANSI N13.7-1981, under RG 8.28 in Appendix 1AA. Since the VEGP applicant has endorsed RAI 1-10, the staff expects this discrepancy to be corrected in a future revision of the VEGP FSAR. This is VEGP Confirmatory Item 12.5-2.

Correction of Error in the Standard Content Evaluation Text

The NRC staff identified two errors in the text reproduced above from the BLN SER, Section 12.5.4 that require correction. In the change numbered 5 above, the reference to "NEI 07-03, Section 12.5.4.4," is incorrect. The correct reference is to "NEI 07-03, Section 12.5.4.2." In the change numbered 10, above, the reference to "Section 12AA.5.4.14 and Section 12AA.5.4.15" is incorrect. The correct reference is to "Section 12.5.4.14 and Section 12.5.4.15."

Resolution of Standard Content Confirmatory Item 12.1-1

The NRC staff compared the VEGP and BLN COL applications regarding STD COL 12.5-1, and found them to be essentially identical, with the exception that VEGP FSAR Appendix 12AA references NEI 07-03A and BLN FSAR

Appendix 12AA references Revision 3 of NEI 07-03. Additional clarifying information has been added to the VEGP FSAR regarding STD COL 12.5-1, which is discussed below. As indicated in Section 12.1.4 above, Confirmatory Item 12.1-1, is resolved for VEGP because the applicant has adopted the approved version of NEI 07-03, which is now designated as NEI 07-03A.

In Revision 2 of the FSAR, the applicant modified parts of FSAR Chapter 12, Appendix 12AA, that relate to STD COL 12.5-1. The changes are as follows:

1. *Text describing a closed circuit television system associated with high radiation areas has been moved from Appendix 12AA to Section 12.5.2.2 (this text is associated with STD COL 12.3-1, and is evaluated in Section 12.3.4 of this SER).*

2. *References in NEI 07-03A have been revised to reflect the appropriate sections of the FSAR.*

3. *Proposed modifications to the second bullet of NEI 07-03, Section 12.5.4.7 have been withdrawn.*

4. *Bullet number 3 of NEI 07-03A, Section 12.5, has been revised to address aspects of the radiation program functional areas that must be in place at various milestones.*

5. *A cross reference to NEI 08-08A has been added in NEI 07-03A.*

6. *The first paragraph of Section 12.5.4.12 of NEI 07-03A has been revised to address 10 CFR 20.1101 and the Quality Assurance Program.*

Items 1, 2, and 5 are acceptable because they are editorial and do not affect content. The change described in Item 3 is acceptable because NEI 07-03A is acceptable without modification. The changes described in Item 4 are acceptable because they are consistent with the milestones described in FSAR Table 13.4-201 and with applicable regulatory requirements. The changes described in Item 6 are acceptable because they are consistent with 10 CFR 20.1101 and the Quality Assurance Program described in FSAR Section 17.5.

Resolution of VEGP Confirmatory Item 12.5-2

Appendix 1AA of the WLS COL FSAR correctly references ANSI N13.27-1981 under the conformance discussion of RG 8.28. Therefore, VEGP Confirmatory Item 12.5-2 is resolved for WLS COL application.

The following portion of this technical evaluation section is reproduced from VEGP SER Section 12.5.4:

<u>Exceptions to RGs 8.2, 8.4, 8.6, and Section C.3.b of RG 8.8</u>

The following portion of this technical evaluation section is reproduced from Section 12.5.4 of the BLN SER.

The applicant took exception to RG 8.2, "Guide for Administrative Practices in Radiation Monitoring," regarding a reference to a previous version of 10 CFR Part 20 (10 CFR 20.401), because it is no longer valid. The staff agrees with the applicant's exception.

The applicant took exception to RG 8.4, "Direct Reading and Indirect Reading Pocket Dosimeters," regarding references to previous versions of 10 CFR Part 20 (10 CFR 20.202(a), and 10 CFR 20.401) because they are no longer valid. The staff agrees with the applicant's exception. The applicant also took exception to ANSI N13.5-1972 (R-1989), in that two performance criteria, accuracy and leakage, specified in the guidance, are to be met by acceptance standards in ANSI N322-1997, "ANSI Test, Construction, and Performance requirements for Direct Reading Electrostatic/Electroscope Type Dosimeters." The staff finds that by using ANSI N322-1997 for performance criteria, 10 CFR 20 requirements are still met, as the major change is the allowance of an additional one percent leakage over a comparable time period. Test and calibration intervals recommended by RG 8.4 are not affected.

The applicant took exception to RG 8.6, "Standard Test Procedures for Geiger Mueller Counters," to reference an instrument calibration program based upon ANSI Criteria N323A-1997 (with 2004 Correction Sheet), "Radiation Protection Instrumentation Test and Calibration, Portable Survey Instruments." This methodology is acceptable over the previous program referenced in RG 8.6 because the ANSI standard reflects current industry practices. The staff agrees with the applicant's position.

The applicant took exception to part of Position C.3.b in RG 8.8, "Information Relevant to Ensuring that Occupational Radiation Exposure at Nuclear Power Stations will be ALARA." This exception was to the reporting requirements associated with operating exposure. The applicant's basis for justifying the exception to RG 8.8, Position C.3.b, is that reporting of operating exposure information is no longer required. The staff agrees with the applicant's exception to RG 8.8, Position C3.b, because this specific reporting requirement has been superseded. All licensees are now required to report records of ionizing exposure to the NRC annually in accordance with 10 CFR 20.2206.

<u>License Condition</u>

- *License Condition 3, Items C.1, D.2, G.4, and K.1*

Implementation milestones were provided by the applicant to address the RPP required by 10 CFR 20.1101. A phased-in implementation should include appropriate milestones in the construction of the facility. Staffing levels, equipment, facilities, and procedures necessary to ensure radiation safety of the workers and public for each phase of implementation should be identified. In

RAI 12.5-2, the staff requested that the applicant provide the specific programs to be implemented at each milestone identified in Table 13.4-201 of the BLN COL FSAR. In its response to the RAI, the applicant provided clarifying information regarding Table 13.4-201.

In a supplemental response to RAI 12.5-2, dated December 16, 2008, the applicant provided a proposed revision to BLN COL FSAR Table 13.4-201 to show the specific program(s) for each milestone and assignment of a Radiation Protection Manager and Supervisor. The proposed change to BLN COL FSAR Table 13.4-201 is acceptable subject to a formal revision to the BLN COL FSAR, based on the specific commitment to establish an individual responsible for each milestone. Accordingly, this is identified as Confirmatory Item 12.5-1.

The following portion of this technical evaluation section is reproduced from VEGP SER Section 12.5.4:

<u>Resolution of Standard Content Confirmatory Item 12.5-1</u>

The NRC staff verified that the VEGP FSAR was updated to include the information identified in the initial and supplemental BLN response to RAI 12.5-2. Accordingly, Standard Content Confirmatory Item 12.5-1 is resolved for the VEGP COL FSAR.

<u>Resolution of Standard Content Confirmatory Item 12.5-1</u>

The NRC staff verified that the WLS FSAR includes the information identified in the initial and supplemental BLN response to RAI 12.5-2. Accordingly, the standard content Confirmatory Item 12.5-1 is resolved for the WLS COL FSAR.

The following portion of this technical evaluation section is reproduced from VEGP SER Section 12.5.4:

- *Part 10, License Condition 6, Operational Program Readiness*

The applicant proposed a license condition to provide a schedule to support NRC inspection of operational programs, including the RPP. The proposed license condition is consistent with the policy established in SECY-05-0197, "Review of Operational Programs in a Combined License Application and General Emergency Planning Inspections, Tests, Analyses, and Acceptance Criteria," and is acceptable.

12.5.5 Post Combined License Activities

The license condition language in this section has been clarified from previously considered language. In a letter dated March 22, 2016 (ADAMS Accession No. ML16084A099), the applicant did not identify any concerns with the clarified license condition language. The changes do not affect the staff's above analysis of the conditions, and therefore, for the reasons discussed in the technical evaluation section above, the staff finds the following license conditions acceptable:

- License Condition (12-1) – The licensee shall implement the Radiation Protection Program (RPP) (including the ALARA principle) or applicable portions thereof (as identified in FSAR Section 12.5) as described in the milestones below:

  1. RPP features (including the ALARA principle) applicable to receipt of by-product, source, or special nuclear materials (excluding exempt quantities as described in 10 CFR 30.18) implemented before initial receipt of such materials;

  2. RPP features (including the ALARA principle) applicable to new fuel implemented before receipt of initial fuel on site;

  3. All other RPP features (including the ALARA principle) except for those applicable to control radioactive waste shipment implemented before initial fuel load;

  4. RPP features (including the ALARA principle) applicable to radioactive waste shipment implemented before first shipment of radioactive waste;

- License Condition (12-2) – No later than 12 months after issuance of the COL, the licensee shall submit to the Director of the Office of New Reactors a schedule that supports planning for and conduct of NRC inspections of the operational program (RPP). The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until this operational program has been fully implemented.

12.5.6 Conclusion

The staff reviewed the WLS COL application and checked the referenced DCD. The staff's review confirmed that the applicant addressed the required information relating to the radiation protection design features, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the WLS COL FSAR is acceptable based on the relevant acceptance criteria provided in NUREG-0800, Section 12.5. The staff based its conclusion on the following:

- WLS DEP 18.8-1, in which the applicant proposed to relocate the OSC from the location described in the AP1000 DCD Section 12.5.2.2, is acceptable insofar as the HP facility design is concerned because the location of the OSC does not have an impact on the radiation protection facilities design. The ALARA briefing room remains as stated in the AP1000 DCD, so there is no impact on radiation protection facilities, programs or functions.

- STD COL 12.5-1, which addresses the RPP description, is acceptable because the applicant incorporates NEI 07-03A into the WLS COL FSAR in order to meet the applicable regulatory requirements and guidance specified in Sections 12.5.3 and 12.5.4 of this report.

13 CONDUCT OF OPERATIONS

13.1 Organizational Structure of Applicant

13.1.1 Introduction

Duke Energy Carolinas', LLC. (Duke) (the applicant) organizational structure includes the design, construction, and preoperational responsibilities of the organizational structure. The management and technical support organization includes a description of the corporate or home office organization, its functions and responsibilities, and the number and the qualifications of personnel. The applicant's organizational structure activities include facility design, design review, design approval, construction management, testing, and operation of the plant. The descriptions of the design and construction and preoperational responsibilities include the following:

- how these responsibilities are assigned by the headquarters staff and implemented within the organizational units
- the responsible working- or performance-level organizational unit
- the estimated number of persons to be assigned to each unit with responsibility for the project
- the general educational and experience requirements for identified positions or classes of positions
- early plans for providing technical support for the operation of the facility

This section of the of the William States Lee III Nuclear Station (WLS) combined license (COL) Final Safety Analysis Report (FSAR) also describes the structure, functions, and responsibilities of the onsite organization established to operate and maintain the plant.

13.1.2 Summary of Application

WLS COL FSAR, Revision 11, Section 13.1 incorporates by reference AP1000 Design Control Document (DCD), Revision 19, Section 13.1.

In addition, in WLS COL FSAR Section 13.1, the applicant provided the following:

AP1000 COL Information Items

- WLS COL 13.1-1

The applicant provided additional information in WLS COL 13.1-1 to resolve COL Information Item 13.1-1 (COL Action Item 13.1-1). COL Information Item 13.1-1 requires the COL applicant to describe its organizational structure. WLS COL 13.1-1 describes organizational positions of the nuclear power station and owner/applicant corporations and associated functions and responsibilities. WLS COL FSAR Table 1.8-202, “COL Item Tabulation,” provides WLS COL 13.1-1 cross-references.

- WLS COL 9.5-1

The applicant provided additional information in WLS COL 9.5-1, describing the fire protection program in WLS COL FSAR Section 9.5.1.8. For this WLS COL item, the applicant added a new WLS COL FSAR Section 13.1.1.2.10, “Fire Protection,” and a new WLS COL FSAR Section 13.1.2.1.2.9, “Engineer - Fire Protection.” WLS COL FSAR Table 1.8-202, “COL Item Tabulation,” provides WLS COL 9.5-1 cross-references.

- WLS COL 18.6-1

The applicant provided additional information in WLS COL 18.6-1, describing the qualifications of the nuclear plant technical support personnel. WLS COL 18.6-1 is addressed under WLS COL FSAR Section 13.1.1.4, “Qualifications of Technical Support Personnel,”; WLS COL FSAR Section 13.1.3.1, “Qualification of Nuclear Plan Personnel.”; WLS COL FSAR Table 13.1-201 “Generic Position/Site Specific Position Cross Reference,”; and WLS COL FSAR Table 13.1-202 “Minimum On-Duty Operations Shift Organization For Two-Unit Plant”; and WLS COL FSAR Table 1.8-202, “COL Item Tabulation,” provides WLS COL 18.6-1 cross-references.

- WLS COL 18.10-1

The applicant provided additional information in WLS COL 18.10-1 to address the responsibilities of the manager in charge of nuclear training. WLS COL 18.10-1 is addressed in WLS COL FSAR Section 13.1.1.3.2.4, “Functional Manager – Training and Development” WLS COL FSAR Table 1.8-202, “COL Item Tabulation,” provides WLS COL 18.10-1 cross-references.

13.1.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793, “Final Safety Evaluation Report Related to Certification of the AP1000 Standard Design,” and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of NRC regulations for WLS COL 13.1-1, WLS COL 9.5-1, WLS COL 18.6-1, and WLS COL 18.10-1 are given in WLS COL FSAR Sections 13.1.1, “Management and Technical Support Organization,” and 13.1.2-13.1.3, “Operating Organization,” of NUREG-0800, “Standard Review Plan for the Review of Safety Analysis Reports for Nuclear Power Plants: LWR Edition.”

The applicable regulatory guidance for the organizational structure of the applicant is as follows:

- American National Standards Institute (ANSI)/American Nuclear Society (ANS)-3.1-1993, “American National Standard for Selection, Qualification, and Training of Personnel for Nuclear Power Plants,” as endorsed and amended by Regulatory Guide (RG) 1.8, Revision 3, “Qualification and Training of Personnel for Nuclear Power Plants.”

The applicable regulations and regulatory guidance for the management, technical support, and operating organizations of the applicant are as follows:

- Title 10 of the *Code of Federal Regulations* (10 CFR) 50.34, “Contents of applications; technical information”
- 10 CFR 50.40, “Common standards”
- 10 CFR 52.47, “Contents of applications; technical information”
- 10 CFR 50.48, “Fire Protection”
- 10 CFR 50.50 Appendix B, “Quality Assurance Criteria for Nuclear Power Plants and Fuel Reprocessing Plants”
- 10 CFR 50.54, “Conditions of licenses”
- 10 CFR Part 55, “Operator's Licenses”
- 10 CFR 50.71, “Maintenance of records, making of reports”
- 10 CFR 52.79, “Contents of applications; technical information in final safety analysis report”
- RG 1.33, Revision 2, “Quality Assurance Program Requirements (Operation)”
- RG 1.8, “Qualification and Training of Personnel for Nuclear Power Plants”
- RG 1.28, “Quality Assurance Program Criteria (Design and Construction)”
- RG 1.33, “Quality Assurance Program Requirements (Operation)”
- RG 1.68, “Initial Test Programs for Water-cooled Nuclear Power Plants”
- RG 1.114, AGuidance to Operators at the Controls and to Senior Operators in the Control Room of a Nuclear Power Unit”
- RG 1.160, “Monitoring the Effectiveness of Maintenance at Nuclear Power Plants”
- RG 1.174, “An Approach for Using Probabilistic Risk Assessment in Risk-Informed Decisions on Plant-Specific Changes to the Licensing Basis.”
- RG 1.175, “An Approach for Plant-Specific, Risk-Informed Decisionmaking: Inservice Testing”
- RG 1.177, “An Approach for Plant-Specific, Risk-Informed Decisionmaking: Technical Specifications”
- RG 1.178, “An Approach for Plant-Specific Risk-Informed Decisionmaking for Inservice Inspection of Piping”
- RG 1.182, “Assessing and Managing Risk Before Maintenance Activities at Nuclear Power Plants”

- RG 1.206 “Combined License Applications for Nuclear Power Plants (LWR Edition)”
- NUREG-0660, “NRC Action Plan Developed as a Result of the TMI-1 Accident”
- NUREG-0694, “TMI-Related Requirements for New Operating Licenses”
- NUREG-0711,“Human Factors Engineering Program Review Model”
- NUREG-0718, “Licensing Requirements for Pending Applications for Construction Permits and Manufacturing License”
- NUREG-0737 and Supplement 1, “A Clarification of TMI Action Plan Requirements”

13.1.4 Technical Evaluation

The U.S. Nuclear Regulatory Commission (NRC) staff reviewed WLS COL FSAR Section 13.1 and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The NRC staff’s (the staff) review confirmed that the information in the application and incorporated by reference addresses the required information relating to the organizational structure of the applicant. The results of the staff’s evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

The staff reviewed the information in the WLS COL FSAR:

AP1000 COL Information Items

- WLS COL 13.1-1

The staff reviewed WLS COL 13.1-1 related to the organizational structure of the COL applicant included under WLS COL FSAR Section 13.1. WLS COL FSAR Section 13.1 describes the organizational positions of a nuclear power plant and owner/applicant corporations and associated functions and responsibilities.

The applicant provided the following additional WLS site-specific COL information to resolve COL Information Item 13.1-1, which addresses the organizational structure of the COL applicant. COL Information Item 13.1-1 states:

> Combined License applicants referencing the AP1000 certified design will address adequacy of the organizational structure.

The commitment was also captured as COL Action Item 13.1-1 in NUREG-1793, Appendix F, which states:

> The COL applicant will describe its organizational structure.

---

[1] See Section 1.2.2 of this report for a discussion of the staff’s review related to verification of the scope of information to be included in a COL application that references a design certification (DC).

The applicant provided additional information as part of the WLS COL FSAR to describe the organizational positions of a nuclear power station and owner/applicant corporations and associated functions and responsibilities. The position titles used in the text are generic and describe the function of the position. The applicant stated that WLS COL FSAR Table 13.1-201, "Generic Position/Site-Specific Position Cross-Reference" provides a cross-reference to identify site-specific position titles.

The applicant added new sections and information related to the site-specific organizational structure to WLS COL FSAR Section 13.1 beyond the structure given in RG 1.206, "Combined License Applications for Nuclear Power Plants (LWR Edition)." The new section titles are:

Section 13.1.1, "Management and Technical Support Organization"

Section 13.1.2, "Operating Organization"

Section 13.1.3, "Qualifications of Nuclear Plant Personnel"

Section 13.1.4, "Combined License Information Item"

Section 13.1.5, "References"

Table 13.1-201, "Generic Position/Site-Specific Position Cross-Reference"

Table 13.1-202, "Minimum On-Duty Operations Shift Organization for Two-Unit Plant"

Figure 13.1-201, "Plant Management Organization"

Section 13.1-202, "Shift Operations Organization"

Section 13.1-203, "Nuclear Executive Organization"

Section 13.1-204, "Duke Energy Corporate"

Section 13AA-201, "Construction Management Organization"

Section 13AA-202 "Hiring Schedule for Plant Staff"

In addition, the applicant added a new appendix to Chapter 13 titled, "Appendix 13AA, Design and Construction." This appendix describes the applicant's construction organization. Once plant operation commences, this appendix will become historical.

The staff reviewed WLS COL 13.1-1 and concludes that the management, technical support, and operating organizations, as described are acceptable and meet the requirements of 10 CFR 50.40(b) based on the following.

The applicant described its organization for the management of, and its means of providing, technical support for the plant staff for the design, construction, and operation of the facility and described its plans to manage the project and utilize the nuclear steam system supplier (NSSS) vendor and architect-engineer (AE). These plans provide reasonable assurance that the applicant will establish an acceptable organization and that sufficient resources are available to provide offsite technical support and to satisfy the applicant's commitments for the design, construction, and operation of the facility.

The applicant described the assignment of plant operating responsibilities; the reporting chain up through the chief executive officer; the functions and responsibilities of each major plant staff group; the proposed shift crew complement for single-unit or multiple-unit operation; the qualification requirements for members of its plant staff; and staff qualifications. In WLS COL FSAR Table 1.9-202, "Conformance with SRP Acceptance Criteria," the applicant noted an exception to the criteria of NUREG-0800, Section 13.1.2-13.1.3 that suggests resumes of personnel holding plant managerial and supervisory positions be included in the WLS COL FSAR. The staff finds this exception to the criteria of NUREG-0800, Section 13.1.2-13.1.3 acceptable because resumes for management and principal supervisory and technical positions will be available for review after position vacancies are filled.

NUREG-0800, Section 13.1.2-13.1.3, "Operating Organization," provides the following acceptable characteristics for an applicant's operating organization:

1. The applicant is technically qualified, as specified in 10 CFR 50.40(b).

2. An adequate number of licensed operators will be available at all required times to satisfy the minimum staffing requirements of 10 CFR 50.54(j).

3. On-shift personnel are able to provide initial facility response in the event of an emergency.

4. Organizational requirements for the plant manager and radiation protection manager have been satisfied.

5. Qualification requirements and qualifications of plant personnel conform to the guidance of RG 1.8.

6. Organizational requirements conform to the guidance of RG 1.33.

The staff finds that the operating organization proposed by the applicant will comply with these characteristics. These findings contribute to the judgment that the applicant complies with the requirements of 10 CFR 50.40(b). That is, the applicant is technically qualified to engage in design and construction activities and to operate a nuclear power plant; that the applicant will have the necessary managerial and technical resources to support the plant staff in the event of an emergency; and that the applicant has identified the organizational positions responsible for fire protection matters and delegated the authorities to these positions to implement fire protection requirements as discussed under WLS COL 9.5-1 below.

- WLS COL 9.5-1

The applicant added text to WLS COL FSAR Section 13.1.1.2.10, "Fire Protection," indicating that the nuclear power station is committed to maintaining a fire protection program as described in WLS COL FSAR Section 9.5.1.8, and that the site executive in charge of plant management, through the engineer in charge of fire protection, is responsible for the fire protection program. The applicant added text to WLS COL FSAR Section 13.1.2.1.2.9, “Engineer - Fire Protection,” describing the responsibilities of the engineer in charge of the fire protection program.

The staff reviewed WLS COL 9.5-1 relative to the text added to Sections 13.1.1.2.10 and 13.1.2.1.2.9 of the WLS COL application. Based on the management descriptions provided in WLS COL FSAR Sections 13.1.1.2.10 and 13.1.1.3.2.1.4, the staff finds the applicant’s fire protection organization meets the guidance of NUREG-0800. The technical review for WLS COL 9.5-1, as it relates to the programmatic requirements, is addressed in Section 9.5.1.8 of this report.

- WLS COL 18.6-1

The staff reviewed WLS COL 18.6-1, which describes the qualifications of the nuclear plant technical support personnel.

In WLS COL FSAR Table 1.9-202, “Conformance with SRP Acceptance Criteria,” the applicant noted an exception to the criteria of NUREG-0800, Section 13.1.1. The SRP acceptance criteria suggest that the experience requirements of managers and supervisors of the technical support organization are to be included in the WLS COL FSAR. The staff finds this exception to the criteria of NUREG-0800, Section 13.1.1 acceptable because the applicant added text to WLS COL FSAR Section 13.1.1.4, “Qualifications of Technical Support Personnel,” stating the qualifications of managers and supervisors of the technical support organization will meet the education and experience requirements described in ANSI/ANS-3.1-1993 and RG 1.8.

The applicant added text to WLS COL FSAR Section 13.1.3, “Qualification of Nuclear Plant Personnel,” stating, in WLS COL FSAR Section 13.1.3.1, the qualifications of managers, supervisors, operators, and technicians of the operating organization will meet the education and experience requirements described in ANSI/ANS-3.1-1993 and RG 1.8. In addition, WLS COL FSAR Section 13.1.3.2 states that resumes and other documentation of the qualifications and experience of initial appointees to appropriate management and supervisory positions will be available for review after position vacancies are filled.

The applicant added WLS COL FSAR Table 13.1-202, “Minimum On-Duty Operations Shift Organization for Two-Unit Plant.” WLS COL FSAR Table 13.1-202 describes the minimum composition of the operating shift crew for all modes of operation. Position titles, license requirements and minimum shift manning for the various modes of operation are addressed in Technical Specifications and will be addressed in administrative procedures.

The staff reviewed the text added to WLS COL FSAR Sections 13.1.1.4 and 13.1.3.1 relative to WLS COL 18.6-1 and concludes that the qualification requirements are acceptable and meet the requirements of 10 CFR 50.40(b) based on the following.

The applicant described its organization for the management of, and its means of providing, technical support for the plant staff for the design, construction, and operation of the facility and described its plans for managing the project and utilizing the NSSS vendor and AE. These plans give reasonable assurance that the applicant will establish an acceptable organization and that sufficient resources are available to provide offsite technical support and to satisfy the applicant's commitments for the design, construction, and operation of the facility.

- WLS COL 18.10-1

The staff reviewed WLS COL 18.10-1 included under WLS COL FSAR Section 13.1.1.3.2.4, “Functional Manager – Training and Development.” This section describes the responsibilities of the manager in charge of nuclear training relative to the site training programs required for the safe and proper operation and maintenance of the plant. This item is cross-referenced to WLS COL FSAR Section 18.10 in WLS COL FSAR Table 1.8-202, “COL Item Tabulation.” The staff concludes that the qualification requirements are acceptable and meet the requirements of 10 CFR 50.40(b) and the regulatory guidelines in NUREG-0800, Sections 13.1.1 and 13.1.2-13.1.3 because the applicant described how the training manager will carry out his or her position responsibilities for designing, developing, implementing, and maintaining training programs for the safe and proper operation and maintenance of the plant.

13.1.5 Post Combined License Activities

There are no post COL activities related to this section.

13.1.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff’s review confirmed that the applicant addressed the required information relating to the organizational structure of the applicant, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the staff’s technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

The applicant described clear responsibilities and definite resources for the design and construction of the facility and has described its plans for managing the project and utilizing the Nuclear Steam Supply System (NSSS) vendor and architect engineer (AE). The staff reviewed these plans and determined that they provide adequate assurance that an acceptable organization has been established and that sufficient resources are available to satisfy the applicant’s commitments for the design and construction of the facility. These findings contribute to the judgment that the applicant complies with the requirements of 10 CFR 50.34, 10 CFR 50.40, 10 CFR 50.48, 10 CFR Part 50 Appendix B, 10 CFR 52.47, 10 CFR 52.79, and 10 CFR 52.80, as applicable; that is, the applicant is technically qualified to engage in design and construction activities.

The applicant described its organization for the management of, and its means of providing, technical support for the plant staff during operation of the facility. These measures have been reviewed and the staff finds that the applicant has an acceptable organization and adequate resources to provide offsite technical support for the operation of the facility under both normal and off-normal conditions.

The applicant described the assignment of plant operating responsibilities; the reporting chain up through the chief executive office of the applicant; the proposed size of the regular plant staff; the functions and responsibilities of each major plant staff group; the proposed shift crew complement for single-unit or multiple-unit operation; the qualification requirements for members of its plant staff; and plant staff qualifications (through personnel resumes for management and principle supervisory and technical positions as submitted during the later stages of plant design, construction, and licensing).

The staff finds that the operating organization proposed by the applicant is acceptable because it meets the requirements of 10 CFR 50.40(b), as applicable. That is, the applicant is technically qualified to operate a nuclear power plant; and will have the necessary managerial and technical resources to support the plant staff in the event of an emergency and has identified the organizational positions responsible for fire protection matters and delegated the authorities to these positions to implement fire protection requirements.

In addition, the staff concludes that the information presented in the WLS COL FSAR is acceptable because it meets the acceptance criteria provided in NUREG-0800, Section 13.1. The staff based its conclusion on the following:

- WLS COL 13.1-1, as it relates to the organizational structure of the COL applicant, is acceptable because it meets the requirements of 10 CFR 50.40(b).

- WLS COL 9.5-1, as it relates to the fire protection organization meets the guidance of NUREG-0800, Section 13.1 and is acceptable.

- WLS COL 18.6-1, as it relates to the qualifications of nuclear plant technical support personnel, is acceptable because it meets the requirements of 10 CFR 50.40(b).

- WLS COL 18.10-1, as it relates to the qualification requirements for the manager in charge of nuclear training, is acceptable because it meets the requirements of 10 CFR 50.40(b).

13.2 Training

13.2.1 Introduction

This section of the WLS COL FSAR addresses the description and schedule of the training program for reactor operators (ROs) and senior reactor operators (SROs) (i.e., licensed operators). This section of the WLS COL FSAR addresses the scope of licensing examinations as well as training requirements. The licensed operator training program also includes the requalification programs as required in 10 CFR 50.54(i) (i-1) and 10 CFR 55.59, “Requalification.” In addition, this section of the WLS COL FSAR includes the description and schedule of the training program for non-licensed plant staff.

13.2.2 Summary of Application

WLS COL FSAR, Revision 11, Section 13.2, incorporates by reference AP1000 DCD, Revision 19, Section 13.2.

In addition, in WLS COL FSAR Section 13.2, the applicant provided the following:

AP1000 COL Information Items

- STD COL 13.2-1

The applicant provided additional information in Standard (STD) COL 13.2-1 to resolve COL Information Item 13.2-1 (COL Action Item 13.2-1), which incorporates the provisions of Nuclear Energy Institute (NEI) 06-13A, “Template for an Industry Training Program Description,” providing the description and scheduling of the training program for plant personnel, including the requalification program for licensed operators.

- STD COL 18.10-1

The applicant provided additional information in STD COL 18.10-1 to address training for those operators involved in the Human Factors Engineering (HFE) Verification and Validation Program, using a systematic approach to training and Westinghouse Commercial Atomic Power (WCAP)-14655, “Designer’s Input to the Training of the Human Factors Engineering Verification and Validation Personnel.”

License Conditions

- Part 10, License Condition 3, Items B.1, C.3

The applicant proposed a license condition in Part 10 of the WLS COL application, which provides the milestones for implementing the Reactor Operator Training (B.1) and the applicable portions of the Non-Licensed Plant Staff Training Program (C.3) related to radioactive material required in accordance with 10 CFR 50.120, “Training and Qualification of Nuclear Power Plant Personnel.” The license condition related to the portions of the Non-Licensed Plant Staff Training Program applicable to radioactive material is addressed in Chapter 1 of this report.

- Part 10, License Condition 6

The applicant proposed a license condition to provide a schedule to support the NRC’s inspection of operational programs included in WLS COL FSAR Table 13.4-201, including the Non-Licensed Plant Staff Training Program, required in accordance with 10 CFR 50.120, Reactor Operator Training Program, and the Reactor Operator Requalification Program.

13.2.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of NRC regulations for the description and schedule of the training program for licensed operators are given in WLS COL FSAR Sections 13.2.1 and 13.2.2 and in NUREG-0800, Chapter 18.

The applicable regulations and regulatory guidance documents for STD COL 13.2-1 are as follows:

- 10 CFR 50.54(m)

- 10 CFR Part 55, “Operators’ licenses”
- RG 1.8
- RG 1.149, “Nuclear Power Plant Simulation Facilities for Use in Operator Training and License Examinations”
- NUREG-1021, “Operator Licensing Examination Standards for Power Reactors”

The applicable regulations for the Non-Licensed Plant Staff Training Program are as follows:

- 10 CFR 50.120
- 10 CFR 52.79(a)(33), “Contents of applications; technical information”

The applicable regulations for the licensed operators training program are as follows:

- 10 CFR 55.13, “General exemptions”
- 10 CFR 55.31, “How to apply”
- 10 CFR 55.41, “Written examinations: Operators”
- 10 CFR 55.43, “Written examinations: Senior operators”
- 10 CFR 55.45, “Operating tests”

The applicable regulations for the licensed operator’s requalification program are found in the following:

- 10 CFR 50.34(b), “Final safety analysis report”
- 10 CFR 50.54(i)
- 10 CFR 55.59

The applicable regulatory guidance for STD COL 18.10-1 is as follows:

- NUREG-0711, “Human Factors Engineering Program Review Model”

13.2.4 Technical Evaluation

The staff reviewed WLS COL FSAR Section 13.2 and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The staff’s review confirmed that the information in the application and incorporated by reference addresses the required information relating to the description and schedule of the training programs for nuclear plant personnel. The results of the staff’s evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this report provides a discussion of the strategy used by the staff to perform one technical review for each standard issue outside the scope of the design certification (DC) and use this review to evaluate subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (Vogtle Electric Generating Plant (VEGP), Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews.

- The staff compared the VEGP COL FSAR, Revision 5 to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from responses to requests for additional information (RAIs).

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.

- The staff verified that the site-specific differences were not relevant.

The staff completed its review and found the evaluation performed for the standard content to be directly applicable to the WLS COL application. This standard content material is identified in this report by use of italicized, double-indented formatting. Section 1.2.3 of this report provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the Bellefonte Nuclear Station (BLN) Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from VEGP SER Section 13.2.4:

> <u>*AP1000 COL Information Items*</u>
>
> - *STD COL 13.2-1*
>
> *The NRC staff reviewed STD COL 13.2-1 related to COL Information Item 13.2-1 (COL Action Item 13.2-1) included under Section 13.2 of the BLN COL FSAR. COL Information Item 13.2-1 states:*
>
>> *The Combined License applicants referencing the AP1000 certified design will develop and implement training programs for plant personnel. This includes the training program for the operations personnel who participate as subjects in the human factors engineering verification and validation. These Combined License applicant training programs will address the scope of licensing examinations as well as new training requirements.*
>
> *The commitment was also captured as COL Action Item 13.2-1 in Appendix F of the NRC staff FSER for the AP1000 DCD (NUREG-1793), which states:*
>
>> *The COL applicant will develop and implement training programs for plant personnel.*

The applicant provided the following text to supplement Section 13.2, "Training," of the AP1000 DCD, dealing with the training program for plant personnel.

> *This section incorporates by reference NEI 06-13* (sic) [NEI 06-13A], *Template for an Industry Training Program Description. See Table 1.6-201.*

This technical report provides a complete training program description for use with COL applications. The staff has endorsed NEI 06-13A, Revision 1, as it provides an acceptable template for describing licensed operators and non-licensed plant staff training programs. The applicant has incorporated by reference NEI 06-13A, Revision 1.

The applicant provided the following text to supplement Section 13.2, "Training," of the AP1000 DCD, which is included in the [design certification] DC amendment as part of the BLN COL FSAR to address STD COL 13.2-1, dealing with the training program for plant personnel.

> *Table 13.4-201 provides milestones for training implementation.*

NUREG-0800, Section 13.2.1, establishes milestones for the licensed operators and non-licensed plant staff training programs and for the licensed operator requalification training program. The BLN COL FSAR has identified those milestones in Table 13.4-201. The staff determined that this is acceptable, as the milestone information included in this table meets the criteria found in NUREG-0800.

- *STD COL 18.10-1*

The NRC staff reviewed STD COL 18.10-1, related to COL Information Item 18.10-1 (COL Action Item 18.10.3-1). COL Information Item 18.10-1 states:

> *Combined License applicants referencing the AP1000 certified design will develop and implement training programs for plant personnel. This includes the training program for the operations personnel who participate as subjects in the human factors engineering verification and validation. These Combined License applicant training programs will address the scope of licensing examinations as well as new training requirements*.

The commitment was also captured as COL Action Item 18.10.3-1 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:

> *With regard to the training program development, the COL applicant will: (1) address the training program development considerations in NUREG-0711, (2) address relevant concerns identified in this report [NUREG-1793], and (3) identify the minimum documentation that the COL applicant will provide to enable the staff to complete its review.*

This section refers to Sections 13.1, "Organizational Structure of Applicant" and 13.2, "Training" regarding the training program development.

The NRC staff reviewed the resolution to STD COL 18.10-1, related to staffing and qualifications included under Section 18.10 of the BLN COL FSAR. The applicant provided the referenced NRC-endorsed NEI 06-13A, Revision 1, to address COL Information Item 18.10-1.

NEI 06-13A, Revision 1 was written to provide COL applicants with a generic program description for use with COL application submittals. In a letter dated December 5, 2008, the staff stated that the training template of NEI 06-13A, Revision 1, was an acceptable means for describing licensed operator and non-licensed plant staff training programs. The staff finds the applicant's incorporation of NEI 06-13A, Revision 1 to be acceptable because it utilizes an NRC-endorsed methodology.

In Table 1.9-202, "Conformance with SRP Acceptance Criteria," of the BLN COL FSAR, the applicant identified two exceptions to the criteria of NUREG-0800, Section 13.2, which recommends following the guidance in NUREG-0711 and RG 1.149. Further, the applicant stated in Table 1.9-202 that NEI 06-13A is incorporated by reference into the BLN COL FSAR. The staff's safety evaluation report for NEI 06-13A (ML0709504790) states that NEI 06-13A complies with the guidance in NUREG-0711 and RG 1.149. Therefore, the staff finds the two exceptions to the criteria in NUREG-0800, Section 13.2 to be acceptable because NEI 06-13A complies with the guidance in NUREG-0711 and RG 1.149.

License Conditions

- *Part 10, License Condition 3, Item B1*

The NRC staff finds the implementation milestone for the Reactor Operator Training Program (18 months prior to schedule date of initial fuel load) to be acceptable because it is consistent with 10 CFR 50.120.

- *Part 10, License Condition 6*

The applicant proposed a license condition in Part 10 of the VEGP COL application to provide a schedule to support the NRC's inspection of operational programs, including the Non-Licensed Plant Staff Training Program, (required in accordance with 10 CFR 50.120), Reactor Operator Training Program, and Reactor Operation Requalification Program. The proposed license condition is consistent with the policy established in SECY-05-0197, "Review of Operational Programs in a Combined License Application and Generic Emergency Planning Inspections, Tests, Analyses, and Acceptance Criteria," for operational programs in general, and is acceptable.

13.2.5 Post Combined License Activities

For the reasons discussed in the Technical Evaluation section above, the staff finds the following license conditions acceptable:

- License Condition (13-1) – The licensee shall implement the Reactor Operator Training Program at least 18 months prior to schedule date of initial fuel load.

- License Condition (13-2) – No later than 12 months after issuance of the COL, the licensee shall submit to the Director of the Office of New Reactors (NRO) a schedule that supports planning for and conduct of NRC inspection of the operational programs (the Non-Licensed Plant Staff Training Program (required in accordance with 10 CFR 50.120), Reactor Operator Training Program, and Reactor Operation Requalification Program). The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until these operational programs have been fully implemented.

13.2.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant addressed the required information relating to the description and schedule of the training program for licensed operators, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the information presented in the WLS COL FSAR is acceptable because it meets the acceptance criteria provided in NUREG-0800, Section 13.2. The staff based its conclusion on the following:

- STD COL 13.2-1 incorporates by reference Nuclear Energy Institute (NEI) 06-13A, Revision 1, which provides an acceptable template for describing licensed operators and non-licensed plant staff training programs. The staff finds this acceptable, as it applies an NRC-endorsed approach.

- STD COL 18.10-1, relating to training, references WLS COL FSAR Section 13.2, in which the applicant committed to use WCAP-14655 to ensure a systematic approach to training development and has referenced NEI 06-13A, Revision 1. The staff finds this acceptable because it applies an NRC-endorsed approach.

13.3 Emergency Planning

13.3.1 Introduction

This section of the WLS COL FSAR addresses the plans, design features, facilities, functions, and equipment necessary for radiological emergency planning (EP) that must be considered in a COL application (hereinafter referred to as "COLA" or "application"). This includes both the COL applicant's onsite emergency plan and State and local (offsite) emergency plans, which the

NRC and the Federal Emergency Management Agency (FEMA) evaluated to determine whether the plans are adequate, and that there is reasonable assurance that they can be implemented. The emergency plans are an expression of the overall concept of operation and describe the essential elements of advance planning that have been considered and the provisions that have been made to cope with radiological emergency situations.

Duke is the applicant for the WLS Units 1 and 2 COLs (hereinafter referred to as “Lee Nuclear Station” for discussions of the site or plant, “WLS” as a description of the applicant, or “applicant”). Duke submitted its COLA (Revision 0) on December 12, 2007, for two new nuclear reactors, which will be located in the eastern portion of Cherokee County in north central South Carolina, approximately (56 kilometers (km)) (35 miles (mi)) southwest of Charlotte, North Carolina (NC). WLS encompasses approximately 768.9 hectares (1900 acres) of property. In the early 1970s, the site was evaluated for construction of three nuclear units. The NRC docketed the application on February 25, 2008 (Docket Nos. 52-018 and 52-019.

The applicant submitted a complete and integrated emergency plan for WLS pursuant to 10 CFR 52.79(a)(21), which consists of the Lee Nuclear Station Emergency Plan in Part 5 of the COLA (hereinafter referred to as “Emergency Plan” or “WLS Emergency Plan”), supplemental information that includes the offsite radiological emergency response plans for the States of South Carolina and North Carolina and the Counties of Cherokee, Cleveland, York, and the Lee Nuclear Station Evacuation Time Estimate (ETE) Report No. KLD TR-407, Revision 2, “William S. Lee Nuclear Station– Development of Evacuation Time Estimates,” March 2010 (hereinafter referred to as “ETE Report”). The application also includes Table 3.8-1, “Emergency Plan Inspections, Tests, Analyses, and Acceptance Criteria,” in Part 10, “License Conditions and ITAAC,” which provides a listing of EP ITAAC that address required elements of emergency planning that cannot be completed during the COLA stage, and that will be completed before initial fuel load. The COLA also references the AP1000 standard design certification, NUREG-1793 “Final Safety Evaluation Report Related to Certification of the AP1000 Standard Design,” Revision 19.

As described below, in consultation with FEMA, the staff reviewed the COLA, ETE Report, the applicant’s responses to RAIs, and generally available reference material in accordance with the guidance provided in the Standard Review Plan (SRP) NUREG-0800, “Standard Review Plan for the Review of Safety Analysis Reports for Nuclear Power Plants: LWR Edition,” Revision 3, March 2007, Section 13.3, “Emergency Planning,” and Section 14.3.10, “Emergency Planning – Inspections, Tests, Analyses, and Acceptance Criteria.” FEMA reviewed the offsite radiological emergency response plans of the States of South Carolina and North Carolina and local government plans for Cherokee, Cleveland, and York Counties.

In a February 17, 2010, letter, FEMA provided the NRC with its Interim Finding Report for Reasonable Assurance for the WLS COLA, which found that all planning standards associated with their review are adequate; the State and local emergency plans are adequate; and there is reasonable assurance that the plans can be implemented with no corrections needed. The staff reviewed the FEMA findings, and the overall FEMA conclusions are reflected below in Sections 13.3.4 and 13.3.6 of this report.

13.3.2 Summary of Application

WLS COL FSAR, Revision 11, Section 13.3, incorporates by reference AP1000 DCD, Revision 19, Section 13.3. In addition, the applicant provided the following in the COLA.

Departures

In WLS COL FSAR Tier 2[2], Table 1.8-201, "Summary of FSAR Departures from the DCD," and WLS COLA Part 7, "Departures and Exemption Requests," the applicant identified one plant-specific departure from the AP1000 generic DCD, which is associated with emergency planning:

- WLS DEP 18.8-1

  The Technical Support Center (TSC) is not located in the control support area (CSA) as identified in AP1000 DCD Section 18.8.3.5; the TSC location is as described in the Emergency Plan. Additionally, the Operations Support Center (OSC) is also being moved from the location identified in AP1000 DCD Sections 12.5.2.2 and 18.8.3.6 and as identified on AP1000 DCD Figures 1.2-18, 9A-3 (Sheet 1 of 3), 12.3-2 (Sheet 11 of 15), and 12.3-3 (Sheet 11 of 16); the OSC location is as described in the Emergency Plan.

The staff's evaluation of the applicant's description of this AP1000 DCD departure is addressed below in Section 13.3.4.8 of this report.

AP1000 COL Information Items

Consistent with the AP1000 Tier 2 DCD, in WLS COL FSAR Table 1.8-202, "COL Item Tabulation," the applicant identified AP1000 DCD COL (information) items, including the AP1000 DCD subsections and WLS COL FSAR sections where each COL item is resolved. In WLS COL FSAR Section 13.3, the applicant identified the following two COL items relating to emergency planning:

- STD COL 13.3-1

The applicant provided additional information in STD COL 13.3-1 to address COL Information Item 13.3-1 (COL Action Item 13.3-1) of the AP1000 DCD, which states:

> Combined License applicants referencing the AP1000 certified design will address emergency planning including post-72 hour actions and its communication interface.

[2] The definitions of Tier 1, Tier 2, and Tier 2*, which reflect design-related information contained in the generic AP1000 DCD, are provided in 10 CFR Part 52, Appendix D, Section II.

- STD COL 13.3-2

The applicant provided additional information in STD COL 13.3-2 to address COL Information Item 13.3.1 of the AP1000 DCD, which states:

> Combined License applicants referencing the AP1000 certified design will address the activation of the emergency operations facility [EOF] consistent with current operating practice and NUREG-0654/FEMA-REP-1 ["Criteria for Preparation and Evaluation of Radiological Emergency Response Plans and Preparedness in Support of Nuclear Power Plants," Revision 1 (hereinafter referred to as "NUREG-0654")].

The applicant also identified the following three additional COL items in their respective WLS COL FSAR sections, which relate to emergency planning:

- WLS COL 9.5-9 and WLS COL 9.5-10

In WLS COL FSAR Sections 9.5.2.5.1, "Offsite Interfaces," and 9.5.2.5.2, "Emergency Offsite Communications," the applicant provided additional information to address AP1000 DCD COL Information Items 9.5-9 and 9.5-10. As addressed by the applicant, offsite interfaces and emergency offsite communication are described in the Emergency Plan. COL Information Items 9.5-9 and 9.5-10 are as follows:

> WLS COL 9.5-9 – Combined License applicants referencing the AP1000 certified design will address interfaces to required offsite locations; this will include addressing the recommendations of NRC Bulletin (BL)-80-15 (COL Reference 21)[3] regarding loss of the emergency notification system due to a loss of offsite power.
>
> WLS COL 9.5-10 – The emergency offsite communication system, including the crisis management radio system, will be addressed by the Combined License applicant.

- WLS COL 18.2-2

In WLS COL FSAR Section 18.2, "Human Factors Engineering Program Management," the applicant provided additional information in WLS COL 18.2-2 to address AP1000 DCD COL Information Item 18.2-2 (COL Action Item 18.2.3.1-1). Specifically, the applicant stated that the EOF and TSC communication strategies and human factors attributes are described in the Emergency Plan. COL Information Item 18.2-2 states:[4]

---

[3] NRC IE Bulletin No. 80-15 (BL-80-15), "Possible Loss of Emergency Notification System (ENS) with Loss of Offsite Power," June 18, 1980.

[4] See also, Section 18.2.7, "Evaluation of COL Information Item 18.2-2 (no comparable NUREG-1793 section)," of NUREG-1793, Supplement 2, Volume 2, "Final Safety Evaluation Report Related to Certification of the AP1000 Standard Plant Design – Docket No. 52-006," August 5, 2011 (published September 2011).

> Specific information regarding EOF and TSC communications, and EOF and TSC human factors attributes will be provided by the Combined Operating License applicant to address the Combined License information requested in this [DCD] subsection [i.e., DCD Tier 2 Subsection 18.2.6].

The staff's evaluation of the applicant's resolution of these five COL items is addressed below in Section 13.3.4.18 of this report.

Supplemental Information

- STD SUP 13.3-1

In WLS COL FSAR Section 13.3, "Emergency Planning," the applicant provided supplemental information in STD SUP 13.3-1, which states that WLS COL FSAR Table 13.4-201, "Operational Programs Required by NRC Regulations," provides milestones for emergency planning program implementation. STD SUP 13.3-1 is evaluated by the staff as part of its evaluation of License Condition 6 in Section 13.3.4.19 of this report.

- WLS SUP 14.3-1

The applicant provided the following statement in WLS COL FSAR Section 14.3.2.3.1, "Emergency Planning ITAAC (EP-ITAAC)," with regard to EP ITAAC:

> EP-ITAAC have been developed to address implementation of elements of the Emergency Plan. Site-specific EP-ITAAC are based on the generic ITAAC provided in Appendix C.II.1-B of Regulatory Guide 1.206. These ITAAC have been tailored to the specific reactor design and emergency planning program requirements.

The EP ITAAC are identified below in Table 13.3-1 of this report, and WLS SUP 14.3-1 is evaluated by the staff in Section 13.3.4.19 of this report.

Onsite Emergency Plan

Emergency planning for Units 1 and 2 is addressed throughout WLS COL FSAR, with the Radiological Emergency Plan for Units 1 and 2 (WLS Emergency Plan) provided in COLA Part 5. The WLS Emergency Plan addresses guidance and meets the intent of the criteria established in NUREG-0654. The WLS Emergency Plan consists of a full and integrated emergency plan. In addition, the WLS Emergency Plan is structured to have ten appendices (listed below), one of which is not used, which provide additional detailed information on specific aspects of emergency planning.

- Appendix 1 [Not Used]
- Appendix 2 Radiological Assessment and Monitoring
- Appendix 3 Public Alert and Notification System Description
- Appendix 4 Evacuation Time Estimate

- Appendix 5 Implementing Procedures
- Appendix 6 Emergency Equipment and Supplies
- Appendix 7 Certification Letters
- Appendix 8 Cross References to Regulations, Guidance, and State and Local Plans
- Appendix 9 Justification for Common EOF
- Appendix 10 Technical Support Center Description

Offsite Emergency Plans

Pursuant to 10 CFR 50.33, "Contents of Applications; General Information," paragraph (g), a COL applicant is required to submit the radiological emergency response plans of State and local governments that are wholly or partially within the 16-kilometer (km) (10-mi) plume exposure pathway emergency planning zone (EPZ), as well as plans of State governments wholly or partially within the 80-km (50-mi) ingestion pathway EPZ (hereinafter referred to as the "10-mi EPZ" and "50-mi EPZ"). The WLS COLA includes supplemental information, consisting of the offsite radiological emergency response plans of the States of South Carolina and North Carolina and local government plans for Cherokee, Cleveland, and York Counties. The supplemental information also includes the detailed ETE Report for the 16-km (10-mi) EPZ, which is discussed in Section 13.3.4.17 of this report.

ITAAC

Part 10, "Proposed License Conditions (Including ITAAC)," of the WLS COL application provides information regarding EP ITAAC. The EP ITAAC is evaluated in Section 13.3.4.19 of this report.

License Conditions

COLA Part 10, "License Conditions (Including ITAAC)," includes the following proposed license conditions related to EP:

- Part 10, License Condition 1

The applicant proposed a license condition to incorporate EP ITAAC into the COL, which are identified in Table 3.8-1 of Appendix B to Part 10 of the WLS COL application.

- Part 10, License Condition 4 (Emergency Planning Actions)

  The licensee shall submit a fully developed set of site-specific Emergency Action Levels (EALs) to the NRC in accordance with the NRC-endorsed version of NEI 07-01, Rev. 0, with no deviations. The EALs shall have been discussed and agreed upon with State and local officials. These fully developed EALs shall be submitted to the NRC for confirmation not less than 180 days prior to the date scheduled for initial fuel load. (Identified below as License Condition (13-3))

Prior to the full participation exercise to be conducted in accordance with the requirements of Appendix E to 10 CFR Part 50, Duke Energy shall identify the specific locations of the reception centers and relocation sites and shall obtain Letters of Agreement for locations not under Duke Energy's control. (Identified below as License Condition (13-4))

At least two (2) years prior to scheduled initial fuel load, Duke Energy shall have performed an assessment of emergency response staffing in accordance with NEI 10-05, "Assessment of On-Shift Emergency Response Organization Staffing and Capabilities," Revision 0. (Identified below as License Condition (13-5))

Prior to the full-participation exercise to be conducted in accordance with the requirements of Appendix E to 10 CFR Part 50, Duke Energy will have available for NRC inspection Letters of Agreement with the entities listed in Appendix 7 of the Lee Nuclear Station COLA Part 5, Emergency Plan. These Letters of Agreement will detail each entity's specific emergency planning responsibilities, including response to hostile action affecting the plant site, and certify the entity's concurrence with their responsibilities. (Identified below as License Condition (13-6))

Prior to fuel load, Duke Energy will demonstrate the integrated capability and functionality of the Emergency Operations Facility (EOF) for activation and operation of the facility to respond to emergency events at both the Lee Nuclear Station and one additional nuclear facility that is supported by the EOF. Integrated communication and data capability and functionality will include the Technical Support Centers for Lee Nuclear Station and one additional nuclear facility, and other Federal, State, and local coordination centers as appropriate. (Identified below as License Condition (13-7))

- Part 10, License Condition 6, Items a. and e. (Operational Program Readiness)

  a. The licensee shall submit to the appropriate Director of the NRC, a schedule, no later than 12 months after issuance of the COL, that supports planning for and conduct of NRC inspections of operational programs listed in the operational program FSAR Table 13.4-201. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until either the operational programs in the FSAR table have been fully implemented or the plant has been placed in commercial service, whichever comes first. This schedule shall address:

  e. An emergency response data system (ERDS) implementation program plan consistent with 10 CFR Part 50, Appendix E, Section VI. (Identified below as License Condition (13-9))

- Part 10, License Condition 12.C (Fukushima Actions – Emergency Planning Actions)

  Staffing (Identified below as License Condition (13-10))

At least two (2) years before the latest date set forth in the schedule for completing the inspections, tests, and analyses in the ITAAC submitted in accordance with 10 CFR 52.99(a), the Licensee shall have performed assessments of the on-site and augmented staffing capability to satisfy the regulatory requirements for responding to a multi-unit event. The staffing assessments will be performed in accordance with NEI 12-01, Revision 0.

- Incorporation of corrective actions identified in the staffing assessments required by this condition, and
- Identification of how the augmented staff will be notified given degraded communications capabilities.

Communications (Identified below as License Condition (13-11))

At least two (2) years before the latest date set forth in the schedule for completing the inspections, tests, and analyses in the ITAAC submitted in accordance with 10 CFR 52.99(a), the Licensee shall have performed an assessment of on-site and off-site communications systems and equipment relied upon during an emergency event to ensure communications capabilities can be maintained during an extended loss of ac power. The communications capability assessment shall be performed in accordance with NEI 12-01, “Guideline for Assessing Beyond Design Basis Accident Response Staffing and Communications Capabilities,” Revision 0.

At least one hundred eighty (180) days before the date scheduled for initial fuel load set forth in the notification submitted in accordance with 10 CFR 52.103(a), the Licensee shall complete implementation of corrective actions identified in the communications capability assessment described above, including any related emergency plan and implementing procedure changes and associated training.

ITAAC

WLS COLA Part 10 proposes License Condition 1 (described above) that incorporates into the COL the ITAAC identified in Appendix B of Part 10. WLS COLA Part 10, Appendix B includes Table 3.8-1 (EP ITAAC) and incorporates by reference AP1000 DCD Tier 1, Table 3.1-1 (ITAAC). The EP ITAAC are evaluated below in this report.

13.3.3 Regulatory Basis

The regulatory basis of the AP1000 DCD information incorporated by reference is addressed in NUREG-1793, “Final Safety Evaluation Report Related to Certification of the AP1000 Standard Design,” and its supplements. The applicable regulatory requirements and guidance for emergency planning are as follows:

- 10 CFR 52.79(a)(21) requires that the FSAR include emergency plans that comply with the requirements of 10 CFR 50.47, “Emergency plans,” and 10 CFR Part 50, “Domestic Licensing of Production and Utilization Facilities,” Appendix E, “Emergency Planning and Preparedness for Production and Utilization Facilities.” In addition, 10 CFR 52.79(a)(22)(i) requires emergency pllanning certifications from State and local governmental agencies with emergency planning responsibilities. Under 10 CFR 50.47(a)(1)(ii), no initial COL under 10 CFR Part 52, "Licenses, Certifications, and Approvals for Nuclear Power Plants," will be issued unless a finding is made by the NRC that there is reasonable assurance that adequate protective measures can and will be taken in the event of a radiological emergency. In addition, 10 CFR 50.47(a)(2), states that the NRC will base its findings on a review of the FEMA findings and determinations as to whether State and local emergency plans are adequate, and whether there is reasonable assurance that they can be implemented, and on the NRC assessment as to whether the applicant's onsite emergency plans are adequate and whether there is reasonable assurance that they can be implemented.

- The staff also considered the applicable requirements in 10 CFR 50.33(g); 10 CFR 52.80, "Contents of applications; additional technical information"; 10 CFR 52.83, "Finality of referenced NRC approvals; partial initial decision on site suitability"; and 10 CFR 100.21, "Non-seismic siting criteria."

- NUREG-0800 identifies NUREG-0654 and other related guidance that the staff should consider during its review. The related acceptance criteria are identified in NUREG-0800, Section 13.3.II, and the applicable regulatory guidance for reviewing emergency preparedness as an operational program is established in NUREG-0800, Section 13.4. In addition, the staff considered NUREG/CR-7002, "Criteria for Development of Evacuation Time Estimate Studies" (November 2011), the current guidance for conducting and evaluating evacuation time estimates; NUREG/CR-6863, "Development of Evacuation Time Estimate Studies for Nuclear Power Plants" (January 2005); and Interim Staff Guidance (ISG) NSIR/DPR-ISG-01.[5]

- 44 CFR Part 350, "Review and Approval of State and Local Radiological Emergency Plans and Preparedness," and 44 CFR Part 352, "Commercial Nuclear Power Plants: Emergency Preparedness Planning," provide procedures for FEMA's review and evaluation of the adequacy of offsite radiological emergency planning and preparedness. Pursuant to 44 CFR Part 353, "Memorandum of Understanding Between Federal Emergency Management Agency and Nuclear Regulatory Commission Relating to Radiological Emergency Planning and Preparedness," Appendix A, "Memorandum of Understanding Between Federal Emergency Management Agency and Nuclear Regulatory Commission" (58 FR 47996, September 14, 1993), FEMA provided its findings and determinations on offsite planning to the NRC for NRC's use in the licensing process.

13.3.4 Technical Evaluation

The staff reviewed the information in WLS COL FSAR Section 13.3, "Emergency Planning," and the WLS Emergency Plan for conformance with applicable standards and requirements

[5] NSIR/DPR-ISG-01, Revision 0, "Interim Staff Guidance - Emergency Planning for Nuclear Power Plants," November 2011, provides updated guidance based on changes to emergency planning regulations in 10 CFR 50.47 and 10 CFR Part 50, Appendix E, that were published as a Final Rule in the *Federal Register* (FR) on November 23, 2011 (76 FR 72560), and on integrated offsite response organization event response concepts with onsite emergency planning programs.

identified in NUREG-0800, Sections 13.3 and 14.3.10. The complete set of emergency planning ITAAC for the new reactors is provided in Table 13.3-1, "WLS Units 1 & 2 ITAAC," of this report, and various ITAAC are discussed throughout this section of the report. In addition, the staff reviewed selected portions of the emergency response plans for the States of South Carolina and North Carolina and local government plans for Cherokee, Cleveland, and York Counties. The staff completed this review for understanding and content, in relation to consistency with various sections of the WLS Emergency Plan that address offsite support and response. The staff checked the referenced DCD to ensure that the combination of the DCD and the COLA represents the complete scope of information relating to this review topic.[6] The staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to emergency planning pursuant to 10 CFR 52.77, 10 CFR 52.79, 10 CFR 52.80, and 10 CFR 100.21. The results of the staff's evaluation of the referenced DCD are documented in NUREG-1793 and its supplements.

The staff's and FEMA's technical reviews of the WLS COLA addressed all of the relevant evaluation criteria in the 16 planning standards (i.e., A through P) of NUREG-0654, consistent with NUREG-0800, Section 13.3, which cites the applicable regulations.

In WLS COLA Part 1, the applicant incorporated by reference the AP1000 DCD. WLS COL FSAR Section 13.3 further incorporates by reference AP1000 DCD Section 13.3, "Emergency Planning." WLS COLA Part 5 provides the WLS Emergency Plan, which consists of the basic emergency plan and ten appendices. The basic plan follows the format of NUREG-0654, and provides detailed information regarding each of the 16 planning standards and associated evaluation criteria in NUREG-0654. The format of the staff's review of the WLS Emergency Plan is patterned after the 16 planning standards, which reflect the requirements in 10 CFR 50.47(b)(1) through (b)(16). 10 CFR Part 50, Appendix E, provides additional requirements that duplicate or supplement the evaluation criteria associated with the planning standards. The staff's review of the various aspects of 10 CFR Part 50, Appendix E is included within the associated planning standards review.

13.3.4.1 Assignment of Responsibility (Organizational Control)

The regulation in 10 CFR 50.47(b)(1), as reflected in NUREG-0654 as Planning Standard A, requires that primary responsibilities for emergency response by the nuclear facility licensee and by State and local organizations within the EPZs have been assigned, the emergency responsibilities of the various supporting organizations have been specifically established, and each principal response organization has staff to respond and to augment its initial response on a continuous basis. In addition, 10 CFR Part 50, Appendix E, Section III requires that the emergency plans incorporate information about the emergency response roles of supporting organizations and offsite agencies, and that information shall be sufficient to provide assurance of coordination among the supporting groups and with the licensee. 10 CFR Part 50, Appendix E. Section IV.A requires, among other things, a description of the local offsite services to be provided in support of the licensee's emergency organization; the identification of, and assistance expected from, appropriate local, State, and Federal agencies with responsibilities for coping with emergencies, including hostile action at the site; identification of the State and

[6] See Section 1.2.2 of this report for a discussion on the staff's review related to verification of the scope of information to be included within a COL application that references a design certification (DC).

local officials responsible for planning for, ordering, and controlling appropriate protective actions, including evacuations when necessary; and a detailed analysis demonstrating that on-shift personnel assigned emergency functions are not assigned responsibilities that would prevent timely performance of their assigned functions as specified in the WLS Emergency Plan.

The regulatory guidance provided in NUREG-0654 Evaluation Criterion II.A.3 states, in part, that each plan shall include written agreements referring to the concept of operations developed among Federal, State, and local agencies and other support organizations having an emergency response role within the EPZs. In addition, 10 CFR 52.79(a)(22)(i) states that the COLA must contain all emergency plan certifications that have been obtained from the State and local governmental agencies with emergency planning responsibilities. These certifications must state that (1) the proposed emergency plans are practicable; (2) these agencies are committed to participating in any further development of the plans, including any required field demonstrations; and (3) these agencies are committed to executing their responsibilities under the plans in the event of an emergency.

In the WLS Emergency Plan, Section II.A, “Assignment of Responsibility (Organizational Control),” the applicant described the primary responsibilities and organizational control of WLS, Federal, State, county and other emergency response organizations (EROs) within the 16-km (10-mi) EPZ and the 80-km (50-mi) EPZ. The staff reviewed this section, as well as other relevant portions of the application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff’s primary focus was to evaluate the WLS Emergency Plan against NUREG-0654, Planning Standard A, “Assignment of Responsibility (Organization Control).” Planning Standard A provides the detailed evaluation criteria that the staff should consider in determining whether the WLS Emergency Plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(1).

WLS Emergency Plan, Section II.A, “Assignment of Responsibility (Organizational Control),” describes the relationships and concept of operations for the organizations and agencies that are a part of the overall ERO, and identifies the various Federal, State, county and local government agencies and organizations that are involved in a response to an emergency at WLS. WLS Emergency Plan, Figure II-1, “Emergency Response Organization Interrelationships,” illustrates the interrelationships of organizations that will be participating in emergency response. WLS Emergency Plan, Appendix 7, “Certification Letters,” contains certification letters signed by the supporting State and local agencies.

WLS Emergency Plan, Section II.A.1.b, “Assignment of Responsibility,” footnote 4, states that in the event of a security related attack on the site by a hostile force, a brief notification (site name, emergency classification, if determined, and nature of threat) is provided to the NRC following notification of the designated State and local authorities and within approximately 15 minutes of the discovery of the event.

WLS Emergency Plan, Section II.A.1.d, “Individual in Charge of Emergency Response,” identifies the individual in charge for coordinating the emergency response as the Operations Shift Manager, who will assume the role as Emergency Coordinator. The Operations Shift Manager is relieved as Emergency Coordinator when the Station Manager or a qualified alternate reports to the station, and he or she is updated as to the status of the unit, the emergency actions taken, and the current status of the emergency. Once the EOF is activated the EOF director assumes responsibility for ensuring that the appropriate offsite interface activities are performed (e.g., notifications of emergency status to State and local governments and NRC; and recommending offsite protective measures to the State).

WLS Emergency Plan, Sections II.A.1.e, “24-Hour Emergency Response Capability,” and II.A.4, “Continuous Operations,” states, in part, that Duke Energy and WLS maintains a 24-hour emergency response capability, communication links are staffed, and multiple responders are trained for key emergency response positions, consistent with the training requirements established in WLS Emergency Plan, Section II.O, “Radiological Emergency Response Training.” The Emergency Coordinator or EOF Director is identified as the individual from the principal organization in charge, and he or she has the responsibility for ensuring continuity of technical, administrative, and material resources during emergency operations. In addition, Section II.B.7, “Corporate Off-site Support for Plant Staff,” of the WLS Emergency Plan states, “The EOF is capable of 24 hours/day operation for a protracted period.”

WLS Emergency Plan, Section II.A.3, “Written Agreements,” states that Appendix 7 includes initial certification letters established between Duke Energy, the State and local government agencies, and private sector organizations that will be supporting the emergency response effort. As previously described in Section 13.3.2, “Summary of Application,” of this report, the applicant will develop updated letters of agreement (LOAs) in accordance with License Condition (13-6), which is evaluated in Section 13.3.4.3 of this report.

In RAI 25, Question 13.03-54(A), the staff requested that the applicant provide the title of the State and local officials who will be responsible for implementing offsite protective actions. In a December 23, 2008, response, the applicant provided additional information related to State and local officials who will be responsible for implementing offsite protective actions and provided proposed revisions to WLS Emergency Plan, Section II.A.1.b. The States of South Carolina and North Carolina, and counties of Cherokee, Cleveland, and York have emergency response plans that specify the responsibilities and functions for the major agencies, departments, and key individuals of their emergency response organizations. The governors for these states have the overall command authority for radiological and non-radiological aspects of a nuclear incident, and will provide for public protection through assignment of appropriate States’ resources and agencies. Within the State of South Carolina, should a rapidly-developing emergency condition arise that requires implementation of protective actions before the State Emergency Operations Center can be activated, affected county managers may implement the facility-recommended protective actions without prior consultation with the Director of the Emergency Management Division or the governor. Within the State of North Carolina, should a rapidly-developing emergency condition arise that requires the implementation of protective actions before the State Emergency Operations Center can be activated, affected Chairmen of the Board of County Commissioners may implement the facility recommended protective actions without prior consultation with the State agencies or governor. Since the above referenced States and counties reside within the 16-km (10-mi) and 80-(km (50-mi) EPZs, the applicant included the respective emergency response plans as supplemental information to the WLS COLA pursuant to 10 CFR 50.33(g).

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and the associated evaluation criteria found in NUREG-0654.

The staff reviewed the information provided by the applicant and finds that the applicant adequately assigned primary responsibilities for emergency response, and has the necessary staffing to respond to and augment its initial response on a continuous basis. The staff notes that the applicant is capable of providing 24-hour-per-day emergency response and staffing of communication links, including continuous (24-hour) operations for a protracted period. In addition, the applicant identified the appropriate organizations that are intended to be part of the overall response organization, and established the emergency responsibilities of the various supporting organizations, including providing adequate written agreements. The applicant specified the concept of operations and its relationship to the total effort, illustrated the interrelationships in a block diagram, and has identified the individuals in charge of the emergency response and for ensuring continuity of resources.

In addition, the staff confirms that the applicant incorporated information about the emergency response roles of supporting organizations and offsite agencies into the WLS Emergency Plan, and finds that the information provided by the applicant and reviewed by the staff is sufficient to provide assurance of coordination among the supporting groups and with the licensee. Further, the applicant described the local offsite services to be provided in support of the licensee's emergency organization, and identified the assistance expected from appropriate local, State, and Federal agencies, including State and/or local officials responsible for planning for, ordering, and controlling appropriate protective actions.

The staff confirms that the certification letters in WLS Emergency Plan, Appendix 7 state that (1) the proposed emergency plans are practicable; (2) these agencies are committed to participating in any further development of the plans, including any required field demonstrations; and (3) these agencies are committed to executing their responsibilities under the plans in the event of an emergency. Therefore, the staff finds that the WLS COLA meets the requirements of 10 CFR 52.79(a)(22)(i).

The staff finds the additional information and clarifications provided by the applicant in the December 23, 2008, response to RAI 25, Question 13.03-54(A) acceptable because it conforms to the guidance in NUREG-0654. Accordingly, the staff considers these questions resolved.

Conclusion

Subject to License Condition (13-6), the staff concludes that the information provided in the WLS COLA conforms to the evaluation criteria in NUREG-0654, Planning Standard A. Accordingly, the staff finds the information acceptable and meets the relevant requirements of 10 CFR 52.79(a)(22)(i), 10 CFR 50.47(b)(1) and 10 CFR Part 50, Appendix E, Sections III and IV.A, insofar as the information describes the primary responsibilities for emergency response by the applicant, State and local organizations within the EPZs, and various supporting organizations, and that each principal response organization has staff to respond to and augment its initial response on a continuous basis.

13.3.4.2 Onsite Emergency Organization

The regulation in 10 CFR 50.47(b)(2), as reflected in NUREG-0654 as Planning Standard B, "Onsite Emergency Organization," requires that on-shift facility licensee responsibilities for emergency response are unambiguously defined, adequate staffing to provide initial facility accident response in key functional areas is maintained at all times, timely augmentation of response capabilities is available, and interfaces among various onsite response activities and offsite support and response activities are specified. In addition, 10 CFR Part 50, Appendix E, Section IV.A requires a description of the organization for coping with radiological emergencies, including definition of authorities, responsibilities, and duties of individuals assigned to the licensee's emergency organization, and the means for notification of such individuals in the event of an emergency. This discussion shall include a description of the normal plant operating organization, onsite emergency response organization, headquarters personnel who will augment the onsite emergency organization, and local offsite services to be provided in support of the licensee's emergency organization. The emergency plan shall identify persons within the licensee organization who will be responsible for making offsite dose projections, and other employees with special qualifications for coping with emergency conditions that may arise. Other persons with special qualifications, who are not licensee employees and who may be called upon for assistance, shall also be identified, including a description of the special qualifications. 10 CFR Part 50, Appendix E, Section IV.A.9 requires a detailed analysis demonstrating that on-shift personnel assigned emergency plan implementation functions are not assigned responsibilities that would prevent the timely performance of their assigned functions, as specified in the emergency plan.

In WLS Emergency Plan, Section II.B, "On-site Emergency Organization," the applicant described the ERO, its key positions and associated responsibilities, including outlining the staffing requirements that provide initial emergency response actions and provisions for timely augmentation of on-shift personnel. The staff reviewed this section, as well as other relevant portions of the application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff's primary focus was to evaluate the emergency plan against NUREG-0654, Planning Standard B, "Onsite Emergency Organization." Planning Standard B provides the detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(2).

WLS COL FSAR Section 13.1, "Organizational Structure of Applicant," (referenced from the DCD) and WLS COL FSAR Table 13.1-201, "Generic Position/Site Specific Position Cross Reference," provides a description of the proposed operating plant staffing, including position titles and functions. The normal plant personnel complement is established with the Site Executive – Plant Management directly responsible for the management and direction of activities associated with the efficient, safe, and reliable operations of the station. The Site Executive is assisted in management and technical support activities by the Plant Manager. The Plant Manager is responsible for onsite activities necessary for safe operation and maintenance of the plant (e.g., Operations, Chemistry, and Outage Management). Additionally, the Plant Manager has overall responsibility for occupational and public radiation safety. The Functional Manager in charge of operations reports to the Plant Manager and has overall responsibility for the day-to-day operation of the plant with assistance from the Assistant Functional Manager - Operations. The manager in charge on-shift (Shift Manager) is a licensed senior reactor operator (SRO) responsible for the control room command function, and is the Plant Manager's direct management representative for the conduct of operations. As such, the manager in charge on-shift has the responsibility and authority to direct the activities and personnel onsite as required to do the following:

- Protect the health and safety of the public, the environment, and personnel on the plant site

- Protect the physical security of the plant
- Prevent damage to site equipment and structures
- Comply with the operating license

WLS Emergency Plan, Section II.B states that the Shift Manager position is staffed at all times. In an emergency, he or she will act as the Emergency Coordinator until relieved by a qualified member of management or termination of the emergency. The Emergency Coordinator is responsible for initiating required emergency response actions (e.g., activation of emergency personnel and facilities, and authorizing emergency exposure limits). Other Emergency Coordinator responsibilities include: emergency classification, authorizing notification to the NRC, State, and local authorities, and the decision to notify and recommend protective actions to authorities responsible for offsite emergency measures. These responsibilities are designated as non-delegable. The Emergency Coordinator may also request assistance from any organization deemed necessary to mitigate the emergency. Once the EOF is activated the EOF director assumes responsibility for ensuring that the appropriate offsite interface activities are performed (e.g., notifications of emergency status to State and local governments and NRC; and recommending offsite protective measures to the State). At any time during an emergency should the Shift Manager be rendered unable to fulfill the duties and responsibilities of the Emergency Coordinator due to illness or injury, the Unit Supervisor (present on shift at all times) will assume the Emergency Coordinator position until relieved by a qualified member of the management staff.

The plant also has personnel on-shift at all times that can provide an initial response to an emergency event. WLS Emergency Plan, Table II-2, “Plant Staff Emergency Functions,” describes positions and major tasks to be performed by persons assigned to the functional areas of emergency activity. Upon declaration of an emergency, members of the plant staff assume positions in the ERO consistent with their training and management assignments, and provide for key functions of accident assessment, radiological monitoring and analysis, security, fire-fighting, first aid and rescue, and communication. On-shift staffing will be augmented with additional ERO personnel at an Alert and higher emergency classifications or earlier, as deemed necessary. WLS Emergency Plan, Section II.B states that the minimum staff required to conduct routine and immediate emergency operations is maintained at the station consistent with 10 CFR Part 50, Appendix E. In addition, minimum staffing was established based on the guidance provided in NUREG-0654, Table B-1, and provisions of other emergency plans from currently licensed Duke Energy facilities. The positions, titles and major tasks to be performed by station emergency responders are further described in emergency plan implementing procedures (EPIPs). Additional personnel may be designated by station management or the EOF Director as emergency responders providing special expertise deemed beneficial, but not mandatory, to the planned response based on the technical requirements of the position. WLS Emergency Plan, Figure II-2, “Emergency Response Organization–Site Only,” and WLS Emergency Plan, Figure II-3, “Offsite Emergency Response Organization,” illustrate the high level organizations that will be located in respective emergency response facilities (ERFs), which are the TSC, the OSC, EOF and Joint Information Center (JIC). WLS Emergency Plan, Section II.B.6, “Interface Between Functional Areas,” and WLS Emergency Plan, Figure II-1, “Emergency Response Organization Interrelationships,” identify and illustrate the interfaces among functional areas of the station emergency response activity, Duke Energy’s corporate support, and the affected State and local government response organizations. The applicant proposed EP-ITAAC 10.1 to verify that the emergency plan implementing procedures provide minimum and augmented on-shift staffing levels consistent with WLS Emergency Plan, Table II-2.

In RAI 25, Question 13.03-55(A), the staff requested that the applicant provide additional information related to staffing of accountability, decontamination, and public information positions. In a December 23, 2008, response, the applicant stated that on-shift security personnel are responsible for accountability; decontamination activities are conducted by on-shift Radiation Protection Technicians initially, and public information is handled by the EOF.

In RAI 25, Questions 13.3-55(M), (P), (P.2), and (Q), the staff requested that the applicant provide additional information related to staffing of the on-shift dose assessment as a part of the continual assessment capability. In a December 23, 2008, response, the applicant stated that the position and function would be staffed and performed in the EOF. While evaluating WLS Emergency Plan, Table II-2, “Plant Staff Emergency Functions,” the staff noted that Footnote 3 indicated that there will be personnel assigned to the shift, who are trained and qualified to perform dose assessment functions. Furthermore, in a supplement to the initial response to RAI 25, Questions 13.3-55(M), (P), (P.2), and (Q), the applicant stated that there will be an individual on-shift with the qualification to perform offsite dose projections until relieved by staff augmentation. This provides for the on-shift capability to perform dose assessment in the determination of emergency classification, onsite protective action, and offsite protective action recommendations.

WLS Emergency Plan, Section II.B.7, “Corporate Off-site Support for the Plant Staff,” states that upon declaration of an Alert, Site Area Emergency, or General Emergency, the Emergency Coordinator directs the activation and notification of the onsite and offsite ERFs. Duke Energy management, technical, and administrative personnel staff the EOF and provide or coordinate augmented support for the plant staff. The Duke Energy corporate staff provides management, technical, and administrative support as needed to support the plant staff and to relieve the plant staff of external coordination responsibilities, including notification of and coordination with offsite authorities and release of information to the media. In addition to the activities identified in WLS Emergency Plan, Table II-2, Duke Energy corporate staff provides logistical support for plant personnel; technical support for planning and recovery operations; management-level interface with governmental authorities; and coordination with and the release of information to the news media.

WLS Emergency Plan, Section II.B.8, “Support from Contractor and Private Organizations,” states that the Institute of Nuclear Power Operations (INPO), when notified of an emergency classification, will serve as a clearinghouse for industry-wide support and provide requested emergency response technical assistance, including emergency staffing and equipment. The applicant may request that the reactor vendor, Westinghouse, provide technical support for emergency response activities. If required at the time of the event, additional resources can be obtained from consultants and vendors through purchase agreements with the supporting institutions based on their expertise and plant needs. In addition, the applicant has established and will maintain agreements for emergency response support services, including firefighting, rescue squad, and medical and hospital services. WLS Emergency Plan, Section II.L describes the arrangements for medical support services, including hospital and ambulance support, and is addressed in Section 13.3.4.12 of this report. WLS Emergency Plan, Appendix 7 provides the certification letters for organizations providing these services. (Emergency response support and resources are further described in Section 13.3.4.3 of this report.)

WLS Emergency Plan, Section II.B.9, “Local Emergency Response Support,” describes the agreements between the applicant and local emergency response support services, including firefighting, rescue squad, medical and hospital services. The applicant’s emergency plan implementing procedure, “Site Response to Security Events,” provides information regarding measures to integrate offsite response resources and capabilities into the onsite response activities.

Fukushima Dai-ichi – NTTF Recommendation 9.3

On March 12, 2012, the NRC requested information pursuant to the 10 CFR 50.54(f) process from all power reactor licensees and holders of construction permits, associated with the NRC Near-Term Task Force (NTTF) review of the accident at the Fukushima Dai-ichi nuclear facility. In NTTF Recommendation 9.3, the NTTF addressed staffing and communication provisions for enhancing emergency preparedness. On January 23, 2013, the NRC issued a follow-up letter, which identified eight generic technical issues that need to be addressed as part of NTTF Recommendation 9.3 for conducting the communication capability assessment.

In an April 25, 2012, letter, the NRC informed the existing licensees and COL applicants that the staff would issue an RAI concerning the implementation of the NTTF recommendations in SECY-12-0025. In RAI 105, Question 01.05-4, the staff requested that the applicant address Recommendation 9.3, "Provisions for Enhancing Emergency Preparedness." The NRC issued this information request regarding the power supplies for communication systems and staffing to determine if additional regulatory action is warranted. This request was based upon NTTF Recommendation 9.3, which proposed that facility emergency plans provide for a means to power communication equipment needed to communicate onsite and offsite during an extended loss of alternating current power and staffing to fill all necessary positions to respond to a mult-unit event. In a June 11, 2012, response to RAI 105, Question 01.05-4, the applicant proposed License Condition 12.C “Emergency Planning Actions” in Part 10 of the WLS COLA. With respect to staffing, the staff refers to the following as License Condition (13-10):

Proposed License Condition (13-10):

> Staffing:
>
> At least two (2) years before the latest date set forth in the schedule for completing the inspections, tests, and analyses in the ITAAC submitted in accordance with 10 CFR 52.99(a), the Licensee shall have performed assessments of the on-site and augmented staffing capability to satisfy the regulatory requirements for responding to a multi-unit event. The staffing assessments will be performed in accordance with NEI 12-01, Revision 0.
>
> At least 180 days before the date scheduled for initial fuel loading set forth in the notification submitted in accordance with 10 CFR 52.103(a), the Licensee shall revise the Emergency Plan to include the following:
>
> - Incorporation of corrective actions identified in the staffing assessments required by this condition, and

- Identification of how the augmented staff will be notified given degraded communications capabilities.

In WLS COLA Part 10, the applicant proposed License Condition 12.C, “Fukushima Actions – Emergency Planning Actions,” which addresses both the staffing and communication areas addressed in NTTF Recommendation 9.3. The staff reviewed License Condition (13-10) and finds it acceptable, except for the scheduling of the assessment, because it is consistent with NTTF Recommendation 9.3 and reflects the use of NEI technical report NEI 12-01, “Guideline for Assessing Beyond Design Basis Accident Response Staffing and Communications Capabilities,” Revision 0, which the NRC has endorsed as an acceptable method for licensees to employ when addressing NTTF Recommendation 9.3.[7] To address the scheduling of completing the actions for staffing assessments from “2 years” to “18 months,” the staff identified License Condition (13-10) below. (Emergency communication and the other part of License Condition 12.C (referred to as License Condition (13-11)) are addressed in Section 13.3.4.6 of this report.)

License Condition (13-10):

- At least 18 months before the latest date set forth in the schedule submitted in accordance with 10 CFR 52.99(a) for completing the inspections, tests, and analyses in the ITAAC, the licensee shall have performed assessments of the onsite and augmented staffing capability for response to a multi-unit event. The staffing assessments will be performed in accordance with NEI 12-01, “Guideline for Assessing Beyond Design Basis Accident Response Staffing and Communications Capabilities,” Revision 0.

  At least 180 days before the date scheduled for initial fuel load set forth in the notification submitted in accordance with 10 CFR 52.103(a), Duke Energy shall revise the WLS Emergency Plan to include the following:

  - incorporation of corrective actions identified in the staffing assessments described above

  - identification of how the augmented staff will be notified given degraded communication capabilities

As previously referenced, with the staff’s revisions incorporated above, the staff finds License Condition (13-10) and the response to RAI 01.05-acceptable.

Enhancements to Emergency Preparedness Regulations

On November 23, 2011, the NRC published a Final Rule, “Enhancements to Emergency Preparedness Regulations” (hereinafter referred to as “Final Rule”), which included a new

[7] See (1) NRC May 15, 2012, letter, ‘U.S. Nuclear Regulatory Commission Review of NEI 12-01, “Guideline for Assessing Beyond Design Basis Accident Response Staffing and Communications Capabilities,” Revision 0, May 2012’ (ADAMS Accession No. ML12131A043); (2) NEI May 3, 2012, letter, ‘Transmittal of NEI 12-01, “Guideline for Assessing Beyond Design Basis Accident Response Staffing and Communications Capabilities,” Revision 0, May 2012’ (ADAMS Accession No. ML12125A411); and (3) NEI Report No. 12-01, Revision 0, “Guideline for Assessing Beyond Design Basis Accident Response Staffing and Communications Capabilities,” May 2012 (ADAMS Accession No. ML12125A412).

requirement in 10 CFR Part 50, Appendix E, Section IV.A associated with on-shift ERO personnel. Specifically, 10 CFR Part 50, Appendix E, Section IV.A.9 requires nuclear power reactor licensees conduct a detailed analysis demonstrating that on-shift personnel assigned emergency plan implementation functions are not assigned responsibilities that would prevent the timely performance of their assigned functions as specified in the emergency plan.

As part of the issuance of the Final Rule, the NRC issued associated guidance in ISG Nuclear Security and Incident Response (NSIR)/Division of Preparedness and Response (DPR)-ISG-01. In NSIR/DPR-ISG-01, Section IV.C, "On-Shift Staffing Analysis," the NRC endorsed NEI technical report NEI 10-05, "Assessment of On-Shift Emergency Response Organization Staffing and Capabilities," Revision 0, June 2011 – stating, in part, that NEI 10-05 establishes a standard methodology for a licensee to perform the 10 CFR Part 50, Appendix E, Section IV.A.9 required staffing analysis, and that the NRC has reviewed NEI 10-05 and found it an acceptable methodology for this purpose.

In WLS COLA Part 10, as part of the applicant's proposed License Condition 4 "Emergency Planning Actions," which addresses the requirements in 10 CFR Part 50, Appendix E, Section IV.A.9 for a detailed on-shift staffing analysis associated with the emergency plan. The applicant proposed the following license condition, which the staff refers to as License Condition (13-5).

Proposed License Condition (13-5):

> At least two (2) years prior to scheduled initial fuel load, Duke Energy shall have performed an assessment of emergency response staffing in accordance with NEI 10-05, "Assessment of On-Shift Emergency Response Organization Staffing and Capabilities," Revision 0.

With the staff's revisions incorporated below, the staff finds License Condition (13-5) acceptable because it is consistent with the Final Rule and NSIR/DPR-ISG-01:

License Condition (13-5):

> At least 18 months before the latest date set forth in the scheduled submitted in accordance with 10 CFR 52.99(a) for completing the inspections, tests, and analyses in the ITAAC, Duke Energy shall have performed a detailed staffing analysis, in accordance with NEI 10-05, "Assessment of On-Shift Emergency Response Organization Staffing and Capabilities," Revision 0.
>
> At least one hundred eighty (180) days before the date scheduled for initial fuel load set forth in the notification submitted in accordance with 10 CFR 52.103(a), Duke Energy shall revise the WLS Emergency Plan to incorporate any changes identified in the staffing analysis that are needed to bring staff to the required levels.

The staff reviewed the information provided by the applicant and finds that the applicant adequately designated an individual as the Emergency Coordinator who has the authority and responsibility to initiate emergency actions, including recommending protective actions to the authorities responsible for implementing offsite emergency measures. The staff also finds that the applicant clearly specified which responsibilities may not be delegated to other elements of the emergency organization, and has identified an adequate line of succession for the Emergency Coordinator position.

The staff reviewed WLS Emergency Plan, Table II-2, and other associated sections and figures as described above, and finds that the required minimum on-shift staff and augmentation staffing in support of WLS are acceptable because they are consistent with NUREG-0654, Table B-1 in and the guidance provided in Emergency Preparedness Position (EPPOS)-3[8], "On Requirement For Onshift Dose Assessment Capability."

Subject to License Condition (13-5) and License Condition (13-10), the staff finds that the applicant explicitly defined its responsibilities for emergency response, has adequate staffing to provide and maintain at all times initial facility accident response in key functional areas, including response to a hostile action, and is capable of timely augmentation of the response capabilities. In addition, the staff finds that the applicant adequately specified the interfaces among various onsite and offsite support and response activities; described the organization for coping with radiological emergencies, including the authorities, responsibilities, and duties of individuals assigned to the licensee's emergency organization and the means for their notification in the event of an emergency; and described the normal plant operating organization, the onsite ERO, and the headquarters and local offsite personnel and services that will augment and support the onsite organization. Licensee employees that are responsible for making offsite dose projections, and licensee and other persons with special qualifications for coping with emergency conditions, are also identified.

The staff finds the additional information and clarifications provided by the applicant in the December 23, 2008, response to RAI 25, Question 13.03-55(A), (M), (P)(P.2), and (Q) acceptable because they conform to the guidance in NUREG-0654. Accordingly, the staff considers these questions resolved.

Conclusion

Subject to License Condition (13-5) and License Condition (13-10), the staff concludes that the information provided in the WLS COLA conforms to the evaluation criteria in NUREG-0654, Planning Standard B. Therefore, the staff finds the information acceptable and meets the relevant requirements of 10 CFR 50.47(b)(2) and 10 CFR Part 50, Appendix E, Section IV.A, insofar as the information describes the applicant's on-shift responsibilities for emergency response, which are unambiguously defined; adequate staffing to provide initial facility accident response in key functional areas maintained at all times; timely augmentation of response capabilities; and interfaces among various onsite and offsite response support activities.

13.3.4.3 Emergency Response Support and Resources

As stated in NUREG-0654, Planning Standard C, "Emergency Response Support and Resources," 10 CFR 50.47(b)(3) requires that arrangements for requesting and effectively using assistance resources have been made, arrangements to accommodate State and local staff at the licensee EOF have been made, and other organizations capable of augmenting the planned response have been identified. In addition, 10 CFR Part 50, Appendix E, Section III requires

[8] EPPOS 3 (1995) ADAMS Accession No. ML023040473

that the emergency plans incorporate information about the emergency response roles of supporting organizations and offsite agencies, and that the information shall be sufficient to provide assurance of coordination among the supporting groups and with the licensee. 10 CFR Part 50, Appendix E, Section IV.A.7 requires identification of, and a description of the assistance expected from, appropriate local, State, and Federal agencies with responsibilities for coping with emergencies, including hostile action at the site.

In WLS Emergency Plan, Section II.C, "Emergency Response Support and Resources," the applicant addressed the responsibilities and concepts of operations for the various organizations that would support the Lee Nuclear Station in an emergency. The staff reviewed this section, as well as other relevant portions of the application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff's primary focus was to evaluate the emergency plan against NUREG-0654, Planning Standard C, which provides the detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(3).

WLS Emergency Plan, Section II.C.1 "Federal Response Capability," provides general information related to support expected from Federal Radiological Monitoring and Assessment Center (FRMAC), Department of Energy (DOE) Savannah River, DOE Oak Ridge and Radiation Emergency Assistance Center/Training Site (REAC/TS), and the NRC. WLS Emergency Plan, Section II.C.1.a, identifies that the EOF Director or Radiological Assessment Manager may request FRMAC assistance through the NRC for offsite radiological monitoring support. Additionally, DOE Savannah River may provide radiological monitoring assistance (DOE Radiological Assistance Program). DOE Oak Ridge may provide medical support from the REAC/TS. The FRMAC Advance Party could arrive at the Lee Nuclear Station within 3 to 4 hours following the order to deploy. Assistance from the NRC Region II office in Atlanta, Georgia, could arrive 7 to 8 hours following notification. The timeframe could be reduced if air travel were used.

WLS Emergency Plan, Section II.C.1.e states that facilities and resources needed to support the Federal response through the EOF will be provided. This includes office space and telephones. The applicant will also provide limited office space and telephone communication facilities for the NRC personnel in the TSC. In addition, WLS Emergency Plan, Section II.C.1.c, "Federal Response Capability," describes provisions for incorporating the Federal response capability into its operation plan, including specific licensee, State and local resources available to support the Federal response, (e.g., air fields, command posts, telephone lines, radio frequencies, and telecommunication centers).

WLS Emergency Plan, Section II.A.1.b, "Concept of Operations," provides general information related to assistance that will be provided from all Federal, State, and local agencies. WLS Emergency Plan, Section II.B.9, "Local Emergency Response Support," states that the applicant has established and maintains agreements with local emergency response support services. WLS Emergency Plan, Section II.E.1, "Notification of State and Local Authorities," provides an overview of the notification systems for prompt notification of State, local and Federal authorities. WLS Emergency Plan, Section II.L, "Medical and Public Health Support," discusses local hospital and medical support, including first aid and ambulance transport, and REAC/TS responsibilities during emergencies.

WLS Emergency Plan, Section II.C.2, “Off-site Organization Representation in the EOF,” states that designated work areas have been provided in the EOF for the State and county Emergency Management Liaisons and State Radiation Protection Liaisons.

WLS Emergency Plan, Section II.C.3, “Radiological Laboratories,” identifies radiological laboratories in South Carolina Departments of Health and Environmental Control, Bureau of Radiological Health; North Carolina Department of Environment and Natural Resources, Radiation Protection Section; and the DOE Radiological Assistance Team. Mobile monitoring and assessment capabilities in addition to fixed facilities for gross counting and spectral analysis are also identified. Other applicant facilities at the McGuire, Oconee, and Catawba Nuclear Stations are available to provide additional support within 1 to 4 hours, if needed. In RAI 25, Question 13.03-56(C), the staff requested that the applicant provide additional information related to the location of the station counting laboratory and when it will be used, the criterion that would be used to determine when the additional facilities would be needed, and the process for requesting additional support. In a December 23, 2008, response, the applicant stated that facilities used for health physics monitoring and assessment are discussed in AP1000 DCD Section 12.5, “Health Physics Facilities Design”; WLS COL FSAR Chapter 12, “Radiation Protection”; and WLS COL FSAR Section 13.1.1.2.4, “Chemistry.” The Radiological Assessment Manager, working with the EOF Director, determines staffing needs and assigns resources in support of efforts to coordinate radiological aspects of an emergency. The Radiological Assessment Manager also has the authority to seek assistance from other organizations within the applicant’s resources. Fixed radiological facilities at the Catawba, McGuire, and Oconee Nuclear Stations may also be used in an emergency.

WLS Emergency Plan, Section II.C.4, “Other Supporting Organizations,” describes arrangements with State and local emergency management authorities that establish cooperation for fire, medical and local law enforcement in accordance with 10 CFR Part 50, Appendix E, Section IV.A.7. A statewide mutual aid agreement in the South Carolina Emergency Response Plan provides coordination with State law enforcement for additional resources in the event of hostile action against the site and evacuation of the public. WLS Emergency Plan, Section II.C.4 also identifies additional emergency response support from: INPO Fixed Nuclear Facility Voluntary Assistance Agreement signatories and REAC/TS. Certification letters are provided in WLS Emergency Plan, Appendix 7, “Certification Letters.” LOAs for INPO or REAC/TS were not included. In RAI 25, Question 13.03-56(D), the staff requested that the applicant provide LOAs or other appropriate supporting documentation related to the emergency assistance provided by INPO and REAC/TS. In a December 23, 2008, response, the applicant stated LOAs with INPO and REAC/TS will be incorporated into WLS Emergency Plan, Appendix 7 in a future revision to the WLS Emergency Plan once they have been reached, or INPO and REAC/TS will be removed from WLS Emergency Plan, Section II.C.4, “Other Supporting Organizations.” In WLS COLA Part 10, the applicant identified License Condition 4, which includes a license condition regarding the schedule to update LOA’s. The staff identified this as License Condition (13-6). The staff has evaluated License Condition (13-6) in Section 13.3.4.16 of this report.

The staff finds the additional information and clarifications provided by the applicant in response to RAI 25, Question 13.03-56(C) and (D) acceptable because they conform to the guidance in NUREG-0654. Accordingly, the staff considers these questions resolved.

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and the associated evaluation criteria in NUREG-0654.

The staff finds the information provided by the applicant and finds that the WLS Emergency Plan adequately describes the applicant's operational role, its concept of operations, and its relationship to the total effort. The staff finds this acceptable because it meets the applicable requirements in 10 CFR Part 50, Appendix E.

Conclusion

Subject to License Condition (13-6), the staff concludes that the information provided in the WLS COLA conforms to the evaluation criteria in NUREG-0654, Planning Standard C. Therefore, the staff finds the information acceptable and because it meets the relevant requirements of 10 CFR 50.47(b)(3) and 10 CFR Part 50, Appendix E, Sections III and IV.A.7, insofar as the information describes the arrangements for requesting and effectively using assistance resources; arrangements to accommodate State and local staff at the applicant's Emergency Operations Facility; and identification of other organizations capable of augmenting the planned emergency response.

13.3.4.4 Emergency Classification System

As stated in NUREG-0654, Planning Standard D, "Emergency Classification System," 10 CFR 50.47(b)(4) requires that a standard emergency classification and action level scheme, the bases of which include facility system and effluent parameters, is in use by the nuclear facility licensee, and that State and local response plans call for reliance on information provided by facility licensees for determinations of minimum initial offsite response measures. In addition, 10 CFR Part 50, Appendix E, Section IV.B requires a description of the means to be used for determining the magnitude, and for continually assessing the impact, of the release of radioactive materials, including emergency action levels (EALs) that are to be used as criteria for determining the need for offsite agency notifications and participation, and when and what types of protective measures should be considered. The EALs must include hostile actions that might adversely affect the nuclear power plant. The initial EALs shall be discussed and agreed upon by the applicant or licensee and State and local governmental authorities, and approved by the NRC. Thereafter, EALs shall be reviewed with State and local governmental authorities on an annual basis. 10 CFR Part 50, Appendix E, Section IV.C requires a description of EALs and emergency conditions that involve alerting or activating the total emergency organization, including communication steps to be taken under each emergency class. The emergency classes defined shall include (1) notification of unusual event, (2) alert, (3) site area emergency, and (4) general emergency. 10 CFR Part 50, Appendix E, Section IV.C.2 requires the capability to assess, classify, and declare an emergency condition within 15 minutes after the availability of indications to plant operators, which positions are defined in NSIR/DPR-ISG-01, that an EAL threshold has been exceeded, and to promptly declare the emergency conditions as soon as possible after the identification of the appropriate emergency classification level.

In WLS Emergency Plan, Section II.D, "Emergency Classification System," the applicant described the emergency classification and action level scheme used to determine the minimum response to an abnormal event at the plant. The staff reviewed this section, as well as other relevant portions of the application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff's primary focus was to evaluate the emergency plan against NUREG-0654, Planning Standard D, which provides detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(4).

In WLS Emergency Plan, Section II.D, "Emergency Classification System," the applicant described its capability to declare an emergency classification level within 15 minutes after the availability of the indications to trained and qualified staff that an emergency action level threshold has been exceeded are described in the emergency plan implementing procedures. The responsibilities for declaring emergencies at WLS are also included, as well as, the responsibility for terminating the emergency.

WLS Emergency Plan, Section II.D.1, "Classification System," includes a standard emergency classification and action level scheme, the bases of which include facility system and effluent parameters. The following emergency classes are identified: "Notification Of Unusual Event," "Alert," "Site Area Emergency," and "General Emergency." The applicant also proposed EP-ITAAC Acceptance Criterion 1.1.1, which states, "The specific parameters identified in the Emergency Action Thresholds in the emergency plan implementing procedure addressing 'Emergency Classification' have been retrieved and displayed in the control room, TSC, and EOF." In addition, the applicant also proposed EP-ITAAC Acceptance Criterion 1.1.2, which states, "The ranges available in the control room, TSC, and EOF encompassed the values for the specific parameters identified in the Emergency Action Level Thresholds in the emergency plan implementing procedure addressing 'Emergency Classification.'"

For a COL application, the requisite EAL information is limited and the applicant is required to address four critical elements: (1) An overview of the EAL scheme, including a definition of the four emergency classification levels and general list of licensee actions; (2) a commitment to develop the remainder of the EAL scheme using a specified NRC-endorsed guidance document; (3) a proposed license condition that addresses EAL completion, agreement with State and local officials (as appropriate), and submission of the fully developed EALs to the NRC; and (4) maintaining the EALs in a document subject to 10 CFR 50.54(q). The information associated with these critical elements provides a sufficient level of applicable detail to support the staff's reasonable assurance evaluation.

In RAI 83, Question 13.03-75, the staff requested that the applicant submit either an entire EAL scheme or a revised WLS Emergency Plan, Section D, "Emergency Classification System" to address the four critical elements of the EAL scheme. In a June 12, 2009, response, the applicant provided a revised WLS Emergency Plan, Section D, and proposed a license condition to submit a fully developed set of site-specific EALs in accordance with the NRC-endorsed version of NEI 07-01, Revision 0, with no deviations. In WLS COLA Part 10, the applicant committed to meet EP-ITAAC (Table 3.8-1) and has proposed License Condition 4 "Emergency Planning Actions" related to the development and schedule for EALs. The staff refers to this as License Condition (13-3):

Proposed License Condition (13-3):

> The licensee shall submit a fully developed set of site-specific Emergency Action Levels (EALs) to the NRC in accordance with the NRC-endorsed version of NEI 07-01, Rev. 0, with no deviations. The EALs shall have been discussed and agreed upon with State

> and local officials. These fully developed EALs shall be submitted to the NRC for confirmation not less than 180 days prior to the date scheduled for initial fuel load.

The staff finds the description of the EAL scheme is acceptable because it is consistent with 10 CFR Part 50, Appendix E, Section IV.C, and addresses critical element (1). The staff considers the applicant's incorporation of the fully developed site-specific EAL scheme into implementing procedures acceptable because it ensures that the EALs are maintained in a document subject to the required change control process in 10 CFR 50.54(q) (i.e., EPIPs) and, therefore, addresses critical element (4). With regard to critical elements (2) and (3), in WLS COLA Part 10, the applicant proposed License Condition (13-3) (EALs), which includes a commitment to develop an EAL scheme with fully developed site-specific EALs in accordance with NRC-endorsed guidance document NEI 07-01, Revision 0. In addition, License Condition (13-3) requires a discussion and agreement with State and local officials, and submission of the fully developed EALs to the NRC. The EAL scheme is also addressed in NRC Bulletin 2005-02, "Emergency Preparedness and Response Actions for Security Based Events," (BL 2005-02), which requested, in part, that all holders of operating licenses provide information regarding the identification of emergency classification levels and EALs for security-based events. In NEI 07-01, Revision 0, the emergency classification scheme for security events, including hostile actions, is addressed in Section 5.9, "Hazards or Other Conditions Affecting Plant Safety EALs."

The staff reviewed License Condition (13-3) and, with the exception of the timeframe for submission of the EALs, finds that it is acceptable because it is consistent with NEI 07-01, Revision 0. The staff proposes a similar timeframe for submission of the EALs to the NRC, which is based on the date scheduled for initial fuel load set forth in the notification submitted in accordance with 10 CFR 52.103(a). Therefore, the staff identified License Condition (13-3), which includes the staff's proposed timeframe for submission of the EALs to the NRC.

License Condition (13-3):

> No later than 180 days before the date scheduled for initial fuel load set forth in the notification submitted in accordance with 10 CFR 52.103(a), Duke Energy shall submit a fully developed set of plant-specific emergency action levels (EALs) for WLS, Units 1 and 2, in accordance with NEI 07-01, "Methodology for Development of Emergency Action Levels – Advanced Passive Light Water Reactors," Revision 0, with no deviations. The EALs shall have been discussed and agreed upon with State and local officials.

The staff considers the proposed EAL scheme and License Condition (13-3) acceptable because they meet the requirements of 10 CFR Part 50, Appendix E and conform to the guidance provided in NUREG-0654.

Letters of Certification with State and local governments are included in WLS Emergency Plan, Appendix 7, "Certification Letters." These letters state that the signature on the letter indicates that the parties concurred with the emergency classification system, initiating conditions, and EALs for the Lee Nuclear Station. In RAI 83, Question 13.03-83, the staff requested that the applicant address when the initial EALs will be discussed and agreed upon with State and local governmental authorities. In a December 11, 2009, response, the applicant stated that in its proposed license condition, it would gain approval of the revised EAL scheme by local and State officials prior to submitting it to the NRC. In addition, in RAI 83, Question 13.03-78, the staff requested that the applicant provide a confirmation that the EAL scheme would be coordinated with State and local offsite response organizations. In a December 11, 2009, response, the applicant stated this would be accomplished through a proposed license condition, which is discussed above.

The staff finds the additional information and clarifications provided by the applicant in response to RAI 83, Questions 13.03-75, 13.03-78, and 13.03-83 acceptable because they conform to the guidance in NUREG-0654. Accordingly, the staff considers these questions resolved.

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and the associated evaluation criteria in NUREG-0654.

Subject to License Condition (13-3), the staff finds that the applicant established a standard emergency classification and action level scheme, the bases of which include facility system and effluent parameters, which includes the four emergency classes identified above. The applicant described EALs and emergency conditions that involve ERO activation, including steps to be taken under each emergency class. The applicant also described the means to determine the magnitude of, and for continually assessing the impact of, the release of radioactive materials, and EALs (including those pertaining to hostile actions) that are used to determine the need for offsite notifications and protective measures. In addition, the applicant has the capability to assess, classify, and declare an emergency condition within 15 minutes after the availability of indications to plant operators that an EAL threshold has been exceeded, and to promptly declare the emergency condition.

Conclusion

Subject to License Condition (13-3), the staff concludes that the information provided in the WLS COLA is consistent with the guidelines in NUREG-0654, Planning Standard D. Therefore, the staff finds the information acceptable and that it meets the relevant requirements of 10 CFR 50.47(b)(4) and 10 CFR Part 50, Appendix E, Sections IV.B and IV.C, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.5 Notification Methods and Procedures

As stated in NUREG-0654, Planning Standard E, “Notification Methods and Procedures,” 10 CFR 50.47(b)(5) requires that procedures have been established for notification, by the licensee, of State and local response organizations and for notification of emergency personnel by all organizations; the content of initial and follow-up messages to response organizations and the public has been established; and that the means to provide early notification and clear instruction to the populace within the 16-km (10-mi) plume exposure pathway EPZ have been established. In addition, 10 CFR Part 50, Appendix E, Section IV.A.4 requires a description of how offsite dose projections will be made and the results transmitted to State and local authorities, NRC, and other appropriate governmental entities. 10 CFR Part 50, Appendix E, Section IV.C requires a description of EALs and emergency conditions that involve alerting or activating the emergency organization, including communication steps to be taken under each class of emergency, and the existence of a message-authentication scheme. 10 CFR Part 50,

Appendix E, Section IV.D.1 requires a description of administrative and physical means for notifying local, State, and Federal officials and agencies and agreements reached with these officials and agencies for the prompt notification of the public and for public evacuation or other protective measures. The description shall include identification of the appropriate officials, by title and agency, of the State and local government agencies within the EPZs. 10 CFR Part 50, Appendix E, Section IV.D.3 requires the licensee to have the capability to notify responsible State and local governmental agencies within 15 minutes after declaring an emergency. The licensee shall demonstrate that appropriate governmental authorities have the capability to make a public alerting and notification decision promptly on being informed by the licensee of an emergency condition, and that administrative and physical means have been established for alerting and providing prompt instructions to the public within the plume exposure pathway EPZ. The alerting and notification capability shall include a backup method. Finally, 10 CFR 50.72(a)(3) requires NRC notification no later than 1 hour after declaring an emergency.

NRC notifications are further addressed in Commission Orders issued on February 25, 2002, as well as BL 2005-02, which requested in part that all holders of operating licenses provide information regarding the implementation of an NRC notification time period of approximately 15 minutes from discovery of a security-based event, as well as subsequent NRC guidance.

In WLS Emergency Plan, Section II.E, “Notification Methods and Procedures,” the applicant described the specific methods and sequencing of notifications that will be covered in the appropriate implementing procedures for WLS in an emergency. The staff reviewed this section, as well as other relevant portions of the application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff’s primary focus was to evaluate the emergency plan against NUREG-0654, Planning Standard E, which provides the detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(5).

WLS Emergency Plan, Section II.E, “Notification Methods and Procedures,” states that onsite emergencies are immediately reported to the Shift Manager on duty. Offsite response is the responsibility of local government officials in accordance with the State plans. Procedures for notification of State and local response organizations and licensee emergency responders reference the prepared messages in the State plans. Notification is initiated by the Emergency Coordinator within 15 minutes of emergency declaration based on EALs. All affected organizations (warning points) are listed. The NRC is notified following notification of State and local authorities and within 1 hour of declaration of an emergency. The notification system consists of a primary and a back-up system maintained through the use of commercial telephones (Section II.F.1, “Description of Communications Links”). In RAI 25, Question 13.03-58(B) and RAI 83, Question 13.03-79, the staff requested that the applicant specify the “officials” to be notified as described in 10 CFR Part 50, Appendix E, Section IV.D.1 and describe procedures and physical means for making notifications to offsite agencies. In a December 11, 2009, response, the applicant explained that North Carolina, South Carolina, and county warning point Cherokee County, York County and Cleveland County duty officers are notified via the Selective Signaling System within 15 minutes of a declared emergency at the site. The State and county warning point duty officers will then notify State and local officials according to their respective procedures. This process and the procedures have been cooperatively developed between the States of North and South Carolina and the counties of

Cherokee, York, and Cleveland. The applicant proposed EP-ITAAC 2.1 to test the emergency notification capabilities.

WLS Emergency Plan, Section II.E.1, “Notification of State and Local Authorities,” states that systems and procedures needed to provide prompt notification of the NRC Operations Center following the declaration of any emergency condition are maintained. The NRC is notified as soon as is practical following the notification of State and local authorities and within 1 hour of the emergency declaration, including escalation or de-escalation of any emergency declaration. WLS Emergency Plan, Section II.A.1.b, “Assignment of Responsibility,” footnote #4, states that in the event of a security-related attack on the site by a hostile force, a brief notification (site name, emergency classification, if determined, and nature of threat) is provided to the NRC following notification of the designated State and local authorities and within approximately 15 minutes of the discovery of the event.

WLS Emergency Plan, Section II.E.2, “Notification and Mobilization of Licensee Response Organizations,” is directed by the Emergency Coordinator. WLS has an evacuation alarm and a Telephone/Page System. There is redundant notification through the paging system and an automated telephone system. A siren tone generator and public address system speakers can be activated from the control room in case of emergency (see AP1000 DCD Section 9.5.2.2, “Communications Systems-System Design”). ERO personnel are notified by alpha-numeric pagers following procedures in the EPIPs. The applicant proposed EP-ITAAC 2.2 to test the capabilities of the system used to notify licensee response personnel.

WLS Emergency Plan, Section II.E.3, “Message Content,” states, “The content of the messages has been established in conjunction with the State and local governments and include the class of emergency, whether a release is in progress, and potentially affected areas and populations, and any recommended protective measures. Additional information is provided as it becomes available.”

In RAI 25, Question 13.03-58(A), the staff requested that the applicant provide documentation detailing the notification process. In a December 23, 2008, response, the applicant stated the Emergency Coordinator provides emergency notification directly to the State and county governments through the Selective Signaling Telephone System discussed in WLS Emergency Plan, Section II.F. Emergency notification forms are transmitted to the 24-hour warning points in North Carolina and South Carolina as soon as they are online and hourly updates are provided throughout the emergency. Warning points implement their respective emergency plans and notify the appropriate State or local officials specified in their plans once notified. Commercial and satellite phones can be used as backup.

WLS Emergency Plan, Section II.E.4, “Follow-up Messages to Off-site Authorities,” states that there are dedicated communicators for continuous communication allowing regular updates. Communication with designated authorities is to be continuous with the NRC, and provides updates approximately every 60 minutes to State and local authorities. Follow-up messages shall include all information listed in NUREG-0654, Evaluation Criterion E.4.a-n, (as appropriate). In RAI 25, Question 13.03-58(D), the staff requested that the applicant provide information identifying the communicators, where they will be located during an emergency, and how they will obtain the necessary information for the follow-up messages. In a December 23, 2008, response, the applicant stated that the Selective Signaling Telephone System is used for follow-up communication with State and local authorities as described in WLS Emergency Plan, Section II.F.1.b and the response to RAI 25, Question 13.03-58(A). Communication support is provided for by communicators in the TSC or EOF. Follow-up communication during notification of an unusual event is provided by the Control Room (CR).

WLS Emergency Plan, Section II.E.6, “Instructions to the Public in the Plume Exposure EPZ (Emergency Planning Zone),” states that the Alert and Notification System (ANS) is used and that it includes an outdoor acoustic warning system designed to meet the acceptance criteria of NUREG- 0654/FEMA-REP-1, Revision 1, as revised by Supplement 4 (October 2011) Appendix 3, “Means for Providing Prompt Alerting and Notification of Response Organizations and the Population,” Section B, “Criteria for Acceptance,” The physical description of the primary and backup systems is detailed in a FEMA-approved ANS design report. The design objective of the primary system is to have the capability to essentially complete the initial alerting and initiate notification of members of the public within the plume exposure pathway EPZ, including those in remote and low population areas within 15 minutes following a decision by cognizant offsite agencies to notify the public. The capability includes any transient populations in remote and rural areas, open water, rivers, hunting, recreational and low population areas that may require special alerting procedures. Furthermore, as a back-up, State and local plans maintain the alert mechanism via systems such as emergency vehicles, automated dialing systems, and Public Alerting (PA) systems to also alert the public to monitor commercial broadcasts for emergency information. The primary and back-up alert systems may include any combination of fixed sirens, tone alert radios, National Oceanographic and Atmospheric Agency (NOAA) weather radios or route alerting. The notification systems may consist of a combination of Emergency Alert System (EAS), NOAA weather radios or route alerting. Each county controls the activation of the sirens within its boundaries. Individuals by title that will initiate alarm are listed in the referenced State plans. The applicant proposed EP-ITAAC 2.3 and EP-ITAAC Acceptance Criteria 8.1.1.2.B.4 to confirm the means to notify and provide instructions to the populace in the plume exposure pathway EPZ.

WLS Emergency Plan, Section II.E.7, “Written Messages to the Public,” states that written pre-scripted messages are released to the local media by the State Director of Emergency Management or local Director of Emergency Management. The messages give instruction to specific actions to be taken, the nature of the emergency and recommended protective actions, including sheltering, evacuation, and the use of potassium iodide, as appropriate. The WLS Emergency Plan also states that the applicant will assist with the development of the messages. In RAI 25, Question 13.03-58(E), the staff requested that the applicant provide details related to the applicant’s support for written messages to the public. In a December 23, 2008, response, the applicant stated that the EOF News Manager manages the communication organization, which is responsible for coordinating plant status updates to State and local authorities and the media. The applicant provides detailed information regarding the emergency to support the preparation of the emergency messages. The applicant also provided Duke Energy’s corporate procedure for emergency communication between corporate and the EOF as an example. This example was reviewed by the NRC staff and found acceptable. Actual procedures for WLS will be developed and submitted in accordance with License Condition (13-8). This License Condition is evaluated in Section 13.3.4.19 of this report.

NRC notifications are further addressed in BL 2005-02, which requested in part that all holders of operating licenses provide information regarding the implementation of an NRC notification time period of approximately 15 minutes from discovery of a security-based event.

WLS Emergency Plan, Section II.E.1, "Notification of State and Local Authorities," states that systems and procedures needed to provide prompt notification of the NRC Operations Center following the declaration of any emergency condition are maintained. The NRC is notified as soon as is practical following the notification of State and local authorities and within 1 hour of the emergency declaration, including escalation or de-escalation of any emergency declaration.

WLS Emergency Plan, Section II.A.1.b, "Assignment of Responsibility," footnote #4, states that in the event of a security-related attack on the site by a hostile force, a brief notification (site name, emergency classification, if determined, and nature of threat) is provided to the NRC following notification of the designated State and local authorities and within approximately 15 minutes of the discovery of the event.

WLS Emergency Plan, Section II.F, "Emergency Communications," states that dedicated communicators are available to maintain a continuous channel of communication with the NRC as requested and to provide regular updates to State and local officials approximately every 60 minutes, when conditions change, or as otherwise agreed.

The staff finds the additional information and clarifications provided by the applicant in response to RAI 25, Questions 13.03-58(A), (B), (D) and (E), and RAI 58, Question 13.03-79 acceptable because they conform to the guidance in NUREG-0654. Accordingly, the staff considers these questions resolved.

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and the associated evaluation criteria in NUREG 0654.

After reviewing information provided by the applicant, the staff finds that procedures for notification of State and local response organizations and emergency personnel by all organizations have been established, and the licensee has the capability to notify offsite officials and agencies, including State and local governmental agencies within 15 minutes, and NRC no later than 1 hour after declaring an emergency. The appropriate officials of the States and local government agencies within the EPZs have been identified. The licensee has described the entire spectrum of emergency conditions that involve alerting or activating the emergency organization, including EALs for offsite agency notification and communication steps to be taken under each class of emergency. Message authentication is described in the States' and local emergency plans. The applicant has also described how appropriate governmental authorities have the capability to make a public alerting and notification decision promptly following notification of an emergency by the licensee, and administrative and physical means have been established for alerting and providing prompt instruction to the public within the plume exposure pathway EPZ (including a backup methods to alert populations), and for public evacuation and other protective measures.

Conclusion

The staff concludes that the information provided in the WLS COLA is consistent with the guidelines in NUREG-0654, Planning Standard E. Therefore, the staff finds the information acceptable and that it meets the relevant requirements of 10 CFR 50.47(b)(5), 10 CFR 50.72(a)(3), and 10 CFR Part 50, Appendix E, Sections IV.A.4, IV.C, IV.D.1, and IV.D.3, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.6 Emergency Communications

As stated in NUREG-0654, Planning Standard F, "Emergency Communications," 10 CFR 50.47(b)(6) requires that provisions exist for prompt communication among principal response organizations, to emergency personnel, and to the public. In addition, 10 CFR Part 50, Appendix E, Section IV.E.9 requires onsite and offsite communication systems with backup power sources, including provisions for communication with State and local governments within the plume exposure pathway EPZ, and Federal emergency response organizations and the NRC. Also required are provisions for communication among the Control Room, TSC, EOF, principal State and local emergency operations centers (EOCs), and field assessment teams. Communication systems shall be tested at designated frequencies.

WLS Emergency Plan, Section II.F, "Emergency Communications," describes the station communication systems. The staff reviewed this section, as well as other relevant portions of the WLS COL application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff's primary focus was to evaluate the emergency plan against NUREG-0654, Planning Standard F, which provides the detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(6).

WLS Emergency Plan, Section II.F, "Emergency Communications," states that the applicant maintains systems and procedures that provide for prompt communication between its ERFs and between the site and offsite ERFs. Dedicated communicators are available to maintain continuous communication with the NRC and to provide regular updates to State and local officials approximately every 60 minutes, when conditions change or as otherwise agreed.

The communication systems are designed to provide redundant means to communicate with essential areas of the station during normal operation and under accident conditions. Communication systems vital to operation and safety are designed so that failure of one component would not impair the reliability of the total communication systems. This is accomplished within the station by using diverse systems. The EPIPs define the responsibilities of designated personnel for use of the communication systems.

The communication systems include those systems described in AP1000 DCD Section 9.5.2, "Communication System," and the following emergency communication systems:

- Wireless telephone system
- Telephone/page system
- Private automatic branch exchange (PABX) system
- Emergency offsite communication
- Security communication system

In the event of a natural disaster, WLS maintains a satellite phone system described in WLS COL FSAR Section 9.5.2.2.3.1.3.

WLS Emergency Plan, Section II.F, "Emergency Communications," states that responsibilities of designated personnel for the communication systems can be found in State and local plans and in the EPIPS. The station maintains capabilities for 24 hours per day emergency notification to the State and county emergency response network. All State and county warning points are staffed 24 hours per day.

WLS Emergency Plan, Section II.F.1.a, "Description of Communication Links," states that the applicant maintains capabilities for 24 hours per day emergency notification to the State and county emergency response network. In RAI 25, Question 13.03-59(D), the staff requested that the applicant discuss who is designated to use communication systems and what responsibilities they have for using those communication systems. In a December 23, 2008, response, the applicant stated that a communicator will be assigned by the Operations Shift Manager/Emergency Coordinator from the on shift staff. The position will be filled by a Control Room Operator or Non-Licensed Operator from the unaffected unit that has been trained to perform this function. Full-time communication positions in the ERO include the TSC Off-site Agency Communicator, the EOF Off-site Agency Communicator, and the NRC Communicator.

WLS Emergency Plan, Section II.F.1.b, "Description of Communications Links," identifies communication links (EOF to State and county warning points). The applicant proposed EP-ITAAC 3.1 to test that the means exist for communication among the CR, TSC, EOF, principal State and local EOCs, and radiological field assessment teams. The applicant proposed ITAAC 3.2 to test the communication capabilities from the control room, TSC, EOF to the NRC Headquarters Operation Center (HOC) and Region II EOC, which also addresses the establishment of the availability of an access port for ERDS and transfer of data from the units to the NRC HOC.

WLS Emergency Plan, Section II.F.1.c, "Description of Communications Links," identifies dedicated communication links with the NRC through Emergency Notification System (ENS), Health Physics Network (HPN), Reactor Safety Counterpart Link (RSCL), Protective Measures Counterpart Link (PMCL), ERDS, Management Counterpart Link (MCL), and Local Area Network (LAN) systems.

WLS Emergency Plan, Section II.F.1.d, "Description of Emergency Communications Links," states that the applicant provides capability for communication between CR or TSC and the EOF, county, and State EOCs. This section states that communication between the TSC, EOF and offsite monitoring teams is via radio. In RAI 25, Question 13.03-59(C), the staff requested that the applicant provide clarification regarding the testing frequency from the licensee to the NRC Headquarters and appropriate NRC Regional Office Operations Center. In a December 23, 2008, response, the applicant revised Section II.N.2.a to clarify communication systems testing between the facility, NRC Headquarters, and NRC Regional Operations will be performed monthly.

WLS Emergency Plan, Section II.F.1.e, "Description of Communications Links," refers back to WLS Emergency Plan, Section II.E.2, "Notification and Mobilization of Licensee Response Organizations," for notification, alerting, and activation of emergency response personnel in the TSC, OSC, and EOF.

WLS Emergency Plan, Section II.F.1.f describes that WLS communicates with the NRC Headquarters Operations Center by the Emergency Telecommunications System (ETS) located in the CR, TSC and EOF or by private telephone systems, and between the CR, TSC and EOF to the NRC regional office by the normal private telephone capability. The applicant maintains radio communication between the TSC, EOF and offsite radiological monitoring teams.

WLS Emergency Plan, Section II.F, “Emergency Communications,” provides communication system descriptions but does not identify communication between the licensee and Federal EROs other than NRC. Additional information related to communication between the licensee and Federal EROs was requested in RAI 25, Question 13.03-59(B). In a December 23, 2008, response, the applicant stated that the Radiological Assessment Manager may contact the DOE-Savannah River and/or REAC/TS for radiological monitoring assistance as discussed in WLS Emergency Plan, Section II.C.1.b. The NRC is the primary interface for communication with other Federal agencies. WLS Emergency Plan, Section II.N.2.a, “Communications Drills,” states that communication testing with NRC Headquarters’ and Region’s Operation Centers is tested monthly.

The applicant’s communication plans have arrangements for emergencies, including titles and alternates for those in charge at both ends of the communication links and the primary and backup means of communication.

WLS Emergency Plan, Section II.F.2, “Communication with Fixed and Mobile Medical Support Facilities,” states Duke Energy maintains radio and telephone communication systems that allow for communication between Lee Nuclear Station and fixed and mobile medical support facilities.

WLS Emergency Plan, Section II.F.3, “Communication System Reliability,” discusses system reliability. WLS COL FSAR Section 9.5.2.2.3.1.1, “NRC Offsite Interfaces,” states the design addresses the recommendations of NRC Bulletin 80-15, “Possible Loss of Emergency Notification System (ENS) with Loss of Offsite Power.” WLS Emergency Plan, Section F, “Emergency Communications,” states, “The communications systems include those systems described in Section 9.5.2 of the AP1000 DCD,” and that a normal source power supply failure does not impact offsite communication systems since backup power sources are provided, in most cases. Furthermore, the section states that onsite communication systems are periodically tested and that dedicated telephone lines are checked according to specified schedules.

In RAI 25, Question 13.03-59(A), the staff requested that the applicant clarify the use of backup power. In a December 23, 2008, response, the applicant stated that systems are maintained to communicate within the station and offsite as discussed in WLS COL FSAR Section 9.5.2.2.3, “Private Automatic Branch Exchange System.” The selective signaling system is used as the primary means of communication between the station and offsite agencies. The system has sufficient backup power sources with automatic transfer capability to maintain communication if power is lost. Commercial telephone company lines and the Duke Energy Radio network can be used as secondary means of communication.

WLS Emergency Plan, Section II.N.2.a, “Communications Drills,” states that communication testing with State and local governments within the 16-km (10-mi) EPZ is performed monthly; communication testing with State and Federal EROs within the 80-km (50-mi) EPZ and outside the 16-km (10-mi) EPZ is performed quarterly; and from WLS to NRC Headquarters Operations Center and to the Region Operations Center monthly. Additionally, Duke Energy conducts a communication drill annually. The drills' acceptance criteria are established for both operability of the systems and intelligibility of the messages. WLS Emergency Plan, Appendix 8, "Cross References to Regulations, Guidance, and State and Local Plans," provides a cross reference between the WLS Emergency Plan and the State and local plans.

In WLS COLA Part 10, the applicant proposed License Condition 12C, "Emergency Planning Actions," to address the NTTF Recommendation 9.3 for communication capabilities. With respect to communications, the staff refers to this as License Condition (13-11):

Proposed License Condition (13-11):

> Communications –
>
> At least two (2) years before the latest date set forth in the schedule for completing the inspections, tests, and analyses in the ITAAC submitted in accordance with 10 CFR 52.99(a), the Licensee shall have performed an assessment of on-site and off-site communications systems and equipment relied upon during an emergency event to ensure communications capabilities can be maintained during an extended loss of ac power. The communications capability assessment shall be performed in accordance with NEI 12-01, "Guideline for Assessing Beyond Design Basis Accident Response Staffing and Communications Capabilities," Revision 0.
>
> At least one hundred eighty (180) days before the date scheduled for initial fuel load set forth in the notification submitted in accordance with 10 CFR 52.103(a), the Licensee shall complete implementation of corrective actions identified in the communications capability assessment described above, including any related emergency plan and implementing procedure changes and associated training.

With the exception of the timeframes for completion and submission of the communication capability assessment, the staff finds the license condition acceptable because it is consistent with NTTF Recommendation 9.3 and reflects the use of (NEI technical report NEI 12-01, "Guideline for Assessing Beyond Design Basis Accident Response Staffing and Communications Capabilities," which the NRC has endorsed as an acceptable method for licensees to employ when addressing NTTF Recommendation 9.3.[9]

The staff proposes a similar timeframe for completion of the communication capabilities assessment as for the staffing assessment in License Condition (13-10). Therefore, consistent with the applicant's proposed License Condition (13-11), the staff identified License Condition

[9] See (1) NRC May 15, 2012, letter, 'U.S. Nuclear Regulatory Commission Review of NEI 12-01, "Guideline for Assessing Beyond Design Basis Accident Response Staffing and Communications Capabilities," Revision 0, May 2012' (ADAMS Accession No. ML12131A043); (2) NEI May 3, 2012, letter, 'Transmittal of NEI 12-01, "Guideline for Assessing Beyond Design Basis Accident Response Staffing and Communications Capabilities," Revision 0, dated May 2012' (ADAMS Accession No. ML12125A411); and (3) NEI Report No. 12-01, Revision 0, "Guideline for Assessing Beyond Design Basis Accident Response Staffing and Communications Capabilities," May 2012 (ADAMS Accession No. ML12125A412).

(13-11), which addresses enhanced communication capabilities and includes the timeframes for completion of the assessments and their submission to the NRC.

License Condition (13-11):

> At least 18 months before the latest date set forth in the schedule submitted in accordance with 10 CFR § 52.99(a) for completing the inspections, tests, and analyses in the ITAAC, Duke Energy shall have performed an assessment of onsite and offsite communications systems and equipment relied upon during an emergency event to ensure communication capabilities can be maintained during an extended loss of alternating current power. The communications capability assessment shall be performed in accordance with NEI 12-01, "Guideline for Assessing Beyond Design Basis Accident Response Staffing and Communications Capabilities," Revision 0.
>
> At least one hundred eighty (180) days before the date scheduled for initial fuel load set forth in the notification submitted in accordance with 10 CFR § 52.103(a), Duke Energy shall complete implementation of corrective actions identified in the communications capability assessment described above, including any related emergency plan and implementing procedure changes and associated training.

The staff finds License Condition (13-11), as modified, acceptable because it meets the requirements of 10 CFR Part 50, Appendix E and conforms to the guidance provided in NUREG-0654/FEMA REP 1, Revision 1 and in NEI 12-01, Revision 0.

After review, the staff finds the additional information and clarifications provided by the applicant in the December 23, 2008, response to RAI 25, Question 13.03-59 (A through D) acceptable because it conforms to the guidance in NUREG-0654.

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and the associated evaluation criteria in NUREG-0654.

Subject to License Condition (13-11) as modified, and after review of information provided by the applicant, the staff finds that provisions exist for prompt communication among principal response organizations, to emergency personnel, and to the public. Specifically, the applicant established a reliable primary and backup means of communication for alerting and activating the response organizations and personnel, including 24-hour staffing of communication links. Provisions also exist for communication among the Control Room, TSC, EOF, State and local governments within the EPZs, and field assessment teams. In addition, the applicant provided a coordinated communication link for fixed and mobile medical support facilities. Onsite and offsite communication systems have backup power sources and are tested at designated frequencies.

Conclusion

Subject to License Condition (13-11), the staff concludes that the information provided in the COLA is consistent with the guidelines in NUREG-0654, Planning Standard F, and in NEI 12-01, Revision 0. Therefore, the staff finds the information acceptable and meets the relevant requirements of 10 CFR 50.47(b)(6) and 10 CFR Part 50, Appendix E, Section IV.E.9, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.7 Public Education and Information

As stated in NUREG-0654, Planning Standard G, “Public Education and Information,” 10 CFR 50.47(b)(7) requires that information be made available periodically to the public concerning notification methods and initial actions the public should take in an emergency, for example, listening to a local broadcast station and remaining indoors, the principal points of contact with the news media for dissemination of information during an emergency (including the physical location or locations) be established in advance, and procedures for coordinating dissemination of information to the public be established. In addition, 10 CFR Part 50, Appendix E, Section IV.D.2 requires a description of provisions for yearly dissemination to the public within the plume exposure pathway EPZ of basic emergency planning information, such as methods for public notifications and protective actions planned if an accident occurs, general information as to the nature and effects of radiation, and a listing of local broadcast stations that will be used for dissemination of information during an emergency. Signs or other measures shall also be used to disseminate information to any transient population within the plume exposure pathway EPZ.

In WLS Emergency Plan, Section II.G, “Public Education and Information,” the applicant described the public education and information program for the WLS, including the process for keeping the public within the 16-km (10-mi) EPZ informed in the event of an emergency. The staff reviewed this section, as well as other relevant portions of the application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff’s primary focus was to evaluate the emergency plan against NUREG-0654, Planning Standard G, which provides the detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(7). The applicant commits to coordinating with the State and local authorities to disseminate information to the public on responding to a radiological emergency at the WLS.

WLS Emergency Plan, Section II.G.1, “Public Information Program,” states that information provided to the public includes educational information on radiation, point of contact for additional information, protective measures (evacuation routes, relocation centers, sheltering, respiratory protection, etc.) and information addressing special needs of the handicapped on an annual basis.

WLS Emergency Plan, Section II.G.2, “Distribution and Maintenance of Public Information,” lists how written information may be provided to permanent residences and transient populations. WLS COL FSAR Section II.G.2 states that information for transient populations, which may be staying in hotels, motels and campgrounds, will be provided by public postings and publications, which will provide local information sources for emergencies. However, the WLS Emergency Plan does not address who will be responsible for creating the material and having the material disseminated. In RAI 25, Question 13.03-60(A), the staff requested that the applicant identify the individual responsible for coordinating and disseminating educational information for the general public with State and local authorities and discuss the process. In a December 23, 2008, response, the applicant stated that the Emergency Communications Manager is responsible for operation and maintenance of the JIC, and coordinating the creation and distribution of public informational materials in cooperation with State and local authorities for the WLS. Educational material is distributed to commercial and residential addresses within the plume exposure pathway EPZ annually. The applicant provided examples of this material used at the Catawba site as examples of the types of public information material that would be developed and distributed for the WLS. Public education material for Duke Energy's operating nuclear plants is also available via the Duke Energy Nuclear Emergency Preparedness website. The applicant further stated that details regarding the creation and distribution of public information materials will be developed on a schedule that supports NRC inspection activities and execution of the emergency exercise required by 10 CFR Part 50, Appendix E, Section IV.F.2.

WLS Emergency Plan, Section II.G.3, “News Media Coordination states that the JIC is located in the Energy Center located in Charlotte, North Carolina. The section also indicates that the News Manager and Public Spokesperson are the primary contacts for the news media. The JIC, co-located with the EOF is where approved news releases will be provided to the media for dissemination to the public. The JIC is equipped with appropriate seating, lighting, and visual aids to allow for public announcements and briefings to be given to the news media. The JIC is activated at the declaration of an “Alert” or higher classification. Additionally, WLS Emergency Plan, Section II.G.3 states that an onsite media center can be promptly established and provide space for a limited number of media. The applicant has proposed EP-ITAAC 4.1 to ensure that the licensee has provided space that may be used for a limited number of the news media.

WLS Emergency Plan, Section II.B, “On-site Emergency Organization,” Figure II-3, “Off-site Emergency Response Organization,” shows the JIC organization as part of the EOF Director’s span of control.

WLS Emergency Plan, Section II.G.4.a, “Information Exchange,” indicates that the public spokesperson has access to all the required information related to the emergency and provides plant status information during news conferences and briefings. The Chief Nuclear Officer and his direct reports are the designated public spokespersons.

WLS Emergency Plan, Section II.G.4.b, “Information Exchange,” states that liaisons coordinate with licensee and designated members of the State and local EROs on a periodic basis. WLS Emergency Plan, Appendix 9, “Justification for Common EOF,” states that the applicant and state officials cooperate in releasing information to the media. In RAI 25, Question 13.03-60(B), the staff requested that the applicant provide details on how timely and accurate information is provided to the media during an emergency. In a December 23, 2008, response, the applicant stated that WLS Emergency Plan, Sections II.G.3, “News Media Coordination,” and II.G.4, “Information Exchange,” address arrangements for news media coordination and the exchange of information among designated spokespersons. The applicant has specified that Duke Energy has corporate procedures are in place, which describe the public information responsibilities of emergency response personnel. The Chief Nuclear Officer and his or her direct reports fill the position of public spokesperson to provide plant status and company information during news conferences and media briefings conducted on an hourly basis. The applicant committed to revise their corporate JIC Activation Procedure to incorporate the WLS on a schedule to support the requirements of 10 CFR Part 50, Appendix E. The applicant proposed EP-ITAAC 9.1 to verify that the emergency plan implementing procedures provide for 24-hour per day emergency response, continuous staffing of communication links and operations for a protracted period.

WLS Emergency Plan, Section II.G.4.c, “Information Exchange,” states that contact between the designated spokespersons and by the activities of a licensee liaison in the JIC serves to control rumors. Customer inquiries are handled by Customer Contact Centers. Employees are updated through company intranet. Elected officials and regulatory agencies are updated through the Corporate Communications and Governmental Affairs Departments. Industry groups assist in disseminating information to other industry groups.

WLS Emergency Plan, Section II.G.5, “News Media Training,” states that information regarding emergency plans and radiation hazards, and points of contact for release of public information is provided annually to media organizations.

The staff finds the additional information and clarifications provided by the applicant in the December 23, 2008, response to RAI 25, Question 13.03-60 (A) and (B) acceptable because they conform to the guidance in NUREG-0654.

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and the associated evaluation criteria in NUREG-0654.

The staff finds that the applicant has provided for a coordinated and periodic dissemination of information to the public, including the permanent and transient population within the 16-km (10-mi) EPZ, regarding how they will be notified and what their actions should be in an emergency. The applicant has also established the principal points of contact with the news media for dissemination of information during an emergency, and procedures for coordinated dissemination of information to the public. In addition, the applicant has described the provisions for yearly dissemination to the public within the plume exposure pathway EPZ of basic emergency planning information, including the use of signs or other measures to disseminate information to any transient population within the plume exposure pathway EPZ.

Conclusion

The staff concludes that the information provided in the WLS COLA is consistent with the guidelines in NUREG-0654, Planning Standard G. Therefore, the staff finds the information acceptable and meets the relevant requirements of 10 CFR 50.47(b)(7) and 10 CFR Part 50, Appendix E, Section IV.D.2, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.8 Emergency Facilities and Equipment

As stated in NUREG-0654, Planning Standard H, “Emergency Facilities and Equipment,” 10 CFR 50.47(b)(8) requires that adequate emergency facilities and equipment to support the emergency response be provided and maintained. In addition, 10 CFR Part 50, Appendix E, Section IV.E.8 requires that adequate provisions be made and described for emergency facilities and equipment, including a licensee’s onsite OSC and TSC, as well as an EOF from which effective direction can be given and effective control can be exercised during an emergency. 10 CFR Part 50, Appendix E, Section IV.E.8.b addresses various requirements associated with EOF locations and required provisions, which are not applicable to an existing EOF pursuant to 10 CFR Part 50, Appendix E, Section IV.E.8.e. 10 CFR Part 50, Appendix E, Section IV.E.8.c requires various EOF capabilities, which include supporting response to multiple reactors/sites and simultaneous events, as applicable. 10 CFR Part 50, Appendix E, Section IV.E.8.d requires an alternative facility (for use when onsite emergency facilities cannot be safely accessed during hostile actions) that would be accessible and could function as a staging area for augmentation of emergency response staff. 10 CFR Part 50, Appendix E, Section IV.G requires a description of provisions to be employed to ensure that the emergency plan, its implementing procedures, and emergency equipment and supplies are maintained up to date. 10 CFR Part 50, Appendix E, Section VI.1 requires an ERDS data link between the licensee's onsite computer system and the NRC Operations Center, through which a limited data set of selected parameters can be automatically transmitted.

In WLS Emergency Plan, Section II.H, "Emergency Facilities and Equipment," Appendix 10, "Technical Support Center Description," and Appendix 9, "Justification for Common EOF," the applicant described the ERFs and the equipment that will be used to assess an accident and monitor functions following the declaration of an emergency. The staff reviewed the section and appendices in the WLS Emergency Plan, as well as other relevant portions of the application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff's primary focus was to evaluate the emergency plan against NUREG-0654, Planning Standard H; NUREG-0696; NUREG-0737; and NSIR/DPR-ISG-01, which provide the detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(8) and Appendix E to 10 CFR Part 50.

Technical Support Center

WLS Emergency Plan, Section II.H, "On-site Emergency Response Facilities," provides a discussion about the TSC and the OSC, and it states the facilities were designed to meet the intent of the guidance in NUREG-0696 and the clarification in NUREG-0737, Supplement 1. In RAI 25, Question 13.03-61(I), the staff requested that the applicant provide additional information regarding how the facilities will meet the guidance in NUREG-0696 and the clarification in NUREG-0737, Supplement 1. In a December 23, 2008, response, the applicant stated that a design description addressing the criteria provided in NUREG-0696, Sections 2.1 through 2.10 is included as WLS Emergency Plan, Appendix 10, "Technical Support Center Description," of the WLS Emergency Plan. The applicant also stated that the design satisfies the criteria established in the AP1000 DCD with the exception of being within a 2-minute walk of the CR.

The TSC is common to WLS Units 1 and 2 and is not located in the nuclear island CSA as described in the AP1000 DCD, rather, it is located in the Maintenance Support Building to provide centralized response management oversight for the site. Consequently, the applicant proposed departure WLS DEP 18.8-1 in WLS COLA Section 10, "Departures and Exemption Requests," to address the location for the TSC. In WLS COLA Part 7, the applicant evaluated WLS DEP 18.8-1 pursuant to 10 CFR Part 52, Appendix D, Section VIII.B.5.b, and found that the departure has no safety significance. Specifically, the departure is for a non-safety-related system, the location of the TSC meets applicable requirements, and relocating the TSC does not adversely affect its function. The staff agrees with the applicant's evaluation, for the reasons described below.

WLS Emergency Plan, Section II.H.1, "On-site Emergency Response Facilities," in part, describes the mission of the TSC and the purpose of the TSC. During an emergency, the TSC will provide a workspace and resources for the site personnel to support the CR by relieving the operators from tasks that are not directly related to reactor plant control manipulations. The TSC will provide communication, radiological, and engineering support. Command and control of the emergency response will transfer from the CR to the TSC. To provide technical support the TSC is equipped with the safety parameter display system (SPDS) that provides plant parameters. The TSC is provided radiological protection similar to the CR. WLS Emergency Plan, Section II.H.1, states in the event that all offsite alternating current (ac) power is unavailable, the TSC could be evacuated and function transferred to an unaffected location. A description of the procedure and locations to be considered was not provided. Therefore, in RAI 25, Question 13.03-61(A), the staff requested that the applicant provide information related to this procedure. In a December 23, 2008, response, the applicant stated that procedures for relocating the WLS TSC will be similar to those used at other Duke Energy nuclear plants. However, the applicant stated that alternate locations for the TSC and OSC have not been determined. The applicant proposed EP-ITAAC 5.1 to validate the location for the TSC and EP-ITAAC 5.1.3 Acceptance Criterion to verify back-up power was available to the TSC. The applicant also provided Catawba Nuclear Station procedures for activation of the TSC and OSC as Attachments 1 and 2 in the response to RAI 25, Question 13.03-55 as examples for future WLS procedures. WLS Emergency Plan, Appendix 10, “Technical Support Center Description” provides additional information on the TSC.

WLS Emergency Plan, Appendix 10 also states the TSC provides working space for the personnel assigned to the TSC at the maximum level of occupancy. The working space is sized for a minimum of 25 persons. Minimum size of working space is approximately 75 square feet per person. The applicant proposed EP-ITAAC 5.1 to inspect the as-built TSC and OSC. The applicant also proposed EP-ITAAC Acceptance Criterion 5.1.1 to confirm that the TSC has been located in the Maintenance Building. Also, additional ITAAC for the as-built TSC and OSC are addressed in AP1000 Design Control Document Tier 1, Revision 19, Table 3.1-1.

Due to the proposed TSC location, WLS Emergency Plan, Appendix 10 states that the TSC may not be within a 2-minute walk of either unit’s CR as identified in NUREG-0696. The applicant also states that the capability to retrieve and display plant data and use the communication systems, listed below, reduce the need for face-to-face meetings between the TSC and CR personnel. The communication systems consist of the following:

a. selective signaling telephone system

b. orivate telephone capability to the county and State warning points/EOCs

c. satellite telephone capability available in the TSC and EOF and via portable units

d. dedicated radio networks to the county and State warning points and EOCs

e. separate telephone lines are dedicated for communication with the NRC

f. separate radio system that provides for communication capabilities between the CR, TSC and EOF to the radiological monitoring teams in the field

The communication facilities include the means for reliable primary and backup communication. In addition, AP1000 DCD Tier 1, Revision 19, ITAAC Table 3.1-1, Item 2 will confirm that communication equipment is installed, and voice transmission and reception are accomplished for the TSC.

WLS Emergency Plan, Section II.H.1 states that plant data that is available in the TSC via the SPDS is described in AP1000 DCD Section 18.8.2, "Safety Parameter Display System (SPDS)." AP1000 DCD Tier 2, Chapter 1.9, "Compliance with Regulatory Criteria," Section 1.9, "Three Mile Island Issues," Section (2)(iv), "Safety Parameter Display System," states the purpose of the plant safety parameter display console (or SPDS) is to display important plant variables in the CR in order to assist in rapidly and reliably determining the safety status of the plant. In addition, displays are available at the operator workstations, the remote shutdown workstation, and at the TSC.

In RAI 25, Question 13.03-61(I), the staff requested that the applicant provide additional information regarding how the facilities meet the intent of the guidance in NUREG-0696 and the clarification in NUREG-0737, Supplement 1. In a December 23, 2008, response, the applicant stated that a design description addressing the criteria provided in NUREG-0696, Sections 2.1 through 2.10 is included in WLS Emergency Plan, Appendix 10. The applicant also stated that the design satisfies the criteria established in the AP1000 DCD with the exception of being within a 2-minute walk of the CR. AP1000 DCD Tier 1, Revision 19, EP-ITAAC Table 3.1-1, Item 3 will confirm that the plant parameters listed in AP1000 DCD Tier 1, Revision 19, Table 2.5.4-1, minimum inventory table, with a "Yes" in the "Display" column, can be retrieved in the TSC.

In RAI 25, Question 13.03-61(I)(b), the staff requested that the applicant address management plans, facility staffing, and task assignments of TSC personnel. In a December 23, 2008, response, the applicant stated that management, staffing, and assignments of TSC personnel are addressed in EPIPs. These procedures will be similar to Catawba Nuclear Stations TSC activation procedure, which was included as Attachment 1 to the response to RAI 25, Question 13.03-55. This Attachment 1 was reviewed by the NRC staff and found to be an acceptable example. Actual procedures for WLS will be developed and submitted in accordance with License Condition (13-8). This License Condition is discussed in Section 13.3.4.19 of this report.

In RAI 25, Question 13.03-61(I)(c), the staff requested that the applicant provide a detail staffing plan for the TSC to address the overall management of licensee resources and the continuous evaluation and coordination of licensee activities during and after an accident. In a December 23, 2008,response, the applicant stated that WLS Emergency Plan, Section II.A.4, "Continuous Operation," outlines the capability for continuous operations through training of multiple responders for key emergency response positions allowing for multiple shifts for extended response operations. Additional information on staffing of the TSC is provided in the response to RAI 25, Question 13.03-55. The staff reviewed this information and finds it acceptable.

In RAI 25, Question 13.03-61(I)(d), the staff requested that the applicant provide the TSC staff assignments to address that TSC management of licensee onsite and offsite radiological monitoring, to perform radiological evaluations, and to interface with offsite officials. The staff also requested that the applicant address whether the personnel assigned to the TSC varies according to the emergency class. In a December 2008, response, the applicant stated that TSC staff assignments will be similar to that in use at other Duke Energy nuclear stations. In accordance with procedures, Radiation Protection personnel are responsible for activating and dispatching field monitoring teams. TSC offsite agency communicators ensure that communicators in the EOF are aware of information affecting offsite agencies. Staffing levels are not varied based on the emergency classification. Procedures will contain provisions for emergency response managers to request additional support from other organizations to assess and mitigate the emergency condition. The Catawba Nuclear Station procedure for activation of the TSC was included as Attachment 1 in the response to RAI 25, Question 13.03-55 as an example. This Attachment 1 was reviewed by the staff and found to be an acceptable example. Actual procedures for WLS will be developed and submitted in accordance with License Condition (13-8). This License Condition is discussed in Section 13.3.4.19 of this report.

In RAI 25, Question 13.03-61(I)(e), the staff requested that the applicant address procedures for and training of personnel to use the data systems and instrumentation and include limitations of instrumentation. In a December 23. 2008, response, the applicant stated that information regarding the Emergency Response Training program is discussed in the response to RAI 25, Question 13.03-61(I)(a) and the training program description within the WLS Emergency Plan, Section II.O.4. The training program requires TSC staff to receive an overview of the site emergency plan and training on facility operations, technical assessment function, and task-specifics consistent with assigned duties. This task-specific training includes, for example, use of data systems and instrumentation, including the limitation of instrumentation for assigned personnel.

In RAI 25, Question 13.03-61(I)(f), the staff requested that the applicant address how the TSC staff maintain proficiency (participation in drills). In a December 23, 2008, response, the applicant stated that the exercise and drill program is discussed in WLS Emergency Plan, Sections II.N.1.a, “Exercise Scope and Frequency”; II.N.1.b, “Exercise Scenarios and Participation”; and II.N.2, “Drills.” The applicant also provided additional information related to the goals and primary objectives of drills and exercises. The applicant further stated that TSC staffs participate in these exercises and drills to maintain their proficiency.

In RAI 25, Question 13.03-61(I)(g), the staff requested that the applicant address whether there are means for facsimile transmission capability between the EOF, TSC, and NRC Operations Center. In a December 23, 2008, response, the applicant stated that facsimile transmission between the EOF, TSC, and NRC Operations Center will be supported at the TSC. New advancements in technology will be considered before incorporating transmission systems into the facilities. An EP-ITAAC regarding this capability was proposed in AP1000 DCD Tier 1, Table 3.1-1 and WLS COLA Part 10, Table 3.8.1.

WLS Emergency Plan, Appendix 10 states that the TSC is designed in accordance with the Uniform Building Code (UBC) to withstand earthquakes and high winds. Support facilities are located within the TSC to support long term operation of the TSC. WLS Emergency Plan, Appendix 10 further states that the TSC is provided with reliable power and backup power supplies. Lighting is powered by the normal and backup electrical supply system. An emergency battery operated lighting system is installed. Power for vital information systems is provided by reliable power supplies including a battery backed uninterruptible power supply (UPS) system.

WLS Emergency Plan, Appendix 10 states that the TSC is environmentally controlled to provide room air temperature, humidity, and cleanliness appropriate for personnel and equipment. The ventilation system includes high efficiency particulate air (HEPA) filters and charcoal filters. The ventilation system is designed to maintain exposures at or below 0.05 Sievert (Sv) (5 roentgen equivalent man (rem)) TEDE as defined in 10 CFR 50.2, "Definitions," for the duration of an accident. The TSC structure, shielding, and ventilation system are also designed to protect the TSC personnel from radiological hazards. The ventilation system is operated in accordance with approved procedures and is manually controlled from the TSC. In RAI 25, Question 13.03-61(J), the staff requested that the applicant provide details pertaining to ventilation design such as air inlet flow rates, recirculation flow rates, unfiltered air inleakage, and other factors necessary to complete a radiological assessment. In December 2008 and March 16, 2015, responses, the applicant provided a TSC Design Description Document and a detailed radiological assessment. The TSC Design Description Document stated that the TSC heating, ventilation, and air-conditioning (HVAC) system functions to provide normal environmental control for personnel and equipment operational requirements; and provides environmental control for habitability through filtration of potentially radioactive particulates and adsorption of iodine during emergency conditions. The applicant also stated that the TSC is designed to comparable levels of habitability, such as humidity and temperature, as described in the AP1000 DCD, as well as the same radiological habitability as the CR, under accident conditions. A design description for the location of the TSC is provided in WLS Emergency Plan, Appendix 10 of the application, which addresses criteria in NUREG-0737, Supplement 1, Section 8.2.1.

Furthermore, in TSC Design Description Document the applicant stated that radiation monitoring systems are available to personnel in the TSC. These monitoring systems may be composed of installed monitors or portable monitoring equipment. These systems continuously indicate radiation dose rates and airborne radioactivity concentrations inside the TSC while it is in use during an emergency. These monitoring systems include local alarms with trip levels set to provide early warning to TSC personnel of adverse conditions that may affect the habitability of the TSC. These detectors are able to distinguish the presence or absence of radioiodines at concentrations as low as 10^{-7} microcuries per cc. In addition, Appendix 10 states that portable radiation monitors are available to personnel in the TSC. EP-ITAAC Acceptance Criterion 5.1.2 has been proposed to confirm that the TSC includes radiation monitors and a ventilation system with a HEPA and charcoal filter.

Equipment and supplies are provided in accordance with WLS Emergency Plan, Appendix 6, "Emergency Equipment and Supplies." WLS Emergency Plan, Appendix 6 provides a general list of equipment located in the ERFs, including the TSC.

WLS Emergency Plan, Appendix 10 describes the technical and operational data and information that is available for each Lee Nuclear Station unit within the TSC. The TSC is equipped with a computer system, which provides source term and meteorological data and technical data displays to allow TSC personnel to perform detailed analysis and diagnosis of abnormal plant conditions, including assessment of any significant release of radioactivity to the environment. EP-ITAAC 6.4 has been proposed to verify the capability to perform an inspection of the TSC to verify the availability of the meteorological data is available in the TSC. Also, HFE is incorporated into the design of the TSC related to the display and availability of plant data.

WLS Emergency Plan, Appendix 10 states that the TSC has ready access to plant records and provides a list of specific documents, procedures, reports, and drawings that will be maintained in the TSC.

WLS Emergency Plan, Section II-H.4, “Activation and Staffing of Emergency Response Facilities,” states that all WLS ERFs will activate at an Alert or higher classification. Following notification, emergency response personnel report to their assigned ERF and undertake activities necessary to make the ERF fully functional. Additionally, should security or other conditions make activating the onsite ERFs impracticable or hazardous, the Emergency Coordinator will implement alternate plans as described in the EPIPs, which may direct the ERO to alternate offsite ERFs to assemble and await instructions until favorable conditions exist to activate the onsite ERFs.

The staff finds that the common TSC provides an area that meets the applicable regulatory guidance in NUREG-0696 and NUREG-0737, Supplement 1 and, as such, will adequately support its intended emergency response functions. Therefore, the staff concludes that WLS DEP 18.8-1 is acceptable with respect to the TSC location.

Operations Support Center

WLS Emergency Plan, Section II.H.1, “On-site Emergency Response Facilities,” describes the primary function of the OSC staff is to dispatch assessment, corrective action, and rescue personnel to locations in the plant as directed by the TSC and CR. Each unit has a separate OSC, and provides a centralized area and the necessary supporting resources during emergency conditions. Designated plant support personnel, as indicated in WLS Emergency Plan, Section II.B, “Onsite Emergency Organization,” assemble in the designated OSC to provide support to both the CR and TSC. WLS Emergency Plan, Section II.B.6, “Plant Emergency Response Staff,” states that WLS Emergency Plan, Figure II-2, “WSL Emergency Response Organization-TSC/OSC Only,” illustrates the plant staff emergency organization. The figure identifies an OSC Director as directing the OSC staff and reporting to the Site Emergency Director. WLS Emergency Plan, Section II.B.5, “Plant Emergency Response Staff,” describes the OSC Director as the one who directs repair teams, performs damage assessment, and coordinates OSC teams to provide proper briefings and accompaniment by radiation protection personnel as applicable.

WLS DEP 18.8-1 states that the OSC location will be described in the WLS Emergency Plan. WLS Emergency Plan, Section II.H states that the OSCs are located in the space formerly designated in the AP1000 DCD for the TSC. In WLS COLA Part 7, the applicant evaluated WLS DEP 18.8-1 pursuant to 10 CFR Part 52, Appendix D, Section VIII.B.5.b and found that the departure is for a non-safety-related system, that the location of the OSC meets applicable requirements, and that relocating the OSC does not adversely affect its function. The staff agrees with the applicant’s evaluation for the reasons described below.

WLS Emergency Plan, Section II.H.1 statement: “Implementing procedures make provisions for the relocation of the OSC as needed…” Additional information on the operation of the OSC and TSC can be found in AP1000 DCD Section 18.8.3.5, “Technical Support Center Mission and Major Tasks.” AP1000 DCD Tier 1, Section 3.1, “Emergency Response Facilities,” contains a description of the facility and its EP-ITAAC acceptance criteria. In RAI 25, Question 13.03-61(H), the staff requested that the applicant provide additional information related to the design of the OSC. In a December 23. 2008, response to RAI 25, Question 13.03-61(H), the applicant stated that site layout drawings are not included in emergency plans or implementing procedures. This information will be included in training and orientation of OSC personnel. The applicant also stated AP1000 DCD Figures 1.2-17 through 1.2-20 are designated as security-related information and properly withheld from public disclosure pursuant to NRC regulations and guidance. WLS COLA Figure 1.2-201, (which replaces AP1000 DCD Figure 1.2-18) is similarly withheld and included in WLS COLA Part 9, “Withheld.” The applicant also stated that this information is available for review through processes and procedures established by the NRC for such material. The applicant proposed EP-ITAAC Acceptance Criterion 5.1 to test that the applicant has established a TSC and OSC. The introductory information in WLS Emergency Plan, Section H, “Emergency Facilities and Equipment,” states that the OSCs are designed to meet the intent of Supplement 1 to NUREG-0737. The applicant proposed EP-ITAAC Acceptance Criterion 5.1.4 to confirm that the OSC is in a location separate from the CR.

WLS Emergency Plan, Section II.H.1 describes OSC resources for communicating with the CR and the TSC. Also, WLS Emergency Plan, Section II.F, “Emergency Communications,” describes a radio system as the back-up communication capability. The communication capabilities permit personnel reporting to the OSC to be assigned to duties in support of emergency operations. AP1000 DCD Tier 1, Revision 19, EP-ITAAC, Table 3.1-1, Item 4 ensures that communication equipment is installed, and voice transmission and reception are accomplished for the OSC. Communication systems are covered in WLS Emergency Plan, Sections II.E, “Notification Methods and Procedures,” and II.F, “Emergency Communications.” In RAI 25, Question 13.03-61(F), the staff requested that the applicant provide additional information regarding communication systems available in the OSC. In a December 23, 2008,response, the applicant stated that WLS Emergency Plan, Section II.H.1 describes functionality and habitability of the ERFs in compliance with NUREG-0696, Criteria 3.1 and 3.2. WLS Emergency Plan, Section II.F discusses the use of a wireless telephone system for communication between the facilities. The telephone-page and Private Branch Exchange (PBX) telephone communication systems serve as backups to this system.

The OSC is not designed to remain habitable under all projected emergency conditions. However, implementing procedures make provisions for relocating the OSC as needed, based on ongoing assessments of plant conditions and facility habitability. The Site Emergency Director directs relocation of the OSC if required.

WLS Emergency Plan, Section II.H.1 states that protective clothing and respirators are discussed in WLS Emergency Plan, Section II.J.6, “Protective Measures.” WLS Emergency Plan, Appendix 6, “Emergency Equipment and Supplies,” provides a list of supplies and equipment for all ERFs and states that detailed equipment and supplies will be addressed in implementing procedures.

The staff finds that the relocation of the units’ OSCs to the space formerly designated in the AP1000 DCD for the TSCs is acceptable because the OSCs provide an area that meet the applicable guidance in NUREG-0696 and NUREG-0737; Supplement 1 and, as such, will allow the OSC to adequately support its intended emergency response functions. From a support and functional standpoint, the staff finds the applicant’s proposed OSCs locations acceptable, subject to a demonstration of adequacy during the full participation exercise (addressed in ITAAC 8.1). Therefore, the staff concludes that WLS DEP 18.8-1 is acceptable.

Emergency Operations Facility

WLS Emergency Plan, Section II.H.2, "Off-site Emergency Response Facilities," states that the purpose of the EOF and associated EOF staff is to provide the facilities and staffing for evaluating, coordinating, and directing the overall activities involved in coping with a radiological emergency. During an emergency, the EOF Director and his staff review the response to the emergency by the Duke Energy and the appropriate State and local agencies to facilitate execution of an effective and cooperative effort. The EOF Director is responsible for providing the Duke Energy's recommended protective actions to the appropriate State and local officials. The EOF staff coordinates with other Duke Energy emergency centers to facilitate an effective Duke Energy effort in response to an emergency situation. The EOF staff also provides an accurate description of the emergency situation for Duke Energy management and public information. In addition, the EOF coordinates with offsite Federal agencies, such as the NRC and DOE, to provide availability of additional outside resources to Duke Energy.

Duke Energy has filed for an exception to have the EOF located in the Charlotte General Office in the Energy Center at 526 South Church Street, Charlotte, North Carolina. Justification of this exception can be found in WLS Emergency Plan, Appendix 9, "Justification for Common EOF." WLS Emergency Plan, Appendix 9 states that because the EOF is more than 16 km (10 mi) from any of the Duke Energy nuclear stations, no radiological monitoring equipment is required. The applicant has proposed that the Charlotte, North Carolina, EOF currently used for Duke Energy's existing nuclear stations at McGuire Nuclear Station (MNS), Catawba Nuclear Station (CNS), and Oconee Nuclear Station (ONS) be used for the WLS as well. The applicant stated that the centralized EOF has proven to be an effective facility for implementing the nuclear station emergency plans. MNS and CNS have used a common EOF since August 1987. The existing facility has been in use since October 2005 and was used in the Catawba 2006 biennial exercise. In 2006, the applicant received NRC approval to use the EOF for ONS. Communication systems, data links, and staffing have been incorporated and tested. Using the centralized EOF for WLS would allow the applicant to apply its corporate emergency response structure and experience to the WLS Emergency Plan. The applicant has discussed this proposal with South Carolina Emergency Management, North Carolina Emergency Management, South Carolina Department of Health and Environmental Control, North Carolina Department of Environmental Health and Natural Resources, Cherokee County, South Carolina Emergency Management, York County, South Carolina Emergency Management, and Cleveland County, North Carolina Emergency Management. North and South Carolina are familiar with the EOF because it is the current facility used for responding to an event at MNS, CNS, and ONS. Acknowledgement of their support for use of the EOF location is included in their respective letters certifying their agreement with the WLS Emergency Plan. The NRC will have access to plant data through the Duke Energy satellite display system (SDS) and ERDS. The NRC also has telephones on the ETS in Charlotte, North Carolina. Equipment exists in the EOF for the acquisition, display, and evaluation of radiological, meteorological, and plant system data used to determine offsite protective measures. Release information is provided by the field monitoring teams and is used to determine appropriate PARs. Plant and effluent data would be provided on as timely a basis at an EOF in Charlotte as it would be at a near-site location. Various plant parameters are available to the EOF staff via a connection through Duke's Wide Area Network (WAN). Data available at the EOF provides a snapshot of data from each unit's integrated set of plant data as described in AP1000 DCD Chapter 18, "Human Factors Engineering." Plant data can be displayed at the EOF. These data sets are sufficient to perform accident assessment and evaluate the potential onsite and offsite environmental consequences of an emergency at Lee Nuclear Station. The computers in the Dose Assessment Area are capable of running the dose projection computer programs (Raddose-V) and accessing SDS data. A Duke Energy staff meteorologist in the EOF provides meteorological information to the EOF staff, in support of offsite dose projections. In addition, the applicant proposed EP-ITAAC 6.4 to perform an inspection of the EOF to verify the availability of the meteorological data.

WLS Emergency Plan, Appendix 9 describes the building construction, radiological protection, installed equipment to support the response, security measures, up-to-date plant reference information, and communication systems. The EOF is constructed so that it is capable of withstanding wind loads and live loads equal to or greater than those specified in the current North Carolina State Building Code (2000 International Building Code). The current Building Code specifies a basic design wind speed of 145 kilometers per hour (90 miles per hour) (mph))-3 second gust and a total minimum floor live load of 342 kilograms per square meter (70 pounds per square foot (psf)). This evaluation is based on a review of original structural drawings and comparison to requirements of the current North Carolina State Building Code. The EOF includes space for South and North Carolina liaisons reporting to the EOF, as well as workspace for the NRC that is co-located with decision-makers, radiological assessment, and accident assessment personnel. The EOF draws its primary power from commercial sources. A loss of commercial power should not impact any of the voice or data communication equipment located in the EOF. Common Duke Energy telecommunication infrastructure that supports EOF functions, including, but not limited to, fiber optic transmission equipment, telephone switching equipment and data network routers, is configured to operate from at least one and usually multiple backup power sources in the event of a loss of commercial power. These backup sources include generator, dc battery, and UPS systems. EP-ITAAC Acceptance Criterion 5.2.1 will confirm that the EOF has at least 243 square meters (2625 square feet).

Since the EOF is located outside of the 16-km (10-mi) EPZ, it is not required to have any additional radiation protection factor.

The communication systems at the EOF are designed to provide for the reliable, timely flow of information between all parties having an emergency response role. The single facility results in commonality of communication and interface with offsite officials and liaisons. The Selective Signaling System continues to be the primary means of communicating changes in event classification and PARs to the States and counties. The Selective Signaling System, as well as the Decision Line, operate on a combination of the Duke Energy Telecommunications network and leased circuits. The offsite communication network is used to communicate with Federal, State, and other supporting agencies. Access to these agencies is provided through several redundant, diverse routes. This diversity provides offsite routing through more than one type of facility. These facilities include, but are not limited to, commercial facilities such as central office trunks, tie-lines and digital services, plus privately owned and maintained microwave and fiber-optic systems. The offsite telecommunication networks are designed to facilitate traffic in the most fail-safe manner to the EROs. ENS, HPN and commercial telephones provide communication from each site TSC, CR, and the EOF to the NRC Headquarters and regional offices. These telephones are tested on a periodic basis consistent with the WLS Emergency Plan. A control station with a remote connection to the EOF allows the EOF to communicate with the WLS Field Monitoring Teams. Additional radio capability for communication with counties within the WLS plume exposure pathway EPZ will include South Carolina Local Government Radio for Cherokee and York Counties, and North Carolina Satellite Radio for

Cleveland County. Existing commercial telephone service will serve as the designated backup means of communication in the event of a Selective Signaling System or Decision Line failure. Duke Energy has telecommunication capabilities that can provide access to long distance networks without having to go through a local telephone company switch. Long distance calls from the EOF are routed through Duke Energy's corporate PBX in Charlotte, NC, directly to either a primary or backup long distance carrier. Telephones are provided for the respective Federal and State representatives, including lines for faxes and modems. Facsimile machines are available in the EOF to support the transmission of information between the ERFs and with State, local, and Federal authorities.

The applicant proposed ITAAC Acceptance Criteria 5.2.2 and 5.2.3, which will verify the EOF's capability to communicate with the TSC by voice and the use of the Selective Signaling Telephone system with the local and State Warning Points.

Hard copies of key reference materials are maintained in the Nuclear General Office facilities in Charlotte, and are brought to the EOF upon activation. In addition, station design documentation, plant drawings, WLS COL FSAR, procedures, etc., are available via local area network (LAN) connection from the Nuclear Electronic Document Library. The following information is available for WLS at the EOF: plant technical specifications, plant operating procedures, emergency operating procedures, WLS COL FSAR, up-to-date license, State and local emergency response plans, offsite population distribution data, and evacuation plans.

The EOF is provided with normal industrial security, and processes are already established to upgrade security during activation.

Section 18.2.1 of this report discusses the implementation and verification of applicable EOF displays in accordance with the AP1000 HFE program.

WLS Emergency Plan, Section II.E.2, "Notification and Mobilization of Licensee Response Organizations," describes staffing of the EOF. The EOF can be activated within about 75 minutes of the declaration of an "alert" or higher level emergency. The EOF staff has demonstrated their ability to staff the EOF within 75 minutes of emergency declaration during annual augmentation drills for McGuire and Catawba Nuclear Stations. The EOF staff will include personnel to manage overall licensee emergency response, coordinate radiological and environmental assessment, determine recommended public protective actions, and interface with offsite officials. WLS Emergency Plan, Section II.F, "Emergency Communications," provides a description of the communication capabilities provided in the EOF. The EOF is staffed and activated in accordance with EPIPs. WLS COL FSAR Table 13.4-201, "Operational Programs Required by NRC Regulations," states detailed implementing procedures will be submitted at least 180 days prior to fuel loading. The EOF is declared activated following an assessment of staffing levels, habitability, operability of installed systems, sufficiency of supplies and equipment, and communication interfaces. Alternate plans can be initiated in a time of adverse conditions. In RAI 25, Question 13.03-73(B), the staff requested that the applicant provide clarification between the concepts of "activation" and "staffing." In a December 23, 2008, response, the applicant stated that within the WLS Emergency Plan, the concept of "activation" as used in NUREG-1793 and the AP1000 DCD includes the activities of notifying the appropriate emergency response personnel, staffing the ERFs, establishing the required communication interfaces, and declaring the facility to be operational.

The staff focused its review on the extension of the existing centralized Duke Energy EOF to the WLS, and concluded that the EOF is applicable to the proposed reactor, the information provided in the application was adequate to support a combined use facility, and that WLS will be addressed in the EOF procedures as part of the implementation milestones and requirements related to emergency planning in WLS COL FSAR Table 13.4-301, “Operational Programs Required by NRC Regulations,” Item 14, In accordance with the Staff Requirements Memorandum (SRM) to SECY 10-0078, “Centralized Emergency Operations Facilities and Combined License Applications,” the Commission granted the authority for the staff to review any applicant proposals for centralized EOFs and to determine their respective acceptability as part of the 10 CFR Part 52 COL application process. Therefore, the staff finds that the WLS Emergency Plan adequately describes a combined EOF from which evaluation and coordination of all licensee activities related to an emergency is to be carried out. In addition, the EOF provides information to Federal, State and local authorities responding to radiological emergencies. The considers this acceptable because it meets the applicable guidance in NUREG-0737, Supplement 1 and the applicable regulatory requirements of 10 CFR 50.34(f)(2)(xxv).

In WLS COLA Part 10, the applicant proposed License Condition 4 “Emergency Planning Actions,” to demonstrate the integrated capability and functionality of the EOF. The staff refers to this as License Condition (13-7).

License Condition (13-7):

> Prior to fuel load, Duke Energy will demonstrate the integrated capability and functionality of the EOF for activation and operation of the facility to respond to emergency events at both the WLS and one additional nuclear facility that is supported by the EOF. Integrated communication and data capability and functionality will include the Technical Support Centers for WLS and one additional nuclear facility, and other Federal, State, and local coordination centers as appropriate.

The staff evaluated the proposed license condition and finds License Condition (13-7) acceptable because it is consistent with the Final Rule and NSIR/DPR-ISG-01.

Other Emergency Facilities and Equipment

WLS Emergency Plan, Section II.H.1 designates and describes two alternate facilities that would be used for an assembly and staging location if the onsite emergency facilities were not available, including during a hostile action event. The WLS Training building, which will be located within the owner-controlled area outside of the protected area, and the Kings Mountain Generation Support Facility, which is located approximately 25 kilometers (km) (15.5 mi) from the site support a rapid site response. Both locations have communication links with the EOF, control room and security; the capability to provide timely notification to offsite response organizations for changes in classification levels or protective action recommendations; the capability for engineering assessment, damage control planning and preparations; and computer links to the site’s plant data.

WLS Emergency Plan, Section II.H.5, “Onsite Monitoring Systems,” contains a description of the various monitoring systems necessary for initiating emergency measures and performing accident assessment. This includes monitoring systems for geophysical phenomena, radiological conditions, plant procedures, and fire hazards as follows:

- Personnel monitoring equipment is described in the AP1000 DCD, Revision 19, and the WLS COL FSAR corresponding section.

- Geophysical phenomena are described in AP1000 DCD, Revision 18, Section 3.7.4, “Supporting Media for Seismic Category I Structures” and the WLS COL FSAR corresponding section.

- Radiological monitoring systems can be found in AP1000 DCD, Revision 19, Sections 11.5, “Radiation Monitoring,” and 12.3, “Radiation Protection Design Features,” and the WLS COL FSAR corresponding sections. A supply of portable radiation monitoring and sampling equipment and emergency response equipment is addressed in WLS Emergency Plan, Section II.H, “Emergency Facilities and Equipment,” and WLS Emergency Plan, Appendix 6, “Emergency Equipment and Supplies.”

- Plant process monitoring systems are described in AP1000 DCD, Revision 19, Section 11.5 and the WLS COL FSAR corresponding section.

- Plant fire monitoring systems are described AP1000 DCD, Revision 19, Section 9.5.1, “Fire Protection Systems” and the WLS COL FSAR corresponding section.

- An emergency plan implementing procedure will describe the bases for the selection of the designated instruments as indicators of emergency conditions.

WLS Emergency Plan, Section II.H.7, “Off-site Radiological Monitoring Equipment,” states that WLS provides offsite radiological monitoring equipment suitable for assessment of offsite radiological consequences of facility incidents. WLS Emergency Plan, Appendix 6, “Emergency Equipment and Supplies,” lists the general types of equipment that would be available for offsite measurements. This equipment includes: radiation survey instruments; surface contamination control and survey supplies; air sampling equipment and media; and scalers or other appropriate radio analytical counting instruments. Further, WLS Emergency Plan, Section II.I.9, “Measuring Radioiodine Concentrations,” states that the field equipment is capable of detecting radioiodine concentrations of 10E-7 microcuries per milliliter under field conditions. Furthermore, WLS has an Offsite Dose Calculation Manual (ODCM) that describes the monitoring systems. The plant also has equipment and radiological laboratory facilities available on site. Environmental monitoring equipment includes multiple radioiodine and particulate monitors and thermo luminescent dosimeters (TLDs). The TLDs are posted and collected in accordance with Branch Technical Position (BTP), Revision 1, Table 1 included with GL 79-65, “Environmental Monitoring for Direct Radiation.” Locations of TLDs and air sampler postings are listed in the ODCM. In RAI 25, Question 13.03-61(E), the staff requested that the applicant provide additional information on monitoring systems and the locations of dosimeters and air samplers that is available in the ODCM. In a December 23, 2008, response, the applicant stated that the ODCM is discussed in Environmental Report (ER), Section 6.2, “Radiological Monitoring.” WLS COL FSAR Section 11.5.7, “Combined License Information,” states that a description of the ODCM program will be finalized prior to fuel load. Milestones for implementation of the ODCM program are provided in WLS COL FSAR Table 13.4-201. Station monitoring and sampling locations are identified in WLS COL FSAR Table 6.2-2, and WLS COL

FSAR Figures 6.2-1, “Near Field Radiological Sampling and Monitoring Locations,” and 6.2-2, “Far Field Radiological Sampling and Monitoring Locations.” The program is based on guidance in BTP Revision 1 included with GL 79-65. The applicant identified a license condition for implementing ODCM and Radiological Environmental Monitoring Program, which is addressed in WLS COLA Part 10, “Proposed Licensed Conditions (including EP-ITAAC).” The staff notes this is consistent with 10 CFR Part 50, Appendix E, Section V and the allowances provided in SECY-05-0197, “Review of Operational Programs in a Combined License Application and Generic Emergency Planning Inspections, Tests, Analyses, and Acceptance Criteria.” Arrangements for backup support and analysis are described in WLS Emergency Plan, Section II.A, “Assignment of Responsibility (Organizational Control),” and arrangements with other organizations are documented with certification letters in WLS Emergency Plan, Appendix 7, “Certification Letters.” Descriptions of laboratory facilities both fixed and mobile are in WLS Emergency Plan, Section II.C.3, “Radiological Laboratories.”

WLS Emergency Plan, Section II.H.8, “Meteorological Instrumentation and Procedures,” discusses the onsite meteorological data collection system. The meteorological data is acquired from an onsite meteorological tower. The tower measures wind speeds, ambient temperatures, atmospheric stability, dew point, and precipitation. The meteorological monitoring program and climatology are described in WLS COL FSAR Section 2.3, “Meteorology.” All measured data from onsite meteorological tower is available to the plant and ERF display systems. Meteorological data can also be obtained from the CNS and the NWS in Greer, South Carolina. In RAI 25, Question 13.03-61(E)(1), the staff requested that the applicant provide additional information regarding the procedures related to meteorological data. In a December 23, 2008, response, the applicant stated that alternate meteorological data sources are located within 80 km (50 mi) of the WLS site and have been found to be representative of the WLS location. The applicant’s meteorologist is responsible to interpret data received and to determine representativeness of the data when onsite meteorological systems cannot be used. The applicant also provided Duke Energy's corporate procedure for obtaining data from an alternate source as Attachment 1 to the response to RAI 25, Question 13.03-62. Furthermore, flooding data is available from NOAA Hydro Meteorological Reports, and the backup seismic data is available from the U.S. Geological Survey (USGS). All of the data is shared with local, State, and Federal organizations. (See WLS Emergency Plan, Section II.F, “Emergency Communications,” for a description.)

WLS Emergency Plan, Section II.H.10, “Emergency Equipment and Supplies,” n states that the applicant performs inspections and operational test of emergency equipment once each calendar quarter. Reserves are maintained to replace instruments removed for calibration or repair. The scope and responsibilities for performing these tests are provided in administrative procedures. A description of the equipment is in WLS Emergency Plan, Appendix 6, “Emergency Equipment and Supplies.” In RAI 25, Question 13.03-61(B), the staff requested that the applicant provide additional information on the procedures to inspect and test dedicated emergency equipment. In a December 23, 2008, response, the applicant stated that the procedure for verifying availability and readiness of emergency response equipment will be similar to that in use at other Duke Energy nuclear plants. The applicant provided CNS's Procedure and a Duke Energy corporate procedure as examples of this process. The staff notes that a license condition has been proposed in WLS COLA Part 10 addressing the submittal schedule for operational programs, including EPIPs, which is consistent with 10 CFR Part 50, Appendix E, Section V and the allowances provided in SECY-05-0197.

WLS Emergency Plan, Appendix 6, “Emergency Equipment and Supplies,” states there will be emergency equipment and provided a general list of its contents. In RAI 25, Question 13.03-61(G), the staff requested that the applicant provide additional information on the contents of the emergency kits. In a December 23, 2008, response the applicant stated that information regarding emergency kits will be similar to that in use at other Duke Energy nuclear plants. The applicant provided a CNS's procedure and a Duke Energy corporate procedure as examples of this process. A license condition addressing the submittal schedule for implementation of EPIPs, is addressed in WLS COLA Part 10, “Proposed Licensed Conditions (including EP-ITAAC),” which is consistent with 10 CFR Part 50, Appendix E, Section V and the allowances provided in SECY-05-0197.

WLS Emergency Plan, Section II.H.12, “Receipt of Field Monitoring Data,” states that Radiological Assessment personnel in the EOF are the central point for the receipt of offsite monitoring data results and sample media analysis. The Radiological Assessment personnel will evaluate the information and make recommendations. The equipment in the lab can be used to determine activity of samples. Instruments are routinely calibrated to ensure availability. Field monitoring equipment is maintained at Lee Nuclear Station.

Onsite first aid capability is discussed in WLS Emergency Plan, Section II.L.2, “On-site First Aid Capability,” and a generic list of supplies can be found in WLS Emergency Plan, Appendix 6, “Emergency Equipment and Supplies.”

Procedures to review, audit, and update the emergency plan are covered in WLS Emergency Plan, Section II.P.4, “Plan Reviews and Updates.” The WLS Emergency Plan is to be reviewed and updated on an annual basis. Implementing procedures are discussed in WLS Emergency Plan, Section II.P.7, “Implementing Procedures,” and WLS Emergency Plan, Appendix 5, “Implementing Procedures.” WLS Emergency Plan, Section II.H.10, “Emergency Equipment and Supplies,” states that the applicant performs inspections and operational tests of emergency equipment once each calendar quarter.

Emergency Response Data System (ERDS)

WLS Emergency Plan, Section II.F.1.g, “Description of Communications Links,” states that the ERDS is activated within 1 hour after declaring an “Alert,” or higher emergency classification. WLS Emergency Plan, Section II.N.2.a states that testing of the communication systems between the WLS and the NRC Headquarters and the Regional Operations Center will be performed monthly. Additional information is provided in WLS COL FSAR Section 9.5.2.2.3.2.1, “NRC Communication Interfaces.” AP1000 DCD Tier 2, Section 7.7, “Control and Instrumentation Systems,” discusses system parameters. Meteorological data parameters are discussed in WLS COL FSAR Chapter 2, “Site Characteristics,” and WLS COL FSAR Section 2.3.3, “Onsite Meteorological Measurement Programs.” and WLS Emergency Plan, Section II.H.8, “Meteorological Instrumentation and Procedures.” Radiation monitoring is discussed in the AP1000 DCD Tier 2, Section 11.5, “Radiation Monitoring,” and AP1000 DCD Section 11.1.2, “Plant Monitoring Systems.” Containment parameter monitoring is discussed in AP1000 DCD Chapter 7, “Instrumentation and Controls.” In RAI 25, Question 13.03-61(C), the staff requested that the applicant provide the following information regarding the data points transmitted for selected plant conditions: (1) verify that data points can be transmitted for reactor core and coolant system conditions; reactor containment conditions; radioactivity release rates; and plant meteorological tower data; (2) verify that a separate data feed will be provided for each reactor unit; (3) if the ERDS is to communicate with a safety system, verify that appropriate isolation devices will exist at these interfaces. The staff also requested additional information regarding the ERDS in RAI 25, Questions 13.03-61(D)(1 through 4). In a December 23, 2008,response, the applicant stated that data points for reactor and core coolant system conditions; reactor containment conditions; radioactivity release rates; and plant meteorological tower data will be available for transmittal, and a separate data feed for each reactor unit is to be provided. Data transmission design will include isolation devices as part of the Cyber Security Program being developed. The process and hardware used to transmit data has not been identified but will be specific to AP1000 design features and based on regulatory guidance. The applicant also stated that the ERDS for WLS will be developed on a schedule in compliance with the milestones provided in WLS COLA, Part 10.

In RAI 25, Question 13.03-61(D)(1), the staff requested that the applicant verify that the system is capable of transmitting ERDS parameters in not more than 60 seconds or no less than 15 seconds. In a December 23, 2008, response, the applicant stated that ERDS parameters can be transmitted in no more than 60 seconds or no less than 15 seconds.

In RAI 25, Question 13.03-61(D)(2), the staff requested that the applicant verify that the link control and data transmission is established in a compatible format with NRC receiving equipment. In a December 23, 2008, response, the applicant stated that link control and data transmission is in a compatible format with the NRC receiving equipment.

In RAI 25, Question 13.03-61(D)(3), the staff requested that the applicant verify that any hardware or software changes that affect the transmitted data points identified in the ERDS Data Point Library will be submitted to the NRC within 30 days after the changes are completed. The staff also requested that the applicant verify that hardware and software changes that could affect the transmission format and computer communication protocol to the ERDS will be provided to the NRC at least 30 days prior to the modification. In a December 23, 2008, response, the applicant stated that hardware or software changes that affect the transmitted data points identified in the ERDS Data Point Library will be submitted to the NRC within 30 days after the changes are completed. The applicant also stated that hardware and software changes that could affect the transmission format and computer communication protocol to the ERDS will be provided to the NRC at least 30 days prior to the modification. The applicant proposed EP-ITAAC Acceptance Criterion 3.2.2 that confirms ERDS data was provided from the plant computer system to NRC Headquarters and Region II EOC.

In RAI 25, Question 13.03-61(D)(4), the staff requested that the applicant verify that an ERDS implementation program plan has or will be submitted to the NRC. In a December 23, 2008, response, the applicant stated that an ERDS implementation program plan will be submitted to the NRC. The applicant also stated that some of the details regarding this information are specific to the design features of the AP1000 and will be based on applicable regulatory guidance. Other details are applicable to the emergency planning program implementation. The ERDS and implementation procedures for WLS will be developed on a schedule in compliance with the milestones provided in WLS COLA, Part 10, Tier 1, Table 2.3-1, “ITAAC for Emergency Planning.”

In WLS COLA Part 10, the applicant proposed License Condition 6e to address the implementation of ERDS. This proposed License Condition is evaluated in Section 13.3.4.19 of this report and the staff refers to this as License Condition (13-9).

In RAI 94, Question 13.03-88(A), the staff requested that the applicant additional information to address alternate ERO facilities to be used during security based events. In an April 25, 2011, response, the applicant stated that in the event of hostile actions directed at WLS; the Security Training Area, Nuclear Station Training Building and the Visitor's Center are designated as alternate locations for the assembly of relocated, evacuated and responding personnel. In addition to the identified near site locations, two additional sites available for staging of personnel were discussed in the applicant's December 22, 2008, response to RAI 13.3-80. The York Operations Center is located approximately 24 km (15 mi) East South East of WLS and the new Duke Energy In-Processing Facility is located approximately 24 km (15 mi) North North East of WLS as described in WLS Emergency Plan, Section II.J.2. The York Operations Center and Duke Energy In-Processing Centers have telecommunication capabilities consistent with their emergency function as a designated relocation center. If necessary, technical support activities can be established in the Duke Energy EOF to support onsite and offsite communication and to coordinate the entry of damage control and engineering teams when safe conditions are established at the site.

The assessment of other nearby hazards that could potentially affect the safety of the Lee Nuclear Station was not addressed in the WLS Emergency Plan. In RAI 94, Question 13.03-88(B), the staff requested that the applicant provide additional information concerning other nearby hazards that could cause a security-based event. In an April 25, 2011, response, the applicant stated that no additional modification is needed for the WLS Emergency Plan based on the analysis of nearby hazards provided in WLS COL FSAR Section 2.2 identifying no hazards that pose a significant risk.

The staff finds the additional information and clarifications provided by the applicant in response to RAI 25, Questions 13.03-61, 13.03-62, 13.03-73(B); RAI 83, Question 13.03-80; and RAI 94, Question 13.03-88(A and B) acceptable because they conform to the guidance in NUREG-0654, NUREG-0696, or NUREG-0737.

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and the associated evaluation criteria in NUREG-0654.

Subject to License Condition (13-7) and License Condition (13-9), the staff finds that the applicant has described, provided, and maintains adequate emergency facilities and equipment to support the emergency response, including a licensee onsite OSC and TSC, and an EOF from which effective direction can be given and effective control can be exercised during an emergency. This includes onsite and offsite radiological and meteorological monitoring systems. The applicant also described provisions to be employed to ensure that the emergency plan, its implementing procedures, and emergency equipment and supplies are kept up-to-date. In addition, the applicant provided for an ERDS data link between the onsite computer system and the NRC Operations Center. The potential effect has been determined on the plant, onsite staffing and augmentation, and onsite evacuation strategies from damage to nearby hazardous facilities, dams, and other nearby sites, in consideration of a security based event.

The staff further finds that WLS DEP 18.8-1, which addresses the new locations of the TSC and OSC, provides for adequate emergency facilities and equipment to support the emergency response. The new locations conform to the guidance in NUREG-0654 except for being within two minutes of the control room. The locations' installation of various and redundant communication systems supports the need for immediate communication between the control room and TSC and provides for adequate communication capability between the control room and TSC.

Conclusion

Subject to License Condition (13-7) and License Condition (13-9), the staff concludes that the information provided in the WLS COLA is consistent with the guidelines in NUREG-0654, Planning Standard H and the guidance in NUREG-0696, NUREG-0737, and NSIR/DPR-ISG-01. Therefore, the staff finds the information acceptable and meets the relevant requirements of 10 CFR 50.47(b)(8) and 10 CFR Part 50, Appendix E, Sections IV.E.8, IV.G, VI.1 and VI, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.9 Accident Assessment

As stated in NUREG-0654, Planning Standard I, “Accident Assessment,” 10 CFR 50.47(b)(9) requires the use of adequate methods, systems, and equipment for assessing and monitoring the actual or potential offsite consequences of a radiological emergency condition. In addition, 10 CFR Part 50, Appendix E, Section IV.A.4 requires the identification of persons within the licensee organization who will be responsible for making offsite dose projections, and a description of how these projections will be made and the results transmitted to State and local authorities, the NRC, and other appropriate governmental entities. 10 CFR Part 50, Appendix E, Section IV.B requires a description of the means to be used for determining the magnitude of, and for continually assessing the impact of, the release of radioactive materials. 10 CFR Part 50, Appendix E, Section IV.E.2 requires that adequate provisions shall be made and described for emergency facilities and equipment, including equipment for determining the magnitude of, and for continuously assessing the impact of, the release of radioactive materials to the environment.

In WLS Emergency Plan, Section II.I, “Accident Assessment,” the applicant described the methods, systems, and equipment available for assessing and monitoring actual or potential consequences of a radiological emergency. The staff reviewed this section, as well as other relevant portions of the application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff’s primary focus was to evaluate the emergency plan against NUREG-0654, Planning Standard I, which provides the detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(9).

WLS Emergency Plan, Section II.I, “Accident Assessment,” briefly describes measuring, monitoring, readout and continuous sampling systems. WLS COL FSAR Section 7.5, “Safety-Related Display Information,” states this section of the referenced AP1000 DCD is incorporated by reference with no departures or supplements. In RAI 25, Question 13.03-62(A), the staff requested that the applicant provide additional information regarding the emergency preparedness-related instrumentation found in the CR that is available for use in emergency classification and dose assessment. In a December 23, 2009, response, the applicant stated that the selection of monitored variables, based on guidance provided in RG 1.97, “Criteria for Accident Monitoring Instrumentation for Nuclear Power Plants,” is discussed in AP1000 DCD

Tier 2, Section 7.5 and incorporated by reference in the WLS COL FSAR. Instrument design criteria are described in AP1000 DCD Sections 7.5.2, “Variable Classifications and Requirements,” and 7.5.3, “Description of Variables.” AP1000 DCD Section 7.5.4, “Processing and Display Equipment,” discusses the equipment that processes the safety-related display information and make it available to the operator. The applicant stated WLS Emergency Plan, Appendix 2, “Radiological Assessment and Monitoring,” provides information regarding atmospheric transport and diffusion assessment. Plant vent and turbine island vent effluent monitors are discussed in AP1000 DCD, Revision 19, Section 11.5.3, “Effluent Monitoring and Sampling.” The applicant proposed EP-ITAAC 6.1 to test that the means exists to provide initial and continuing radiological assessment throughout the course of an accident.

WLS Emergency Plan, Section II.I.1, “Parameters Indicative of Emergency Conditions,” states that an EPIP, "Emergency Classification," includes the various indications that correspond to the emergency initiating conditions. Plant procedures specify the instruments used to indicate emergency conditions. In RAI 83, Question 13.03-75, the staff requested that the applicant submit a revised EAL scheme based on an approved and endorsed NEI 07-01 document. In a June 12, 2009, response, the applicant stated that a license condition to provide a revised EAL scheme will be developed and submitted to the NRC for approval in accordance with the ITAAC and license condition. (See Section 13.3.4.4, “Emergency Classification System,” of this report for additional information.

WLS Emergency Plan, Section II.I.2, “Plant Monitoring Systems,” describes the methods of making initial and continuing assessments of plant conditions through the course of an event. This section incorporates AP1000 DCD Section 9.3.3, “Primary Sampling System,” dealing with the primary sampling system by reference. The primary sampling system includes a post-accident sampling capability, but it does not include a post-accident sampling system specifically. WLS Emergency Plan, Section II.I.2 also incorporates AP1000 DCD Tier 2, Section 11.5, “Radiation Monitoring.” WLS COL FSAR Section 11.5, “Radiation Monitoring,” supplements this information and lists departures from the AP1000 DCD.

WLS Emergency Plan, Section II.H.5, “On-site Monitoring Systems,” contains a description of the various monitoring systems necessary for initiating emergency measures and performing accident assessment. A supply of portable radiation monitoring and sampling equipment and emergency response equipment (WLS Emergency Plan, Section II.H, “Emergency Facilities and Equipment,” and Appendix 6, “Emergency Equipment and Supplies”) are available. Plant process monitoring systems are described in AP1000 DCD Section 11.5, “Radiation Monitoring,” and the corresponding section of the WLS COL FSAR. Additional information related to accident assessment can be found in WLS Emergency Plan Appendix 2, “Radiological Assessment and Monitoring.”

WLS Emergency Plan, Section II.I.3, “Determination of Source Term and Radiological Conditions,” refers to WLS Emergency Plan, Appendix 2, “Radiological Assessment and Monitoring,” for descriptions of the means for relating various measured parameters, including containment radiation monitor reading, to the source term available for release within plant systems and effluent monitor readings to the magnitude of the release of radioactive materials. WLS Emergency Plan, Appendix 2, Section 3.0, “Conceptual Design Description: Atmospheric Transport and Diffusion Assessment,” lists five basic release types. Four of the release types have fixed radionuclide composition; the user can specify the composition for the fifth types.

The fixed release types are reactor coolant, gap, core damage, and core melt. The source term may also be specified as noble gas or isotope Iodine-131 release rate. Tabulated release mixes are used if either of these options is used. The applicant has proposed EP-ITAAC 6.2 to evaluate the EPIPs to determine that the means exist to identify the source term of releases of radioactive material within plant systems and the magnitude of a release of radioactive materials using plant system parameters and effluent monitors.

In RAI 25, Question 13.03-62(D), the staff requested that the applicant provide additional information on the process used to estimate accident source terms. In a December 23, 2008, response, the applicant stated that WLS Emergency Plan, Appendix 2, "Radiological Assessment and Monitoring," provides a description of the Raddose-V dose assessment model, which is used to analyze offsite doses at Duke Energy facilities. This model provides results that are compatible and consistent with the NRC dose assessment models evaluated during successful emergency plan exercises. The code is maintained current with respect to the facility's physical and operational characteristics and the assumptions and criteria used in the dose consequence analysis performed as part of the regulatory required accident analyses described in WLS COL FSAR Chapter 15, "Accident Analysis." The applicant further stated that Raddose-V does not currently include modeling for WLS, but anticipate modifying the code to include data for WLS or using more advanced assessment capabilities that may be available. The applicant proposed EP-ITAAC 6.2 to analyze the emergency plan implementing procedures for a methodology to determine the source term of the releases within plant systems.

In RAI 25, Question 13.03-62(D)(1), the staff requested that the applicant provide a list of procedures that cover the estimation of accident source terms (radionuclides and activities) and describe the contents of each procedure. In a December 23, 2008, response, the applicant stated that instruction to dose assessors for determining source term and calculating the projected offsite dose to the public using Raddose-V and guidance for completion of Emergency Notification Forms is provided in Duke Energy's corporate procedure for making offsite dose projections.

In RAI 25, Question 13.03-62(D)(2), the staff requested that the applicant identify the person responsible for making source term estimates at various stages of the event. In a December 23, 2008, response, the applicant stated that Dose Assessors in the EOF, under the direction of the Radiological Assessment Manager, are responsible for evaluating source terms until the event is terminated.

In RAI 25, Question 13.03-62(D)(3), the staff requested that the applicant clarify assumptions related to the pathway from the reactor to the environment. In a December 23, 2008, response, the applicant stated that AP1000 DCD Section 15.6, "Decrease in Reactor Coolant Inventory," identifies the following pathways to the environment: (1) a steam generator tube rupture where the pathways may involve the unit vent and main steam isolation valves; (2) a loss of coolant accident inside containment where the pathway involves a loss of containment or design basis leakage with significant increase in reactor coolant activity (unit vent); (3) a loss of coolant accident outside of containment (unit vent); and (4) a fuel handling accident (unit vent).

In RAI 25, Question 13.03-62(D)(4), the staff requested that the applicant discuss whether the assumptions include reduction of the source term to account for filters, sprays, or other safety [features]. In a December 23, 2008, response, the applicant stated that the code used in Raddose-V includes provisions for features that provide for source term reduction specific to the as-built plant. The applicant further stated that features of the Lee Nuclear Station have not yet been added to the code as specified in response to RAI 25, Question 13.3-62(D).

In RAI 25, Question 13.03-62(D)(5), the staff requested that the applicant clarify whether the source term estimates will be modified during the course of the event to account for changes in the release pathway. In a December 23, 2008, response, the applicant stated that the source term available for release is modified within the Raddose-V program to account for processes that reduce or increase the release based on the pathway or release rates. The applicant further stated that features of the Lee Nuclear Station have not yet been added to the code as specified in response to RAI 25, Question 13.03-62(D).

In RAI 25, Question 13.03-62(D)(6), the staff requested that the applicant clarify how long it takes to obtain source term estimates. In a December 23, 2008, response, the applicant stated that 15-minute averages of effluent or accident monitors may be needed to obtain source term estimates for the model, which is currently used for other Duke Energy's operating facilities.

In RAI 25, Question 13.03-62(D)(7), the staff requested that the applicant explain how source term estimates are obtained in the event that the computer-based methods are not available. In a December 23, 2008, response, the applicant stated that laptop computers are available for onsite evaluations if the primary computers are not functional. The applicant further stated that the program can also be run at other Duke Energy facilities if necessary. Source term estimates can be obtained by inserting data provided by the affected site or using default values in the program code for the facility.

WLS Emergency Plan, Section II.I.4, "Relationship Between Effluent Monitor Reading and Exposure and Contamination Levels," introduces the dose assessment capability. WLS Emergency Plan, Appendix 2, Section 3.0, "Conceptual Design Description: Atmospheric Transport and Diffusion Assessment," describes the dose assessment programs. WLS Emergency Plan, Sections 3.3, "Data Acquisition"; 3.4, "Modeling"; and 3.5, "Data Output," of Emergency Plan, Appendix 2, "Radiological Assessment and Monitoring," describe the method of estimating offsite exposures and contamination from monitoring readings and meteorological data using the Raddose-V computer code. In RAI 25, Question 13.03-62(E)(1-6), the staff requested that the applicant provide additional information regarding the dose assessment program. In December 23, 2008, response, the applicant stated that WLS specific procedures have not yet been developed but they will be similar to those in use at CNS. Dispatch of onsite survey teams is discussed in procedure HP/0/B/1009/009, "Guidelines for Accident and Emergency Response," Enclosure 5.1. The dispatch of teams to monitor the particulate and iodine levels present during an emergency is discussed in procedure HP/0/B/1009/007, "In-Plant Particulate and Iodine Monitoring Under Accident Conditions." These procedures were provided as Attachments 2 and 3 to the applicant's response.

In RAI 25, Question 13.03-62(E)(2), the staff requested that the applicant identify the person responsible for making estimates of onsite exposures and contamination. In a December 23, 2008, response, the applicant stated that WLS specific procedures have not yet been developed but they will be similar to those in use at CNS. On-shift staff is responsible for initial emergency response actions as discussed in HP/0/B/1009/009 Section 4.1. This procedure is provided as Attachment 2 to the applicant's response.

In RAI 25, Question 13.03-62(E)(3), the staff requested that the applicant provide a list of procedures that cover the estimation [of] offsite exposures and contamination and summarize the contents of each procedure. In a December 23, 2008, response, the applicant stated that the WLS-specific procedures have not yet been developed but they will be similar to those in use at other Duke Energy facilities. The procedure contains guidance for utilizing the automatic mode for data input, which uses a number of defaults to speed the initial dose assessment process. Dose assessment is performed by the ERO dose assessors in the EOF. The applicant also stated that Raddose-V will be updated with actual plant data to improve the dose estimates. Duke Energy's corporate procedure for making offsite dose projections will be modified to include the Lee Nuclear Station. This procedure is provided as Attachment 1 to the applicant's response.

In RAI 25, Question 13.03-62(E)(4), the staff requested that the applicant identify the person responsible for making estimates of offsite exposures and contamination. In a December 23, 2008, response, the applicant stated that dose assessment will be provided by EOF Dose Assessment personnel reporting to the EOF Director.

In RAI 25, Question 13.03-62(E)(5), the staff requested that the applicant identify how exposure and contamination estimates would be made in the event that the computer method is unavailable. In a December 23, 2008, response, the applicant refers to information provided in response to RAI 25, Question 13.03-62(D)(7).

In RAI 25, Question 13.03-62(E)(6), the staff requested that the applicant describe how exposure and contamination estimated would be adjusted in the event that onsite meteorological data are not available. In a December 23, 2008, response, the applicant refers to information provided in response to RAI 25, Question 13.03-62(C) regarding meteorological data.

WLS Emergency Plan, Section II.D, "Emergency Classification System," discusses WLS standard emergency classification scheme, based on system and effluent parameters, on which affected State and local response organizations may rely for determining initial offsite response measures. WLS Emergency Plan, Section II.H, "Emergency Facilities and Equipment," describes the capability of WLS to assess the magnitude and consequences of releases.

The applicant proposed EP-ITAAC 6.3 to analyze the emergency plan implementing procedures to identify the relationship between effluent monitor readings and the onsite and offsite exposures using various meteorological conditions.

WLS Emergency Plan, Section II.H.6.a, "Access to Data from Monitoring Systems," WLS Emergency Plan, Section II.H.8, "Meteorological Instrumentation and Procedures," and WLS Emergency Plan, Appendix 2, "Radiological Assessment and Monitoring," of the WLS Emergency Plan briefly discuss meteorological data acquisition and evaluation. There is a more detailed discussion in WLS COL FSAR Section 2.3.3, "Onsite Meteorological Measurement Programs." In RAI 25, Question 13.03-62(F), the staff requested that the applicant provide additional information on the acquisition and distribution of the representative meteorological information. In a December 23, 2008, response, the applicant referred to information provided in the response to RAI 25, Questions 13.03-62(B) and 13.03-62(C) regarding distribution of meteorological information to the CR, TSC, and EOF and processes used in the event the primary meteorological data system is unavailable. The applicant proposed EP-ITAAC 6.4 to conduct an inspection to verify that 10-meter and 60-meter wind speeds, wind directions and temperatures are available in the control room, TSC and EOF. WLS Emergency Plan, Section II.I.6, “Determination of Release Rates and Projected Doses When Installed Instruments are Inoperable or Off-Scale,” states that plant implementing procedures establish processes for estimating release rates and doses when instrumentation used for assessments is not available. In addition, two considerations are mentioned by the applicant: field monitoring data and surrogate instrumentation as methods for estimating fuel damage. In RAI 25, Question 13.03-62(G), the staff requested that the applicant provide additional information on surrogate monitoring and estimating fuel damage.

In RAI 25, Question 13.03-62(G)(1), the staff requested that the applicant describe methods to determine release rates and doses when instrumentation used for assessments is inoperable or readings are off-scale, and summarize the contents of each procedure. In a December 23, 2008, response, the applicant stated that release rates can be estimated by using default source term inventories or back calculations from field data both provided in the Raddose-V model.

In RAI 25, Question 13.03-62(G)(2), the staff requested that the applicant identify the person who makes the decision to use alternative methods to estimate release rates and doses. In a December 23, 2008, response, the applicant stated that the Radiation Protection Manager in the TSC or the Radiological Assessment Manager in the EOF would make the decision to use alternative methods for estimating release rates and doses.

In RAI 25, Question 13.03-62(G)(3), the staff requested that the applicant identify the person who estimates release rates in these cases. In a December 23, 2008, response, the applicant stated that the ERO Dose Assessors under guidance of the Radiological Assessment Manager will estimate the release rates, in all cases.

In RAI 25, Question 13.03-62(G)(4), the staff requested that the applicant explain what compensatory measures are taken in the assessment. In a December 23, 2008, response, the applicant stated that necessary or appropriate compensatory measures not already considered in the existing dose assessment procedures and Raddose-V code that are specific to WLS operation will be addressed in the procedures implemented for or to include the WLS when developed.

In RAI 25, Question 13.03-62(G)(5), the staff requested that the applicant describe how release rates are estimated from field monitoring data. In a December 23, 2008, response, the applicant stated that the Raddose-V code uses field data, meteorology, and accident assumptions to back-calculate source term required to result in measured field dose. That source term could then be used to generate a complete dose projection.

In RAI 25, Question 13.03-62(G)(6), the staff requested that the applicant explain what assumptions are made in the process. In a December 23, 2008, response, the applicant stated that any assumptions beyond those provided in WLS COL FSAR Chapter 15 that are specific to the WLS will be determined during the modifications made to Raddose-V or within the development of alternative software.

In RAI 25, Question 13.03-62(G)(7), the staff requested that the applicant explain what the sensitivity of the release rate estimates is to the assumptions. In a December 23, 2008, response, the applicant stated that sensitivities of the release rates will be determined and evaluated based on the site-specific modification to the software determined for the WLS.

WLS Emergency Plan, Section II.I.7, “Field Monitoring Capability,” briefly describes the field monitoring capability. Implementing procedures provide guidance for field monitoring teams’ performance of monitoring activities. Instrumentation typically available for field deployment is listed in WLS Emergency Plan, Appendix 6, “Emergency Equipment and Supplies,” and WLS Emergency Plan, Section II.B, “Onsite Emergency Organization,” WLS Emergency Plan, Table II-2, “Plant Staff Emergency Functions,” indicates that four individuals comprise two teams. Each field monitoring team has a driver and a qualified radiation protection (RP) technician, and the teams should be available for offsite field monitoring within 75 minutes. Field monitoring teams are directed by RP personnel in the TSC.

WLS Emergency Plan, Section II.I.8, “Assessing Hazards Through Liquid or Gaseous Release Pathways,” states that actual or potential magnitude and locations of radiological hazards are assessed by field teams consistent with WLS Emergency Plan, Section II.I.7, “Field Monitoring Capability.” Implementing procedures provide guidance for field monitoring teams’ performance of monitoring activities. Notification and activation of field team personnel described in WLS Emergency Plan, Section II.E, “Notification Methods and Procedures.” Mobilization times are described in WLS Emergency Plan, Section II.B, “Onsite Emergency Organization.” The applicant proposed EP-ITAAC 6.5 to analyze the emergency plan implementing procedures to determine that the means exist to make rapid assessments of actual or potential magnitude of and locations of any radiological hazards through liquid or gaseous release pathways.

WLS Emergency Plan, Section II.I.9, “Measuring Radioiodine Concentrations,” states that equipment typically available to field teams is listed in WLS Emergency Plan, Appendix 6, “Emergency Equipment and Supplies.” This list includes air samplers, appropriate sample media, and analysis equipment, stated to be capable of detecting radioiodine concentrations at or below 10^{-7} microcuries per milliliter under field conditions. The applicant proposed EP-ITAAC 6.6 to verify the capability exists to detect and measure radioiodine concentrations in air in the plume exposure pathway EPZ, as low as 10E-7 μCi/cc under field conditions.

WLS Emergency Plan, Section II.I.10, “Relating Measured Parameters to Dose Rates,” states that WLS Emergency Plan, Appendix 2 describes the methods to relate the measured activity levels to dose rates for the key isotopes listed in NUREG-0654, Table 3 and the provisions to estimate the projected dose based on the actual dose rates. Radiation Protection personnel are responsible for directing implementation of these procedures under emergency conditions. Therefore, in RAI 25, Question 13.03-62(H), the staff requested that the applicant provide additional information on relating measured parameter to dose rates. In a December 23, 2008, response, the applicant provided Duke Energy's corporate procedure to activate the EOF, which provides instructions for preparing protective action recommendations (PARs) to appropriate State authorities. The procedure includes Offsite Protective Action Flowcharts used by Duke Energy at its operating nuclear plants. The flowcharts include radiological dose considerations. The applicant stated that the dose assessment procedures used for the WLS will be similar to those in use at other Duke Energy nuclear plants. The procedure is included as Attachment 1 in the response to RAI 252, Question 13.03-55. The applicant also stated that implementing procedures and programs will be modified to include WLS on a schedule that supports NRC inspection activities and execution of the emergency exercise required by 10 CFR Part 50, Appendix E, Section IV.F.2. The applicant proposed EP-ITAAC 6.7 to test that the means exist to estimate integrated dose and for comparing these estimates with the EPA protective action guides (PAGs).

The staff finds the additional information and clarifications provided by the applicant in response to RAI 25, Question 13.03-55 and all the questions in RAI 25, Question 13.03-62 acceptable because the responses conform to the guidance in NUREG-0654. Accordingly, the staff considers RAI 25, Question 13.03-5 resolved.

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and the associated evaluation criteria in NUREG-0654.

The staff finds that the applicant has described and provided adequate facilities, systems, equipment, and means for assessing and monitoring the actual or potential offsite consequences of a radiological emergency condition, including determining the magnitude of, and continually assessing the impact of, the release of radioactive materials. The applicant also described the capability and resources for field monitoring within the 16-km (10-mi) plume exposure pathway EPZ, and has the methods, equipment, and expertise to rapidly assess actual or potential radiological hazards. This includes the capability to detect and measure radioiodine airborne concentrations within the plume exposure pathway EPZ as low as 1×10^{-7} µCi/cc under field conditions, and to relate the various measured parameters to dose rates for key isotopes and gross radioactivity measurements. In addition, the applicant identified, by position and function to be performed, persons within the licensee organization who will be responsible for making offsite dose projections, and has described how these projections will be made and the results transmitted to State and local authorities, the NRC, and other appropriate governmental entities.

Conclusion

The staff concludes that the information provided in the WLS COLA is consistent with the guidelines in NUREG-0654, Planning Standard I. Therefore, the staff finds the information acceptable and meets the relevant requirements of 10 CFR 50.47(b)(9) and 10 CFR Part 50, Appendix E, Sections IV.A.4, IV.B, and IV.E.2, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.10 Protective Response

As stated in NUREG-0654, Planning Standard J, "Protective Response," 10 CFR 50.47(b)(10) requires that a range of protective actions have been developed for the plume exposure pathway EPZ for emergency workers and the public. In developing this range of actions, the applicant considered evacuation, sheltering, and as a supplement to these, the prophylactic use of potassium iodide (KI). ETEs have been developed by the applicant. Guidelines for the choice of protective actions during an emergency are developed and in place, and protective actions for the ingestion exposure pathway EPZ appropriate to the locale have been developed. In addition, 10 CFR 50.47(c)(2) and 10 CFR Part 50, Appendix E, Section I require that the size and configuration of the EPZs be determined in relation to local emergency response needs and capabilities, as they are affected by such conditions as demography, topography, land characteristics, access routes, and jurisdictional boundaries. 10 CFR Part 50, Appendix E, Section IV.I requires the development of a range of protective actions to protect onsite personnel during hostile action to ensure the continued ability of the licensee to safely shut down the reactor and perform the functions of the emergency plan.

In WLS Emergency Plan, Section II.J, “Protective Response,” the applicant described the protective response measures that have been developed to limit radiation exposure of plant personnel and the public following an accident at the WLS. The staff reviewed this section, as well as other relevant portions of the application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff’s primary focus was to evaluate the emergency plan against NUREG-0654, Planning Standard J, which provides the detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(10).

WLS Emergency Plan, Section II.J.1, “Onsite Notification,” describes that individuals within the protected area are notified by the plant public address system and audible warning systems. In high noise areas, other measures may be used. Individuals located outside of the protected area are notified by audible warnings, by Security Force actions, and, if needed, by local law enforcement personnel. Information on the warning systems and response actions are provided through plant training programs, visitor orientation, escort instructions, posted instructions, or within the audible messages. The applicant stated that it has the ability to notify all individuals within the owner controlled area within about 15 minutes of the declaration of an emergency requiring individual responses, such as evacuation and accountability. Additionally, the applicant states that there are methods to notify and alert onsite personnel in a timely manner during a hostile action. The actions are coordinated with Security and maintained in the EPIPs.

In RAI 25, Question 13.03-63(A), the staff requested that the applicant: (1) clarify other measures to be used for notification of individuals in high noise areas; and (2) provide information on timing to notify the people outside the protected area. In a December 23, 2008, response, the applicant stated audibility problems encountered on evacuation of personnel from high-noise areas for its fleet were addressed in previous Duke Energy responses to IE Bulletin No. 79-18, “Audibility Problems Encountered on Evacuation of Personnel from High-Noise Areas.” A consistent process will be used for the WLS, in that the plant alarm system will use the telephone page system amplifiers and speakers that will be assessed in the as-built plant to determine if additional measures or equipment is necessary. The accountability process has been proven at other Duke Energy facilities. The CNS’s procedure for site assembly and evacuation was provided as Attachment 1 to the response to RAI 25, Question 13.03-63(A). The applicant stated that the site alarm system along, with surveillances of the owner controlled area, will be adequate to assemble and evacuate nonessential personnel. The applicant proposed EP-ITAAC 7.1 to test that the means exist to warn and provide instructions to onsite individuals of an emergency, including those in areas controlled by the operator, including: (a) employees not having emergency assignments; (b) visitors;(c) contractor and construction personnel; and (d) other persons who may be in the public access areas, on or passing through the site, or within the owner controlled area using the plant public announcement system within the protected area or an audible warning system for those who may be outside the protected area and within the owner controlled area.

WLS Emergency Plan, Section II.J.2, “Evacuation Routes and Transportation,” states that evacuation routes are determined by the Shift Manager or Emergency Coordinator using available information on conditions. Provisions for evacuation of onsite individuals include evacuation by private automobile. WLS Emergency Plan, Section II.J.2, also states that the Security Forces will arrange transportation for those individuals without cars. The designated relocation site will have decontamination and contamination control capability and equipment. In adverse conditions, affected individuals will be directed to a safe onsite area (as determined by the Emergency Coordinator). Relocation centers were not identified in the WLS Emergency Plan. Therefore, in RAI 25, Question 13.03-63(B), the staff requested that the applicant: (1) explain why prearranged routes, coordinated with the State and local governments did not exist; and (2) provide information on the type of transportation the Security Force will have available to transport people without cars. In RAI 25, Question 13.03-80, the staff requested that the applicant identify where the relocation center will be established. Additionally, if the relocation center is not within the control of Duke Energy, when will the letters of agreement (LOAs) be available? In a December 23, 2008, response to RAI 25, Question 13.03-63(B), the applicant provided additional information regarding the role of the Security Force in site evacuation, stating that if an individual does not have access to personal transportation, either the affected individual or the Security Force will make arrangements for transportation (ride-share) with another affected individual. In a December 11, 2009, response to RAI 25, Question 13.03-80, the applicant identified the York County Operations Center and a planned Duke Energy In-Processing Facility as designated locations for relocated site personnel. Both locations will have personnel decontamination capabilities and both are controlled by Duke Energy. The locations of reception centers and shelter areas are not finalized.

In Part 10 of the WLS COL application, the applicant proposed License Condition 4 “Emergency Planning Actions,” which states that reception centers and relocation sites will be identified and LOAs will be obtained prior to the full participation exercise. The staff refers to this as License Condition (13-4). WLS Emergency Plan, Appendix 4 contains maps that include proposed reception centers, relocation site, and pre-selected radiological sampling and monitoring locations.

License Condition (13-4):

> Prior to the full participation exercise to be conducted in accordance with the requirements of 10 CFR Part 50, Appendix E, Duke Energy shall identify the specific locations of the reception centers and relocation sites and shall obtain Letters of Agreement for locations not under the Duke Energy’s control.

The staff evaluated the proposed license condition and finds it is acceptable because it is consistent with the guidance in NUREG-0654, Planning Standard J and the requirements in 10 CFR Part 50.47(b)(10) and 10 CFR Part 50, Section IV.I, Appendix E.

WLS Emergency Plan, Section II.J.3, “Personnel Monitoring and Decontamination,” states that the Emergency Coordinator directs contamination monitoring of personnel, vehicles, and personal property arriving at relocation sites. The procedures and criteria for monitoring are not addressed in the plan. Therefore, in RAI 25, Question 13.03-63(C), the staff requested that the applicant: (1) provide a summary of the decontamination capabilities and equipment; and (2) provide information to identify the criteria for monitoring. In a December 23, 2008, response, the applicant stated procedures for personnel and vehicle monitoring at relocation sites will be consistent with that in use at other Duke Energy facilities. The applicant provided CNS procedures for personnel/vehicle monitoring and equipment inspection and inventory as examples.

WLS Emergency Plan, Section II.J.4, “Non-Essential Personnel Evacuation and Decontamination,” states that non-essential personnel will be evacuated in accordance with WLS Emergency Plan, Section II.J.2, “Evacuation Routes and Transportation,” and that the appropriate equipment and supplies will be moved from WLS to the decontamination site. All public visitors will be evacuated whenever the possibility exists that a visitor may be exposed to levels exceeding 2 millirem per hour or 1 times the derived air concentration (DAC) for an unrestricted area.

WLS Emergency Plan, Section II.J.5, “Personnel Accountability,” states that the WLS maintains the capability for all individuals within the protected area to be accounted and missing individuals identified within 30 minutes following initiation of evacuation and accountability processes and to maintain continuous accountability for any individual within the protected area consistent with the requirements of the WLS Security Plan.

Furthermore, WLS Emergency Plan, Section II.J.5 addresses protective measures in the event of a hostile attack against the site. The section states that in the event of a hostile attack against the site, conditions may dictate initiation of protective measures other than personnel assembly, accountability, and evacuation. The Emergency Coordinator will make decisions regarding appropriate protective measures based on evaluation of site conditions, including input from the security force. If, based on the judgment of the Emergency Coordinator, personnel assembly, accountability, and evacuation may result in undue hazards to site personnel, the Emergency Coordinator may direct other protective measures, including:

- evacuation of personnel from areas and buildings perceived as high value targets
- site evacuation by opening, while continuing to defend, security gates
- dispersal of key personnel
- onsite sheltering
- staging of ERO personnel in alternate locations pending restoration of safe conditions
- implementation of accountability measures following restoration of safe conditions

WLS Emergency Plan, Section II.J.6, “Protective Measures,” describes the provisions for respiratory protection, ventilation systems, use of protective clothing, and individual thyroid protection. The plan states that measures are taken to minimize ingestion and or inhalation of radionuclides to minimize exposure below limits specified in 10 CFR Part 20, “Standards for Protection against Radiation,” WLS Emergency Plan, Appendix B, “Annual Limits on Intake (ALIs) and Derived Air Concentrations (DACs) of Radionuclides for Occupational Exposure; Effluent Concentrations; Concentrations for Release to Sewerage.” However, the protective measures used are not identified. WLS Emergency Plan, Section II.J.6, “Protective Measures,” states that self-contained breathing apparatus (SCBA) are used in locations where there is low oxygen or fires. Other respiratory protection is available and issued by Radiation Protection personnel or Safety and Health staff. The plan does not address training for use of SCBAs or other respiratory protection equipment, the number of respirators available, or the maintenance of the equipment. The criteria for use of protective clothing are given; however, the location of the equipment and inventory is not addressed to ensure that the protective clothing is available when needed. The use of radioprotective drugs (potassium iodide [KI]) is also mentioned, and there are no criteria for issuance, how and where it is stored and inventoried, and who makes the decision on issuance. Therefore, in RAI 25, Question 13.03-63(D), the staff requested that the applicant provide additional information related to: (1) measures used to minimize ingestion and inhalation of radionuclides; (2) training in the use of respiratory equipment as well as the inventory and maintenance of the respiratory equipment; (3) storage and inventory of the protective clothing; and (4) storage and use of radioprotective drugs. In a December 23, 2008, response, the applicant stated that radiation protection personnel will be responsible for monitoring the safety of personnel during a site assembly or site evacuation, which includes contamination monitoring at site exits, and monitoring of work locations for personnel remaining on site. A description of their monitoring process was provided. Respiratory protection will be prescribed for workers that are trained, qualified, and fit tested in accordance with the respiratory protection program discussed in WLS COL FSAR Chapter 12, “Radiation Protection.” Details related to procedures and quantity or locations of respiratory equipment are not available. The applicant expects procedures will be similar to CNS's procedure for inspection and inventory of emergency equipment provided in response to RAI 25, Question 13.03-61. Procedures will be completed in accordance with 10 CFR Part 50, Appendix E, Section IV.F.2. With regard to protective clothing, the applicant stated that they are maintained in the change rooms inside the Radiation Control Area (RCA) and inventoried each quarter. A discussion related to the issuance of protective clothing was included. Additional information related to protective clothing was also provided in the response to RAI 25, Question 13.03-61. With regard to the distribution of KI, the applicant stated Duke Energy’s corporate procedure for distribution of KI provides information related to distribution, storage, and supply of KI tablets. The WLS Radiation Protection Manager shall evaluate the distribution of KI. The KI is distributed only to prevent a significant uptake that would result in a committed dose equivalent (CDE) of 5 rem or more to the thyroid.

WLS Emergency Plan, Section II.J.7, “Protective Action Recommendations and Bases,” describes the process in which WLS develops protective action recommendations (PARs) and issues them to the affected State and local governments. General public PARs are based on plant conditions (EALs), dose projection results or both. Plant and dose based PARs are developed from the guidance contained in NUREG-0654, Supplement 3, “Criteria for Protective Action Recommendations for Severe Accidents.” The process includes EALs corresponding to projected dose to the general public and with the recommendations set forth in EPA-520/1-75-001, “Manual of Protective Action Guides and Protective Actions for Nuclear Incidents.” The dose projection results are compared to PAGs shown in WLS Emergency Plan, Table II-3. The PAGs are derived from EPA-400-R-92-001, “Manual of Protective Action Guides and Protective Actions for Nuclear Incidents.” Based on the comparison, PARs are developed by the Radiological Assessment Manager. If the recommendations suggest sheltering or evacuation of the public around the plant, The Radiological Assessment Manager informs the Emergency Coordinator or EOF Director so that he or she notifies the affected States and counties. The Emergency Coordinator or EOF Director is responsible for recommending offsite protective actions to the affected States and counties. WLS is required to issue PARs within 15 minutes of declaring a General Emergency to the affected States and local governments. The State and local governments are responsible for notification of the public and implementation of protective measures. (Emergency Action Levels are discussed in Section 13.3.4.3 of this report. Emergency Notification is discussed in Section 13.3.4.5 of this report, and Accident Assessment is discussed in Section 13.3.4.9 of this report.)

WLS Emergency Plan, Section II.J.8, “Evacuation Time Estimates,” of the WLS Emergency Plan states that the ETE Report is included in the COLA as supplemental information to the WLS Emergency Plan, and the updated population distribution and ETEs are summarized in WLS Emergency Plan Appendix 4, which includes the updated ETE’s Executive Summary. ETEs are a factor considered in the development of offsite PARs, and are provided to the States and local governmental authorities for use in developing offsite protective action strategies. The ETE Report provides maps of the plume exposure pathway EPZ, which illustrate the population distribution around the WLS, evacuation areas and routes, and locations of assembly areas. A summary of the staff’s detailed review of the ETE Report is included in Section 13.3.4.17 of this report.

WLS Emergency Plan, Section II.J.10.a, “Protective Measure Implementation,” states that maps of evacuation routes, evacuation areas, and general locations of shelter areas and relocation sites are provided in WLS Emergency Plan, Appendix 4, “Evacuation Time Estimate.” In RAI 25, Question 13.03-63(E), the staff requested that the applicant provide the specific location of the shelter areas and relocation sites and the pre-identified monitoring locations or provide an EP-ITAAC for when those locations would be identified. In a December 23, 2008, response to RAI 83, Question 13.03-80, the applicant identified the York County Operations Center and a planned Duke Energy In-Processing Facility as designated locations for relocated site personnel and provided wording for WLS Emergency Plan, Section II.J.2.a that will be included in a future revision of the WLS Emergency Plan. Additional information related to reception centers can be found in the evaluation of Section II.J.2, above.

WLS Emergency Plan, Section II.J.10.b, “Protective Measures Implementation,” states that maps of the EPZ population distribution around the facility by evacuation area and in a sector format can be found in WLS Emergency Plan, Appendix 4.

WLS Emergency Plan, Section II.J.10.c. “Protective Measures Implementation,” states that the Alert and Notification System will be used to warn the public within the 16-km (10-mi) EPZ and that this is the responsibility of State and local officials. The Alert and Notification System is described in Section 13.3.4.5 of this report.

WLS Emergency Plan, Section II.J.10.c. “Protective Measures Implementation,” n states that recommended protective actions are based on the guidance provided in NUREG-0654, Supplement 3 4, WLS Emergency Plan, Section II.J.8, and WLS Emergency Plan, Appendix 4.

The staff finds the additional information and clarifications provided by the applicant in response to RAI 25, Questions 13.03-61 and 13.03-63 and RAI 83, Question 13.03-80 acceptable because they conform to the guidance in NUREG-0654. Accordingly, the staff considers RAI 25, Questions 13.03-61 and 13.03-63 and RAI 83, Question 13.03-80 resolved.

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and the associated evaluation criteria in NUREG-0654.

Subject to License Condition (13-4), the staff finds that the applicant developed a range of protective actions for the 16-km (10-mi) plume exposure pathway EPZ for emergency workers and the public, including consideration of evacuation, sheltering, and the prophylactic use of KI. The staff finds that the applicant has developed guidelines for the choice of protective actions during an emergency that are consistent with Federal guidance, including protective actions for the 80-km (50-mi) ingestion exposure pathway EPZ that are appropriate to the locale. The size and configuration of the EPZs have been determined in relation to local emergency response needs and capabilities, as they are affected by such conditions as demography, topography, land characteristics, access routes, and jurisdictional boundaries. In addition, the staff finds that the applicant has developed a range of protective actions to protect onsite personnel during hostile action. Development of ETEs is addressed in Section 13.3.4.17 of this report.

Conclusion

Subject to License Condition (13-4), the staff concludes that the information provided in the WLS COLA is consistent with the guidelines in NUREG-0654, Planning Standard J. Therefore, the staff finds the information acceptable and meets the relevant requirements of 10 CFR 50.47(b)(10), 10 CFR 50.47(c)(2), and 10 CFR Part 50, Appendix E, Sections I and IV.I, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.11 Radiological Exposure Control

As stated in NUREG-0654, Planning Standard K, "Radiological Exposure Control," 10 CFR 50.47(b)(11) requires that the means for controlling radiological exposures in an emergency be established for emergency workers. The means for controlling radiological exposures shall include exposure guidelines consistent with EPA "Manual of Protective Action Guides and Protective Actions for Nuclear Incidents," EPA 400-R-92-001, May 1992. In addition, 10 CFR Part 50, Appendix E, Section IV.E.3 requires that adequate provisions shall be made and described for emergency facilities and equipment, including facilities and supplies at the site for decontamination of onsite individuals.

In WLS Emergency Plan, Section II.K, "Radiological Exposure Control," the applicant described the emergency exposure limits for emergency workers, including decisions and efforts made to minimize exposures. The staff reviewed this section, as well as other relevant portions of the application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff's primary focus was to evaluate the emergency plan against NUREG-0654, Planning Standard K, which provides the detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(11).

WLS Emergency Plan, Section II.K.1, "On-site Exposure Guidelines and Authorizations," discusses implementation of guidelines from EPA-400-R-92-001, Table 2.2, "Guidance on Dose Limits for Workers Performing Emergency Services," and are listed in Table II-4, "Emergency Worker Exposure Guidelines." In consultation with senior radiological protection personnel, the Emergency Coordinator is responsible for authorizing onsite emergency exposures that would result in doses in excess of occupational dose limits in 10 CFR Part 20. Exposures in excess of 10 CFR Part 20 limits are limited to individuals who are properly trained and knowledgeable of the tasks to be performed and the risks associated with the exposures. Selection criteria for volunteer emergency workers are outlined. In the absence of extenuating circumstances listed in WLS Emergency Plan, Table II-4, routine dose limits are applied to activities including those listed above.

WLS Emergency Plan, Section II.K.2, “Radiation Protection Program (RPP),” of the WLS Emergency Plan refers to WLS COL FSAR Chapter 12, “Radiation Protection,” for a description of the WLS Radiation Protection Program (RPP), which is stated to be consistent with 10 CFR Part 20. WLS Emergency Plan, Section II.K.1, “On-site Exposure Guidelines and Authorizations,” describes the provisions made for implementation of emergency exposure guidelines. The RPP in the WLS COL FSAR incorporates by reference material from the AP1000 DCD and NEI 07-08, “Generic FSAR Template Guidance for Ensuring that Occupational Radiation Exposures Are As Low As Is Reasonably Achievable (ALARA),” to support ALARA principles for exposure criteria, and NEI 07-03, “Generic FSAR Template Guidance for Radiation Protection Program Description,” Appendix 12AA, to develop RPP. In RAI 25, Questions 13.03-64(A) and 13.03-64(B), the staff requested that the applicant provide a summary of the occupational RPPs outlined in the WLS COL FSAR, the AP1000 DCD, NEI 07-08, and NEI 07-03. In response to RAI 13.03-64(A), the applicant provided a description of their procedure for requesting exposures in excess of occupational dose limits. The applicant also provided CNS’s procedure for emergency worker dose extension as an example. The applicant expects that a similar process will be established for the WLS via implementing procedures that are to be developed on a schedule that supports NRC inspection activities and execution of the emergency exercise required by 10 CFR Part 50, Appendix E, Section IV.F.2. In a December 23, 2008, response to RAI 25, Question 13.03-64(B), the applicant stated that a summary of the WLS RPP is provided in WLS COL FSAR Appendix 12AA, “Radiation Protection Program Description.” Milestones for the development of the RPP are provided in WLS COL FSAR Table 13.4-201. Procedures are discussed in WLS COL FSAR Section 13.5.2.2.1, “Plant Radiation Protection Procedures.” The processes for authorizing and implementing emergency dose constraints consistent with EPA guidance are discussed in WLS Emergency Plan, Section II.K. The applicant also stated that compliance with the RPP is maintained under emergency conditions. Procedures are discussed in more detail in the response to RAI 25, Question 13.03-64(A). The applicant further stated that variations from routine radiation protection practices may be implemented on a case-by-case basis, consistent with ERO management direction and the provisions of 10 CFR 20.1001(b).

WLS Emergency Plan, Section II.K.3, “Dosimetry and Dose Assessment,” states that self-reading and cumulative type dosimeters are provided to all personnel involved in emergency onsite response. Dose records are maintained and checked throughout the emergency. A personnel radiation dosimetry program with capability to determine both external and internal doses consistent 10 CFR Part 20 is maintained. The external dosimetry program includes provisions and requirements for use of both permanent record and self-reading dosimeters. EPIPs establish requirements for distributing dosimeters to emergency responders, including individuals from offsite locations. Internal doses are estimated with whole body counting and/or in-vitro sampling and analysis routines. Dose assessment capabilities are available on a 24-hour per day basis. Procedures related to external and internal dosimetry are mentioned. WLS Emergency Plan, Section II.H.5, “On-site Monitoring Systems,” states that an adequate supply of portable radiation monitoring equipment is maintained at the site including dedicated emergency response equipment. A generic description of this equipment is provided in WLS Emergency Plan, Appendix 6, “Emergency Equipment and Supplies.”

Furthermore, of the WLS Emergency Plan, Section II.K.3, “Dosimetry and Dose Assessment,” states, “Station procedures establish guidance for wearers to periodically read their self-reading dosimeters….” and, “Duke Energy maintains individual dose records in accordance with the requirements of 10 CFR Part 20 and the radiation protection program and its supporting procedures." In RAI 25, Question 13.03-64(C), the staff requested that the applicant provide a list and summary of applicable implementing procedures. In a December 23, 2008, response, the applicant stated that WLS provides and distributes self-reading and cumulative type dosimeters to personnel involved in emergency onsite response regardless of their affiliation. Dosimetry is available at the single point access in the operating facilities. Distribution of dosimetry to TSC and OSC personnel is discussed in the facility activation procedures. Dosimetry is also available for NRC personnel if needed. Radiation protection personnel are assigned to locations to assist and support this effort. Requirements for determining internal and external doses are established by the RPP. When instrument failure or an inadvertent contamination event occurs that requires dose analysis, support can be provided by unaffected Duke Energy facilities. Duke currently maintains procedure SH/0/B/2001/001, which determines dose received while working at a Duke Energy facility that will also be used at WLS. In RAI 25, Question 13.03-63(D), the staff requested that the applicant provide a description or summary of contingency plans for dosimetry services (including recordkeeping), loss of power, instrument failure, inadvertent contamination, etc. In a December 23, 2008, response to RAI 13.03-64(D), the applicant stated that the Dose Records Coordinator Supervisor in the OSC is responsible for maintaining the emergency dose records in accordance with the OSC Activation Procedure. The applicant included applicable portions of the CNS procedure as Attachment 2 to the response. The applicant anticipates that a similar procedure will be developed for the WLS. The applicant further stated that immediate approximations of external dose may be derived from self-indicating dosimeters during an emergency. Records of dosimeter readings may be maintained on log sheets or other record form. Individual dose records are maintained on plant computer systems. If the records are not available during an emergency, the OSC activation procedures requires that copies of the Daily Dose Report be gathered for the TSC and OSC upon activation. The WLS COL FSAR addresses radiation protection procedures as discussed in the response to RAI 25, Question 13.03-64(A).

WLS Emergency Plan, Section II.K.5.a, "Decontamination Action Levels," states that the applicant implements procedures and has supplies. WLS Emergency Plan, Section II.K.5.a does not state what the decontamination levels are, who decides how and when to decontaminate, etc. Therefore, in RAI 25, Question 13.03-64(C), the staff requested that the applicant provide a list and summary of applicable implementing procedures. The WLS Emergency Plan does not reference the RPP in this area or describe any procedures related to decontamination. Therefore, in RAI 25, Question 13.03-64(A), the staff requested that the applicant provide a summary of the occupational RPPs outlined in the WLS COL FSAR, the AP1000 DCD, NEI 07-08, and NEI 07-03. Additional information received in a December 23, 2008, response to RAI 25, Questions 13.03-64(A) and 13.03-64(C) and are summarized in the evaluations of Section K.2 and Section K.3.b, of this report.

WLS Emergency Plan, Section II.K.5, "Decontamination Action Levels," states that the applicant implements procedures to decontaminate onsite emergency personnel wounds, etc., and refers to the general list of decontamination supplies found in WLS Emergency Plan, Appendix 6, "Emergency Equipment and Supplies." In RAI 25, Question 13.03-64(E), the staff requested that the applicant provide a list and summary of applicable implementing procedures related to responsibilities for maintenance, inventories, waste disposal, and locations of decontamination supplies and decontamination of wounds. In a December 23, 2008, response, the applicant provided a definition for contaminated based on their procedures and also procedures for surveying equipment or items and personnel, decontamination of equipment and the return of equipment to normal use. The applicant also stated that the applicant follows Electric Power

Research Institute (EPRI), “Guidelines for Industry Response to Personnel Contaminants.” Levels used at WLS will be consistent with those used at other Duke Energy nuclear stations. Decontamination methods are established in radiation protection procedures and are implemented under the direction of trained radiation protection personnel. The WLS COL FSAR addresses the RPP and procedures with respect to decontamination as discussed in the response to RAI 25, Question 13.03-64(B). In RAI 25, Question 13.03-64(F), the staff requested that the applicant provide a summary of the occupational RPPs outlined in the WLS COL FSAR, the AP1000 DCD, NEI 07-08, and NEI 07-03. In a December 23, 2008, response, the applicant stated that the WLS COL FSAR addresses the RPP as discussed in the response to RAI 25, Question 13.03-64(B). A description of personnel and equipment decontamination facilities and the means for handling radioactive waste is provided in AP1000 DCD Section 1.2, “Definitions.” The applicant expects that the bulk of the emergency equipment and supplies will be stored in the established ERFs. Additional supplies may be stored at locations convenient for use by emergency response personnel, for example, within the radiological control area, access areas, and decontamination areas. The applicant will determine initial storage locations based on an assessment of plant layout and their experience operating nuclear power plants. Locations may be changed based on assessments of plant emergency operations, drills, and exercises. WLS Emergency Plan, Section II.K.5.b, “Decontamination Action Levels,” states that WLS implements procedures for decontamination of onsite emergency personnel. In a December 23, 2008, response to RAI 25, Question 13.03-63, the applicant stated the hot machine shop (Room 40358) will contain decontamination equipment.

WLS Emergency Plan, Section II.K.6.a, “Contamination Control Measures,” discusses access control in the event of an emergency by stating that requirement for site access control is established in the WLS COL FSAR and Security Plan. State and local agencies will control access to the owner-controlled area consistent with State and local plans. In addition, the Station Security Force will control entry to the protected area in the event of an emergency. In RAI 25, Question 13.03-64(G), the staff requested that the applicant provide a list and summary of applicable implementing procedures. In a December 23, 2008, response, the applicant stated that access to the protected area is maintained by the Security Force. The security plans and associated procedures are discussed in WLS COLA Part 8, “Safeguards.” Milestones associated with the implementation of the security program are presented in WLS COL FSAR Table 13.4-201. WLS COL FSAR Chapter 12, “Radiation Protection,” describes the RPP, applicable to contamination control measures, consistent with the requirements of 10 CFR Part 20. WLS COL FSAR Appendix 12AA provides a summary of the WLS RPP; WLS COL FSAR Table 13.4-201 addresses milestones associated with the development of the RPP; and WLS COL FSAR Section 13.5.2.2.1 provides a discussion of radiation protection procedures. In RAI 83, Question 13.03-81, the staff requested that the applicant address the control of access to contaminated areas in the WLS Emergency Plan. In a December 23, 2008, response, the applicant stated that the OSC radiation protection staff, when activated, controls access to RCAs, assesses onsite radiological conditions, and initiates contamination control for the protected area. In addition, the OSC monitors radiological status and provides for radiological monitoring inside the protected area; and, based on survey results identifies travel routes and assigns personnel protective and monitoring equipment that limits or controls access to contaminated areas. The applicant updated the WLS Emergency Plan in the response to RAI 83, Question 13.03-81.

WLS Emergency Plan, Section II.K.6.b, “Contamination Control Measures,” states that Nuclear Supply Chain Personnel will make arrangements for transport of non-contaminated offsite supplies in event of contamination. In RAI 25, Question 13.03-64(H), the staff requested that the applicant provide a list and summary of applicable implementing procedures. In a December 23, 2008, response, the applicant stated that procurement support located in the EOF is responsible for ensuring adequate supplies of food and water are available to the ERO. Food and water would be made available onsite through acquisition of supplies under the applicant's commercial arrangements and subsequent transportation of supplies to the site, using either vendor or the applicant-supplied transport. The applicant expects that distribution of food and water under emergency conditions would be made on an ad-hoc basis. The applicant also stated that procedures are likely to be limited to the existing Duke Energy corporate procedure, assigning responsibility to the procurement support assigned to the EOF. The applicant will modify Duke Energy's corporate procedure describing EOF procurement support to incorporate WLS on a schedule that supports execution of the emergency exercise required by 10 CFR Part 50, Appendix E, Section IV.F.2.

WLS Emergency Plan, Section II.K.6.c, "Contamination Control Measures," states that areas and items are permitted to return to normal use following conduct of appropriate surveys and verification that the contamination levels meet criteria specified in the RPP or its supporting procedures. In RAI 25, Question 13.03-64(I), the staff requested that the applicant provide additional information related to radiological surveys and to summarize the RPP criteria for decontamination. In a December 23, 2008, response, the applicant stated that contamination levels and decontamination are discussed in the response to RAI 25, Question 13.03-64(E). The applicant also stated that the WLS will use the same radiological guidance followed at all existing Duke Energy nuclear stations. The list of procedures in use at Duke Energy's existing nuclear stations to address decontamination and the release of previously contaminated areas and items to normal was provided. The applicant expects that similar procedures will be developed or corporate procedures expanded to account for WLS.

WLS Emergency Plan, Section II.K.7, "Decontamination of Relocated Lee Nuclear Station Personnel," states that WLS makes provisions for protective clothing, contamination monitoring, and decontamination at the designated relocation site. A general description of the equipment and supplies that are typically available is included in WLS Emergency Plan, Appendix 6. In RAI 25, 13.03-64(J), the staff requested that the applicant provide additional information requesting how WLS would use decontamination equipment and facilities, personnel and vehicle monitoring. In a December 23, 2008, response, the applicant stated that the WLS would use procedures similar to those in use at other Duke Energy facilities. Procedures for CNS were provided as examples. Procedures will be available in accordance with 10 CFR Part 50, Appendix E, Section IV.F.2. The applicant proposed License Condition (13-4), which states that reception centers and relocation sites will be identified and LOAs will be obtained prior to the full participation exercise. The license condition is evaluated in Section 13.3.4.10 of this report,

The staff finds the additional information and clarifications provided by the applicant in response to RAI 25, Question 13.03-64 and RAI 83, Question 13.03-81 acceptable because they conform to the guidance in NUREG-0654. Accordingly, the staff considers RAI 25, Question 13.03-64 and RAI 83, Question 13.03-81 resolved.

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and the associated evaluation criteria in NUREG-0654.

The staff finds that the applicant has established the means to control radiological exposures for emergency workers in a way consistent with the exposure guidelines in EPA 400-R-92-001. In addition, the applicant made and described adequate provisions for emergency facilities and equipment, including facilities and supplies for monitoring and decontamination of onsite and relocated personnel, vehicles, and other affected materials, and has established appropriate contamination control measures.

Conclusion

The staff concludes that the information provided in the WLS COLA is consistent with the guidelines in NUREG-0654, Planning Standard K. Therefore, the staff finds the information acceptable and meets the relevant requirements of 10 CFR 50.47(b)(11) and 10 CFR Part 50, Appendix E, Section IV.E.3, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.12 Medical and Public Health Support

As reflected in NUREG-0654, Planning Standard L, "Medical and Public Health Support," 10 CFR 50.47(b)(12) requires that arrangements be made for medical services for contaminated injured individuals. In addition, 10 CFR Part 50, Appendix E, Section IV.E requires facilities and medical supplies at the site for appropriate emergency first aid treatment, and arrangements for medical service providers qualified to handle radiation emergencies onsite. Arrangements are also required for transportation of contaminated injured individuals from the site to specifically identified treatment facilities outside the site boundary.

In WLS Emergency Plan, Section II.L, "Medical and Public Health Support," the applicant described the arrangements for medical services for contaminated injured personnel at the WLS. The staff reviewed this section, as well as other relevant portions of the WLS COLA to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. In this evaluation, the staff's primary focus was to evaluate the emergency plan against NUREG-0654, Planning Standard L. Planning Standard L provides the detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(12).

WLS Emergency Plan, Section II.L.1, "Hospital and Medical Support," states that an agreement has been established with Piedmont Medical Center (PMC) to provide medical services for injured personnel. Radiation monitoring equipment, dosimeters, and protective clothing are available at PMC. The PMC has the capability to evaluate and handle contaminated victims due to training courses supported by Duke Energy. Radiation protection personnel may accompany victims to support the radiological aspects of the treatment. Periodic drills, exercises, and material support are provided consistent with agreements developed with medical support providers addressed in Section II.N, "Exercise and Drills," and certification letters in WLS Emergency Plan, Appendix 7, "Certification Letters." In RAI 25, Question 13.03-65, the staff requested that the applicant discuss when the agreements will be finalized between Duke Energy and the medical support providers. In a December 23, 2008, response, the applicant proposed License Condition (13-4) and stated LOAs will be established and incorporated into the WLS Emergency Plan prior to receipt of nuclear fuel at the site. The license condition is evaluated in Section 13.3.4.10 of this report

WLS Emergency Plan, Section II.L.2, “On-site First Aid Capability,” states that a trained Medical Emergency Response Team (MERT) is maintained at the site to provide 24-hour first aid support. The MERT personnel are Department of Transportation (DOT) first responder trained. Medical services are also available from Upstate Carolina Medical Center (ambulance) and Draytonville-McKown Mountain-Wilkinsville Volunteer Fire Department. Duke Energy provides for First Aid Team readiness through training consistent with WLS Emergency Plan, Section II.O, “Radiological Emergency Response Training,” and drills and exercises consistent with WLS Emergency Plan, Section II.N. WLS Emergency Plan, Appendix 6, “Emergency Equipment and Supplies,” provides a brief description of first aid supplies and equipment.

WLS Emergency Plan, Section II.L.4, “Medical Emergency Transportation,” states that initial offsite support for medical emergencies is provided by the Draytonville-McKown Mountain-Wilkinsville Volunteer Fire Department, and Upstate Carolina Center Emergency Medical Services (UCCEMS) provides transport for non-contaminated injured personnel. However, WLS Emergency Plan, Appendix 7 contains a letter of agreement with UCCEMS to suggest that that they will provide ambulance services to transport contaminated injured personnel.

WLS Emergency Plan, Section II.L.4 also states that PMC provides ambulance services for transport of contaminated personnel to PMC. Contaminated injured personnel are suitably clothed or prepared to prevent the spread of contamination in the transporting vehicle. Communication can be maintained from the station to the site ambulance or to the ambulance through the dispatching station. Response team members receive training concerning transportation of contaminated injured individuals. The approximate time to transport a patient to PMC is 60 minutes. The estimated time for local rescue squads to arrive at the station is 30 minutes.

The staff finds the additional information and clarifications provided by the applicant in the response to RAI 25, Question 13.03-65 acceptable because the information and clarifications conform to the guidance in NUREG-0654. Accordingly, the staff considers RAI 25, Question 13.03-65 resolved.

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and the associated evaluation criteria in NUREG-0654.

The staff reviewed the certification letter for the medical service providers described above and the additional information provided in WLS Emergency Plan, Section II.L. The staff finds that the applicant has made arrangements for hospital and medical service providers that have the capability to evaluate radiation exposure and uptake, and persons providing these services are adequately prepared to handle contaminated individuals. In addition, the applicant provided for appropriate emergency first aid treatment at the site, including qualified medical personnel to handle radiation emergencies, and arrangements for transporting victims of radiological accidents (i.e., contaminated injured individuals) to offsite medical support facilities.

Conclusion

The staff concludes that the information provided in the WLS COLA is consistent with the guidelines in NUREG-0654, Planning Standard L. Therefore, the staff finds the information acceptable and meets the relevant requirements of 10 CFR 50.47(b)(12) and 10 CFR Part 50, Appendix E, Section IV.E, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.13 Recovery and Reentry Planning and Post-accident Operations

As reflected in NUREG-0654, Planning Standard M, "Recovery and Reentry Planning and Post-Accident Operations," 10 CFR 50.47(b)(13), requires that general plans for recovery and reentry be developed. In addition, 10 CFR Part 50, Appendix E, Section IV.H requires a description of criteria to be used to determine when, following an accident, reentry of the facility would be appropriate or when operation could be resumed.

In WLS Emergency Plan, Section II.M, "Recovery and Re-entry," the applicant provides a general framework for the contents of recovery plans and procedures to address a range of recovery and re-entry activities including recovery organization and its concepts of operation. The staff reviewed this section, as well as other relevant portions, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff's primary focus was to evaluate the emergency plan against NUREG-0654, Planning Standard M. NUREG-0654, Planning Standard M provides the detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(13).

WLS Emergency Plan, Section II.M states that the applicant implements plans and procedures for recovery and re-entry that provide guidance on: the recovery/re-entry organization; responsibilities for decision-making activities, including decisions for relaxing protective measures based on existing or potential hazardous conditions; the means for informing ERO members about organizational structure changes and the start of recovery operations; and the methods for periodically updating estimates of total population exposure. WLS Emergency Plan, Appendix 5 includes an EPIP titled, "Recovery and Re-entry," which implements WLS Emergency Plan, Section II.M.2.

WLS Emergency Plan, Section II.M.2, "Recovery Organization," states that the applicant establishes a recovery organization consistent with existing conditions and continuing organizational needs that may be modified to address the given situation. The applicant does not expect this to be necessary following a Notification of Unusual Event or an Alert emergency classification level. Primary positions for the Recovery Organization are identified by title and responsibilities, including the Emergency Coordinator who acts as site liaison with the Recovery Organization and the EOF Director who assumes control and direction of the recovery operation with the authority and responsibilities as described in the EPIPs, including the coordination with Federal, State, and local governments. Other key Recovery Organization personnel include the Work Control, Radiological Assessment, Engineering Support, Public Information, and EOF Services managers who support the EOF Director and site recovery and re-entry efforts. The Recovery Organization may perform its activities from one or more designated ERFs or from other locations as specified by the responsible recovery organization managers. The applicant's response to RAI 25, Question 13.03-66(A) provided additional insight into the applicant's intent to model the WLS recovery organization to align with Catawba, Maguire, and Oconee nuclear stations. The applicant's corporate procedure for recovery and re-entry was provided as an example of this structure. Although no revision to the WLS Emergency Plan was proposed in response to this RAI, the staff considers the additional clarification provided by the applicant regarding its Recovery Organization structure acceptable since it conformed to the guidance in NUREG-0654.

WLS Emergency Plan, Section II.M.2 also includes provisions for relaxing protective measures when reentry of the facility would be appropriate or when operation could be resumed: station parameters no longer indicate a potential or actual emergency exists; the release of radioactivity is controllable, does not exceed permissible levels, and does not present a credible danger to the public; and the station is capable of sustaining itself in a long term shutdown condition.

WLS Emergency Plan, Section II.M.3, "Changes in Organizational Structure," states that the recovery process is implemented when the ERO managers, with concurrence from State and Federal agencies, have determined the station is in a stable and controlled condition. Upon this determination, the EOF Director notifies the NRC Operations Center, and the State and local EOCs, to inform them that the emergency condition has been terminated and any required recovery has commenced.

WLS Emergency Plan, Section II.M.4, "Updating Total Population Exposure During Recovery Operations," states that the Radiological Assessment Manager will work with South Carolina and North Carolina officials to periodically update estimates of total population exposure using population distribution data. In a December 23, 2008, response to RAI 25, Question 13.03-66(C), the applicant provided additional information to indicate that the Radiological Assessment Manager will communicate with South Carolina Department of Health and Environmental Control and the North Carolina Department of Environment and Natural Resources/Radiation Protection section via liaison personnel that are assigned within the EOF to periodically update estimates of total population exposure using population distribution data. Although no revision to the WLS Emergency Plan was proposed in response to this RAI, the staff finds the additional clarification provided by the applicant acceptable since it conformed to the guidance in NUREG-0654. Accordingly, the staff considers this question resolved.

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and the associated evaluation criteria in NUREG-0654.

The staff finds that the applicant has developed general plans for recovery and reentry, including describing criteria to be used to determine when, following an accident, reentry of the facility is appropriate or operation can be resumed. In addition, the applicant designated the individuals who will fill key positions in the facility recovery organization. The staff finds that the plans adequately specify the means for informing members of the response organizations that a recovery operation is to be initiated, describe how decisions to relax protective measures are made, and include a method for periodically estimating total population exposure.

Conclusion

The staff concludes that the information provided in the WLS COLA is consistent with the guidelines in NUREG-0654, Planning Standard M. Therefore, the staff finds the information acceptable and meets the relevant requirements of 10 CFR 50.47(b)(13) and 10 CFR Part 50, Appendix E, Section IV.H, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.14 Exercises and Drills

As stated in NUREG-0654, Planning Standard N, "Exercises and Drills," 10 CFR 50.47(b)(14) requires that periodic exercises be conducted to evaluate major portions of emergency response capabilities, periodic drills be conducted to develop and maintain key skills, and deficiencies identified as a result of exercises or drills be corrected. In addition, 10 CFR Part 50, Appendix E, Section IV.F requires a description of the program that provides for training of employees, exercising by periodic drills, and participation by other assisting persons. The exercises, including hostile action exercises of the onsite and offsite emergency plans, shall test the adequacy of timing and content of implementing procedures and methods, test emergency equipment and communication networks, test the public alert and notification system, and ensure that emergency organization personnel are familiar with their duties. 10 CFR Part 50, Appendix E, Section IV.F describes the full participation exercise, including timing of the exercise, correction of any deficiencies identified during the exercise, the use of remedial exercises, developing exercise scenarios, and an eight-year exercise cycle.

In WLS Emergency Plan, Section II.N, "Exercises and Drills," the applicant described the conduct and frequency of emergency exercises and drills, including coordination between WLS and offsite organizations. The staff reviewed this section, as well as other relevant portions of the application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff's primary focus was to evaluate the emergency plan against NUREG-0654, Planning Standard N, which provides the detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(14).

WLS Emergency Plan, Section II.N.1, "Exercises and Drills," states that exercises are conducted on a biennial basis in a manner that tests the major elements of the plans and emergency response capabilities. Exercises test adequacy of timing and content of implementing procedures; test emergency equipment and communication networks, and public notification systems; evaluate emergency organization personnel's familiarity with their duties; and identify deficiencies.

WLS Emergency Plan, Section II.N.2, "Drills," states that upon request, the applicant allows affected State and local governments located within the plume exposure pathway EPZ to participate in drills. Drills are conducted between biennial exercises to maintain adequate emergency response capabilities, and the drills are controlled and observed by individuals qualified to conduct and evaluate the drill. The drills are used to implement accident management strategies, provide supervised instruction, allow the operating staff to resolve problems and focus on internal training objectives. One or more drills may be included as portions of an exercise. WLS Emergency Plan, Section II.A.1, "Emergency Organization," identifies participating organizations. The section describes communication, fire, medical emergency and radiation protection drills.

As described in WLS Emergency Plan, Section II.N.2.a, "Communication Drills," communication drills are performed monthly to test the notification capabilities with State and local governments within the plume exposure pathway EPZ. The capability to notify NRC Headquarters and the Regional Operations Center is also tested monthly. The capability to notify the NRC region and Federal EROs from the EOF is tested quarterly along with the functionality of computer and communication equipment. All communication systems discussed in WLS Emergency Plan, Section II.F, “Emergency Communications,” are tested annually. The drills include provisions to ensure that all participants are able to understand the content of the messages. Communication between the nuclear facility, State and local EOCs, and field assessment teams will be tested annually.

WLS Emergency Plan, Section II.N.2.b, “Fire Drills,” describes that fire drills are conducted as required by WLS COL FSAR Section 9.5.1, “Other Auxiliary Systems.” WLS COL FSAR Section 9.5.1, “Fire Brigade Training,” states that training is conducted by qualified individuals and consists of classroom instruction supplemented with periodic classroom retraining, practice in firefighting, and fire drills. WLS COL FSAR Table 13.4-201 (Sheet 2 of 7), “Operational Programs Required by NRC Regulations,” identifies the Fire Protection Program implementation milestones to be completed prior to receipt of fuel onsite and prior to initial fuel load.

WLS Emergency Plan, Section II.N.2.c, “Medical Emergency Drills,” states that medical emergency drills that include a simulated contaminated injured individual, transportation to offsite facilities, and participation by the local medical support agencies are performed annually. The WLS Emergency Plan also states that the offsite portions of the medical drill may be performed as part of the required biennial exercise.

WLS Emergency Plan, Section II.N.2.d, “Radiological Monitoring Drills,” states that radiological monitoring drills, involving both onsite and offsite radiological monitoring activities are conducted at least once each calendar year. Radiological monitoring drills include the use of appropriate procedures for collecting and analyzing samples and recording results; collection and analysis of the sample media for which the facility is responsible; communication with monitoring teams and recordkeeping activities. Drills may be coordinated with State and local organizations or conducted separately.

WLS Emergency Plan, Section II.N.2.e, “Radiation Protection Drills,” states that onsite radiation protection drills that include response to, and analysis of, simulated elevated airborne and liquid activity levels and elevated area radiation levels in the environment are conducted at least semi-annually.

WLS Emergency Plan, Section II.N.3 “Conduct of Drills and Exercises,” states that basic performance objectives, the participants, observers, coordination of offsite resources, casualties, simulated events, a timeline, a narrative summary of the events and plant conditions, and evaluation criteria are included in scenario materials. The WLS Emergency Plan states that exercises and drills will be carried out to allow free play for decision-making and to meet the drill objectives.

WLS Emergency Plan, Section II.N.4, “Exercise and Drill Evaluation,” states that one or more qualified instructors or evaluators supervises and evaluates drills and exercises. A qualified individual must have been evaluated by an Emergency Planning Manager. Areas to be observed by the evaluators are defined in a critique sheet.

WLS Emergency Plan, Section II.N.5, “Drill and Exercise Critiques,” states that the applicant records input from the critique participants, evaluates the need for changes to the plan, procedures, equipment, facilities, and other components of the program and develops an action plan to address the identified substantive issues. Identified substantive issues are written up as corrective actions and are tracked to completion following the corrective action program. WLS

Emergency Plan, Section II.O.4, “Emergency Response Training and Qualification,” states that training programs may include practical drills consistent with WLS Emergency Plan, Section II.N, “Exercises and Drills.” Instructors or evaluators immediately correct any erroneous action and if appropriate, demonstrate performance consistent with procedures.

WLS Emergency Plan, Section II.N, “Exercises and Drills,” does not contain a statement related to conducting remedial exercises if the emergency plan is not satisfactorily tested during the biennial exercise. Therefore, in RAI 25, Question 13.03-67, the staff requested that the applicant provide additional information related to remedial exercises. In a December 18, 2008, response, the applicant revised WLS Emergency Plan, Section II.N.1.c, “Remedial Exercises,” to include a discussion on remedial exercises. The staff finds the additional information and clarifications provided by the applicant in response to RAI 25, Question 13.03-67 acceptable because they conform to the guidance in NUREG-0654. Accordingly, the staff considers RAI 25, Question 13.03-67 resolved.

The applicant proposed EP-ITAAC 8.1 to test that the licensee conducts a full participation exercise within the specified time periods of 10 CFR Part 50, Appendix E prior to fuel load to evaluate major portions of emergency response capabilities, including participation by each State and local agency within the plume exposure pathway EPZ, and each State within the ingestion pathway EPZ.

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and the associated evaluation criteria in NUREG-0654. In addition, FEMA stated that the adequacy of the WLS Emergency Plan review is also dependent on satisfactory demonstration of plan implementation during a joint exercise with the licensee and State and local governments, and utilizing WLS facilities. EP-ITAAC Acceptance Criterion 8.1.3.1 establishes the standards that the exercise is completed per 10 CFR Part 50, Appendix E, the offsite objectives are met, and there is no uncorrected offsite deficiencies or a license condition requiring that offsite deficiencies to be corrected prior to any operation above 5 percent rated thermal power.

The staff finds that the applicant has described provisions for conducting periodic exercises and drills to evaluate major portions of emergency response capabilities and to develop and maintain key skills. The exercises will test the adequacy of implementing procedures, emergency equipment and communication networks, and the public notification system, and will ensure that the ERO personnel are familiar with their duties. In addition, the applicant described the full participation exercise, participation by offsite authorities, and how exercise and drill deficiencies will be identified and corrected. The staff notes that EP-ITAAC Acceptance Criterion 8.1.3.1 conforms to EP-ITAAC Acceptance Criterion 14.1.3 from NUREG-0800, Chapter 14.3.10, Table 14.3.10-1. The staff finds the WLS Emergency Plan adequately describes the security based drill and exercise program.

Conclusion

The staff concludes that the information provided in the WLS COLA is consistent with the guidelines in NUREG-0654, Planning Standard N. Therefore, the staff finds the information acceptable and meets the relevant requirements of 10 CFR 50.47(b)(14) and 10 CFR Part 50, Appendix E, Section IV.F, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.15 Radiological Emergency Training

As stated in NUREG-0654, Planning Standard O, "Radiological Emergency Response Training," 10 CFR 50.47(b)(15) requires that radiological emergency response training be provided to those who may be called on to assist in an emergency. In addition, 10 CFR Part 50, Appendix E, Section IV.F.1 requires a description of the program that provides for training of employees, exercising by periodic drills, and participation by other assisting persons.

In WLS Emergency Plan, Section II.O, "Radiological Emergency Response Training," the applicant described the training that will be conducted for both onsite and offsite response organizations in support of an emergency at the WLS. The staff reviewed this section, as well as other relevant portions of the application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff's primary focus was to evaluate the emergency plan against NUREG-0654, Planning Standard O, which provides the detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(15).

WLS Emergency Plan, Section II.O.1, "General," states that the WLS training program provides for initial training and retraining for individuals who have been assigned emergency response duties. WLS Emergency Plan, Sections II.O.1.a, "Off-site Emergency Response Training," and "Mutual Aid Agreements," describe training of offsite personnel likely to provide assistance during an emergency. The training addresses: scope of the WLS Emergency Plan; emergency classification, notification methods, basic radiation protection, individuals in response organizations who direct onsite activities, definition of support roles, and station access procedures. In RAI 25, Question 13.03-68, the staff requested that the applicant provide additional information on training of media representatives. In a December 17, 2008, response, the applicant stated this information is provided in WLS Emergency Plan, Section II.G.5, "News Media Training," and states that, "Annually, Duke Energy provides to affected media organizations information regarding the emergency plans, information regarding radiation hazards, and points of contact for release of public information during an emergency." Training is performed prior to assignment to a position, which includes practical drills consistent with WLS Emergency Plan, Section II.N, "Exercises and Drills."

WLS Emergency Plan, Section II.O.2, "On-site Emergency Response Training," states that the emergency response training program includes Duke Energy personnel who may be called upon to respond to an emergency. The training program includes classroom training and practical drills in which each individual demonstrates ability to perform his/her assigned emergency function. Training is complete prior to assignment to a position in the ERO. The training program includes practical drills addressed in WLS Emergency Plan, Section II.N, "Exercises and Drills," during which each individual demonstrates the ability to discharge the assigned emergency response function. Any erroneous performance is immediately noted during these practical drills, and proper performance may be demonstrated consistent with procedures and standards by an instructor or evaluator. Training is provided to the following categories of responders:

a. Directors or coordinators of the plant emergency organization

b. Personnel responsible for accident assessment, including CR shift personnel

c. Radiological monitoring teams

d. Fire control teams (fire brigades)

e. Repair and damage control teams

f. First aid and rescue teams

g. Medical support personnel

h. Licensee's headquarters support personnel

i. Security personnel

WLS Emergency Plan, Section II.O.4, "Emergency Response Training and Qualification," states that the applicant implements a program to provide position-specific training for positions covered in WLS Emergency Plan, Sections II.O.4.a through II.O.4.j, including offsite local support personnel. Content of the training program is appropriate for the duties and responsibilities of the assigned position.

WLS Emergency Plan, Section II.O.5, "Retraining," states that failure to successfully complete training in a timely manner as specified in plant training program requirements results in the individual's removal from the ERO pending completion of the required training.

The staff finds the additional information and clarifications provided by the applicant in response to RAI 25, Question 13.03-68 acceptable because they conform to the guidance in NUREG-0654. Accordingly, the staff considers RAI 25, Question 13.03-68 resolved.

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and the associated evaluation criteria in NUREG-0654.

The staff finds that the applicant has provided for radiological emergency response training to those who may be called on to assist in an emergency. In addition, the applicant described the program that trains employees to ensure they are familiar with their specific emergency response duties, including exercising with periodic drills. The applicant also described the participation in training and drills by other persons whose assistance might be needed, including specialized initial training and periodic retraining.

Conclusion

The staff concludes that the information provided in the WLS COLA is consistent with the guidelines in NUREG-0654, Planning Standard O. Therefore, the staff finds the information is acceptable and meets the relevant requirements of 10 CFR 50.47(b)(15) and 10 CFR Part 50, Appendix E, Section IV.F.1, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.16 Responsibility for the Planning Effort

As reflected in NUREG-0654, Planning Standard P, “Responsibility for the Planning Effort – Development, Periodic Review, and Distribution of Emergency Plans,” 10 CFR 50.47(b)(16), as reflected in the Planning Standard P, requires that responsibilities for plan development and review and for distribution of emergency plans are established and that planners are properly trained. In addition, 10 CFR Part 50, Appendix E, Section IV.G requires a description of provisions to be employed to ensure that the emergency plan, its implementing procedures, and emergency equipment and supplies are maintained up to date.

In WLS Emergency Plan, Section II.P, “Responsibility for the Planning Effort,” the applicant described the responsibilities associated with maintaining the emergency preparedness program, including the development, review, and distribution of the emergency plan. The staff reviewed this section, as well as other relevant portions of the application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff’s primary focus was to evaluate the emergency plan compared to NUREG-0654, Planning Standard P, “Responsibility for the Planning Effort: Development, Periodic Review and Distribution of Emergency Plans.” Planning Standard P provides the detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(16).

WLS Emergency Plan, Section II.P.1, “Training,” describes the process used to provide training for the Emergency Planning Manager and support staff to facilitate effective implementation of the emergency planning effort, consistent with applicable regulatory requirements and guidance, license conditions, other commitments, and accepted good practices. Training may include formal education, professional seminars, plant-specific training, industry meetings, and other activities and forums that provide for an exchange of pertinent information.

WLS Emergency Plan, Section II.P.2, “Responsibility for Radiological Emergency Response Planning,” describes the responsibility of plan development. The WLS Emergency Plan states that the WLS Site Vice President is the overall authority for ensuing that there is an adequate level of emergency preparedness maintained at the site. The responsibility for the planning effort is delegated to the Emergency Planning Manager.

WLS Emergency Plan, Section II.P.3, “Emergency Planning Manager,” describes the Emergency Planning Manager position. The incumbent is responsible for developing and updating the Emergency Plan and coordinating that plan with other response organizations. The Duke Energy corporate staff may augment the WLS onsite emergency planning efforts, as needed.

WLS Emergency Plan, Section II.P.4, “Plan Reviews and Updates,” states that the WLS Emergency Plan is reviewed, updated as needed, and certified to be current on an annual basis. Changes identified by drills and exercises are incorporated into the WLS Emergency Plan. On an annual basis, the Emergency Planning Manager reviews with each affected State and local organization Lee Nuclear Station procedures for emergency classification.

WLS Emergency Plan, Section II.P.5, “Distribution of Revised Plans,” covers the distribution of the revised plans. The Emergency Planning Manager or designee makes needed changes to the WLS Emergency Plan. The pages that are changed are marked and dated to indicate the change. The WLS Site Vice President reviews and approves the changes. The approved revised plans are distributed through the WLS document control organization to organizations and individuals that have responsibilities associated with implementing the Plan.

WLS Emergency Plan, Section II.P.6, “Supporting Plans,” provides a list of supporting plans, including the following:

- South Carolina Operational Radiological Emergency Response Plan, Appendix 2 South Carolina Emergency Operation Plan
- North Carolina Emergency Operations Plan
- North Carolina Radiological Emergency Response Plan for Nuclear Power Facilities
- Cherokee County, SC, Emergency Operations Plan
- York County, SC, Emergency Operations Plan
- NRC Region II Incident Response Plan
- Interagency Radiological Assistance Plan - Region 3 - U.S. Department of Energy
- INPO Emergency Response Plan

WLS Emergency Plan, Section II.P.7, “Implementing Procedures” references the topical listing of EPIPs supporting the plan as being contained in WLS Emergency Plan, Appendix 5, “Implementing Procedures.”

The WLS Emergency Plan contains a Table of Contents. In addition, WLS Emergency Plan, Section II.P.8 “Table of Contents,” states that the format for this Emergency Plan directly follows the format of NUREG-0654. Appendix 8, “Cross-References to Regulations, Guidance, and State and Local Plans,” provides a cross reference for regulatory requirements (includes Appendix E) and NUREG-0654.

WLS Emergency Plan, Section II.P.9, “Emergency Plan Audits,” describes the applicant’s Nuclear Performance Assessment organization’s independent audit of the WLS Emergency Preparedness Program. The organization performs or oversees the performance of periodic independent audits of the emergency preparedness program consistent with 10 CFR 50.54(t). Frequency of the periodic audits is based on an assessment of performance, but all elements of the emergency preparedness program must be reviewed at least once every 24 months. An audit is performed after a change occurs in personnel, procedures, equipment, or facilities that potentially could adversely affect emergency preparedness, but no longer than 12 months after the change. Audit results are documented and improvement recommendations sent to WLS and Duke Energy management. Duke Energy’s Records Management shall file and maintain records of this and a description of any corrective actions for five years.

WLS Emergency Plan, Section II.P.10, “Emergency Telephone Numbers,” states that the Emergency Planning Manager (or designee) is responsible for performing a quarterly review of the telephone numbers in the emergency response procedures and for ensuring required revisions are completed.

In WLS COLA Part 10, the applicant proposed License Condition 4 “Emergency Planning Actions” to address NRC inspection of Letters of Agreement with entities specific to emergency planning responsibilities. The staff refers to this as License Condition (13-6).

Proposed License Condition (13-6):

> Prior to the full-participation exercise to be conducted in accordance with the requirements of Appendix E to 10 CFR Part 50, Duke Energy will have available for NRC inspection Letters of Agreement with the entities listed in Appendix 7 of the Lee Nuclear Station COLA Part 5, Emergency Plan. These Letters of Agreement will detail each entity’s specific emergency planning responsibilities, including response to hostile action affecting the plant site, and certify the entity’s concurrence with their responsibilities.

In addition, as discussed in Section 13.3.4.3 of this report, the general nature of the existing letters of agreement is such that the scope of expected support could include expected assistance associated with hostile action at the site, which is required by 10 CFR Part 50, Appendix E, Section IV.A.7 to be identified and described in the WLS Emergency Plan. However, this requirement was not effective until June 23, 2014, which occurred after WLS COLA submission. The WLS Units 1 and 2 letters of agreement supporting the WLS COLA did not specifically address hostile actions, and were not required to when the WLS COLA was initially submitted on December 12, 2007. To clarify that the expected assistance from offsite agencies includes hostile action, the staff has included in the License Condition (below) the requirement for the updated letters of agreement to reflect expected assistance associated with hostile actions at WLS, as required by 10 CFR Part 50, Appendix E, Section IV.A.7.

For the reasons discussed above, the staff finds that delaying the updating of the letters of agreement, and revising the WLS Emergency Plan to include the letters after execution until prior to WLS fuel load is consistent with the requirements in 10 CFR Part 50, Appendix E, Section IV.G, and guidance in NUREG-0654 Evaluation Criterion II.P.4. The staff reviewed the License Condition, and with the exception of the timeframe for submission of the updated letters of agreement, finds that it acceptable for the reasons as discussed above. The staff includes a similar submission timeframe for the updated letters of agreement based on the date scheduled for initial fuel load set forth in the notification submitted in accordance with 10 CFR 52.103(a). Therefore, consistent with the applicant’s proposed License Condition the staff identified License Condition (13-6).

License Condition (13-6):

> No later than 180 days before the date schedule for initial fuel load set forth in the notification submitted in accordance with 10 CFR 52.103(a), Duke Energy shall submit to the Director of the Office of New Reactors (NRO), or the Director’s designee, in writing, updated WLS Units 1 and 2, Letters of Agreement with the following entities, or their successors. These updated Letters of Agreement shall identify the specific nature of arrangements in support of emergency preparedness for WLS, and reflect expected assistance associated with hostile action at the WLS, as defined in 10 CFR Part 50, Appendix E, Section IV.A.7. The WLS Emergency Plan shall have been revised to include these updated Letters of Agreement after they have been executed.
>
> 1. South Carolina Emergency Management Division

2. Piedmont Medical Center

3. Upstate Medical Center, Emergency Medical Services

4. Draytonville-McKown Mountain-Wilkinsville Volunteer Fire Department

5. Cherokee County Emergency Management

6. Cleveland County Emergency Management and Fire Marshall's Office

7. North Carolina Emergency Management

8. South Carolina Department of Health and Environmental Control

9. York County Emergency Management

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and the associated evaluation criteria in NUREG-0654.

Subject to License Condition (13-6), the staff finds that the applicant has established the responsibilities for plan development and review, including distribution of the emergency plans to all appropriate organizations. In addition, the applicant established provisions to properly train the planners (i.e., the individuals responsible for the emergency planning effort) and described the provisions to be employed to ensure that the emergency plan, its implementing procedures, and emergency equipment and supplies are maintained up-to-date.

Conclusion

Subject to License Condition (13-6), the staff concludes that the information provided in the WLS COLA is consistent with the guidelines in NUREG-0654, Planning Standard P. Therefore, the staff finds the information acceptable and meets the relevant requirements of 10 CFR 50.47(b)(16) and 10 CFR Part 50, Appendix E, Section IV.G, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.17 Evacuation Time Estimate (ETE) Analysis

The WLS Emergency Plan includes an analysis of the time required to evacuate the plume exposure pathway EPZ 16-km (10-mile EPZ). In a March 4, 2010, letter, the applicant filed the WLS Units 1 and 2 Emergency Plan, Revision 2. This submission included the report, "William S. Lee Nuclear Station Development of Evacuations Time Estimates," Revision 2, February 2010, referred to from this point forward as the ETE Report. The ETE Report is a non-public document and the results of the ETE Report, Revision 2, are summarized in WLS Emergency Plan, Appendix 4 ""Evacuation Times Estimate. The ETE Report provides the basis for the following discussion and analyses. At the direction of the staff, technical experts from Sandia National Laboratories reviewed the ETE Report and prepared a technical evaluation report containing the results of their review. The staff and its contractors reviewed the applicant's ETE Report analysis for content and conformity to NUREG-0654, Appendix 4 and to guidance provided in NUREG/CR-7002 and NUREG/CR-6863. The staff considered the contractor's assessment in findings of acceptability and applicability in determining its conclusions of adequacy and compliance with the regulatory guidance.

Introductory Materials Related to the ETE Report

The proposed WLS is located west of the Broad River about 11 km (7 mi) southeast of Gaffney, South Carolina. A description, including a map in the ETE Report (Figure 1-1, "Lee Nuclear Station Site Location"), of the 16-km (10-mi) EPZ and surrounding area was provided. Additional information concerning small communities and topographical features in the WLS vicinity was requested in RAI 25, Questions 13.03-4 and 13.03-5, respectively. In a November 7, 2008, response, the applicant provided an updated Figure 1.1, which identified small unincorporated areas The WLS EPZ includes 14 emergency response planning areas (ERPAs), as illustrated in ETE Report Figure 6-1, "Lee Nuclear Station EPZ ERPA." The ERPAs are described in ETE Report, Appendix L, "ERPA Boundaries," and are typically bounded by State highways, rivers, creeks and town boundaries.

The ETE study includes many assumptions, most of which are identified in Section 2.2, "Study Methodological Assumptions," and Section 2.3, "Study Assumptions." Methodological Assumption Number 3 explains evacuation movements are assumed to be outbound relative to the plant site. Methodological Assumption Number 5 describes assumptions related to voluntary evacuations. Section 2.3 also describes assumptions for the planning basis, school evacuations, mobilization of the general population, percent of households with commuters, and staffing of traffic access and control locations. Study Assumption Number 5 states that vehicles entering the 16-km (10-mi) EPZ along Interstate 85 will not be diverted. A fundamental assumption for the ETE is that advisory to evacuate is coincident with siren notification, which is consistent with guidance in NUREG/CR-7002, "Criteria for Development of Evacuation Time Estimate Studies" (referred to as NUREG/CR-7002)[10]. The assumptions related to commuters are based on the results of a site-specific telephone survey, which is included in the ETE study as Appendix F, "Telephone Survey." Additional assumptions related to factors that influence roadway capacities are described in Section 4, "Estimation of Highway Capacity."

ETE Report Section 3, "Demand Estimation," describes the assumptions for each population segment. For instance, it is assumed 100 percent of the public will evacuate and that no residents are on vacation. Population estimates at special facilities are based on available data from county emergency management offices. Population mobilization times are based on a statistical analysis of data acquired from a telephone survey, as is the relationship between resident population and evacuating vehicles (vehicle occupancy factors). Those without access to private vehicles will be transported to reception centers by bus with an assumption that 50 percent share rides with family, neighbors, and friends. This assumption is consistent with current guidance in NUREG/CR-7002.

The method for analyzing evacuation times included gathering demographic information, performing a field survey of the 16-km (10-mi) EPZ, estimating trip generation times, defining evacuation regions, applying the procedures specified in the 2000 Highway Capacity Manual

[10] 10 CFR 52.17(a)(xii) allows the use of existing guidance in effect 6 months or more from the date of the application submittal to be the basis of the evaluation. The staff used NUREG/CR-7002, which was not issued prior to the application submittal or included in the acceptance criteria in the SRP, to determine if the current guidance would be met for added prudence.

(HCM), and modeling the site using the IDYNEV system. The IDYNEV system includes the PC-DYNEV macroscopic simulation model and the Traffic Assignment Model (TRAD). In the ETE Report, the TRAD model is described in Appendix B, “Traffic Assignment Model,” which provides a description of the model and application of links and nodes. The traffic simulation model is described in the ETE Report, Appendix C, “Traffic Simulation Model: PC-DYNEV,” which describes the model, discusses inputs, outputs, and measures of effectiveness. In the ETE Report, Appendix D, “Detailed Description of Study Procedure,” describes the step-by-step process for integrating the data and models to produce ETEs. In RAI 25, Question 13.03-39, the staff requested that the applicant provide additional information concerning the use of data from field surveys with the default capacity rates of the HCM. The applicant’s December 9, 2008, response clarified that highway characteristics (posted speed, number of lanes, shoulder conditions, free flow speed, terrain, traffic control devices, etc.) observed during the survey were documented in Geographic Information System shapefiles, which were used in the development of the link node analysis network. The capacity of each link was estimated using the procedures outlined in the HCM and the data from the shapefiles. Shadow evacuation is assumed to occur at population percentages that diminish with distance out to 24 km (15 mi). In RAI 25, Question 13.03-7(A) the staff requested that the applicant provide clarification of the assumptions regarding shadow evacuation for partial evacuations and in RAI 25, Question 13.03-7(B) for full 16-km (10-mi) EPZ evacuations. In a November 11, 2008, response, the applicant clarified that 35 percent of individuals in areas within the 16-km (10-mi) EPZ, but not advised to evacuate, may do so voluntarily, and that 30 percent of the population in the shadow region beyond the 16-km (10-mi) EPZ that extends a distance of 24 km (15 mi) from WLS will also elect to evacuate. In RAI 25, Question 13.03-14, the staff requested that the applicant provide a definition of the basis of future projections of numbers of vehicles involved in shadow evacuation. In a November 20, 2008, response, the applicant provided revised information for the year 2011 and proposed textual revisions and updated tables. In RAI 25, Question 13.03-42, the staff requested that the applicant provide additional information related to shadow evacuation. The applicant’s responses to RAI 25, Questions 13.03-42(A) and 13.03-42(C), describes how trip generation times for the shadow evacuation were developed. The applicant’s response to RAI 25, Question 13.03-42(B) describes the population values for the percent shadow evacuation used in the sensitivity analyses of the ETE Report, Appendix I. The response to RAI 25, Question 13.03-42(D) provides the basis for the population used to calculate the shadow evacuation vehicles. In the response, the applicant assumed that the demographics in the shadow region are similar to those in the 16-km (10-mi) EPZ. Results of a sensitivity analysis that varied the shadow population from 15 percent to 60 percent show that the ETE is not sensitive to the number of shadow evacuees. The applicant’s response to RAI 25, Question 13.03-44, clarified that “volunteer” evacuation and “shadow” evacuation have the same meaning.

The ETE Report includes a map showing the proposed site and plume exposure pathway EPZ, as well as transportation networks, topographical features, and political boundaries. The boundaries of the 16-km (10-mi) EPZ, in addition to the evacuation subareas within the 16-km (10-mi) EPZ, are based on factors such as current and projected demography, topography, land characteristics, access routes, and jurisdictional boundaries. A general description of the evacuation model was provided, including the assumptions used in the evacuation time estimate analysis.

The staff finds the clarifications, additional information and textual revisions provided by the applicant in response to RAI 25 Questions 13.03-4, 13.03-5, 13.03-7(A) and 13.03-7(B), 13.03-14, 13.03-39, 13.03-42, and 13.03-44 acceptable because they conform to the guidance in NUREG-0654. The ETE Report describes the method of analyzing the evacuation times. A general description of the evacuation model was provided including the assumptions used in the evacuation time estimate analysis.

Demand Estimation

The ETE study includes an analysis of permanent residents and transient populations, transit-dependent permanent residents (including ambulatory and non-ambulatory), special facility residents, and schools. As described in the ETE Report, Section 2.1, "Data Estimates," the general population is based on the 2000 census data and is projected to 2007.

The population values include those with and without vehicles. Site-specific telephone survey results, provided in the ETE Report, Appendix F, "Telephone Survey," were used to establish demographic characteristics and automobile occupancy information. The ETE Report, Section 3, "Demand Estimation," provides an estimate of the number of people needing to be evacuated (the "demand estimation"), and explains the values for the average household size of 2.62 persons per household and 1.44 vehicles per household were adapted from the survey results. The ETE Report, Table 3-2, "Permanent Resident Population and Vehicles by ERPA," presents the number of residents by evacuation area showing a total 2007 population of 48,249 requiring 26,520 vehicles for a ratio of 1.82 permanent residents per vehicle. The ETE Report, Figure 3-2, "Permanent Residents by Sector," illustrates the residents distributed within radial sectors of the 16-km (10-mi) EPZ. Consistent with guidance in NUREG/CR-6863, "Development of Evacuation Time Estimate Studies for Nuclear Power Plants," demand estimates were adjusted for evening and daytime scenarios and are presented in the ETE Report, Table 6-3, "Percent of Population Groups for Various Scenarios." The ETE Report states that census data showed that the local population increased 7.4 percent between 2000 and 2007. In Revision 2 of the ETE Report, estimates of employees who commute into the 10-mile EPZ to work are based upon the state "Journey to Work Database for 2000," and projected to 2007 using the U.S. Department of Labor job growth rates.

Population estimates are provided for permanent residents, transients, and employees of local businesses. Employment was decreasing by 1.6 percent per year in Cherokee County as shown in the ETE Report, Table 3-3, "Cherokee County Employment," and this was used to extrapolate the 2000 employment numbers to 2007. According to the county website, employment continues to decrease. A vehicle occupancy factor of 1.03 employees per vehicle, obtained from the telephone survey, was used to estimate the number of evacuating vehicles for employees.

In RAI 25, Question 13.03-1, the staff requested that the applicant provide additional information regarding the assumptions related to the population estimates during plant construction, and their consistency with projections in other COL documents. In a November 7, 2008, response, the applicant clarified the methods used to project populations. In RAI 25, Question 13.03-22, the staff requested that the applicant provide clarification regarding the plant construction population itself. The applicant's November 20, 2008, response stated that while the number of employees peak at 1,000, only about 750 are assumed to be onsite at any one time.

In Revision 2 of the ETE Report, the special event evaluated in the analysis was new plant construction. ETE Report Table 6-4, "Vehicle Estimates By Scenario," identifies the peak construction year as 2016 and explains that the permanent resident and shadow populations were escalated to 2016 to determine the ETE. During the peak construction period the workforce estimate is 4,398 construction workers. Based on shift work and operations work, the peak onsite worker estimate is 3,079. In RAI 123, Question 13.03-98, the staff requested that the applicant provide information regarding the peak construction year and the associated demand estimation. In a November 5, 2014, response, the applicant explained that peak construction is currently projected to occur in 2020, and the projected number of evacuating vehicles at that time is 51,255. A sensitivity study that considered 54,381 evacuating vehicles is provided in the ETE Report and shows there is no change to the ETE values with this increase in vehicles. This occurs because of a combination of excess roadway capacity within the 16-km (10-mi) EPZ, and because the ETE is influenced largely by the mobilization times for this site.

A separate analysis for people without personal vehicles is provided in ETE Report Section 8, "Transit Dependent and Special Facility Evacuation Time Estimates." Other transient groups include visitors to local recreational areas, boat launches, and parks. In RAI 25, Question 13.03-23, the staff requested that the applicant provide additional information regarding how transients and employees are factored into the need for additional transit services. The applicants response explained that because there is no mass transit to bring employees and transients into the area, the report assumes that employees and transients will evacuate via the same transportation method used to enter the evacuation area and do not require transit resources for evacuation. In RAI 25, 13.03-29, the staff requested the applicant provide clarification of information regarding special facility transit demand. In a March 4, 2010, response, the applicant explained that contributions for one of the Medical Centers were not included in the total and a revised ETE Report Table 8-4 was provided.

ETE Report, Appendix E, "Special Facility Data," includes data for schools, daycare centers, medical facilities and nursing homes, correctional facilities, hotels, motels and major retail areas. The medical facility patients are identified as ambulatory, wheelchair, and bedridden to quantify specialized vehicles needed to support the evacuation. Revision 2 of the ETE Report lists the EPZ school populations for Cherokee County, York County, and Cleveland County with a combined enrollment of over 10,800 students and 700 staff. Daycare centers in Cherokee County and York County have an enrollment of over 750 children and about 120 employees. In Revision 2 of the ETE Report, medical facilities and nursing homes with inpatient services are listed in Table 8-4, "Special Facilities Transit Demand," showing a capacity of over 500 residents. In RAI 25, Question 13.03-52, the staff requested that the applicant provide additional information regarding the definition of staff for these facilities. In a December 17, 2008, response, the applicant clarified that "staff" includes faculty, but does not include administrative, custodial, food service, and adult volunteers. In RAI 25, Questions 13.03-28(A) and 13.03-28(B), the staff requested that the applicant provide additional information regarding the adequacy of numbers of school buses for a single wave of evacuation. In a March 4, 2010, response, the applicant stated that there were an insufficient number of school buses in Cherokee County for a single wave of relocation. Evacuation of schools and transit-dependent individuals with the existing inventory of school buses available in Cherokee County would require additional trips resulting in an associated increase in the ETE. The applicant provided additional information stating that in accordance with a statewide mutual aid agreement, that in the event of an emergency at the WLS, additional bus transportation resources could be requested from other, non-affected counties or school districts. Also, additional analysis on the impact of solely using Cherokee County school busses for a second and third wave evacuation was provided. In RAI 83, Question 13.03-76, the staffed requested that the applicant provide an analysis to quantify the effect of these multiple trips on the ETE and to identify additional resources or implementation of alternate methods (e.g., mutual aid agreements) that will allow for single wave evacuation. In a December 11, 2009, response, the applicant stated that in accordance with a statewide mutual aid agreement, that in the event of an emergency at WLS, additional bus transportation resources could be requested from other, non-affected counties or school districts. Also, additional analysis on the impact of solely using Cherokee County school busses for a second and third wave evacuation was provided. The applicant updated the WLS Emergency Plan and the ETE Report and incorporated the necessary changes to resolve this question. The staff finds the applicant's responses to RAI 25, Question 13.3-28 and RAI 83, Question 13.03-76 acceptable. Accordingly, the staff considers these questions resolved.

In RAI 25, Questions 13.03-25(A) and 13.03-25(C), the staff requested that the applicant provide additional information regarding evacuation of daycare centers. . In a December 17, 2008, response, the applicant explained that to evacuate children not picked up by parents during the 90-minute mobilization period, daycare centers can transport children to the nearest public elementary school where they can evacuate with the school children. Daycare centers requiring transportation support may also contact the county emergency management agency who would dispatch buses to the daycare center when they become available following evacuation of the school children.

The ETE Report states that the 16-km (10-mi) EPZ has a number of areas that attract transient populations including Prime Outlets at Gaffney, Kings Mountain National Military Park, Kings Mountain State Park and hotels and motels. An estimate of the transient population is provided in ETE Report Section 3, "Demand Estimation," with the cumulative total population presented in ETE Report Figure 3-4, "Transient Population by Sector." The total transient population is listed as 6,678 requiring 2,790 vehicles. The method used to estimate the transient population within the 16-km (10-mi) EPZ included obtaining hotel information from the Cherokee County Office of Emergency Management (OEM), estimating parking spots using aerial imagery for the outlets stores, and obtaining data for the National Military Park and State Park from York County OEM. The staff notes this approach is consistent with the guidance in NUREG/CR-6863.
In RAI 25, Question 13.03-20, the staff requested that the applicant provide additional information concerning transient populations in small parks, recreation areas, and campgrounds not listed in the ETE Report. In a December 20, 2008, response, the applicant indicated that these small facilities are assumed to be used by local residents who are already accounted for in the general population estimates. There is one correctional facility within the 16-km (10-mi) EPZ. In RAI 25, Questions 13.03-25(A) and 13.03-25(B), the staff requested that the applicant provide additional information regarding evacuation of correctional center inmates. In a December 17, 2009, response, the applicant stated that the Cherokee County Detention Center maintains emergency plans that cover facility evacuation and any such evacuation would require only four buses, which would not impact the ETE.

The ETE study states that based on data provided by Limestone College, there are 740 students, of which 370 commute, and it is estimated that 20 percent of the students commute from beyond the 16-km (10-mi) EPZ. In RAI 25, Question 13.03-25(D), the staff requested that the applicant provide additional information about evacuation of Limestone College students. In a December 17, 2008, response, the applicant explained that half of the students are campus residents included in the general population and 80 percent of the remainder are local residents; therefore, only about 74 students are in the same category as "employee commuters." This accounting resulted in a minor change to the ETE Report.

Therefore, in RAI 123, Question 13.03-97, the staff requested that the applicant explain why college students are included as permanent population if they are evacuating in their own vehicles. In a November 6, 2014, response, the applicant explained that the on-campus student population is 1,030 and there is no need to include the full enrollment because this would consider online students and extended campus students who would not be part of an evacuation. The staff finds the applicant's response to RAI 123, Question 13.03-97 acceptable. Accordingly, the staff considers this question resolved.

Evacuation routes are described and times are estimated for transit-dependent and special facilities in ETE Report Section 8, "Transit dependent and Special Facility Evacuation Time Estimates." Additional information provided by the applicant in a November 25, 2009, response to RAI 25, Question 13.03-27, which clarifies that medical facility residents are all assumed to be evacuated by bus. Revision 2 of the ETE Report states that based on experience at other plants, the estimated average mobilization time for buses is 90 minutes. The method for developing the ETEs considered evacuation of the inner areas and outer areas in each direction around the 16-km (10-mi) EPZ. The 3.2-km (2-mi) zone is assumed to be evacuated simultaneously with the downwind sectors and ERPAs following the keyhole configuration. Vehicles traveling through the 16-km (10-mi) EPZ (external trips) at the time of an accident are assumed to continue to enter the 16-km (10-mi) EPZ during the first 90 minutes. Thereafter, none are assumed to enter and those remaining also evacuate with the residents and other transients. In RAI 25, Question 13.03-41, the staff requested that the applicant provide clarification of the number of vehicles passing through the 16-km (10-mi) EPZ. In response, the applicant provided additional information about individual highway segments. In a December 9, 2008, response to RAI 25, Question 13.03-41(B), the applicant clarified that Floyd Baker Boulevard (State Route 11) is also called Chesnee Highway. In the response to RAI 25, Question 13.03-41(C), the applicant provided a revision to ETE Report Table 6-4 (which is also discussed in the response to RAI 25, Question 13.03-14).

In RAI 25, Questions 13.03-6, 13.03-26, and 13.03-30, the staff requested that the applicant provide additional information regarding possible additional special populations. In a March 4, 2010, response to RAI 25, Question 13.03-6, the applicant explained that up to seven additional medical facilities could be operating within the 16-km (10-mi(EPZ and that contact would be made with these facilities to verify that they are operational and to obtain population data. These contacts are described in the responses to RAI 25, Questions 13.03-26 and 13.03-30. In a March 4, 2010, response to RAI 25, Questions 13.03-26 and 13.03-30, the applicant explained that minor revisions will be made in the ETE Report to include these facilities but that each has its own transportation, resulting in no impact to the ETE. In RAI 25, Question 13.03-32, the staff requested that the applicant provide maps showing locations of these facilities. The applicant's response provided additional maps for the ETE Report.

In RAI 25, Question 13.03-15, the staff requested that the applicant provide additional information regarding special needs populations. In a March 4, 2010, response, the applicant provided additional information regarding estimates of homebound disabled individuals who are transit-dependent and proposed new text for the ETE Report. In RAI 25, Question 13.03-21(A), the staff requested that the applicant provide additional information regarding transient populations at special events routinely held in the region. In a November 20, 2008, response, the applicant provided a revision to Section 3 of the ETE Report describing the construction peak scenario and a sensitivity study related to inclusion of the Ed Brown Rodeo in the ETE estimates. In RAI 25, Question 13.03-21(B), the staff requested that the applicant provide additional information regarding peak tourist populations. In a November 20, 2008, response, the applicant clarified that peak tourist populations are included in the recreational areas, shopping, and lodging estimates.

The potential for double counting is discussed in ETE Report Section 3 and subsequent sections quantify how double counting is considered. This includes an approach that avoids double counting by treating non-EPZ residents as commuters and 16-km (10-mi) EPZ residents who are employed within the 16-km (10-mi) EPZ as residents. The mapping clarity is consistent with the guidance in NUREG/CR-6863, "Development of Evacuation Time Estimate Studies for Nuclear Power Plants," with resolution that supports a detailed review of the roadway network and geographic features.

In RAI 25, Question 13.03-13, the staff requested that the applicant provide clarification of the "3 Miles to EPZ" notation in ETE Report Figure 3-3, "Permanent Resident Vehicles by Sector" and ETE Report Figure 3-4, "Transient Population by Sector." In a November 11, 2008, response, the applicant defined the notation as a distance 5 km (3 mi) from the plant to the 16-km (10-mi) EPZ boundary. In RAI 25, Question 13.03-11, the staff requested that the applicant provide additional information regarding number of vehicles estimated per scenario. In a November 11, 2008, response, the applicant clarified the relationship of the scenarios to the vehicle estimates in these figures.

The ETE Report provides an estimate of the number of people who may need to evacuate. Three population segments are considered including permanent residents, transients, and persons in special facilities. The permanent population is adjusted for growth, and the population data is translated into two groups including those with automobiles and those without automobiles. The number of vehicles used by permanent residents is estimated using an appropriate automobile occupancy factor. Evacuation time estimates for simultaneous evacuation of the entire plume exposure pathway 10-mile EPZ were provided.

Estimates of transient populations are developed using local data including peak tourist volumes and employment data. Estimates for special facility populations are provided and schools are included in this segment.

The zones for which evacuation time estimates were determined encompass the entire area within the plume exposure pathway 10-mile EPZ. The maps are generally adequate for the purpose, and the level of detail is approximately the same as USGS quadrant maps. The assumptions on evacuation are based on simultaneous evacuation of inner and outer sectors.

The staff finds the clarifications, additional information, and textual revision submitted by the applicant in response to RAI 25, Questions 13.03-1, 13.03-6, 13.03-11, 130.3-13, 13.03-15, 13.03-20, 13.03-21(A and B), 13.03-22, 13.03-23, 13.03-25(A, B, C, and D), 13.03-26, 13.03-27, 13.03-28(A and B), 13.03-29, 13.03-30, 13.03-32, 13.03-41(A and B), and 13.03-52, acceptable because they conform to the guidance in NUREG-0654. The staff confirmed Revision 2 of the WLS Emergency Plan incorporated the information and textual changes provided in the response to RAI 25, Questions 13.03-6, 13.03-15, 13.03-21(A), 13.03-25(D), 13.03-26, 13.03-28(A and B), 13.03-29, and 13.03-30. The staff finds the ETE Report adequately addresses the estimate of the number of people who may need to be evacuated. This is acceptable because it conforms to the guidance in NUREG-0654, Appendix A, Section II.

Traffic Capacity

As described in ETE Report Section 1.1, "Overview of the ETE Process," a detailed field survey of the highway system and traffic conditions within the 16-km (10-mi) EPZ and shadow evacuation region was conducted. Major evacuation routes are shown in figures within ETE Report Section 10, "Evacuation Routes." The evacuation network used in the analysis is illustrated on mapping provided in ETE Report Appendix K, "Evacuation Roadway Network Characteristics," and the types and capacities of each roadway segment are listed by unique link numbers in ETE Report Table K-1, "Evacuation Roadway Network Characteristics." These unique link numbers identify the upstream and downstream node numbers, length, number of lanes, saturation flow rate, and free flow speed. The high quality of mapping is such that all evacuation routes are illustrated together with residential streets. Separate segments were established for areas where the roadway segment characteristics change or where the roadway is narrowed. In RAI 25, Question 13.03-39, the staff requested that the applicant provide additional information, describing the road network used for the evacuation routes, specifically, information regarding highway lane widths. In a December 9, 2008, response to RAI 25, Question 13.03-39, the applicant clarified the assumptions on lane widths.

The ETE Report included assumptions for determining the number of vehicles needed, as well as the methodology, for determining the transport dependent population. The applicant also analyzed travel times and potential locations for serious congestion along the evacuation routes. Since the maps provided in the ETE Report illustrated areas for which congestion was predicted, but not the duration of that congestion, additional information regarding duration of congestion was requested by the staff in RAI 25, Question 13.03-48. In a March 4, 2010, response, the applicant included updated figures with congested links identified that can be cross referenced to a new table containing related information. In Revision 2 of the ETE Report, traffic queuing and congestion areas are presented in Figure 7-3, "Areas of Traffic Congestion 1 Hour after the Advisory to Evacuate," through Figure 7-5, "Areas of Traffic Congestion 3 Hours after the Advisory to Evacuate." A Level of Service F, which indicates heavy congestion, is observed in and around Gaffney, South Carolina from 30 minutes until more than 2 hours after the advisory to evacuate. After about 3 hours, heavy congestion within the 16-km (10-mi) EPZ is no longer present.

In RAI 25, Question 13.03-12, the staff requested that the applicant provide clarification on several traffic capacity questions. In a March 4, 2010, response to RAI 25, Question 13.03-12(A), the applicant provided clarification that the ETE developed for school in session considers that the same buses will be used to evacuate transit-dependent individuals. In a March 4, 2010, response to RAI 25, Question 13.03-12(B) concerning the effect that this "second wave" had on the transit-dependent individual ETE, the applicant stated that after dropping off school children at the reception centers, the buses return to the 16-km (10-mi) EPZ to perform a "second wave" evacuation of transit-dependent persons. A minor adjustment to the ETE was also made to account for the response to RAI 25, Question 13.03-31, which adjusted assumed bus speeds. The applicant's response to RAI 25, Question 13.03-12(C) indicates that the bus routes pass schools and that some transit-dependent individuals will walk to the bus route and be picked up as the buses traverse these routes; others will walk to a school to await the arrival of a bus. In its response to RAI 25, Question 13.03-12(D) concerning the use of school buses on weekends and in summer, the applicant stated that some buses were assumed to be in use during these periods, but that the ETE calculations were not altered by this assumption. In RAI 25, Question 13.03-12E, the staff also requested that the applicant provide an explanation of inbound travel speed and time. In a March 4, 2010, response, the applicant stated that transit bus speeds would be 72 kph (45 mph) in good weather and 64 kph (40 mph) in adverse weather, conditional on the assumption that traffic control points would not hinder the movement of inbound buses. In a March 4, 2010, response to RAI 25, Question 13.03-12(F), the applicant provided the basis for the estimate for pickup time that each bus will, on average, contain 30 passengers, each picked up individually, with a delay associated with each stop of 1 minute.

The ETE Report Section 4, “Estimation of Highway Capacity,” describes the methods used to estimate highway capacity. Revision 2 of the ETE Report explains the methods used are generally taken from HCM 2000 published by the Transportation Research Board of the National Research Council. In RAI 13.03-40, the staff requested that the applicant provide additional information regarding use of empirical modifiers to the HCM queue discharge flow (QDF) rates. In a November 24, 2008, response, the applicant defended a conservative view in estimating the capacity at bottlenecks when congestion develops, so a QDF factor of 0.85, when flow breaks down as determined by the simulation model, was applied.

The modeling described in ETE Report Section 4 relies upon the simulation model PC DYNEV. In RAI 25, Question 13.03-10(A), the staff requested that the applicant provide clarification regarding the modeling of traffic through intersections. In a November 11, 2008, response, the applicant stated that application of traffic control points was not considered and the modeling used the equations presented in ETE Report Section 4. The staff notes this information was repeated in the December 9, 2008, response to the similar question in RAI 25, Question 13.03-43. In RAI 25, Question 13.03-10(B), the staff requested that the applicant clarify the use of field observations to determine allocation of characteristics to the modeled highway segments. In a November 11, 2008, response, the applicant supplied additional information regarding the use of data characteristics including number and estimated width of lanes, shoulder type and estimated width, intersection configuration, lane channelization, roadway geometrics; posted speed; actual free speed; abutting land use; traffic control devices; street parking; and signage. In RAI 25, Question 13.03-10(C), the staff requested that the applicant provide clarification of the use of several factors from the HCM in estimating flow rates of vehicles turning through intersections. In a November 11, 2008, response, the applicant provided additional information regarding the definition of these parameters.

ETE Report Section 9, “Traffic Management Strategy,” presents a traffic control and management strategy that is designed to expedite the movement of evacuating traffic. The traffic management strategy is based on a field survey of critical locations and consultation with emergency management and enforcement personnel. In RAI 25, Question 13.03-3, the staff requested that the applicant provide clarification on whether local officials concurred with the selection of traffic control points. In a November 7, 2008, response to RAI 25, Question 13.03-3, the applicant explained the iterative process through which the traffic management plan had been arrived at with county and State authorities. In RAI 25, Questions 13.03-34 and 13.03-35, the staff requested that the applicant provide clarification of how the traffic management strategy was integrated into the ETE calculations. The applicant’s responses states that the calculations do not rely upon any of the traffic control measures described and that their use would improve the ETE.

ETE Report Section 10,” Evacuation Routes,” discusses the emergency evacuation routes. In RAI 25, Question 13.03-38, the staff also requested details regarding the link node map presented in ETE Report Appendix K, “Evacuation Roadway Network Characteristics.” In a March 4, 2010, response to RAI 25, Question 13.03-38, the applicant included a disc that contained a revised copy of ETE Report Figure 1-2, “Lee Link Node Analysis Network.” In RAI 25, Question 13.03-36, the staff requested that the applicant provide clarification between the link node map and the evacuation routes of ETE Report Figures 10-2 through 10-5. In a March 4, 2010, response, the applicant clarified that there is no implication that evacuees are restricted to the major evacuation routes shown. The evacuation network includes many other minor roads that are capable of servicing evacuating traffic. In RAI 25, Question 13.03-37, the staff requested that the applicant provide Information regarding funneling of traffic into the reception centers outside of the 16-km (10-mi) EPZ. In a March 4, 2010, response, the applicant indicated that the Reception Centers will be located several miles beyond the 16-km (10-mi) EPZ boundary and that congestion in the vicinity of the relocation/reception centers is unlikely to impact the ETE.

The ETE Report provides a complete review of the evacuation road network. Analyses are made of travel times and potential locations for congestion. All evacuation route segments and their characteristics, including capacity, are described.

A traffic control and management strategy that is designed to expedite the movement of evacuating traffic is described. The traffic management strategy is based on a field survey of critical locations and consultation with emergency management and enforcement personnel. The applicant also analyzed travel times and potential locations for serious congestion along the evacuation routes.

The staff finds the clarifications, additional information and textual revision submitted by the applicant in response to RAI 25 Questions 13.03-3, 13.03-10(A, B, and C), 13.03-12(A, B, C, D, E, and F), 13.03-34, 13.03-35, 13.03-36, 13.03-37, 13.03-38, 13.03-39, 13.03-40, 13.03-43, and 13.03-48 are acceptable because they conform to the guidance in NUREG-0654. The staff confirmed that Revision 2 of the WLS Emergency Plan incorporated the information and textual changes provided in the response to RAI 25, Question 13.03-38. The staff finds the ETE Report adequately describes the highway capacity estimates. The staff considers this acceptable because it conforms to the guidance in NUREG-0654, Appendix 4, Section III.

Analysis of Evacuation Times

The ETE study includes an analysis of permanent residents and transient populations, transit-dependent permanent residents (including ambulatory and non-ambulatory), special facility residents, and schools. There are 12 scenarios described in ETE Report Table 6-2, “Evacuation Scenario Definitions.” These scenarios cover different times of day, days of the week, weather conditions, and a special event. The ETEs for the permanent residents and transients were developed for the 12 evacuation scenarios for each of the 22 evacuation regions presenting a total of 264 unique ETEs.

The assumptions regarding the population allocation for each evacuation scenario are described in ETE Report Table 6-3, “Percent of Population Groups for Various Scenarios.” The percentage of each group of the public for each of the scenarios includes households with returning commuters, households without returning commuters, employees, transients, shadow, and special events. ETE Report Section 5, “Estimation of Trip Generation Time,” describes the process used to develop distributions of elapsed times associated with mobilization activities for each population subgroup for each scenario. A telephone survey of residents of the 16-km (10-mi) EPZ was conducted to gather data for trip generation time elements. In RAIA 25, Question 13.03-24, the staff requested that the applicant provide additional information regarding trip generation times for transients. In a November 20, 2008, response, the applicant clarified that the 2-hour mobilization time for transients is adequate for those transients who return to their lodging facilities before evacuating. In RAI 25, Questions 13.03-45(A) through 13.03-45(F), the staff requested that the applicant provide additional information regarding use of truncated distributions of mobilization times. For each question (A) through (F), in the applicant's December 17, 2008, response the applicant explained that distributions were shortened because the objective was to evaluate the evacuation times under circumstances of greatest highway loading, given the uncertainty about those who are reluctant to prepare to leave or unwilling to evacuate. The applicant stated that although a telephone survey had indicated that some people would require as much as 6 hours preparing for an evacuation, it had used a 4-hour preparation time in its ETE calculations.

The ETEs range from one hour thirty minutes to three hours twenty minutes for the ninetieth percentile normal weather general population. The maximum ETE for the one hundredth percentile is four hours twenty minutes for evacuation during special event, which is the construction of the new plant. Separate ETEs were developed for the transit-dependent and special facility populations. In RAI 25, Question 13.03-46, the staff requested that the applicant provide an explanation for the absence of a "prepare to leave activity" and "travel home" sequences for scenarios on weekends. ETE Report Figure 5-1, "Events and Activities Preceding the Evacuation Trip," was revised to show these activities. The applicant provided data and an analysis example, which explains that due to the small number of people in the affected region working on weekends, the times for those sequences are negligible. Trip generation times were based on results from a telephone survey of the region. In RAI 25, Question 13.03-47, the staff requested that the applicant provide additional information about normalization of the "Don't Know" response to the telephone survey. In a November 24, 2008, response, the clarified that, in effect, the "Don't Know" responses are ignored.

ETE Report Section 6, "Demand Estimation for Evacuation Scenarios," defines the various evacuation cases for which time estimates were made, where a case is a combination of a scenario and a region. A scenario is defined to be a combination of circumstances, including time of day, day of week, season, and weather conditions. Scenarios define the number of people in each of the affected population groups and their respective mobilization time distributions. A region is defined to be a grouping of contiguous evacuation zones, which forms either a "keyhole" sector based area, or a circular area within the plume exposure pathway EPZ, that is evacuated in response to a radiological emergency. The WLS plume exposure pathway EPZ has been defined to contain 14 ERPAs, with boundaries along major roads or rivers. The boundaries do not bisect any population centers.

A summary of the ETEs are provided in ETE Report Section 7, "General Population Evacuation Time Estimates (ETE)." The evacuation times are presented for all 22 evacuation regions and 12 scenarios in ETE Report Appendix J, "Evacuation Time Estimates for All Evacuation Regions and Evacuation Time Graphs for Region 3 (R3), for All Scenarios." Results are presented for 50 percent, 90 percent, 95 percent, and 100 percent of vehicles. Results are also provided for good and adverse (rainy) weather conditions. Evacuation times are reported separately for the general population, schools, and transit-dependent population. ETE Report Figures J-1 through J-12, "Evacuation Time Estimates – Scenarios 1 through 12 for Region 3 (Entire EPZ)," describe the time distribution of evacuating vehicles. In RAI 25, Question 13.03-2, the staff requested that the applicant provide clarification regarding whether the results presented in ETE Report Section 7 included schools, transit dependents, and special facilities. In a November 7, 2008, response, the applicant clarified that the ETE Report Section 7 results include only the general population and that the school, transient, and special facilities populations are reported separately. In RAI 25, Question 13.03-17, the staff requested that the applicant provide clarification regarding the use of rain as adverse conditions rather than icy conditions. In a November 11, 2008, response, the applicant stated that the counties considered icy conditions to be a low probability event that was not seriously under represented by rainy conditions. The apparent lack of impact of adverse weather on the calculated ETE values was questioned by the staff in RAI 25, Question 13.03-49. In a November 24, 2008, response, the applicant clarified that rain reduces the free travel speed somewhat, which is generally not sufficient by itself to increase the ETE, due to the relatively short trip lengths. In RAI 25, Question 13.03-33, the staff requested that the applicant provide clarification regarding the "long tail" of the traffic flow rates as a function of time. In a November 25, 2008, response, the applicant explained that the "long tail" of the curve in the Figure 7-6 of the ETE Report is where the slope of the curve has decreased to the point of being nearly horizontal. The staff finds the applicant's explanation acceptable.

The IDYNEV System, which includes the PC-DYNEV macroscopic simulation model and the Traffic Assignment Model (TRAD), was used in the analysis. Inputs, outputs, and measures of effectiveness for the traffic simulation model are discussed throughout the ETE Report, and a step by step process for integrating the data and models to produce ETEs is provided.

The combined time dependent mobilization distribution, which represents traffic loading, is presented in ETE Report Figure 5-3, "Evacuation Trip Generation for Various Population Groups." The simulation model analyzes when and where roadways are nearing capacity, and calculates the travel delays, queuing lengths, and travel times throughout the network. Traffic queuing and congestion areas are presented in ETE Report Figures 7-3 through 7-5, showing a Level of Service F, which indicates heavy congestion, is observed in and around Gaffney, SC from 30 minutes until more than 2 hours after the advisory to evacuate. After about 3 hours, heavy congestion within the 16-km (10-mi) EPZ is no longer present.

The ETE study describes the evacuation of ambulatory persons from special facilities as requiring 54 wheelchair bus runs. The resources required for each facility are identified in ETE Report Table 8-4, "Special Facility Transit Demand." ETE Report, Revision 2, Section 8.4, "Evacuation Time Estimates for Transit Dependent People," explains that wheelchair buses and vans are often scarce, but that regular buses can be used to transport wheelchair patients.
In RAI 123, Question 13.03-98, the staff requested that the applicant provide information regarding the resources required to evacuate the special facilities. In a November 6, 2014, response, the applicant clarified that the resources identified in ETE Report Table 8-4 do not include regular buses. The applicant explained that in an earlier response on December 11, 2009, to RAI 83, Question 13.03-76, limitations on school buses and the impact to the ETE were discussed. The applicant explained that due to these limitations, the ETE for a multiple wave response was developed resulting in an 8-hour ETE for good weather and 9 hours 15 minutes for rain for schools and the transit-dependent population. However, the maximum ETE for schools shown in the ETE Report, Revision 2, Table 8-5E, "Third Wave School Evacuation Time Estimate – Good Weather," is 5 hours 45 minutes, and the maximum ETE for rain for the third wave is 6 hours 35 minutes. In RAI 123, Question 13.03-98, the staff requested that the

applicant provide information regarding the impact to the ETE due to time to acquire regular buses and time for buses to complete other activities prior to supporting special facility evacuations. In a November 6, 2014, response, the applicant described the times needed to evacuate schools and the transit-dependent population are 8 hours in good weather and 9 hours 15 minutes in rain. The times were given in response to RAI 83, Question 13.03-76. The assumption that the applicant held is that there would be three waves of school evacuations before a single evacuation wave for the transit-dependent population. That is, the school evacuations have priority.

The times given were the sum of the average elapsed time to complete the three waves of school evacuations and the average of the single wave of transit-dependent evacuations. In each case, the applicant limited the evacuation to use only the 60 buses of Cherokee County. With both of the assumptions, the evacuation times are as follows:

Evacuation Population	Evacuation Times (hr:min)	
	Good Weather	Rain
Schools	5:30 (ETE Report Table 8-5E)	6:15 (ETE Report Table 8-5F)
Transit-dependent	2:30 (ETE Report Table 8-7A)	2:55 (ETE Report Table 8-7B)
Total	8:00	9:15 (sum rounded up)

The results prompted Cherokee County to find and use other resources, which are available through the South Carolina Statewide Mutual Aid Agreement for Catastrophic Disaster Response and Recovery. Using the mutual aid agreement will ensure sufficient transportation resources are available for timely evacuation of school children and transit-dependent people and allow the evacuations of both populations to occur simultaneously. The use of additional resources through the mutual aid agreement will reduce the amount of evacuation times. The staff finds the applicant’s responses to RAI 25, Question 13.03-76 and RAI 123, Question 13.03-98 acceptable.

A series of sensitivity tests are documented in Appendix I, “Evacuation Sensitivity Studies,” including sensitivity of the results to trip generation time (directly related to time-dependent traffic loading) and to the amount of shadow evacuation.

The ETE Report includes separate calculations for special populations of school children and transit-dependent individuals in ETE Report Section 8, “Transit Dependent and Special Facility Evacuation Time Estimates.” In RAI 25, Question 13.03-8, the staff requested that the applicant provide clarification of assumptions regarding mobilization of school buses. In a November 11, 2008, response, the applicant stated that the county authorities had suggested 90 minutes for Cherokee County schools, but that the schools in York and Cleveland Counties required only 30 minutes because the buses for those schools remained at the schools. Telephone survey results are used to estimate the portion of the population requiring transit service, including persons in households that do not have a vehicle available and persons in households that have vehicles, but these vehicles would not be available at the time the evacuation is ordered. ETE Report Table 8-1, “Transit Dependent Population Estimates,” shows 2,539 transit-dependent people, of which 1,270 of these would require public transport. ETE Report Table 8-6, “Summary of Transit Dependent Bus Routes for the Lee Nuclear Station,” lists 42 bus runs on 11 routes to evacuate this population. In the ETE Report, Revision 2, Section 8.4, “Evacuation Time Estimates for Transit Dependent People,” the applicant explained that the dispatch of buses should consider the time for transit-dependent evacuees to complete their mobilization activities and be in position to board buses when they arrive. ETE Report Section 8.4 states that bus resources are assigned to evacuating schoolchildren as the first priority. In RAI 123, Question 13.03-99, the staff requested that the applicant provide information regarding the resources needed to evacuate the transit-dependent population. In a November 6, 2014,response, the applicant explained that the times in ETE Report Tables 8-7A and 8-7B do not begin at the end of the three wave school evacuation because it is assumed that additional buses from neighboring counties will be available pursuant to mutual aid agreements. The staff finds the applicant’s response to RAI 123, Question 13.03-99 acceptable.

Proposed routes for transit-dependent and special facility populations are shown in ETE Report Figure 8-2, “Proposed Transit Dependent Bus Routes.” Assumed general population reception centers are shown in ETE Report Figure 10-1, “Assumed General Population Reception Centers.” Clarification of bus routes was requested by the staff in RAI 25, Question 13.03-16. In a November 20, 2008, response, the applicant included a revised ETE Report Figure 8-2 outlining the assumed routing for buses. In RAI 25, Question 13.03-18, the staff requested that the applicant provide clarification of travel times for bus service through congested areas of the City of Gaffney, South Carolina. In a November 20, 2008, response, the applicant stated that average speeds in congested areas include periods of higher speed outside of the congested zones. In RAI 25, Question 13.03-19, the staff requested that the applicant explain the assumptions regarding bus return times for “second wave” evacuation. In a November 20, 2008, response, the applicant clarified that the travel times back to the 16-km (10-mi) EPZ for those buses performing a second wave evacuation of transit dependents are the average travel times based on assumed bus speeds of 72 kph and 64 kpm (45 mph and 40 mph) for good weather and rain, respectively. The bus routes identified in ETE Report Figure 8-2 illustrate the primary evacuation routes and are described in ETE Report Table 8-6, “Summary of Transit Dependent Bus Routes for the Lee Nuclear Station,” which identifies buses travelling major roadways. The Cherokee County Emergency Operating Procedure states that residents should walk to the nearest public school if it is within 0.8 km (0.5 mi) or contact the Cherokee County Emergency Management Agency for assistance. In RAI 123, Question 13.03-100, the staff requested that the applicant provide a description of how the ETE calculation considers the time for buses to travel residential routes to pick up those residents living more than one-half mile from schools. In response, the applicant referenced ETE Report Figure 5-3, “Comparison of Trip Generation Distributions,” show that 85 percent of these evacuees will be ready in 90 minutes, and 100 percent would be ready in 180 minutes. The applicant explained that ETE Report Tables 8-7A and B show 90 minutes for mobilization in good weather and 100 minutes for mobilization in the rain, respectively. The ETE Report shows an additional 30 minutes for pickup time. When considering pickup times, route travel times, and return to the EPZ, the second wave of evacuation takes more than 180 minutes to begin, showing that there is time for all residents to mobilize. In RAI 123, Question 13.03-101, the staff requested that the applicant provide information regarding the ETE values for the transit-dependent population. In a

November 6, 2014, response, the applicant explained that ETE Report, Tables 8-7A and B include time for all buses to complete the evacuation route because the buses travel the routes simultaneously. With this process, there is no impact to the ETE because all buses are considered in the analysis. The staff finds the applicant's responses to RAI 123, Questions 13.03-100 and 13.03-101 acceptable.

The quantity and type of specialized vehicles required to support evacuation of special facilities and special needs populations are identified. The ETE Report, Revision 2 explains that bus mobilization time for special facilities is estimated to be 90 minutes based on experience at other plants. In RAI 123, Question 13.03-102, the staff requested that the applicant provide additional information regarding bus mobilization time. In a November 6, 2014, response, the applicant explained that although previous experience for mobilization times was initially based on other plants, the counties either confirmed or corrected the mobilization times, and county specific times were used in the analysis. In ETE Report Section 8.5, "Special Needs Population," the ETE Report, Revision 2 explains that 24 ambulance runs are needed to evacuate the special facility bed-ridden population and 10 ambulance runs are needed to evacuate the homebound special needs residents. The ETE study describes the time to evacuate the special facility residents first, followed by the homebound population. The study explains that ambulances will be provided from within the 16-km (10-mi) EPZ and additional ambulances will be provided by neighboring cities. In RAI 123, Question 13.03-103, the staff requested that the applicant provide additional information regarding ambulance resources. In a November 6, 2014, response, the applicant clarified that there are 17 ambulances available within 30 minutes, and 7 of these are based in the EPZ. An additional 30 ambulances are available within 90 minutes of notification. The applicant explained that the ETE Report includes the time for ambulances to make return trips to pick up the next set of residents. Using the ambulances that are available within 90 minutes of notification would reduce the ETE value. The maximum ETE for this population segment is 4 hours and 25 minutes. The staff finds the applicant's responses to RAI 123, Questions 13.03-102 and 13.03-103 acceptable.

A total of 264 evacuation time estimates are computed for the evacuation of the general public. Each evacuation time estimate quantifies the aggregate evacuation time estimated for the population within one of the 22 Evacuation Regions to completely evacuate from that Region, under the circumstances defined for one of 12 evacuation scenarios (22 x 12 = 264). Separate evacuation time estimates are calculated for transit-dependent evacuees, including school children. An acceptable variant of the NUREG-0654 format is used for the presentation of the evacuation times.

Distribution functions for notification of the various categories of evacuees were developed. The distribution functions for the action stages after notification predict what fraction of the population will complete a particular action within a given span of time. There are separate distributions for auto-owning households, school population, and transit-dependent populations. These times are combined to form the trip generation distributions.

On-road travel and delay times are calculated. An estimate of the time required to evacuate a particular segment of the non-auto-owning population dependent on public transportation is developed, in a manner similar to that used for the auto-owning population.

The staff finds the clarifications, additional information, and textual revision submitted by the applicant in response to RAI 25, Questions 13.03-2, 13.03-8, 13.03-16, 13.03-17, 13.03-18, 13.03-19, 13.03-24, 13.03-33, 13.03-45(A through F), 13.03-46, 13.03-47, and 13.3-49 acceptable because they conform to the guidance in NUREG-0654. The staff also confirmed that Revision 2 of the WLS Emergency Plan incorporated the information and textual changes provided in the response to RAI 25. Questions 13.03-16 and 13.03-46.

The staff finds that the ETE Report adequately addresses the descriptions of the methods used to estimate the evacuation times. The staff finds this acceptable because it conforms to the guidance in NUREG-0654, Appendix 4, Section IV.

Other Requirements

ETE Report Section 11, "Surveillance of Evacuation Operations," addresses monitoring of the evacuation by use of staff at traffic control points, ground and aerial surveillance and citizen reports via cellular telephones. Surveillance of the evacuation will be coordinated and executed by local authorities. ETE Report Section 12, "Confirmation Time," describes the necessity to confirm the evacuation process and explains this is a county level responsibility. In RAI 13.03-50, the staff requested that the applicant provide clarification regarding assumptions regarding telephone surveys and county agreements on methods of confirming evacuation. In a November 24, 2008, response, the applicant identified an advantage to the telephone based approach and suggested the approach could be reinforced with ground vehicles if decided at a later date. The use of a telephone survey is one approach suggested in NUREG-0654.

Intelligent Transportation Systems (Dynamic Message Signs, Highway Advisory Radio, Automated Traveler Information Systems, etc.) are discussed in ETE Report Section 9. In RAI 25, Question 13.03-51, the staff requested that the applicant provide additional information regarding the use of such systems in the ETE analysis. In a November 24, 2008, response, the applicant clarified that the various intelligent transportation systems were not credited in the development of the ETE, and the results of the ETE are not dependent on their use.

The development of the ETE Report was coordinated with emergency planners from the State of South Carolina, and from Cherokee and York Counties, which are involved in emergency response for the site. In RAI 25, Question 13.03-3, the staff requested that the applicant provide information regarding the review of the ETE Report by State and local organizations involved with emergency response. In a November 7, 2008, response, the applicant described collaboration with State and local emergency management officials and law enforcement personnel in developing the ETE analysis and resolving their comments on the draft ETE Report. In addition, RAI 25, Question 13.03-3, the staff requested that the applicant provide clarification regarding whether State and local organizations provided any comments and that any comments and their resolution be provided as additional information. In a November 7, 2008, response to RAI 25, Question 13.03-3, the applicant described its collaboration with State and local emergency management officials and law enforcement personnel in developing the ETE analysis and resolving their comments on the draft ETE Report. Also, in RAI 25, Question 13.03-3, the staff requested that the applicant provide specific clarification regarding whether the State and local emergency response agencies had concurred with traffic control point and access control point selection and arrangements. In a November 7, 2008, response, the applicant stated that State and local emergency response agencies had concurred with the traffic control points during the development of the Emergency Plan and ETE, and had signed letters of commitment to support the Emergency Plan and ETE. In a November 11, 2008, response to RAI 25, Question 13.03-9, in which the staff requested that the applicant provide clarification of the use of traffic control points in the ETE estimate, the applicant explained that the functions of the traffic control points were not assumed in the ETE estimation and would act to reduce the time if employed. The staff noted in RAI 25, Question 13.03-53 that ETE Report Table G-1, "Lee Nuclear Station Traffic Control Points," that summarized the traffic control points was referred to but omitted from the ETE Report. The applicant's response rectified this omission.

In the March 4, 2010, submission of Revision 2 of the ETE Report, the applicant explained that ETE Report, Revision 2 was provided to State and county emergency management agencies for review and comment. In a March 4, 2010, letter, the applicant provided a list of state and county agencies that had been provided a copy of Revision 2 of the ETE Report. The applicant also provided copies of signed letters from these agencies which indicate they have reviewed the document.

The applicant estimated the time required for confirmation of evacuation. In addition, the development of the ETE Report was coordinated with emergency planners from the state and counties who are involved in emergency response for the site.

The staff finds the clarifications, additional information, and textual revision submitted by the applicant in response to RAI 25, Questions 13.03-3, 13.03-9, 13.03-50, 13.03-51, and 13.03-53 acceptable because they conform to the guidance in NUREG-0654. The staff confirmed that Revision 2 of the WLS Emergency Plan incorporated the information and textual changes provided in the response to RAI 25, Question 13.03-53. The staff finds the ETE Report adequately addresses the description of the procedure to confirm that the evacuation process is effective. This is acceptable because it conforms to the guidance in NUREG-0654, Appendix 4, Section V.

Conclusions

The ETE Report describes the method of analyzing the evacuation times. A general description of the evacuation model was provided including the assumptions used in the evacuation time estimate analysis.

The staff finds the ETE Report adequately addresses the estimate of the number of people who may need to be evacuated. This is acceptable because it conforms to the guidance in NUREG-0654, Appendix 4, Section II.

The ETE Report provides a complete review of the evacuation road network. Analyses are made of travel times and potential locations for congestion. All evacuation route segments and their characteristics, including capacity, are described.

A traffic control and management strategy that is designed to expedite the movement of evacuating traffic is described. The traffic management strategy is based on a field survey of critical locations and consultation with emergency management and enforcement personnel. The applicant also analyzed travel times and potential locations for serious congestion along the evacuation routes.

The time required for confirmation of evacuation was estimated. In addition, the development of the ETE Report was coordinated with emergency planners from the state and counties who are involved in emergency response for the site.

On the basis of its review of the analysis of the ETE Report as described above, the staff concluded that the information provided in the ETE Report is consistent with the guidance in Appendix 4 to NUREG-0654, Appendix 4; NUREG-6368; and portions of NUREG/CR--002 as described above. Therefore, the staff considers the ETE Report acceptable and meets the applicable requirements of 10 CFR Part 50, Appendix E.IV.

13.3.4.18 AP1000 COL Information Items

WLS COLA FSAR Table 1.8-202, "COL Item Tabulation," identifies two COL information items from AP1000 DCD Tier 2, Section 13.3.1, relating to EP. These consist of STD COL 13.3-1 and STD COL 13.3-2, which correspond to COL Action Items 13.3-1 and 13.3.3.3.5-1, respectively, in NUREG-1793, Section 13.3. The following addresses the resolution of the two COL information items.

- STD COL 13.3-1

STD COL Information Item 13.3-1 requires that COL applicants referencing the AP1000 certified design will address EP, including post-72 hour actions and its communication interface. In consideration of WLS COL 13.3-1, the applicant addressed STD COL 13.3-1 in WLS COL FSAR Section 13.3 by stating the following:

> The emergency planning information is submitted to the Nuclear Regulatory Commission as a separate licensing document (WLS COL 13-3.1).
>
> Post-72 hour support actions, as discussed in DCD Subsections 1.9.5.4 and 6.3.4, are addressed in DCD Subsections 6.2.2, 8.3, and 9.1.3. Provisions for establishing post-72 hour ventilation for the main control room, instrumentation and control rooms, and dc [direct current] equipment rooms are established in operating procedures.

The staff's evaluation of communication interfaces is addressed above in Section 13.3.4.6, "Emergency Communications," of this report. With regard to post-72 hour actions associated with the AP1000 DCD, the applicant referenced operating procedures and various AP1000 DCD sections listed above that address post-72 hour support actions. The staff identified additional AP1000 DCD Tier 2 sections that address post-72 hour support actions, which include AP1000 DCD Sections 6.4, "Habitability Systems"; 9.4, "Air-Conditioning, Heating, Cooling, and Ventilation System"; and 9.5, "Other Auxiliary Systems," for example, plant lighting systems described in AP1000 DCD, Section 9.5.3.

As discussed in AP1000 DCD Section 1.9.5.4, post-72 hour support actions relate to an extended loss of the non-safety-related systems for both offsite and onsite ac power sources for more than 72 hours. For purposes of the staff's review of EP information in the WLS COLA, and in the context of COL Action Item 13.3-1, the reference to post-72 hour support actions is limited and indirectly related to the habitability and functionality of the TSC. Specifically, it is limited to the reliability of the electrical power supply (post-72 hours) to the TSC ventilation system and communication equipment. The evaluation of the reliability of the electrical power supplies, including the power supplies to the TSC, is addressed in the AP1000 DCD sections referenced above. The habitability and functionality of the TSC is addressed in Section 13.3.4.8 of this report.

The staff finds that the applicant has addressed EP communication interfaces in support of WLS Units 1 and 2 in the WLS Emergency Plan. In addition, the applicant has addressed post-72 hour actions through reference to the AP1000 DCD sections that specifically address an extended loss of the non-safety-related systems for both offsite and onsite ac power sources for more than 72 hours. The staff's evaluation of those systems and power sources, including the establishment of associated operating procedures, are addressed in their respective sections of this report. Therefore, the staff finds that the COL applicant has adequately addressed STD COL 13.3-1.

- STD COL 13.3-2

STD COL 13.3-2 requires that COL applicants referencing the AP1000 certified design will address the activation of the EOF, consistent with current operating practice and NUREG-0654. In WLS COL FSAR Section 13.3, the applicant addressed STD COL 13.3-2 by stating that the emergency plan describes the plans for coping with emergency situations, including communication interfaces and staffing of the EOF.

Activation and staffing of the EOF is described in the WLS Emergency Plan, and the staff's evaluation of this information is addressed in Section 13.3.4.2, "Onsite Emergency Organization," Section 13.3.4.3, "Emergency Response Support and Resources," Section 13.3.4.5, "Notification Methods and Procedures," and Section 13.3.4.8, "Emergency Facilities and Equipment," of this report. Communication interfaces are addressed in Section 13.3.4.6, "Emergency Communications," of this report. Therefore, the staff finds that the COL applicant has adequately addressed STD COL 13.3-2.

- WLS COL 9.5-9 and WLS COL 9.5-10

WLS COL 9.5-9 requires that COL applicants referencing the AP1000 certified design will address interfaces to required offsite locations, including the recommendations of BL-80-15 regarding loss of the emergency notification system due to a loss of offsite power. In addition, WLS COL 9.5-10 requires that COL applicants referencing the AP1000 certified design will address the emergency offsite communication system, including the crisis management radio system. In WLS COL FSAR Section 9.5.2.2.3, the applicant addressed WLS COL 9.5-9 and WLS COL 9.5-10 together by stating that offsite interfaces and emergency offsite communication are described in the emergency plan (See also, WLS COL FSAR Table 1.8-202).

The applicant described the emergency notification systems, including the ENS, in WLS Emergency Plan, Section II.E, and the emergency communication systems in WLS Emergency Plan, Section II.F. The staff's evaluation of offsite emergency notification and communication systems is addressed in Sections 13.3.4.5 and 13.3.4.6, respectively of this report. Therefore, the staff finds that the COL applicant has adequately addressed WLS COL 9.5-9 and WLS COL 9.5-10, with regard to emergency planning for WLS Units 1 and 2. Offsite interfaces and emergency offsite communication are discussed further in Section 9.5.2, "Communication System," of this report.

- WLS COL 18.2-2

WLS COL 18.2-2 requires that COL applicants referencing the AP1000 certified design will provide specific information regarding EOF and TSC communication and human factors attributes. WLS COL FSAR Table 1.8-202 identifies WLS COL FSAR Section 18.2.1.3 as the location where WLS COL 18.2-2 is addressed. In WLS COL FSAR Section 18.2.1.3, the applicant addressed WLS COL 18.2-2 by stating that the EOF and TSC communication strategies, as well as the EOF and TSC human factors attributes, are described in the emergency plan.

The applicant described EOF and TSC communication and human factors attributes in WLS Emergency Plan, Sections II.E, II.F, and II.H. The staff's evaluation is addressed in Sections 13.3.4.5, 13.3.4.6, and 13.3.4.8, respectively, of this report. Therefore, the staff finds that the COL applicant has adequately addressed WLS COL 18.2-2, with regard to emergency planning for WLS Units 1 and 2. WLS COL 18.2-2 is discussed further in Section 18.2, "Human Factors Engineering Program Management," of this report.

13.3.4.19 Supplemental Information

- STD SUP 13.3-1

Activities that the COL holder shall perform after the COL is issued, that are applicable to emergency planning, consist of the implementation milestones and license conditions. The applicant provided supplemental information in STD SUP 13.3-1, which states that WLS COL FSAR Table 13.4-201, "Operational Programs Required by NRC Regulations," provides milestones for emergency planning implementation. WLS COL FSAR Table 13.4-201 identifies the emergency planning program as operational program Item No. 14, and includes the four associated implementation milestones listed below. (See also, Table 13.3-1 of this report, ITAAC 8.1.) The staff reviewed WLS COL FSAR Table 13.4-201, and finds that the identified implementation milestones associated with the emergency planning program are acceptable because they are consistent with the relevant guidance and acceptance criteria in NUREG-0800; therefore, the milestones meet the respective requirements in 10 CFR Part 50, Appendix E. (See also, Sections 1.5.5[11] and 13.4 of this report.)

Implementation Milestones

- A full participation exercise conducted within 2 years of the scheduled date for initial loading of fuel, as required by 10 CFR Part 50, Appendix E, Section IV.F.2(a)(ii)
- Onsite exercise conducted within 1 year before the scheduled date for initial loading of fuel, as required by 10 CFR Part 50, Appendix E, Section IV.F.2(a)(ii)

---

[11] Section 1.5.5, "Receipt, Possession, and Use of Source, Byproduct and Special Nuclear Material Authorized by 10 CFR Part 52 Combined Licenses," of this report addresses implementation milestones for the various operational programs (including emergency planning) relating to byproduct, source, and special nuclear material (pursuant to 10 CFR Part 30, "Rules of general applicability to domestic licensing of byproduct material"; 10 CFR Part 40, "Domestic licensing of source material"; and 10 CFR Part 70, "Domestic licensing of special nuclear material").

- Licensee's detailed implementing procedures for its emergency plan submitted at least 180 days prior to the scheduled date for initial loading of fuel, as required by 10 CFR Part 50, Appendix E, Section V

- EPZ population change review conducted at least 365 days before scheduled date for initial loading of fuel, as required by 10 CFR Part 50, Appendix E, Section IV.7

License Condition 6

In WLS COLA Part 10, the applicant proposed License Condition 6 to provide a schedule to support NRC inspection of operational programs, including (a) the EPIPs, and (e) an ERDS implementation program plan. The applicant proposed the following, emergency preparedness parts extracted:

> The licensee shall submit to the appropriate Director of the NRC, a schedule, no later than 12 months after issuance of the COL, that supports planning for and conduct of NRC inspections of operational programs listed in the operational program FSAR Table 13.4-201. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until either the operational programs in the FSAR table have been fully implemented or the plant has been placed in commercial service, whichever comes first. This schedule shall address:
>
> a. the emergency planning implementation procedures to the NRC consistent with 10 CFR Part 50, Appendix E, Section V
>
> e. an emergency response data system (ERDS) implementation program plan consistent with 10 CFR Part 50, Appendix E, Section VI

The schedule for submission of the EPIPs to the NRC is addressed in WLS COL FSAR Table 13.4-201. (See implementation milestone, discussed above.) The ERDS program, including implementation, is addressed above in Sections 13.3.4.5, 13.3.4.6, 13.3.4.8 and 13.3.4.14 of this report and in EP-ITAAC 3.2. The staff reviewed License Condition 6 against the recommendations in SECY-05-0197, as endorsed by the related February 22, 2006, SRM. The staff concludes that License Condition 6 conforms to the guidance in SECY-05-0197, with regard to implementation of the emergency planning program (including EPIPs and an ERDS), and is therefore acceptable. Consistent with the applicant's proposed License Condition 6, the staff identified License Condition (13-8) and License Condition (13-9), which include minor revisions to reflect the emergency planning operational program:

License Conditions (13-8) and (13-9)

> No later than 12 months after issuance of the COL, Duke Energy shall submit to the NRC a schedule that supports planning for and conduct of NRC inspection of the emergency planning program implementation as identified in FSAR Table 13.4-201. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until the emergency planning operational program has been fully implemented. This schedule shall address the following two items from FSAR Table 13.4-201:

a. the emergency planning implementation procedures submitted to the NRC consistent with 10 CFR Part 50, Appendix E, Section V. (License Condition (13-8))

e. an emergency response data system (ERDS) implementation program plan consistent with 10 CFR Part 50, Appendix E, Section VI. (License Condition (13-9))

(See also, Section 13.4, “Operational Programs,” of this report.)

ITAAC

- WLS SUP 14.3-1

As stated in Section 13.3.2 of this report, the applicant proposed a license condition to incorporate EP ITAAC into the COL, which are identified in Table 3.8-1 of Appendix B to Part 10 of the WLS COL application. WLS COLA Part 10, Appendix B includes Table 3.8-1 (EP-ITAAC) and incorporates by reference AP1000 DCD Tier 1, Table 3.1-1 (ITAAC). AP1000 DCD Table 3.1-1 also addresses the AP1000 locations of the OSC and TSC, which are changed by WLS COLA Departure WLS DEP 18.8-1 and evaluated in Section 13.3.4.8 of this report. In addition, in WLS COL FSAR Section 14.3.2.3.1, the applicant provided supplemental information in WLS SUP 14.3-1, which states:

> Emergency Planning ITAAC (EP-ITAAC) have been developed to address implementation of elements of the Emergency Plan. Site-specific EP-ITAAC are based on the generic ITAAC provided in Appendix C.II.1-B of Regulatory Guide 1.206. These ITAAC have been tailored to the specific reactor design and emergency planning program requirements.

The staff reviewed the complete set of EP-ITAAC for WLS, which consist of the EP-ITAAC in WLS COLA Part 10, Table 3.8-1 plus the EP ITAAC in AP1000 DCD Tier 1, Table 3.3-1. The staff identified that proposed EP-ITAAC Acceptance Criterion 3.1.4 omitted communication links between the EOF and the radiological monitoring teams as compared to the EP-ITAAC in NUREG-0800, Table 14.3.10-1. Therefore, the staff revised the proposed EP-ITAAC Acceptance Criterion 3.1.4 to conform to NUREG-0800, Table 14.3.10-1. Similarly, the staff identified instances in EP-ITAAC Acceptance Criteria 8.1.1.2.E.4.b and EP-ITAAC 8.1.1.2.E.7.c with ambiguous criteria that did not conform to NUREG-0800, Table 14.3.10-1. The staff revised the acceptance criteria by replacing “and/or” with “or.” The staff noted that the revised EP-ITAAC are collectively adequate because they conform to the respective acceptance criteria in NUREG-0800, Section 14.3.10.[12] Therefore, the staff finds that the WLS SUP 14.3-1 is adequately addressed and that the EP-ITAAC in WLS COLA Part 10, Table 3.8-1, as modified in Table 13.3-1 of this report, and AP1000 DCD Table 3.3-1 are acceptable because they are consistent with NUREG-0800.

[12] The generic EP ITAAC in RG 1.206 Appendix B, Table C.II.1-B1 are identical to the generic EP ITAAC in NUREG-0800, Section 14.3, Table 14.3.10-1.

13.3.5 Post Combined License Activities

The license condition language in this section has been clarified from previously considered language. In a letter dated March 22, 2016 (ADAMS Accession No. ML16084A099), the applicant did not identify any concerns with the clarified license condition language. The changes do not affect the staff's above analysis of the conditions, and therefore, for the reasons discussed in the technical evaluation section above, the staff finds the following ITAAC and license conditions acceptable:

- The licensee shall perform and satisfy the ITAAC defined in SER Table 13.3-1, "Emergency Plan ITAAC."

- License Condition (13-3) – No later than one hundred eighty (180) days before the date scheduled for initial fuel load set forth in the notification submitted in accordance with 10 CFR § 52.103(a), the licensee shall submit to the Director of NRO, or the Director's designee, in writing, a fully developed set of plant-specific emergency action levels (EALs) for WLS Unit [1 and 2], in accordance with NEI 07-01, "Methodology for Development of Emergency Action Levels – Advanced Passive Light Water Reactors," Revision 0, with no deviations. The EALs shall have been discussed and agreed upon with State and local officials. (See Section 13.3.4.4 of this report.)

- License Condition (13-4) – Prior to the full participation exercise to be conducted in accordance with the requirements of 10 CFR Part 50, Appendix E, Duke Energy shall identify the specific locations of the reception centers and relocation sites and shall obtain Letters of Agreement for locations not under the Duke Energy's control.

- License Condition (13-5) – No later than 18 months before the latest date set forth in the schedule submitted in accordance with 10 CFR § 52.99(a) for completing the inspections, tests, and analyses in the ITAAC, the licensee shall have performed a detailed staffing analysis, in accordance with NEI 10-05, "Assessment of On-Shift Emergency Response Organization Staffing and Capabilities," Revision 0.

  No later than one hundred eighty (180) days before the date scheduled for initial fuel load set forth in the notification submitted in accordance with 10 CFR § 52.103(a), the licensee shall have revised the Emergency Plan to incorporate any changes identified in the staffing analysis that are needed to bring staffing to the required levels.

- License Condition (13-6) – No later than 180 days before the date schedule for initial fuel load set forth in the notification submitted in accordance with 10 CFR 52.103(a), Duke Energy shall submit to the Director of the Office of New Reactors (NRO), or the Director's designee, in writing, updated WLS Units 1 and 2, Letters of Agreement with the following entities, or their successors. These updated Letters of Agreement shall identify the specific nature of arrangements in support of emergency preparedness for WLS, and reflect expected assistance associated with hostile action at the WLS, as defined in 10 CFR Part 50, Appendix E, Section IV.A.7. The WLS Emergency Plan shall have been revised to include these updated Letters of Agreement after they have been executed.

  1. South Carolina Emergency Management Division

2. Piedmont Medical Center
3. Upstate Medical Center, Emergency Medical Services
4. Draytonville-McKown Mountain-Wilkinsville Volunteer Fire Department
5. Cherokee County Emergency Management
6. Cleveland County Emergency Management and Fire Marshall's Office
7. North Carolina Emergency Management
8. South Carolina Department of Health and Environmental Control
9. York County Emergency Management

- License Condition (13-7) – Prior to fuel load, DEC will demonstrate the integrated capability and functionality of the EOF for activation and operation of the facility to respond to emergency events at WLS and one additional nuclear site that is supported by the EOF. Integrated communication and data capability and functionality will include the Technical Support Centers for WLS and one additional nuclear site, and other Federal, State, and local coordination centers as appropriate.

- License Condition (13-8) – The licensee shall develop a schedule that supports planning for and conduct of NRC inspections of the operational programs listed in WLS COL FSAR Table 13.4-201, "Operational Programs Required by NRC Regulations." This schedule must be available to the NRC staff no later than 12 months after issuance of the COL. The schedule shall be updated every 6 months until 12 months before scheduled fuel load, and every month thereafter until the operational programs listed in WLS COL FSAR Table 13.4-201 have been fully implemented. This schedule shall include a schedule for submitting the EP implementing procedures to the NRC consistent with 10 CFR Part 50, Appendix E, Section V.

- License Condition (13-9) – The licensee shall develop a schedule that supports planning for and conduct of NRC inspections of the operational programs listed in WLS COL FSAR Table 13.4-201, "Operational Programs Required by NRC Regulations." This schedule must be available to the NRC staff no later than 12 months after issuance of the COL. The schedule shall be updated every 6 months until 12 months before scheduled fuel load, and every month thereafter until the operational programs listed in WLS COL FSAR Table 13.4-201 have been fully implemented. This schedule shall address an emergency response data system (ERDS) implementation program plan to the NRC consistent with 10 CFR Part 50, Appendix E, Section VI.

- License Condition (13-10) – No later than eighteen (18) months before the latest date set forth in the schedule submitted in accordance with 10 CFR § 52.99(a) for completing the inspections, tests, and analyses in the ITAAC, the licensee shall have performed an assessment of the on-site and augmented staffing capability for response to a multi-unit event. The staffing assessment shall be performed in accordance with NEI 12-01, “Guideline for Assessing Beyond Design Basis Accident Response Staffing and Communications Capabilities,” Revision 0.

No later than one hundred eighty (180) days before the date scheduled for initial fuel load, as set forth in the notification submitted in accordance with 10 CFR § 52.103(a), the licensee shall revise the Emergency Plan to include the following:

(a) Incorporation of corrective actions identified in the staffing assessment required by this license condition; and

(b) Identification of how the augmented staff will be notified, given degraded communications capabilities.

- License Condition (13-11) – No later than eighteen (18) months before the latest date set forth in the schedule submitted in accordance with 10 CFR § 52.99(a) for completing the inspections, tests, and analyses in the ITAAC, the licensee shall have performed an assessment of on-site and off-site communications systems and equipment relied upon during an emergency event to ensure communications capabilities can be maintained during an extended loss of alternating current power. The communications capability assessment shall be performed in accordance with NEI 12-01, “Guideline for Assessing Beyond Design Basis Accident Response Staffing and Communications Capabilities,” Revision 0.

  No later than one hundred eighty (180) days before the date scheduled for initial fuel load set forth in the notification submitted in accordance with 10 CFR § 52.103(a), the licensee shall have completed implementation of corrective actions identified in the communications capability assessment, including revisions to the Emergency Plan.

13.3.6 Conclusion

The staff reviewed the WLS COL application, including applicable portions of the referenced AP1000 DCD. The staff confirmed that the applicant addressed the required information relating to emergency planning and there is no additional information needed to support the WLS COLA. The results of the staff’s technical evaluation of the information incorporated by reference in the application are documented in NUREG-1793 and its supplements for the AP1000 DCD.

The EP-ITAAC are provided in Table 13.3-1, “WLS Units 1 & 2 ITAAC,” of this report. The staff concludes that, pursuant to 10 CFR 52.80(a), the applicant included in the WLS COL application the proposed inspections, tests, and analyses that the licensee shall perform, and the acceptance criteria that are necessary and sufficient to provide reasonable assurance that, if the inspections, tests, and analyses are performed and the acceptance criteria met, the facility has been constructed and will operate in conformity with the license, the provisions of the Atomic Energy Act of 1954, as amended, and NRC rules and regulations.

As part of its review of the WLS COL application, FEMA provided its findings and determinations concerning the adequacy of offsite emergency planning, which are based on its review of State and local emergency plans. FEMA concluded that the offsite State and local emergency plans are adequate to cope with an incident at WLS, and there is reasonable assurance that these plans can be implemented. On the basis of its review of the FEMA findings and determinations, the staff concludes that the State and local emergency plans are adequate, and there is reasonable assurance that they can be implemented.

Based on its evaluation, the staff concludes that the onsite emergency plan establishes an adequate basis for an acceptable state of onsite emergency preparedness, and there is reasonable assurance that the plan can be implemented.

Based on FEMA's conclusions and the staff's evaluation the staff concludes that the emergency plans provide an adequate expression of the overall concept of operation and describe the essential elements of advanced planning and the provisions made to cope with emergency situations. Therefore, the staff concludes that the overall state of onsite and offsite emergency preparedness, when fully implemented, will meet the requirements of 10 CFR 50.33(g), 10 CFR 50.47, 10 CFR Part 50, Appendix E; 10 CFR 50.72(a)(3); 10 CFR 52.79(a)(21); 10 CFR 52.79(a)(22)(i); 10 CFR 52.80; and 10 CFR 100.21.

Further, in accordance with 10 CFR 50.47(a), the staff concludes that, subject to the required conditions and limitations of the full-power license, including the license condition listed in Section 13.3.5 of this report, there is reasonable assurance that adequate protective measures can and will be taken in the event of a radiological emergency at the WLS, and that emergency preparedness at WLS Units 1 and 2 is adequate to support full-power operations.

Table 13.3-1 WLS Units 1 and 2 ITAAC

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
1.0 Emergency Classification System			
10 CFR 50.47(b)(4) – A standard emergency classification and action level scheme, the bases of which include facility system and effluent parameters, is in use by the nuclear facility licensee, and State and local response plans call for reliance on information provided by facility licensees for determinations of minimum initial offsite response measures.	1.1 A standard emergency classification and emergency action level (EAL) scheme exists, and identifies facility system and effluent parameters constituting the bases for the classification scheme. [D.1**]	1.1 An inspection of the control room, technical support center (TSC), and emergency operations facility (EOF) will be performed to verify that they have displays for retrieving facility system and effluent parameters that constitute the bases for the classification scheme in the emergency plan implementing procedure addressing "Emergency Classification."	1.1.1 The specific parameters identified in the Emergency Action Level Thresholds in the emergency plan implementing procedure addressing "Emergency Classification" have been retrieved and displayed in the control room, TSC, and EOF.

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
	[**D.1 corresponds to NUREG-0654 /FEMA-REP-1 evaluation criteria.] [**References in brackets throughout this table correspond to with NUREG-0654/FEMA-REP-1 Evaluation Criteria]		1.1.2 The ranges available in the control room, TSC, and EOF encompassed the values for the specific parameters identified in the Emergency Action Level Thresholds in the emergency plan implementing procedure addressing "Emergency Classification."
2.0 Notification Methods and Procedures			
10 CFR 50.47(b)(5) – Procedures have been established for notification, by the licensee, of State and local response organizations and for notification of emergency personnel by all organizations; the content of initial and follow-up messages to response organizations and the public has been established; and means to provide early notification and clear instruction to the populace within the plume exposure pathway Emergency	2.1 The means exist to notify responsible State and local organizations within 15 minutes after the licensee declares an emergency. [E.1]	2.1 A test will be performed of the capabilities.	2.1.1 A report exists that confirms communication has been established via the Selective Signaling Telephone System between the control room and the following: - Cherokee County Warning Point - York County Warning Point - Cleveland County Warning Point - South Carolina Warning Point - North Carolina Emergency

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
Planning Zone have been established.			Operations Center Radiological Warning Point
	2.2 The means exist to notify emergency response personnel. [E.2]	2.2 A test will be performed of the capabilities.	2.2 A report exists that confirms notification to the Lee Nuclear Station emergency response organization has been performed.
	2.3 The means exist to notify and provide instructions to the populace within the plume exposure pathway EPZ. [E.6]	NOTE: The means to notify and provide instructions to the populace within the plume exposure pathway EPZ is addressed by Acceptance Criteria 8.1.1.2.	
3.0 Emergency Communications			
10 CFR 50.47(b)(6) – Provisions exist for prompt communications among principal response organizations to emergency personnel and to the public.	3.1 The means exist for communications among the control room, TSC, EOF, principal State and local emergency operations centers (EOCs), and radiological field assessment teams. [F.1.d]	3.1 A test will be performed of the capabilities. NOTE: Additional ITAAC for the as-built TSC and OSC are addressed in Table 3.1-1 of Tier 1 of the AP1000 Design Control Document, Rev. 19.	3.1.1 A report exists that confirms communication has been established among the control room, OSC, and TSC. 3.1.2 A report exists that confirms communication have been established among the control room, TSC, and EOF. 3.1.3 A report exists that confirms communication via the Selective Signaling

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			Telephone System between the TSC and the following: - Cherokee County Warning Point - York County Warning Point - Cleveland County Warning Point - South Carolina Warning Point - North Carolina Emergency Operations Center Radiological Warning Point 3.1.4 A report exists that confirms communication has been established between the TSC, EOF, and radiological monitoring teams.
	3.2 The means exist for communications from the control room, TSC, and EOF to the NRC headquarters and regional office EOCs (including establishment of the Emergency Response Data System (ERDS) between the onsite computer system and the NRC Operations Center.) [F.1.f]	3.2 A test will be performed of the capabilities from the control room, TSC and EOF to the NRC, including ERDS.	3.2.1 A report exists that confirms communication has been established from the control room, TSC, and EOF to NRC Headquarters and Region II EOC. 3.2.2 A report exists that confirms ERDS data was provided from the plant computer system to

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			NRC Headquarters and Region II EOC.
4.0 Public Education and Information			
10 CFR 50.47(b)(7) – Information is made available to the public on a periodic basis on how they will be notified and what their initial actions should be in an emergency (e.g., listening to a local broadcast station and remaining indoors), the principal points of contact with the news media for dissemination of information during an emergency (including the physical location or locations) are established in advance, and procedures for coordinated dissemination of information to the public are established.	4.1 The licensee has provided space which may be used for a limited number of the news media at the EOF. [G.3.b]	4.1 An inspection of the Joint Information Center will be performed to verify that space is provided for a limited number of the news media.	4.1 The Joint Information Center has been located in the Duke Energy Center at 526 South Church Street, Charlotte, NC.
5.0 Emergency Facilities and Equipment			
10 CFR 50.47(b)(8) – Adequate emergency facilities and equipment to support the emergency response are provided and maintained.	5.1 The licensee has established a technical support center (TSC) and onsite operations support center (OSC). [H.1]	5.1 An inspection of the as-built TSC and OSC will be performed. NOTE: Additional ITAAC for the as-built TSC and OSC are addressed in Table	5.1.1 The TSC has been located in the Maintenance Building. 5.1.2 The TSC includes radiation monitors and a ventilation system with a high efficiency

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
		3.1-1 of Tier 1 of the AP1000 Design Control Document, Rev. 19.	particulate air (HEPA) and charcoal filter. 5.1.3 Back-up electrical power supply was available for the TSC. 5.1.4 The OSC was in a location separate from the control room.
	5.2 The licensee has established an Emergency Operations Facility (EOF). [H.2]	5.2 An inspection of the EOF will be performed.	5.2.1 The EOF had at least 243 square meters (2,625 square feet). 5.2.2 Voice transmission and reception have been accomplished between the EOF and TSC. 5.2.3 A report exists that confirms voice transmission and reception have been accomplished via the Selective Signaling Telephone System between the EOF and the following: - Cherokee County Warning Point

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			- York County Warning Point - Cleveland County Warning Point - South Carolina Warning Point - North Carolina Emergency Operations Center Radiological Warning Point
6.0 Accident Assessment			
10 CFR 50.47(b)(9) – Adequate methods, systems, and equipment for assessing and monitoring actual or potential offsite consequences of a radiological emergency condition are in use.	6.1 The means exist to provide initial and continuing radiological assessment throughout the course of an accident. [I.2]	6.1 A test of the emergency plan will be conducted by performing an exercise or drill to verify the capability to perform accident assessment.	6.1 A report exists that confirms an exercise or drill has been accomplished including use of selected monitoring parameters identified in the EAL Thresholds in the emergency plan implementing procedure addressing “Emergency Classification,” to assess simulated degraded plant conditions and initiate protective actions in accordance with the following criteria: A. Accident Assessment and Classification 1. Initiating conditions identified, EALs parameters determined, and the emergency correctly

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			classified throughout the drill. B. Radiological Assessment and Control 1. Onsite radiological surveys performed and samples collected. 2. Radiation exposure to emergency workers monitored and controlled. 3. Field monitoring teams assembled and deployed. 4. Field team data collected and disseminated. 5. Dose projections developed. 6. The decision whether to issue radioprotective drugs to Duke emergency workers made. 7. Protective action recommendations developed and communicated to appropriate authorities.
	6.2 The means exist to determine the source term of releases of radioactive material within plant systems, and the	6.2 An analysis of emergency plan implementing procedures will be performed.	6.2 A methodology has been established to determine source term of releases of

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
	magnitude of the release of radioactive materials based on plant system parameters and effluent monitors. [I.3]		radioactive materials within plant systems.
	6.3 The means exist to continuously assess the impact of the release of radioactive materials to the environment, accounting for the relationship between effluent monitor readings, and onsite and offsite exposures and contamination for various meteorological conditions. [I.4]	6.3 An analysis of emergency plan implementing procedures will be performed.	6.3 A methodology has been provided to establish the relationship between effluent monitor readings and onsite and offsite exposures and contamination for various meteorological conditions.
	6.4 The means exist to acquire and evaluate meteorological information. [I.5]	6.4 An inspection of the control room, TSC, and EOF will be performed to verify the availability of the following meteorological data is available: - Wind speed (at 10 m and 60 m) - Wind direction (at 10 m and 60 m) - Air temperature (at 10 m and 60 m)	6.4 The specified meteorological data was available at the control room, TSC, and EOF.
	6.5 The means exist to make rapid assessments of actual or potential magnitude and locations of any radiological hazards	6.5 An analysis of emergency plan implementing procedures will be performed.	6.5 A methodology has been established to provide rapid assessment of the actual or potential magnitude and

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
	through liquid or gaseous release pathways, including activation, notification means, field team composition, transportation, communication, monitoring equipment, and estimated deployment times. [I.8]		locations of any radiological hazards through liquid or gaseous release pathways.
	6.6 The capability exists to detect and measure radioiodine concentrations in air in the plume exposure pathway EPZ, as low as 10E-7 μCi/cc (microcuries per cubic centimeter) under field conditions. [I.9]	6.6 A test of Duke field survey instrumentation will be performed to verify the capability to detect airborne concentrations as low as 10E-07 microcuries per cubic centimeter.	6.6 A report exists that confirms instrumentation used for monitoring I-131 to detect airborne concentrations as low as 10E-07 microcuries per cubic centimeter has been provided.
	6.7 The means exist to estimate integrated dose from the projected and actual dose rates, and for comparing these estimates with the EPA protective action guides (PAGs). [I.10]	6.7 An analysis of emergency plan implementing procedures will be performed to verify that a methodology is provided to establish means for relating contamination levels and airborne radioactivity levels to dose rates and gross radioactivity measurements for the following isotopes – Kr-88, Ru-106, I-131, I-132, I-133, I-134, I-135, Te-132, Xe-133,	6.7 The means for relating contamination levels and airborne radioactivity levels to dose rates and gross radioactivity measurements for the specified isotopes has been established.

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
		Xe-135, Cs-134, Cs-137, Ce-144.	
7.0 Protective Response			
10 CFR 50.47(b)(10) – A range of protective actions has been developed for the plume exposure pathway EPZ for emergency workers and the public. In developing this range of actions, consideration has been given to evacuation, sheltering, and, as a supplement to these, the prophylactic use of potassium iodide (KI), as appropriate. Guidelines for the choice of protective actions during an emergency, consistent with Federal guidance, are developed and in place, and protective actions for the ingestion exposure pathway EPZ appropriate to the locale have been developed.	7.1 The means exist to warn and advise onsite individuals of an emergency, including those in areas controlled by the operator, including: [J.1] a. Employees not having emergency assignments b. Visitors c. Contractor and construction personnel d. Other people who may be in the public access areas, on or passing through the site, or within the owner controlled area.	7.1 A test of the onsite warning and communication capability will be performed during a drill or exercise.	7.1.1 A report exists that confirms that, during a drill or exercise, notification and instructions were provided to onsite workers and visitors, within the Protected Area, over the plant public announcement system. 7.1.2 A report exists that confirms that, during a drill or exercise, audible warnings were provided to individuals outside the Protected Area, but within the Owner Controlled Area.
8.0 Exercises and Drills			
10 CFR 50.47(b)(14) – Periodic exercises are (will be) conducted to evaluate major portions of emergency response capabilities, periodic	8.1 Licensee conducts a full-participation exercise to evaluate major portions of emergency response capabilities, which includes participation	8.1 A full participation exercise (test) will be conducted within the specified time periods of Appendix E to 10 CFR Part 50.	8.1.1.1 A report exists that confirms an exercise was conducted within the specified time periods of Appendix E to 10 CFR Part 50, onsite

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
drills are (will be) conducted to develop and maintain key skills, and deficiencies identified as a result of exercises or drills are (will be) corrected.	by the State and local agency within the plume exposure pathway EPZ, and the State within the ingestion control EPZ. [N.1]		exercise objectives listed below were met, and there are no uncorrected onsite exercise deficiencies.
			8.1.1.2 A report exists that confirms the following exercise objectives were satisfied by meeting the specified performance criteria: A. Accident Assessment and Classification 1. Demonstrate the ability to identify initiating conditions, determine emergency action level (EAL) parameters, and correctly classify the emergency throughout the exercise. Performance Criterion: a. Determine the correct emergency classification level based on events which were in progress, considering past events and their impact on the current conditions, within 15 minutes from the time the initiating condition(s) or EAL is identified.

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			B. Notifications 1. Demonstrate the ability to alert, notify and mobilize site emergency response personnel. Performance Criteria: a. Complete the designated actions in accordance with emergency plan implementing procedures and perform the announcement within 15 minutes of the initial event classification for an Alert or higher. b. Mobilize site emergency responders in accordance with emergency plan implementing procedures within 15 minutes of the initial event classification for an Alert or higher. 2. Demonstrate the ability to notify responsible State, local government agencies within 15 minutes and the NRC within 60 minutes after declaring an emergency.

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			Performance Criteria: a. Transmit information in accordance with approved emergency plan implementing procedures within 15 minutes of event classification. b. Transmit information in accordance with approved emergency plan implementing procedures, within 60 minutes of last transmittal for a follow-up notification to State and local authorities. 3. Demonstrate the ability to warn or advise onsite individuals of emergency conditions. Performance Criterion: a. Initiate notification of onsite individuals within 15 minutes of declaration. 4. Demonstrate the capability of the Public Alert and Notification System to operate properly when required. Performance Criteria:

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			a. 90% of the sirens operate properly, as indicated by the siren feedback system. b. The EAS is activated.
			C. Emergency Response 1. Demonstrate the capability to direct and control emergency operations. Performance Criterion: a. Command and control is demonstrated in the control room in the early phase of the emergency, and the technical support center (TSC) within 75 minutes of declaration minutes of an Alert or higher emergency classification. 2. Demonstrate the ability to transfer emergency direction from the control room to the TSC upon activation. Performance Criteria: a. Turnover briefings are conducted in accordance with emergency plan

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			implementing procedures. b. Documentation of transfer of duties is completed in accordance with emergency plan implementing procedures. 3. Demonstrate the ability to prepare for around-the-clock staffing requirements. Performance Criterion: a. Complete 24-hour staff assignments. 4. Demonstrate the ability to perform assembly and accountability within 30 minutes of an emergency requiring protected area assembly and accountability. Performance Criterion: a. Protected area (PA) personnel assembly and accountability completed within 30 minutes of an emergency requiring PA assembly and accountability.
			D. Emergency Response Facilities

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			1. Demonstrate activation of the operational support center (OSC), and full functional operation of the TSC and EOF within 75 minutes declaration of Alert or higher emergency classification. Performance Criterion: a. The TSC, OSC, and EOF are activated within 75 minutes of the initial notification. 2. Demonstrate the adequacy of equipment, security provisions, and habitability precautions for the TSC, OSC, and EOF as appropriate. Performance Criteria: a. Demonstrate the adequacy of the emergency equipment in the emergency response facilities as specified in emergency plan implementing procedures. b. The Security Force implements and follows applicable emergency plan implementing procedures.

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			c. The Radiological Assessment Manager implements habitability controls in accordance with emergency plan implementing procedures if an onsite/offsite release has occurred. 3. Demonstrate the adequacy of communication for all emergency support resources. Performance Criteria: a. Emergency response facility personnel are able to operate communication systems in accordance with emergency plan implementing procedures. b. Emergency response communication systems listed in emergency plan implementing procedures are available and operational for the duration of the exercise.
			E. Radiological Assessment and Control

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			1. Demonstrate the ability to obtain onsite radiological surveys and samples. Performance Criteria: a. Radiation Protection Technicians demonstrate the ability to obtain appropriate instruments (range and type) and perform surveys. b. Airborne samples are taken in accordance with emergency plan implementing procedures. 2. Demonstrate the ability to continuously monitor and control radiation exposure to emergency workers. Performance Criteria: a. Emergency workers are issued self-reading dosimeters when radiation levels require, and exposures are controlled to 10 CFR Part 20 limits (unless the Emergency Coordinator authorizes emergency limits).

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			b. Exposure records are available. c. Emergency workers include Security and personnel within all emergency facilities. 3. Demonstrate the ability to assemble and deploy field monitoring teams within 75 minutes from the decision to do so. Performance Criterion: a. One Field Monitoring team is ready to be deployed within 15 – 30 minutes of their arrival onsite. In addition, an offsite monitoring team must be able to be dispatched within 75 minutes of an Alert or higher emergency classification. 4. Demonstrate the ability to collect and disseminate field team data. Performance Criteria: a. Field team collects data for dose rate and airborne radioactivity levels in accordance with emergency plan implementing procedures.

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			b. Field team communicates data to the TSC or EOF in accordance with emergency plan implementing procedures. 5. Demonstrate the ability to develop dose projections. Performance Criterion: a. Timely and accurate dose projections are performed in accordance with emergency plan implementing procedures. 6. Demonstrate the ability to make the decision whether to issue radioprotective drugs (KI) to onsite emergency workers. Performance Criterion: a. KI is issued (simulated) if the estimated dose to the thyroid will exceed 25 rem committed dose equivalent (CDE). 7. Demonstrate the ability to develop appropriate protective action recommendations (PARs) and notify

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			appropriate authorities within 15 minutes after development. Performance Criteria: a. Total effective dose equivalent (TEDE) and CDE dose protections from the dose assessment computer code are compared, in accordance with emergency plan implementing procedures. b. PARs are developed within 15 minutes of data availability. c. PARs are transmitted to responsible State and local government agencies via voice or fax within 15 minutes of event classification or PAR development.
			F. Public Information 1. Demonstrate the capability to develop and disseminate clear, accurate, and timely information to the news media in accordance with emergency plan implementing procedures.

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			Performance Criterion: a. The Joint Information Center (JIC) is activated within 75 minutes following the declaration of a Site Area Emergency or higher classification or following the Emergency Coordinator’s or JIC Director’s instruction to do so. 2. Demonstrate the capability to establish and effectively operate rumor control in a coordinated fashion. Performance Criteria: a. Calls are answered in a timely manner with the correct information, in accordance with emergency plan implementing procedures. b. Calls are returned or forwarded, as appropriate, to demonstrate responsiveness. c. Rumors are identified and addressed in accordance with emergency plan

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			implementing procedures.
			G. Evaluation 1. Demonstrate the ability to conduct a post-exercise critique, to determine areas requiring improvement and corrective action. Performance Criteria: a. An exercise time line is developed, followed by an evaluation of the objectives. b. Significant problems in achieving the objectives are discussed to ensure understanding of why objectives were not fully achieved. c. Recommendations for improvement in non-objective areas are discussed.
			8.1.2.1 A report exists that confirms onsite emergency response personnel were mobilized to fill emergency response positions and there were no uncorrected onsite exercise deficiencies. 8.1.2.2 A report exists that confirms onsite emergency response

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			personnel performed their assigned responsibilities as provided in Section II.B of the WLS Combined License Application Emergency Plan and there were no uncorrected onsite exercise deficiencies.
			8.1.3.1 The exercise is completed within the specified time periods of Appendix E to 10 CFR Part 50, offsite exercise objectives have been met, and there are either no uncorrected offsite deficiencies, or a license condition requires offsite deficiencies to be corrected prior to operation above 5% rated power.
9.0 Assignment of Responsibility – Organizational Control			
10 CFR 50.47(b)(1) – Primary responsibilities for emergency response by the nuclear facility licensee, and by State and local organizations within the EPZs have been assigned, the emergency responsibilities of the various supporting organizations have been specifically	9.1 The staff exists to provide 24-hour per day emergency response and manning of communications links, including continuous operations for a protracted period. [A.1.e.A.4**]	9.1 An inspection of the emergency plan implementing procedures will be performed.	9.1 Emergency plan implementing procedures provide for 24-hour per day emergency response staffing and manning of communication links, including continuous operations for a protracted period.

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
established, and each principle response organization has staff to respond and to augment its initial response on a continuous basis.			
10.0 Onsite Emergency Organization			
10 CFR 50.47(b)(2) – On-shift facility licensee responsibilities for emergency response are unambiguously defined, adequate staffing to provide initial facility accident response in key functional areas is maintained at all times, timely augmentation of response capabilities is available, and the interfaces among various onsite response activities and offsite support and response activities are specified.	10.1 The staff exists to provide minimum and augmented on-shift staffing levels, consistent with Table B-1 of NUREG-0654/FEMA-REP-1, Rev. 1. [B.5, B.7]	10.1 An inspection of the emergency plan implementing procedures will be performed.	10.1 Emergency plan implementing procedures provide minimum and augmented on-shift staffing levels, consistent with Table II-2 of the WLS Combined License (COL) Application Emergency Plan.

13.4 Operational Programs (Related to RG 1.206, Section C.III.1, Chapter 13, C.I.13.4, "Operational Program Implementation")

13.4.1 Introduction

In SECY-05-0197, "Review of Operational Programs in a Combined License Application and Generic Emergency Planning Inspections, Tests, Analyses, and Acceptance Criteria," October 28, 2005, the staff detailed its plan for reviewing operational programs in a COL application. The Commission approved the staff's plan in the related February 22, 2006, SRM, Although numerous programs support the operation of a nuclear power plant, SECY-05-0197 focused on those programs that meet the following three criteria:

1. required by regulation
2. reviewed in a COL application
3. inspected to verify program implementation as described in the FSAR

The programs that meet the above criteria are collectively referred to as “operational programs” and most are identified in SECY-05-0197.

13.4.2 Summary of Application

WLS COL FSAR, Revision 11, Section 13.4 incorporates by reference AP1000 DCD, Revision 19, Section 13.4.

In addition, in WLS COL FSAR Section 13.4 and in WLS COLA Part 10, “Proposed License Conditions and ITAAC,” the applicant provided the following:

AP1000 COL Information Item

- STD COL 13.4-1

The applicant provided additional information in STD COL 13.4-1 to address COL Information Item 13.4-1 and COL Action Item 13.4-1, identified in NUREG-1793, Appendix F and its supplements. This item states that COL applicants referencing the AP1000 certified design will address each operational program.

License Conditions

- Part 10, License Condition 3, “Operational Program Implementation”
- Part 10, License Condition 6, “Operational Program Readiness”

Both license conditions are related to STD COL 13.4-1. License Condition 3 addresses implementation milestones for those operational programs whose implementation is not addressed in the regulations. License Condition 6 includes the timing of information related to operational programs to support NRC inspection activities.

13.4.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the regulatory basis for acceptance of the supplementary information presented in this application is identified in the individual chapters of this report that address the evaluations of the specific operational programs, which are itemized in the next section, as clarified by the regulatory guidance in SECY-05-0197 and RG 1.206.

13.4.4 Technical Evaluation

The staff reviewed WLS COL FSAR Section 13.4 and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to operational programs. The results of the staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this report provides a discussion of the strategy used by the staff to perform one technical review for each standard issue outside the scope of the DC and use this review to evaluate subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews:

- The staff compared the Vogtle (VEGP) COL FSAR, Revision 5 to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from responses to RAIs.
- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff completed its review and concluded that the evaluation performed for the standard content is directly applicable to the WLS COL application. This standard content material is identified in this report by use of italicized, double-indented formatting. Section 1.2.3 of this report provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the Bellefonte (BLN) Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from VEGP SER Section 13.4.4:

> *Although the staff concluded that the evaluation performed for the standard content is directly applicable to the VEGP COL application, there were differences in the response provided by the VEGP applicant from that provided by the BLN applicant regarding the standard content material. These differences affect the two license conditions and the table listing the operational programs. These differences are evaluated by the staff below, following the standard content material.*
>
> *<u>AP1000 COL Information Item</u>*
>
> - *STD COL 13.4-1*
>
> *The applicant provided supplemental information by adding the following statement to Section 13.4 of the VEGP COL FSAR:*

Operational programs are specific programs that are required by regulations. Table 13.4-201 lists each operational program, the regulatory source for the program, the section of the FSAR in which the operational program is described, and the associated implementation milestone(s).

Each operational program is evaluated by the staff in the applicable SER chapters.

License Conditions

- *License Condition 3, "Operational Program Implementation"*

- *License Condition 6, "Operational Program Readiness"*

These two proposed license conditions are evaluated by the NRC staff as part of its evaluation of each of the operational programs in the applicable SER chapters.

The following portion of this technical evaluation section provides the staff's general evaluation of the operational programs and associated license conditions and is reproduced from Section 13.4.4 of the BLN SER:

The NRC staff's review of the acceptability of the supplemental information added by STD COL 13.4-1 and the proposed license conditions is based on four considerations. The first consideration is the acceptability of the individual operational programs, including the implementation of the different phases of these operational programs. The second consideration is whether the applicant correctly identified those operational programs whose implementation requirements are not addressed in the regulations, and, therefore, need to be included in License Condition 3. The third consideration is whether the applicant correctly specified in License Condition 6 the timing of information related to operational programs to support NRC inspection activities. The fourth consideration is whether the list of operational programs in BLN COL FSAR Table 13.4-201 is complete.

In regard to the first consideration, the SER sections referenced in the above table address the NRC staff's regulatory evaluation of the individual operational programs. For each of these operational programs, the staff has either concluded that the applicant has satisfied the applicable regulatory guidance (including the implementation requirements when specified in the regulations), or the staff's review is still ongoing. For those operational program reviews that are ongoing, the staff's final conclusions will be provided in the SER sections referenced in the above table at a later date.

In regard to the second consideration, the NRC staff verified that those operational programs, whose implementation requirements are not specified in the regulations, are captured in License Condition 3.

In regard to the third consideration, the NRC staff compared License Condition 6 to the recommended license condition in SECY-05-0197 related to the timing of *information to support NRC inspection activities of operational programs. The staff finds that the applicant used language similar to the recommended license condition specified in SECY-05-0197 to develop License Condition 6. It should be noted that License Condition 6 addresses additional scheduler requirements (Sections b. through d.) that are not related to the operational programs evaluated in this section of the SER, and, therefore, are not evaluated in this SER section.*

In regard to the fourth consideration, the NRC staff compared the operational programs provided by the applicant in BLN COL FSAR Table 13.4-201 (included in the above table) to the operational programs specified in SECY-05-0197. The staff finds that the applicant has included all the operational programs specified in SECY-05-0197, including the two operational programs (Motor-Operated Valve Testing Program and the Safeguards Contingency Program) added by the NRC to the list of operational programs provided by the NEI in its letter dated August 31, 2005.

There are differences between BLN COL FSAR Table 13.4-201 and the table of operational programs in SECY-05-0197 with respect to implementation milestone information. The first difference is the SECY paper states that there are no required implementation milestones in the regulations for the Maintenance Rule Program and the Quality Assurance Program (Operation), while BLN COL FSAR Table 13.4-201 references regulations that require implementation milestones for these two programs. The staff has reviewed the regulation references provided by the applicant and concludes that they do provide appropriate requirements for implementation milestones. Further support for this conclusion is the regulatory guidance in Section C.I.13.4 of RG 1.206. The example table located in this section of the RG references the same implementation regulatory guidance for the Maintenance Rule Program and the Quality Assurance Program (Operation) as does BLN COL FSAR Table 13.4-201.

The second difference is that the SECY paper states that 10 CFR Part 50, Appendix J, specifies implementation requirements for the Containment Leakage Rate Testing Program, while BLN COL FSAR Table 13.4-201 states that the implementation milestones for this program will be controlled by a license condition. The staff has reviewed the implementation milestone proposed in License Condition 3 for the Containment Leakage Rate Testing Program, and finds that it is more stringent than the regulatory guidance in Appendix J. Therefore, the staff finds this difference to be acceptable.

The applicant added an operational program to BLN COL FSAR Table 13.4-201, the Initial Test Program, which is not in the list of operational programs specified in SECY-05-0197. The option of adding operational programs to this list is specifically allowed by SECY-05-0197. Further support for the acceptability of adding the Initial Test Program is that the example table located in Section C.I.13.4 of RG 1.206 also lists this operational program.

Therefore, the NRC staff concludes that the additional information (STD COL 13.4-1) provided by the applicant in BLN COL FSAR Section 13.4, in *conjunction with the conditions specified in BLN COL FSAR, Part 10, License Conditions 3 and 6, complies with the applicable regulatory guidance provided in SECY-05-0197.*

Evaluation of Site-specific Response to Standard Content

The staff notes that the VEGP applicant separated the fitness-for-duty (FFD) program from the overall security program and added a new operational program, Cyber Security, to the list of operational programs in FSAR Table 13.4-201. The implementation requirements for these additional operational programs comply with the considerations identified above in the standard content material, and are, therefore, acceptable. In addition, the VEGP applicant also made minor changes to operational program implementation details in License Condition 3 and also modified Sections a. through d. associated with License Condition 6. The changes to these two license conditions are evaluated by the staff in the applicable SER chapters and do not affect the evaluation of operational programs covered in this section of the SER. Therefore, the conclusions reached by the NRC staff related to STD COL 13.4-1 are directly applicable to the VEGP COL application.

The BLN SER text refers to an SER table listing operational programs. This table was not reproduced for the VEGP SER since it duplicates the information in VEGP COL FSAR Table 13.4-201.

The staff also notes that the applicant added the operational program, SNM Material Control and Accounting Program, to the list of operational programs in WLS COL FSAR Table 13.4-201. The implementation requirements for this additional operational program comply with the considerations identified above in the standard content material, and is therefore acceptable.

13.4.5 Post Combined License Activities

The license conditions for each of the operational programs are discussed in the applicable SER chapters. Therefore, there are no post-COL activities related to this section.

13.4.6 Conclusion

The staff reviewed the WLS COL application and checked the referenced DCD. The staff's review confirmed that the applicant addressed the required information relating to operational programs, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

The staff concludes that the relevant information presented in the WLS COL FSAR is acceptable based on the regulatory guidance in SECY-05-0197, in conjunction with the applicable regulations specified in the individual sections of this report that evaluated each of the operational programs discussed above. The staff based its conclusion on the following:

- STD COL 13.4-1, as related to operational programs, is acceptable because each of the operational programs in WLS COL FSAR Table 13.4-201 has been found acceptable by the staff in other sections of this report, as noted in Section 13.4.4 above. In addition, the guidance in SECY-05-0197 and RG 1.206 was used to verify that the applicant's list of operational programs is complete.

13.5 Plant Procedures

13.5.1 Introduction

Descriptions of the administrative and operating procedures that the applicant uses to ensure routine operating, off-normal, and emergency activities are conducted in a safe manner are provided. In its plant procedures, the applicant provided a brief description of the nature and content of the procedures and a schedule for the preparation of appropriate written administrative and operating procedures. The applicant delineated in the description of the procedures the functional position for procedural revision and approval prior to implementation. Inspection of procedures will occur as part of the construction inspection program.

13.5.2 Summary of Application

WLS COL FSAR, Revision 11, Section 13.5, incorporates by reference AP1000 DCD, Revision 19, Section 13.5.

In addition, in WLS COL FSAR Section 13.5, the applicant provided the following:

AP1000 COL Information Item

- STD COL 13.5-1

The applicant provided additional information in STD COL 13.5-1 to resolve COL Information Item 13.5-1 (COL Action Item 13.5-1), which addresses plant procedures.

- WLS COL 13.5-1

The applicant provided additional information in WLS COL FSAR Section 13.5.2.2.5 related to procedures to control radionuclide inventories and personnel doses in the Radwaste Building. This information, as well as related additional WLS COL FSAR information in WLS COL 11.2-1 and proposed License Condition 13 in Part 10 of the WLS COL application. This information is reviewed in Section 11.2 of this report.

The applicant provided additional information in WLS COL FSAR Section 13.5.1 related to the process for implementing the safety/security interface requirements of 10 CFR 73.58. This information is reviewed in Section 13.4.1.17 of this report.

The applicant provided additional information in WLS COL FSAR Section 13.5.2.2.8 related to security procedures provided in the Security Plan related to Special Nuclear Material (SNM) Physical Protection Program. This information is reviewed in Section 1.5.5 of this report.

13.5.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of NRC regulations for plant procedures are given in NUREG-0800. Sections 13.5.1.1 and 13.5.2.1.

The applicable regulations and regulatory guidance are as follows:

- 10 CFR 50.34(a), “Preliminary safety analysis report”
- 10 CFR 50.34(b)
- RG 1.33, “Quality Assurance Program Requirements (Operation)”

13.5.4 Technical Evaluation

The staff reviewed WLS COL FSAR Section 13.5 and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The staff’s review confirmed that the information in the application and incorporated by reference addresses the required information relating to plant procedures. The results of the staff’s evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this report provides a discussion of the strategy used by the staff to perform one technical review for each standard issue outside the scope of the DC and use this review to evaluate subsequent COL applications. To ensure that the staff’s findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5 to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from responses to RAIs.
- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff completed its review and concluded that the evaluation performed for the standard content is directly applicable to the VEGP COL application. This standard content material is identified in this report by use of italicized, double-indented formatting. Section 1.2.3 of this report provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the BLN Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from VEGP SER Section 13.5.4:

<u>AP1000 COL Information Item</u>

- *STD COL 13.5-1, addressing plant procedures*

The applicant provided the following additional information to resolve COL Information Item 13.5-1, which addresses the plant procedures of the COL applicant. COL Information Item 13.5-1 states:

> *Combined License applicants referencing the AP1000 certified design will address plant procedures including the following:*
>
> - *Normal operation*
> - *Abnormal operation*
> - *Emergency operation*
> - *Refueling and outage planning*
> - *Alarm response*
> - *Maintenance, inspection, test and surveillance*
> - *Administrative*
> - *Operation of post-72 hour equipment*

The commitment was also captured as COL Action Item 13.5-1 in Appendix F of the staff's FSER for the AP1000 DCD (NUREG-1793).

The applicant provided additional text in BLN COL FSAR Section 13.5 to describe the administrative, operating and maintenance procedures that the operating organizational staff uses to conduct routine operating, abnormal, and emergency activities in a safe manner.

In BLN COL FSAR Section 13.5, the applicant described the different classifications of procedures that the operators will use, including normal, abnormal, emergency, refueling and outage, and alarm response procedures. The staff finds this information acceptable because it meets the criteria in NUREG-0800, Chapter 13.5.2.1.

In BLN COL FSAR Section 13.5, the applicant stated that the format and content of procedures are controlled by the applicable AP1000 writer's guideline. The DCD, Section 13.5.1, describes a referenced document, APP-GW-GLR-040, "Plant Operations Maintenance and Surveillance Procedures," dated August 23, 2007, which includes the AP1000 writer's guidelines. The staff finds this acceptable because the applicant-provided procedure format and content are consistent with the guidance in NUREG-0800, Section 13.5.2.1.

In BLN COL FSAR Section 13.5.1, the applicant describes the nature and content of administrative procedures for both Category (A) - Controls, and Category (B) - Specific Procedures. The staff finds this acceptable because the listed procedures are consistent with the guidance in NUREG-0800, Section 13.5.1.1.

In BLN COL FSAR Section 13.5.2, the applicant stated that EP procedures are discussed in the Emergency Plan and that security procedures are discussed in the Security Plan. The evaluation of EP procedures may be found in Section 13.3 of this SER. The evaluation of security procedures is found in Section 13.6 of this SER.

In BLN COL FSAR Section 13.5.2, the applicant stated the Quality Assurance Program description (QAPD) provides a description of procedural requirements for maintenance, instrument calibration and testing, inspection, and material control. The evaluation of QAPD procedures is found in Section 17.5 of this SER.

In BLN COL FSAR, Section 13.5.2.1, the applicant stated that information related to EOPs is addressed in the DCD. The DCD, Section 13.5.1, describes the program for developing and implementing EOPs and the required content of EOPs procedures in the referenced document, APP-GW-GLR-040. In addition, this information clarifies the procedure development program (PDP) as described in the procedures generation package (PGP) for EOPs, provides a description of the EOP [emergency operating plan] *verification and validation* (V&V) *program, and describes the program for training operators on EOPs, including an explanation of how the recommendations of TMI Action Plan, Item I.C.1, will be met. The staff finds the program for developing and implementing EOPs acceptable because it meets the criteria in NUREG-0800, Section 13.5.2.1.*

<u>*Evaluation of Plant Procedure Issues Not Address*[ed] *in the Standard Content Evaluation*</u>

In VEGP COL FSAR Table 1.9-202, "Conformance with SRP Acceptance Criteria," the applicant identified two exceptions to the criteria of NUREG-0800, Section 13.5, which recommend[s] *providing a schedule for procedure development in the FSAR, and including a description of procedures to be used by operators in the FSAR. The staff notes that the BLN COL FSAR Table 1.9-202 includes these same two exceptions to the criteria of Section 13.5 of NUREG-0800. The guidance of NUREG-0800, Section 13.5.2.1, states that while the submittal should describe the different classifications of procedures that operators will use, it is not necessary that each applicant's procedures conform precisely. In addition, the procedures, regardless of title or classification, are to be available to accomplish the functions identified in RG 1.33. NUREG-0800 makes allowance for "general areas." The staff finds the two exceptions to the criteria of NUREG-0800, Section 13.5, to be acceptable because the applicant's procedure classification follows the guidance in NUREG-0800, Section 13.5.*

> *In RAI [request for additional information] 13.6-36, the staff requested the VEGP applicant address the requirements of 10 CFR 73.58, "Safety/security requirements for nuclear power plants." In its response dated May 14, 2010, the applicant stated that management controls and processes used to establish and maintain an effective interface between nuclear safety and physical security are addressed by administrative controls. The VEGP applicant committed to revise FSAR Section 13.5.1 to include the safety/security interface implementation process in the list of procedural instructions provided in plant administrative procedures. The NRC staff's review of this safety/security procedural issue, which includes tracking the incorporation of the relevant material into the VEGP COL application, is addressed in Section 13.6.4.1.17 of this SER.*

<u>Supplemental Information</u>

- WLS COL 13.5-1

The applicant provided additional information in WLS COL FSAR Section 13.5.2.2.5 related to procedures to control radionuclide inventories and personnel doses in the Radwaste Building. This information, as well as related additional WLS COL FSAR information in Levy Nuclear Plant (LNP) COL 11.2-1 and proposed License Condition 13 in Part 10 of the WLS COL application. This information is reviewed in Section 11.2 of this report.

The applicant provided additional information in WLS COL FSAR Section 13.5.1 related to the process for implementing the safety/security interface requirements of 10 CFR 73.58. This information is reviewed in Section 13.6.4.1.17 of this report.

The applicant provided additional information in WLS COL FSAR Section 13.5.2.2.8 related to security procedures provided in the Security Plan related to Special Nuclear Material (SNM) Physical Protection Program. This information is reviewed in Section 1.5.5 of this report.

13.5.5 Post Combined License Activities

There are no post COL activities related to this section.

13.5.6 Conclusion

The staff reviewed the WLS COL application and checked the referenced DCD. The staff's review confirmed that the applicant addressed the required information relating to plant procedures, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the WLS COL FSAR is acceptable and meets the recommendations of NUREG-0800, Sections 13.5.1.1 and 13.5.2.1. The staff based its conclusion on the following:

- STD COL 13.5-1, as related to plant procedures, is acceptable because it describes the procedures used by the applicant's operating organizational staff to conduct routine administrative, operating, abnormal, and emergency activities in a safe manner, in accordance with the regulatory guidance in NUREG-0800, Sections 13.5.1.1 and 13.5.2.1.

- In WLS COL FSAR Table 1.9-202, the applicant identified two exceptions to the criteria of NUREG-0800, Section 13.5, related to providing WLS COL FSAR descriptions of, and a development schedule for, procedures to be used by operators. The guidance of NUREG-0800, Section 13.5.2.1, makes allowances for "general areas," stating that while the FSAR submittal should describe the different classifications of procedures used by operators, it is not expected that each applicant's procedures conform precisely. The staff finds the two exceptions acceptable because the applicant's procedure classification follows the guidance in NUREG-0800, Section 13.5.

13.6 Physical Security

13.6.1 Introduction

The COL application for the WLS COL Units 1 and 2 describes the WLS COL applicant's physical protection program, which is intended to meet NRC regulations for the use of the design basis threat (DBT) to design safeguards systems to protect against acts of radiological sabotage as stated in 10 CFR 73.1, "Purpose and Scope." The overall purpose of the applicant's physical protection program is to provide high assurance that activities involving special nuclear material are not inimical to the common defense and security and do not constitute an unreasonable risk to the public health and safety.

The physical protection program includes the design of a physical protection system that ensures the capabilities to detect, assess, interdict, and neutralize threats of radiological sabotage are maintained at all times. The applicant incorporates by reference the standard AP1000 design that includes design of physical protection systems within the design of the vital island and vital structures, as described in the Westinghouse Electric Company (Westinghouse) DC document for the AP1000 standard design Tier 1 and Tier 2 information, including Technical Report (TR)-49, "AP1000 Enhancement Report, TR-94, "AP1000 Safeguards Assessment Report," and TR-96, "Interim Compensatory Measures Report." Part 8 of the WLS COL application consists of the WLS Units 1 and 2 Physical Security Plan (PSP), Training and Qualification Plan (T&QP), and Safeguards Contingency Plan (SCP). WLS COL FSAR Section 13.6 describes the physical protection program and the physical protection system that are not addressed within the scope of the standard AP1000 design for meeting NRC performance and prescriptive requirements for physical protection stated in 10 CFR Part 73, "Physical Protection of Plants and Material." Due to security restraints, the staff's evaluation of the physical security protection program presented in this publicly-available report does not include the same level of detail as the safeguards information version. Those persons with the correct access authorization and need-to-know may view the safeguards information version of the WLS COL application Section 13.6 SER, which is located in the NRC Secure Local Area Network.

13.6.2 Summary of Application

WLS COL FSAR, Revision 11, Section 13.6, incorporates by reference AP1000 DCD, Revision 19, Section 13.6.

- WLS COLA Part 8 – Safeguards/Security Plans

In a December 12, 2007, letter, the applicant submitted a PSP to the NRC as part of the WLS COL application for proposed WLS Units 1 and 2. In a May 12, 2009, letter, the applicant submitted Revision 1 to the PSP. In a November 17, 2011, letter, the applicant submitted PSP, Revision 2. In an April 10, 2013, letter the applicant submitted PSP, Revision 3.

In addition, in WLS COL FSAR Section 13.6, the applicant provided the following:

AP1000 COL Information Items

- STD COL 13.6-1

The applicant provided additional information in STD COL 13.6-1 to address COL Information Item 13.6-1, which provides information related to the security plan. The security plan consists of three parts, the PSP, T&QP, and SCP.

- STD COL 13.6-5

The applicant provided additional information in STD COL 13.6-5 to address COL Information Item 13.6-5, which provides information related to the cyber security program. This COL item is evaluated in Section 13.8 of this report.

License Conditions

- Part 10, License Condition 3 D.3, and G.9

The applicant proposed a license condition in WLS COLA Part 10, which provides the milestones to implement applicable portions of the Security Program:

- Part 10, License Condition 5

The applicant proposed a license condition in WLS COLA Part 10, which proposed the maintenance of the PSP, T&QP, and the SCP when nuclear fuel is onsite (protected area), and continuing until all nuclear fuel is permanently removed from the site.

- Part 10, License Condition 6

The applicant proposed a license condition to provide a schedule to support NRC inspection of operational programs including the PSP, T&QP, and the SCP.

13.6.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793, and its supplements. In addition, the relevant requirements of NRC regulations for the physical security, and the associated acceptance criteria, are summarized in NUREG-0800, Section 13.6.1.

The applicable regulatory requirements for physical protection are as follows:

- The provisions of 10 CFR 52.79(a)(35)(i) and (ii) require that information submitted for a COL describe how the applicant will meet the requirements of 10 CFR Part 73, “Physical Protection of Plants and Material”; and provide a description of the implementation of the PSP. The provisions of 10 CFR 52.79(a)(36)(i) through (iv) require that the application include an SCP in accordance with the criteria set forth in 10 CFR Part 73, Appendix C, “Nuclear Power Plant Safeguards Contingency Plans,” and a T&QP in accordance with 10 CFR Part 73, Appendix B, “General Criteria for Security Personnel.” The provisions also require that the applicant provide a description of the implementation of the SCP and the T&QP and that the applicant protect the PSP, T&QP, and SCP in accordance with the requirements of 10 CFR 73.21, “Protection of Safeguards Information: Performance Requirements” and 10 CFR 73.22, “Protection of Safeguards Information: Specific requirements.”

- The provisions of 10 CFR Part 73 include performance-based and prescriptive regulatory requirements that, when adequately met and implemented, provide high assurance that activities involving special nuclear material are not inimical to the common defense and security and do not constitute an unreasonable risk to the public health and safety. A COL applicant must describe how the regulatory requirements of 10 CFR Part 73 will be met that are applicable to nuclear power plants.

A COL applicant is required to identify and describe design features, analytical techniques, and technical bases for its design and how the provisions of physical protection system requirements in the NRC regulations will be met, using applicable regulatory guides and NUREG-0800. However, NRC regulatory guides and NUREG-0800 are not regulatory requirements and are not a substitute for compliance with established regulations. Where alternative methods are chosen or differences exist, the COL applicant is required to describe how the proposed alternatives to guidance or acceptance criteria provide acceptable methods of compliance with NRC regulations.

NUREG-0800, Section 13.6.1, Revision 1, June 15, 2010, was used by the staff to complete the physical security COL review.

Regulatory guidance documents, TRs, and accepted industry codes and standards that an applicant may apply to meet regulatory requirements include, but are not limited to the following:

Documents publicly available:

- RG 5.7, “Entry/Exit Control for Protected Areas, Vital Areas, and Material Access Areas,” Revision 1

- RG 5.12, “General Use of Locks in the Protection and Control of Facilities and Special Nuclear Materials”

- RG 5.44, “Perimeter Intrusion Alarm Systems,” Revision 3

- RG 5.62, “Reporting of Safeguards Events,” Revision 1
- RG 5.65, “Vital Area Access Controls, Protection of Physical Protection System Equipment and Key and Lock Controls”
- RG 5.66, “Access Authorization Program for Nuclear Power Plants”
- RG 5.68, “Protection Against Malevolent Use of Vehicles at Nuclear Power Plants”
- RG 5.74, “Managing the Safety/Security Interface”
- RG 5.75, “Training and Qualification of Security Personnel at Nuclear Power Reactor Facilities”
- NRC April 9, 2009, letter, NRC Staff Review of NEI 03-12, “Template for Security Plan, Training and Qualification, Safeguards Contingency Plan, [and Independent Spent Fuel Storage Installation Security Program]” (Revision 6).
- SECY-05-0197, “Review of Operational Programs in a Combined License Application and Generic Emergency Planning Inspections, Tests, Analyses, and Acceptance Criteria,” October 28, 2005.

The following documents include security-related or safeguards information and are not publicly available:

- RG 5.69, “Guidance for the Application of Radiological Sabotage Design Basis Threat in the Design, Development, and Implementation of a Physical Security Protection Program that Meets 10 CFR 73.55 Requirements.”
- RG 5.76, “Physical Protection Programs at Nuclear Power Reactors.”
- RG 5.77, “Insider Mitigation Program.”
- NEI 03-12, Revision 6, “Template for the Security Plan, Training and Qualification Plan, Safeguards Contingency Plan, and Independent Spent Fuel Installation Security Program.”
- NUREG/CR-6190, “Update of NUREG/CR-6190 Material to Reflect Postulated Threat Requirements.”

13.6.4 Technical Evaluation

The staff reviewed WLS COL FSAR Section 13.6 and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The staff’s review confirmed that the information in the application and incorporated by reference addresses the required information relating to physical security. The results of the staff’s evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this report provides a discussion of the strategy used by the staff to perform one technical review for each standard issue outside the scope of the DC and use this review to evaluate subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5 to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from responses to RAIs.
- The staff compared the VEGP PSP, T&QP, and SCP to the corresponding WLS programs. The staff concluded that these plans are sufficiently similar to warrant standard content treatment.
- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff completed its review and concluded that the evaluation performed for the standard content is directly applicable to the WLS COL application, with the exception discussed in the following paragraph. This standard content material is identified in this report by use of italicized, double-indented formatting. One clarification to the standard content material presented below is that the staff's detailed evaluation of the physical protection program, which is site-specific, is provided in the safeguards information version of the WLS COL application Section 13.6 SER, which is located in the NRC Secure Local Area Network.

There were site-specific RAIs issued to the WLS applicant that resulted in site-specific evaluations for several of the Security Plan review areas. There were also site-specific RAIs issued to the VEGP applicant that were not applicable to the WLS application. In addition, there are several Security Plan review areas with site-specific characteristics requiring a specific review by the staff. For these cases, the staff provides the WLS evaluation in the same location as provided in the VEGP SER, but without the use of italicized, double-indented formatting.

The following portion of this technical evaluation section is reproduced from VEGP SER Section 13.6.4:

> <u>*AP1000 COL Information Item*</u>
>
> - *STD COL 13.6-1*
>
> *The NRC staff reviewed STD COL 13.6-1 related to COL Information Item 13.6-1, which identified the need for a COL applicant to address the security plan. STD COL 13.6-1 supplemented Section 13.6 of the VEGP COL FSAR by stating the following text is to be added after Section 13.6 of the VEGP ESP SSAR:*
>
>> *The Security Plan consists of the Physical Security Plan, the Training and Qualification Plan, and the Safeguards Contingency*

> *Plan. The Security Plan is submitted to the Nuclear Regulatory Commission as a separate licensing document in order to fulfill the requirements of 10 CFR 52.79(a)(35) and 52.79(a)(36). The Security Plan meets the requirements contained in 10 CFR Part 73 and will be maintained in accordance with the requirements of 10 CFR 52.98. The Plan is categorized as Security Safeguards Information and is withheld from public disclosure pursuant to 10 CFR 73.21.*

Section 13.6 of the VEGP COL FSAR also refers to FSAR Table 13.4-201, "Operational Programs Required by NRC Regulations," as providing the milestones for implementing the security program and cyber security program.

The NRC staff's evaluation of the PSP is documented in Section 13.6.4.1 of this SER. The NRC staff's evaluation of the T&QP is documented in Section 13.6.4.2 of this SER. The NRC staff's evaluation of the SCP is documented in Section 13.6.4.3 of this SER. The NRC staff's evaluation of the safety/security interface is documented in Section 13.6.4.1.17 of this SER. Section 13.6.5 of this SER includes the post-combined license activities. Section 13.6.6 of this SER includes the NRC staff's overall conclusions regarding each of the plan submissions.

The NRC staff's evaluation of the physical protection program is provided in detail in the safeguards information version of the VEGP COL application Section 13.6 SER, which is located in the NRC's Secure Local Area Network, document number ES1000015157. Due to security restraints, the NRC staff's evaluation of the physical protection program presented in this publicly-available SER does not include the same level of detail as the safeguards information version. Those persons with the correct access authorization and need-to-know may view the safeguards information version of the VEGP COL application Section 13.6 SER.

<u>License Conditions</u>

- *Part 10, License Condition 3, Items C.5, D.3, and G.9*

The applicant proposed license condition in Part 10 of the VEGP COL application, which provides the milestones for implementing applicable portions of the Security Program. Specifically, the applicant proposed the following:

> *C. Receipt of Materials – The licensee shall implement each operational program identified below prior to initial receipt of byproduct, source, or special nuclear materials onsite (excluding Exempt Quantities as described in 10 CFR 30.18)*
>
> > *C.5 – Security Program (applicable portions)*
>
> *D. Fuel Receipt – The licensee shall implement each operational program identified below prior to initial receipt of fuel onsite.*

D.3 – Security Program (applicable portions)

G. Fuel Loading – The licensee shall implement each operational program identified below prior to initial fuel load.

G.9 – Physical Security

- *Part 10, License Condition 5*

The applicant proposed license condition in Part 10 of the VEGP COL application, which proposed the maintenance of the PSP, T&QP, and the SCP when nuclear fuel is onsite, and continuing until all nuclear fuel is permanently removed from the site. Specifically, the applicant proposed the following:

> *The licensee shall maintain in effect the provisions of the physical security plan, security personnel training and qualification plan, and safeguards contingency plan, and all amendments made pursuant to the authority of 10 CFR 50.90, 50.54(p), 52.97, and Section VIII of Appendix D to Part 52 when nuclear fuel is onsite, and continuing until all nuclear fuel is permanently removed from the site.*

In a letter dated October 22, 2010, the applicant proposed to revise the [security plan] *milestone included in VEGP COL FSAR Table 13.4-201 to implement the* [security plan] *prior to receipt of fuel onsite (protected area.) The NRC staff finds the implementation milestone for the security ~~program~~* [plan] *(~~security~~ prior to receipt of fuel onsite (protected area)) appropriate and in accordance with the requirement in 10 CFR 73.55. Therefore the staff finds that the proposed License Condition 3, Items C.5, D.3, and G.9 and License Condition 5 are not necessary. The incorporation of proposed changes to the VEGP COL FSAR is tracked as* ***Confirmatory Item 13.6-1.***

Resolution of Standard Content Confirmatory Item 13.6-1

Confirmatory Item 13.6-1 is an applicant commitment to revise its FSAR Table 13.4-201 regarding the implementation milestones for the security program. The staff verified that the VEGP COL FSAR was appropriately revised. As a result, Confirmatory Item 13.6-1 is now closed.

- *Part 10, License Condition 6*

The applicant proposed a license condition to provide a schedule to support the NRC's inspection of operational programs including the PSP, T&QP, and the SCP. Specifically, the applicant proposed the following:

> *The licensee shall submit to the appropriate Director of the NRC, a schedule, no later than 12 months after issuance of the COL, that supports planning for and conduct of NRC inspections of operational programs listed in the operational program FSAR Table 13.4-201. The schedule shall be updated every 6 months*

until 12 months before scheduled fuel loading, and every month thereafter until either the operational programs in the FSAR table have been fully implemented or the plant has been placed in commercial service, whichever comes first.

The staff reviewed the above proposed license condition against the recommendations in SECY-05-0197 as endorsed by the related SRM dated February 22, 2006. The staff concludes these proposed license conditions conform to the guidance in SECY-05-0197 and is, therefore, acceptable.

13.6.4.1 Physical Security Plan

The applicant submitted Part 8 of the COL application for the VEGP PSP, T&QP and SCP, to meet the requirements of 10 CFR 52.79(a)(35) and (36). Part 2, FSAR, Chapter 13, Section 13.6 references the VEGP PSP, T&QP, and SCP in describing the licensing basis for establishing a physical protection program, design of a physical protection system, and security organization, which will have, as its objective, to provide high assurance that activities involving special nuclear material are not inimical to the common defense and security and do not constitute an unreasonable risk to the public health and safety. The VEGP submitted PSP makes references to 10 CFR 50.34(c)(2) and (d)(2). The correct references should be 10 CFR 52.79(a)(35) and (36). It is noted that this is a template error, and both references require that the same criteria be met.

Security plans must describe how the applicant will implement Commission requirements and those site-specific conditions that affect implementation as required by 10 CFR 73.55(c)(1)(i).

The requirements are provided in 10 CFR 73.55(c), and (d) to establish, maintain, and implement a PSP to meet the requirements of 10 CFR 73.55, and 10 CFR Part 73, Appendices B and C. The applicant must show establishment and maintenance of a security organization, the use of security equipment and technology, the training and qualification of security personnel, the implementation of predetermined response plans and strategies, and the protection of digital computer and communication systems and networks. The applicant must have a management system for development, implementation, revision, and oversight of security implementing procedures. The approval process for implementing security procedures will be documented.

The NRC staff has reviewed the applicant's description in PSP Section 1 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP meets the requirements of 10 CFR 73.55(c) and (d), and is, therefore, acceptable.

13.6.4.1.1 Introduction and Physical Facility Layout

The provisions of 10 CFR 52.79(a)(35) require:

(i) A PSP, describing how the applicant will meet the requirements of 10 CFR Part 73 (and 10 CFR Part 11, if applicable, including the identification and description of jobs as required by 10 CFR 11.11(a) of this chapter, at the proposed facility). The plan must list tests, inspections, audits, and other means to be used to demonstrate compliance with the requirements of 10 CFR Parts 11 and 73, if applicable.

(ii) A description of the implementation of the PSP.

The provisions of 10 CFR 52.79(a)(36) require:

(i) An SCP in accordance with the criteria set forth in 10 CFR Part 73, Appendix C. The safeguards contingency plan shall include plans for dealing with threats, thefts, and radiological sabotage, as defined in 10 CFR Part 73 of this chapter, relating to the special nuclear material and nuclear facilities licensed under this chapter and in the applicant's possession and control. Each application for this type of license shall include the information in the applicant's SCP. (Implementing procedures required for this plan need not be submitted for approval).

(ii) A T&QP in accordance with the criteria set forth in 10 CFR Part 73, Appendix B.

(iii) A cyber security plan (CSP) in accordance with the criteria set forth in 10 CFR 73.54 of this chapter.

(iv) A description of the implementation of the SCP, T&QP, and CSP.

(v) Each applicant who prepares a PSP, an SCP, a T&QP, or a CSP, shall protect the plans and other related Safeguards Information against unauthorized disclosure in accordance with the requirements of 10 CFR 73.21 of this chapter.

The provisions of 10 CFR 52.79(a)(44) require a description of the FFD program required by 10 CFR Part 26 “Fitness for Duty Program” and its implementation.

Requirements are established in 10 CFR 73.55(c)(2) to ensure protection of safeguards information (SGI) against unauthorized disclosure in accordance with 10 CFR 73.21. The applicant’s WLS COLA Part 8 submittal acknowledges that the PSP, the TQ&P and the SCP discuss specific features of the physical security system or response procedures and are SGI.

PSP Section 1 describes the applicant’s commitment to satisfy 10 CFR 50.34(c), 10 CFR 50.34(d), and 10 CFR Part 73 by submitting a PSP, and to controlling the PSP and appendices as Safeguards Information according to 10 CFR 73.21.

The provisions of 10 CFR Part 73, Appendix C, Section II.B.3.b, requires a description of the physical layout of the site.

PSP Section 1.1 provides descriptions of location, site layout, and facility configuration. The PSP describes the physical structures and their locations on the site, description of the protected area, and a description of the site in relation to nearby town, roads, and other environmental features important to the coordination of response operations. The plant layout includes identification of main and alternate entry routes for law enforcement assistance forces and the location of control points for marshalling and coordinating response activities.

In addition, WLS COL FSAR Chapter 2, "Site Characteristics," provides general plant descriptions that include details of the 16 to 80-km (10 to 50-mi) radius of the geographical area of the WLS Units 1 and 2 site, a site area map, and general plant and site descriptions. WLS COL FSAR Chapter 1, references the AP1000 DCD for the principal design and operating characteristics for the design and construction of the WLS Units 1 and 2. WLS COLA Part 1, "General Information," describes the name of the applicant and principal business locations.

The staff reviewed the facility physical layout provided in PSP Section 1.1 and as supplemented by WLS COL FSAR. The staff concluded that the applicant included site-specific conditions that affect the applicant's capability to satisfy the requirements of a comprehensive PSP. The applicant has adequately described the physical structures and their locations onsite and the site in relation to nearby towns, roads, and other environmental features important to the effective coordination of response operations. The applicant described the main and alternate entry routes for law-enforcement assistance forces and the location of control points for marshaling and coordinating response activities in the site-specific law enforcement response plan. The staff concludes that the applicant's security plans have met the requirements for content of a PSP as stated above. Therefore, the staff finds the "Facility Layout" described in the PSP and the WLS COL FSAR acceptable.

13.6.4.1.2 **Performance Objectives**

The following portion of this technical evaluation section is reproduced from VEGP SER Section 13.6.4.1:

> ***13.6.4.1.2 Performance Objectives***
>
> *The provisions of 10 CFR 73.55(b)(1) requires, in part, that the applicant shall establish and maintain a physical protection program with an objective to provide high assurance that activities involving special nuclear material are not inimical to the common defense and security and do not constitute an unreasonable risk to the public health and safety. The provisions of 10 CFR 73.55(b)(2) establish, in part, the requirement to protect a nuclear power reactor against the DBT of radiological sabotage as described in 10 CFR 73.1*,[. The provisions of] *10 CFR 73.55(b)(3)(i), and 10 CFR 73.55(b)(3)(ii) require the applicant to establish a physical protection program designed to ensure the capabilities to detect, assess, interdict, and neutralize threats up to and including the DBT of radiological sabotage as stated in 10 CFR 73.1, are maintained at all times, provide defense-in-depth, supporting processes, and implementing procedures, which ensure the effectiveness of the physical protection program.*
>
> *Section 2 of the PSP outlines the requirements for the establishment and maintenance of an onsite physical protection system, security organization, and integrated response capability. As part of the objective, the security program design shall incorporate supporting processes such that no single event can*

disable the security response capability because of defense-in-depth principles including diversity and redundancy. The physical protection systems and programs described herein are designed to protect against the DBT of radiological sabotage in accordance with the requirements of 10 CFR 73.55(a) through (r) or equivalent measures that meet the same high assurance objectives provided by paragraph (a) through (r). VEGP Units 3 and 4 uses the corrective action program to track, trend, correct and prevent recurrence of failures and deficiencies in the physical protection program,

The NRC staff has reviewed the applicant's description in PSP Section 2 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP meets the requirements of 10 CFR 73.55(b), and is, therefore, acceptable.

13.6.4.1.3 Performance Evaluation Program

The following portion of this technical evaluation section is reproduced from VEGP SER Section 13.6.4.1:

13.6.4.1.3 Performance Evaluation Program

Requirements are established in 10 CFR 73.55(b)(4) through (b)(11) for the applicant to analyze and identify site-specific conditions, establish programs, plans, and procedures that address performance evaluations, access authorization, cyber security, insider mitigation, fitness for duty (FFD), corrective actions, and operating procedures. 10 CFR 73.55(b)(6) prescribes specific requirements to establish, maintain, and implement a performance evaluation program in accordance with 10 CFR Part 73, Appendix B, Section VI for implementation of the plant protective strategy.

Section 3.0 of the PSP describes that drills and exercises, as discussed in the T&QP, will be used to assess the effectiveness of the contingency response plan and the effectiveness of the applicant's response strategy. Other assessment methods include formal and informal exercises or drills, self-assessments, internal and external audits and evaluations.

Section 3.0 of the PSP describes that drills and exercises, as discussed in the T&QP, will be used to assess the effectiveness of the contingency response plan and the effectiveness of the applicant's response strategy. Other assessment methods include formal and informal exercises or drills, self-assessments, internal and external audits and evaluations.

The performance evaluation processes and criteria that assess the effectiveness of the security program, including adequate protection against radiological sabotage, will be established in facility procedures and the deficiencies identified are managed through the corrective action program.

Section 3.0 of the PSP references Section 4.0 of the T&QP, which provides additional details related to the performance evaluation of security personnel in accordance with 10 CFR Part 73, Appendix B, Section VI. Section 4.0 of the T&QP includes the requirements to conduct security force tactical ~~dills~~ [drills] *and force-on-force exercises to evaluate security systems effectiveness and response performances of security personnel. In addition, Section 17 of the PSP describes additional detail regarding the applicant's processes for reviews, evaluations and audits that will complement the performance evaluation program.*

The NRC staff has reviewed the applicant's description in PSP Section 3 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP meets the requirements of 10 CFR 73.55(b)(6), and is, therefore, acceptable.

13.6.4.1.4 **Establishment of Security Organization**

The provisions of 10 CFR 73.55(d) establish requirements to describe a security organization, including the management system for oversight of the physical protection program. The security organization must be designed, staffed, trained, qualified, periodically re-qualified, and equipped to implement the physical protection program as required by 10 CFR 73.55(b) and 10 CFR Part 73, Appendices B and C.

As explained below, PSP Section 4.0 describes how the applicant meets the requirements of 10 CFR 73.55(d)(1).

<u>Security Organization Management</u>

PSP Section 4.1 describes the organization's management structure. The PSP establishes that the security organization is a critical component of the physical protection program and is responsible for the effective application of engineered systems, technologies, programs, equipment, procedures, and personnel necessary to detect, assess, interdict, and neutralize threats up to and including the DBT of radiological sabotage. The security organization may be proprietary, contractor, or other qualified personnel.

The PSP describes that the organization will be staffed with appropriately trained and equipped personnel, in a command structure with administrative controls and procedures, to provide a comprehensive response. PSP Section 4.1 also describes the roles and responsibilities of the Security Organization. The PSP provides that at least one full-time, Response Team Leader that has the authority for command and control of all security operations is onsite at all times.

The security force implementing the security functions as described in this section of the plan will be either a proprietary force, contractor, or other qualified personnel. The training qualification provision is described in the T&QP.

The staff has reviewed the applicant's description in PSP Sections 4 and 4.1 for the implementation of the site-specific physical protection program in accordance with NRC regulations and NUREG-0800 acceptance criteria. Since the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in PSP the meets the requirements of 10 CFR 73.55(d), and is therefore acceptable.

13.6.4.1.5 Qualification for Employment in Security

The following portion of this technical evaluation section is reproduced from VEGP SER Section 13.6.4.1:

> ***13.6.4.1.5 Qualification for Employment in Security***
>
> *The requirements of 10 CFR 73.55(d)(3) state, in part, that the applicant may not permit any individual to implement any part of the physical protection program unless the individual has been trained, equipped and qualified to perform assigned duties and responsibilities in accordance with Appendix B to 10 CFR Part 73 and the applicant's T&QP.*
>
> *Section 5 of the PSP describes that employment qualifications for members of the security force are delineated in the T&QP.*
>
> *The NRC staff has reviewed the applicant's description in PSP Section 5 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP meets the requirements of 10 CFR 73.55(d)(3), and is, therefore, acceptable.*

13.6.4.1.6 Training of Facility Personnel

The following portion of this technical evaluation section is reproduced from VEGP SER Section 13.6.4.1:

> ***13.6.4.1.6 Training of Facility Personnel***
>
> *Consistent with requirements in 10 CFR 73.55(d)(3),10 CFR 73.56 and 10 CFR Part 73, Appendix B, Section VI.C.1, all personnel who are authorized unescorted access to the applicant's PA receive training, in part to ensure that they understand their role in security and their responsibilities in the event of a security incident. Individuals assigned to perform security-related duties or responsibilities, such as, but not limited to, material searches and vehicle escort are trained and qualified in accordance with the T&QP to perform these duties and responsibilities and to ensure that each individual has the minimum knowledge, skills, and abilities required for effective performance of assigned duties and responsibilities.*
>
> *Section 6 of the PSP describes the training provided for all personnel who have been granted unescorted access to the applicant's PA.*

The NRC staff has reviewed the applicant's description in PSP Section 6 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP meets the requirements of 10 CFR 73.56 and 10 CFR Part 73, Appendix B, and is, therefore, acceptable.

13.6.4.1.7 Security Personnel Training

The following portion of this technical evaluation section is reproduced from VEGP SER Section 13.6.4.1:

13.6.4.1.7 Security Personnel Training

The provisions of 10 CFR 73.55(d) require that all security personnel are trained and qualified in accordance with 10 CFR Part 73, Appendix B, Section VI prior to performing their duties.

Section 7 of the PSP describes that all security personnel are trained, qualified and perform tasks at levels specific for their assignments in accordance with the applicant's T&QP.

The NRC staff has reviewed the applicant's description in PSP Section 7 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP meets the requirements of 10 CFR 73.55(d), and is, therefore, acceptable. The NRC staff's review of the licensee T&QP is located in Section 13.6.4.2 of this SER.

13.6.4.1.8 Local Law Enforcement Liaison

The following portion of this technical evaluation section is reproduced from VEGP SER Section 13.6.4.1:

13.6.4.1.8 Local Law Enforcement Liaison

The following requirement is stated in 10 CFR 73.55(k)(9) "To the extent practicable, licensees shall document and maintain current agreements with applicable law enforcement agencies to include estimated response times and capabilities." In addition, 10 CFR 73.55(m)(2) requires, in part, that an evaluation of the effectiveness of the physical protection system include an audit of response commitments by local, State and Federal law enforcement authorities.

Section 8 of the PSP provides a detailed discussion of its ongoing relationship with local law enforcement agencies (LLEAs). The plans addressing response, communication methodologies and protocols, command and control structures and marshaling locations are located in the operations procedures, emergency *plan procedures and the site-specific law enforcement response plan. The law enforcement response plan is reviewed biennially concurrent with the PSP effectiveness review.*

The NRC staff has reviewed the applicant's description in PSP Section 8 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP meets the requirements of 10 CFR 73.55(k)(9) and 10 CFR 73.55(m)(2), and is, therefore, acceptable.

13.6.4.1.9 Security Personnel Equipment

The requirements of 10 CFR 73.55(d)(3) state, in part, that the applicant may not permit any individual to implement any part of the physical protection program unless the individual has been trained, equipped and qualified in accordance with 10 CFR Part 73, Appendix B and the T&QP. The provisions of 10 CFR Part 73, Appendix B, Section VI.G.2(a) state, in part, that the applicant must ensure that each individual is equipped or has ready access to all personal equipment or devices required for the effective implementation of the NRC-approved security plans, the applicant's protective strategy, and implementing procedures. The provisions of 10 CFR Part 73, Appendix B, Sections VI.G.2(b) and (c) delineate the minimum equipment requirements for security personnel and armed response personnel.

PSP Section 9 describes the equipment, including armament, ammunition, and communications equipment that is provided to security personnel in order to ensure that security personnel are capable of performing the function stated in the NRC-approved security plans, applicant's protective strategy, and implementing procedures.

The staff reviewed the applicant's description in PSP Section 9 for the implementation of the site-specific physical protection program in accordance with NRC regulations and NUREG-0800 acceptance criteria. Since the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP meets the requirements of 10 CFR 73.55(d)(3) and Appendix B, Section VI.G.2 and is therefore acceptable.

13.6.4.1.10 Work Hour Controls

The following portion of this technical evaluation section is reproduced from VEGP SER Section 13.6.4.1:

13.6.4.1.10 Work Hour Controls

The provisions of 10 CFR Part 26, "Fitness for duty programs" Subpart I, "Managing Fatigue," establish the requirements for managing fatigue. 10 CFR 26.205 establishes requirements for work hours. 10 CFR 26.205(a) requires that any individual who performs duties identified in 10 CFR 26.4(a)(1) through (a)(5) shall be subject to the requirements of this section.

Section 10 of the PSP describes that the site will implement work hour controls consistent with 10 CFR Part 26, Subpart I, and that site procedures shall describe performance objectives and implementing procedures.

The NRC staff's review of the fitness-for-duty program is found in Section 13.7 of this SER/

13.6.4.1.11 Physical Barriers

The following requirements are established in 10 CFR 73.55(e): "Each applicant shall identify and analyze site-specific conditions to determine the specific use, type, function, and placement of physical barriers needed to satisfy the physical protection program design requirements of 10 CFR 73.55(b). (1) The applicant shall: (i) Design, construct, install and maintain physical barriers as necessary to control access into facility areas for which access must be controlled or denied to satisfy the physical protection program design requirements of paragraph (b) of this section." The regulation 10 CFR 73.55(b)(3)(ii) states, that the physical protection program must: "Provide defense-in-depth through the integration of systems, technologies, programs, equipment, supporting processes, and implementing procedures as needed to ensure the effectiveness of the physical protection program."

PSP Section 11 provides a general description of how the applicant will implement its program for physical barriers, and that this implementation will meet the performance objectives and requirements of 10 CFR 73.55(b).

Owner Controlled Area (OCA) Barriers

PSP Section 11.1 describes WLS use of OCA barriers at the site.

Vehicle Barriers

PSP Sections 11.2.1 and 11.2.2 establish and maintain vehicle control measures, as necessary, to protect against the DBT of radiological sabotage, consistent with the physical protection program design requirements of 10 CFR 73.55(b)(3)(ii) and 10 CFR 73.55(e)(10)(i), and in accordance with site-specific analysis. The PSP identifies measures taken to provide high assurance that such an event can be defended against. The applicant's PSP also provides that the inspection, monitoring, and maintenance of the vehicle barrier system (VBS) will be included in the facility procedures.

Waterborne Threat Measures

The provisions of 10 CFR 73.55(e)(10)(ii) require the applicant to "Identify areas from which a waterborne vehicle must be restricted, and where possible, in coordination with local, State, and Federal agencies having jurisdiction over waterway approaches, deploy buoys, markers, or other equipment. In accordance with the site-specific analysis, provide periodic surveillance and observation of waterway approaches and adjacent areas."

PSP Section 11.2.3 states that a site-specific analysis for a water-borne DBT has been conducted and documented. The analysis determined that there is no waterborne access to WLS Units 1 and 2.

Protected Area Barriers

The provisions of 10 CFR 73.55(e)(8)(i) require that the protected area perimeter must be protected by physical barriers that are designed and constructed to do the following: (1) limit access to only those personnel, vehicles, and materials required to perform official duties; (2) channel personnel, vehicles, and materials to designated access control portals; and (3) be separated from any other barrier designated as a vital area physical barrier, unless otherwise identified in the PSP.

The descriptions of the protected area barrier are provided in the PSP Section 11.3. The staff notes that these descriptions meet the definitions of physical barriers and protected areas in 10 CFR 73.2 and requirements of 10 CFR 73.55(e)(8).

PSP Section 11.3 describes the extent to which the protected area barrier at the perimeter is separated from a vital area/island barrier. The security plan identifies where the protected area barrier is not separated from a vital area barrier, as required by 10 CFR 73.55(e)(8)(i)(c).

PSP Section 11.3 describes isolation zones. As required in 10 CFR 73.55(e)(7), the isolation zone is maintained in outdoor areas adjacent to the protected area perimeter barrier and is designed to ensure the ability to observe and assess activities on either side of the protected area perimeter.

Vital Area Barriers

The provisions of 10 CFR 73.55(e)(9) require that "Vital equipment must be located only within vital areas, which must be located within a protected area so that access to vital equipment requires passage through at least two physical barriers, except as otherwise approved by the NRC and identified in the security plans." In addition, 10 CFR 73.55(e)(5) requires that the physical barriers to access of certain vital areas shall be bullet resisting.

PSP Section 11.4 states that vital areas are restricted access areas surrounded by physical barriers with the capability to restrict access to only authorized individuals. All vital areas are constructed in accordance with established regulatory requirements. PSP Section 11.4 also describes that the reactor control room, central alarm station (CAS) and the location within which the last access control function for access to the protected area is performed, must be bullet resisting.

In RAI 97, Question 13.06-49, the staff requested that the applicant provide clarification regarding functionality in certain vital areas. In a July 6, 2011, response, the applicant confirmed that the response provided in VEGP Reference (R)-COLA RAI 13.06-13 (VEGP eRAI 3394) is also applicable to WLS. On the basis of its review, the staff finds the revised description in the November 17, 2011, PSP Revision 2, acceptable, as it provides the additional information on how the applicant meets the requirements of 10 CFR 73.55(e)(9).

Target Set Equipment

The provisions of 10 CFR 73.55(f) require the following, "The licensee shall document and maintain the process used to develop and identify target sets, to include the site-specific analyses and methodologies used to determine and group the target set equipment or elements. The licensee shall consider cyber attacks in the development and identification of target sets. Target set equipment or elements that are not contained within a protected or vital area must be identified and documented consistent with the requirements in 10 CFR 73.55(f)(1) and be accounted for in the licensee's protective strategy. The licensee shall implement a process for the oversight of target set equipment and systems to ensure that changes to the configuration of the identified equipment and systems are considered in the licensee's protective strategy. Where appropriate, changes must be made to documented target sets."

PSP Section 11.5 describes that target set equipment or elements that are not contained within a protected or vital area are identified and accounted for in the site protective strategy.

The staff identified several RAIs relating to target sets for the purpose of reviewing the Westinghouse physical protection program. Westinghouse provided design details as background information to assist an applicant with the development of site-specific target set analyses. The staff evaluated the applicant's responses, and found them acceptable for the DC review of the AP1000 physical protection program. In TR-94, Westinghouse stated in, APP-GW-GLR-066, "AP1000 Safeguards Assessment Report" that target sets were created to aid in the development of the AP1000 physical security system, and that final target sets will be developed by the COL applicant prior to fuel onsite (inside protected areas).

The staff reviewed the applicant's description in PSP Sections 11.5 and 14.5, SCP Section 7 and information in Westinghouse TR-94, APP-GW-GLR-066, "AP1000 Safeguards Assessment Report," for the implementation of the site-specific physical protection program in accordance with NRC regulations and NUREG-0800 acceptance criteria. Since the applicant's description in PSP Sections 11.5 and 14.5, SCP Section 7, and the information in Westinghouse TR-94 are consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP Sections 11.5 and 14.5 and SCP Section 7 meets the requirements of 10 CFR 73.55(f)(1), (3), and (4) and is, therefore, acceptable. The target sets, target set analysis and site protective strategy are in the facility implementing procedures. They will be subject to future NRC inspections in accordance with 10 CFR 73.55(c)(7)(iv) and 10 CFR Part 73, Appendix C, Section II.B.5(iii).

<u>Delay Barriers</u>

The provisions of 10 CFR 73.55(e)(3)(ii) require that physical barriers must "provide deterrence, delay, or support access control" to perform the required function of the applicant physical protection program. The PSP describes the use of delay barriers at WLS Units 1 and 2.

PSP Section 11.6 includes a description of the use of Delay Barriers to meet requirement of 10 CFR 73.55(e).

The staff reviewed the applicant's description in PSP Sections 11, 11.1, 11.2, 11.2.1, 11.2.2, 11.2.3, and Sections 11.3 through 11.6 for the implementation of the site-specific physical protection program in accordance with NRC regulations and NUREG-0800 acceptance criteria. Since the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP meet the requirements of 10 CFR 73.55(e), and are, therefore, acceptable.

13.6.4.1.12 Security Posts and Structures

The following portion of this technical evaluation section is reproduced from VEGP SER Section 13.6.4.1:

> ***13.6.4.1.12 Security Posts and Structures***
>
> *The provisions of 10 CFR 73.55(e)(5) require that the reactor control room, the CAS, and the location within which the last access control function for access to the PA is performed, must be bullet-resisting.*
>
> *Section 12 of the PSP describes that security posts and structures are qualified to a level commensurate with their application within the site protective strategy, and that these positions are constructed of bullet resisting materials.*
>
> *The NRC staff has reviewed the applicant's description in PSP Section 12 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP meets the requirements of 10 CFR 73.55(e)(5), and is, therefore, acceptable.*

13.6.4.1.13 Access Control Devices

The following portion of this technical evaluation section is reproduced from VEGP SER Section 13.6.4.1:

> ***13.6.4.1.13 Access Control Devices***
>
> *It is stated in 10 CFR 73.55(g)(1) that, consistent with the function of each barrier or barrier system, the applicant shall control personnel, vehicle, and material access, as applicable, at each access control point in accordance with the physical protection program design requirements of 10 CFR 73.55(b).*
>
> *The provisions of 10 CFR 73.55(g)(6) require control of access control devices as stated: "The licensee shall control all keys, locks, combinations, passwords and related access control devices used to control access to protected areas, vital areas and security systems to reduce the probability of compromise."*
>
> <u>*Types of Security-Related Access Control Devices*</u>
>
> *Section 13.1 of the PSP describes that the applicant uses security-related access control devices to control access to protected and vital areas and security systems.*
>
> <u>*Control and Accountability*</u>
>
> *Section 13.2.1 of the PSP describes the control of security related locks. Section 13.2.2 of the PSP describes the controls associated with the changes to*

and replacements of access control devices and the accountability and inventory control process, and the circumstances that require changes in security-related locks. The applicant uses facility procedures to produce, control, and recover keys, locks, and combinations for all areas and equipment, which serve to reduce the probability of compromise. The issue of access control devices is limited to individuals who have unescorted access authorization and require access to perform official duties and responsibilities. Keys and locks are accounted for through a key inventory control process as described in facility procedures.

The NRC staff has reviewed the applicant's description in PSP Sections 13, 13.1, 13.2, 13.2.1, and 13.2.2 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP meet the requirements of 10 CFR 73.55(g)(1) and (6), and are, therefore, acceptable.

13.6.4.1.14 Access Requirements

Access Authorization and Fitness for Duty

The provisions of 10 CFR 73.55(b)(7) require the applicant shall establish, maintain, and implement an access authorization program in accordance with 10 CFR 73.56 and shall describe the program in the PSP. The provisions of 10 CFR Part 26 require the applicant to establish and maintain a FFD program.

PSP Section 14.1 describes that the access authorization program implements regulatory requirements utilizing the provisions in RG 5.66, "Nuclear Power Plant Access Authorization Program," Revision 1, July 2009. The staff finds that RG 5.66, is an acceptable method to meet the requirements of 10 CFR 73.55(b)(7).

The staff reviewed the applicant's description in PSP Section 14.1 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Since the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP meets the requirements of 10 CFR 73.55(b)(7), 10 CFR 73.56 and 10 CFR Part 26 and is, therefore, acceptable.

Insider Mitigation Program

The provisions of 10 CFR 73.55(b)(9) require that the applicant shall establish, maintain, and implement an insider mitigation program and shall describe the program in the PSP. The insider mitigation program must monitor the initial and continuing trustworthiness and reliability of individuals granted or retaining unescorted access authorization to a protected or vital area, and implement defense-in-depth methodologies to minimize the potential for an insider to adversely affect, either directly or indirectly, the applicant's capability to prevent significant core damage and spent fuel sabotage. The insider mitigation program must include elements from: the access authorization program, the FFD program, the cyber security program and the physical protection program.

PSP Section 14.2 describes how the applicant will establish, maintain, and implement an insider mitigation program utilizing the guidance in RG 5.77, "Insider Mitigation Program." The insider mitigation program requires elements from the access authorization program described in 10 CFR 73.56; FFD program described in 10 CFR Part 26; the cyber security program described in 10 CFR 73.54; and the physical security program described in 10 CFR 73.55. In addition, PSP Section 14.2 describes the integration of the programs discussed above to form a cohesive and effective insider mitigation program. The applicant addressed the observations for the detection of tampering. The staff notes that RG 5.77 is an acceptable method to meet the requirements of 10 CFR 73.55(b)(9).

The staff reviewed the applicant's description in PSP Section 14.2 for the implementation of the site-specific physical protection program in accordance with NRC regulations and NUREG-0800 acceptance criteria. Since the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP meets the requirements of 10 CFR 73.55(b)(9) and is, therefore, acceptable.

Picture Badge Systems

Requirements for badges are stated in 10 CFR 73.55(g)(6)(ii). "The licensee shall implement a numbered photo identification badge system for all individuals authorized unescorted access to the protected area and vital areas." In addition, identification badges may be removed from the protected area under limited conditions and only by authorized personnel. Records of all badges shall be retained and shall include name and areas to which persons are granted unescorted access.

The provisions of 10 CFR 73.55(g)(7)(ii) require that individuals not employed by the applicant but who require frequent or extended unescorted access to the protected area and/or vital areas to perform duties and responsibilities required by the applicant at irregular or intermittent intervals, shall satisfy the access authorization requirements of 10 CFR 73.56 and 10 CFR Part 26 of this chapter, and shall be issued a non-employee photo identification badge that is easily distinguished from other identification badges before being allowed unescorted access to the protected and vital areas. Non-employee photo identification badges must visually reflect that the individual is a non-employee and that no escort is required.

PSP Section 14.3 describes the site picture badge system. Identification badges will be displayed while individuals are inside the protected area or vital areas. When not in use, badges may be removed from the protected area by authorized holders, provided that a process exists to deactivate the badge upon exit and positively confirm the individual's true identity and authorization for unescorted access prior to entry into the protected area. Records are maintained to include the name and areas to which unescorted access is granted of all individuals to whom photo identification badges have been issued.

The staff reviewed the applicant's description in PSP Section 14.3 for the implementation of the site-specific physical protection program in accordance with NRC regulations and NUREG-0800 acceptance criteria. Since the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP meets the requirements of 10 CFR 73.55(g)(6) and (7) and is, therefore, acceptable.

Searches

The provisions of 10 CFR 73.55(h) require, in part, that applicants meet the objective to detect, deter, and prevent the introduction of firearms, explosives, incendiary devices, or other items that could be used to commit radiological sabotage. To accomplish this, applicant's shall search individuals, vehicles, and materials consistent with the physical protection program design requirements in paragraph (b) of this section, and the function to be performed at each access control point or portal before granting access.

PSP Section 14.4 provides an overview description of the search process for vehicle, personnel, and materials. The search process is conducted using security personnel, specifically trained non-security personnel and technology. Detailed discussions of actions to be taken in the event unauthorized materials are discovered are found in implementing procedures.

Vehicle Barrier Access Control Point

The provisions of 10 CFR 73.55(h)(2)(ii) through (v) provide the requirements for the applicant to search vehicles at the OCA and 10 CFR 73.55(h)(3) provides requirements for searches of personnel, vehicles, and materials prior to entering the protected area.

PSP Section 14.4.1 describes the process for the search of personnel, vehicles, and materials at predetermined locations prior to granting access to designated facility areas identified by the applicant as needed to satisfy the physical protection program. The applicant stated that it has developed specific implementing procedures to address vehicle and materials searches at these locations.

Protected Area Packages and Materials Search

PSP Section 14.4.2 describes the process for conducting searches of packages and materials for firearms, explosives, incendiary devices, or other items that could be used to commit radiological sabotage using equipment capable of detecting these items or through visual and physical searches, or both, to ensure that all items are clearly identified before these items can enter the WLS Units 1 and 2 protected area. Detailed provisions for conducting these searches are found in applicant implementing procedures and include the search and control of bulk materials and products. Applicant implementing procedures also discuss the control of packages and materials previously searched and tamper sealed by personnel trained in accordance with the T&QP.

Protected Area Vehicle Search

PSP Section 14.4.3 describes the process for the search of vehicles for firearms, explosives, incendiary devices, or other items that could be used to commit radiological sabotage using equipment capable of detecting these items or through visual and physical searches, or both, to ensure that all items are clearly identified at the protected area. Detailed provisions for conducting these searches are found in the applicant's implementing procedures. The applicant's implementing procedures also address the search methodologies for vehicles that must enter the protected area under emergency conditions.

Protected Area Personnel Searches

PSP Section 14.4.4 describes the process for searches of all personnel requesting access into protected areas. The PSP describes the search for firearms, explosives, incendiary devices, or other items that could be used to commit radiological sabotage using equipment capable of detecting these items or through visual and physical searches or both to ensure that all items are clearly identified prior to granting access into the protected area. All persons except official Federal, State, and local law enforcement agency personnel on official duty are subject to these searches upon entry to the protected area. Detailed discussions of observation and control measures are found in implementing procedures.

Protected Area Access Controls

PSP Section 14.4.5 of the PSP describes the process for controlling access at all points where personnel or vehicles could gain access into the applicant's protected area. The plan notes that principal personnel access to the protected area is through a lockable portal. Personnel are only permitted into the protected area after positive identification (ID) verification, access authorization verification, and a search is performed per PSP Section 14.4. Vehicles are controlled through positive control methods described in the facility procedures.

Escort and Visitor Requirements

The provisions of 10 CFR 73.55(g)(7) state in part, that the applicant may permit escorted access to protected and vital areas to individuals who have not been granted unescorted access in accordance with the requirements of 10 CFR 73.56 and 10 CFR Part 26. Provision in 10 CFR 73.55(g)(8) establishes escort requirements. Applicants are required to implement procedures to process, escort and control visitors. Procedures shall address confirmation of identity of visitors, maintenance of a visitor control register, visitor badging and escort controls including, training, communications, and escort ratios.

PSP Section 14.4.6 describes the process for control of visitors. The PSP affirms that procedures address the identification, processing, and escorting of visitors and the maintenance of a visitor control register. Training provisions for escorting visitors include responsibilities, communications and escort ratios. All escorts are trained to perform escort duties in accordance with site requirements. All visitors wear a badge that clearly indicates that an escort is required.

The staff reviewed the applicant's description in PSP Sections 14.4, and 14.4.1 through 14.4.6 for the implementation of the site-specific physical protection program in accordance with NRC regulations and NUREG-0800 acceptance criteria. Since the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP meets the requirements of 10 CFR 73.55(h)(2), 10 CFR 73.55(h)(3), 10 CFR 73.55(g)(7) and 10 CFR 73.55(g)(8) and are, therefore, acceptable.

Vital Area Access Controls

The provisions of 10 CFR 73.55(g)(4) require that applicants control access into vital areas consistent with established access authorization lists. In response to a site-specific credible threat or other credible information, applicants shall implement a two-person (line-of-sight) rule for all personnel in vital areas so that no one individual is permitted access to a vital area.

The provisions of 10 CFR 73.56(j) require the applicant to establish, implement, and maintain a list of individuals who are authorized to have unescorted access to specific nuclear power plant vital areas during non-emergency conditions. The list must include only those individuals who have a continued need for access to those specific vital areas to perform their duties and responsibilities. The list must be approved by a cognizant applicant manager or supervisor responsible for directing the work activities of the individual who is granted unescorted access to each vital area, and be updated and re-approved no less frequently than every 31 days.

PSP Section 14.5 describes vital areas and states that the applicant maintains vital areas locked and protected by an active intrusion alarm system. An access authorization system is established to limit unescorted access that is controlled by an access authorization list that is reassessed and reapproved at least once every 31 days. Additional access control measures are described in the facility procedures.

In RAI 97, Question 13.06-50, the staff requested that the applicant clarify how the minimum vital areas and equipment are protected, including any proposed revision to this section of the security plan. The applicant responded that PSP Section 14.5 will be revised, as necessary, to clearly identify any regulatory minimum vital areas that are bounded by the larger vital areas included in the list. In a July 6, 2011, response, the applicant stated that the VEGP R-COLA RAI 13.6-19October 16, 2009, response is applicable to WLS Units 1 and 2. In Enclosure 22 of their July 6, 2011, response, the applicant provided a description that clearly identifies the minimum vital areas. On the basis of its review, the staff finds the revised description in the PSP Revision 2, dated November 17, 2011, acceptable, as it provides the additional information on how the applicant meets 10 CFR 73.55(e)(9) and 10 CFR 73.55(g)(4).

The staff reviewed the applicant's description in PSP Section 14.5 for the implementation of the site-specific physical protection program in accordance with NRC regulations and NUREG-0800 acceptance criteria. Since the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP meets the requirements of 10 CFR 73.55(g)(4) and is, therefore, acceptable.

13.6.4.1.15 Surveillance Observation and Monitoring

The following portion of this technical evaluation section is reproduced from VEGP SER Section 13.6.4.1.15:

> ***13.6.4.1.15 Surveillance Observation and Monitoring***
>
> *The provisions of 10 CFR 73.55(i)(1) require that the applicant establish and maintain intrusion detection systems that satisfy the design requirements of 10 CFR 73.55(b) and provide, at all times, the capability to detect and assess unauthorized persons and facilitate the effective implementation of the protective strategy.*

Illumination

The provisions of 10 CFR 73.55(i)(6) require, in part, that all areas of the facility are provided with illumination necessary to satisfy the design requirements of 10 CFR 73.55(b) and implement the protective strategy. Specific requirements include providing a minimum illumination level of 0.2 foot-candles, measured horizontally at ground level, in the isolation zones and appropriate exterior areas within the PA. Alternatively, the applicant may augment the facility illumination system by means of low-light technology to meet the requirements of this section or otherwise implement the protective strategy. The applicant shall describe in the security plans how the lighting requirements of this section are met and, if used, the type(s) and application of low-light technology.

Section 15.1 of the PSP describes that all isolation zones and appropriate exterior areas within the PA have lighting capabilities that provide illumination sufficient for the initiation of an adequate response to an attempted intrusion of the isolation zone, a PA, or a vital area. A discussion of the implementation of technology using fixed and non-fixed low light level cameras or alternative technological means is provided. The applicant has addressed the potential for loss of lighting and the compensatory actions that would be taken if that event were to occur.

Surveillance Systems

The provisions of 10 CFR 73.55(i)(1) require, in part, that the applicant implement, establish, and maintain intrusion detection and assessment, surveillance, observation and monitoring systems to satisfy the design requirements of 10 CFR 73.55(b), and of the applicant's OCA.

Section 15.2 of the PSP describes that surveillance is accomplished by human observation and technology. Surveillance systems include a variety of cameras, video display, and annunciation systems designed to assist the security organization in observing, detecting assessing alarms or unauthorized activities. Certain systems provide real-time and recorded play back of recorded video images. The specifics of surveillance systems are described in facility implementing procedures.

Intrusion Detection Equipment

Section 15.3 of the PSP describes the perimeter intrusion detection system, and the PA and vital area intrusion detection systems. These systems are capable of detecting attempted penetration of the PA perimeter barrier; are monitored with assessment equipment designed to satisfy the requirements of 10 CFR 73.55(i) and provide real-time and play-back/recorded video images of the detected activities before and after each alarm annunciation. The PSP describes how the applicant will meet regulatory requirements for redundancy, tamper indication and uninterruptable power supply.

Central Alarm Station (CAS) and Secondary Alarm Station (SAS) Operation

The provisions of 10 CFR 73.55(i)(4) provide requirements for alarm stations. It is required, in 10 CFR 73.55(i)(4)(i), that both alarm stations must be designed and equipped to ensure that a single act, in accordance with the DBT of radiological sabotage defined in 10 CFR 73.1, cannot disable both alarm stations. The applicant shall ensure the survivability of at least one alarm station to maintain the ability to perform the following functions: 1) detect and assess alarms; 2) initiate and coordinate an adequate response to an alarm; 3) summon offsite assistance; and 4) provide command and control. 10 CFR 73.55(i)(4)(iii) requires that alarm stations must be equal and redundant.

Section 15.4 of the PSP describes the functional operations of the CAS and the SAS. The PSP provides that the alarm stations are equipped, such that no single act will disable both alarm stations. The applicant's PSP provides that each alarm station is properly manned and that no activities are permitted that would interfere with the operator's ability to execute assigned duties and responsibilities.

Security Patrols

Owner Controlled Area (OCA) Surveillance and Response

The provisions of 10 CFR 73.55(e)(6) require that the applicant establish and maintain physical barriers in the OCA as needed to satisfy the physical protection program design requirements of 10 CFR 73.55(b). It is required, in 10 CFR 73.55(i)(5)(ii), in part, that the applicant provide continuous surveillance, observation and monitoring of the OCA and that these responsibilities may be performed by security personnel during continuous patrols, through the use of video technology, or by a combination of both.

Section 15.5.1 of the PSP describes the processes used to meet this requirement. The PSP discusses the process to be used and provides that details regarding the implementation of OCA surveillance techniques are found in facility procedures. The PSP provides a discussion regarding the implementation of manned and video options for patrolling and surveillance of the OCA.

Protected and Vital Area Patrols

The provisions of 10 CFR 73.55(i)(5)(iii) through (viii) require, in part, that armed patrols check unattended openings that intersect a security boundary, such as an underground pathways, check external areas of the PA and vital area portals, periodically inspect vital areas, conduct random patrols of accessible target set equipment, be trained to recognize obvious tampering and if detected, initiate an appropriate response in accordance with established plans and procedures.

Section 15.5.2 of the PSP describes the process employed by the applicant to meet the above requirements. The PSP describes the areas of the facility that will be patrolled and observed, as well as the frequency of these patrols and *observations. The applicant has addressed the observations for the detection of tampering in Section 14.2 of the PSP and in the facility procedures.*

The NRC staff has reviewed the applicant's description in PSP Sections 15, 15.1 through 15.4, 15.5.1, and 15.5.2 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP meets the requirements of 10 CFR 73.55(b) and (i), and are, therefore, acceptable.

13.6.4.1.16 **Communications**

The following portion of this technical evaluation section is reproduced from VEGP SER Section 13.6.4.1.16:

13.6.4.1.16 Communications

The provisions of 10 CFR 73.55(j)(1) through (6) describe the requirements for establishment and maintenance of continuous communication capabilities with both onsite and offsite resources to ensure effective command and control during both normal and emergency situations. Alarm stations must be capable of calling for assistance, on-duty security force personnel must be capable of maintaining continuous communication with each alarm station and vehicle escorts, and personnel escorts must maintain timely communication with security personnel. Continuous communication capabilities must terminate in both alarm stations, between LLEA and the control room. Non-portable communications must remain operable from independence power sources. The applicant must identify areas where communications could be interrupted or not maintained.

<u>*Notifications (Security Contingency Event Notifications)*</u>

Section 16.1 of the PSP describes that the applicant have a process to ensure that continuous communications are established and maintained between the onsite security force staff and the offsite support agencies.

<u>*System Descriptions*</u>

Section 16.2 of the PSP describes the establishment and maintenance of the communications system. Detailed descriptions of security systems are included in the facility procedures. VEGP has access to both hard wired and alternate communications systems. Site security personnel are assigned communications devices with which to maintain continuous communications with the CAS and SAS. All personnel and vehicles are assigned communications resources with which to maintain continuous communications. Continuous communication protocols are available between the CAS, SAS and the control room.

The NRC staff has reviewed the applicant's description in PSP Sections 16, 16.1 and 16.2 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria.

Because the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP meets the requirements of 10 CFR 73.55(j)(1) through (6), and are, therefore, acceptable.

13.6.4.1.17 Review, Evaluation and Audit of the Physical Security Program

The following portion of this technical evaluation section is reproduced from VEGP SER Section 13.6.4.1.17.

13.6.4.1.17 Review, Evaluation and Audit of the Physical Security Program

The provisions of 10 CFR 73.55(m) require, in part, that each element of the physical protection program will be reviewed at least every 24 months. An initial review is required within 12 months after original plan implementation, or a change in personnel, procedures, equipment or facilities, which could have a potentially adverse affect on security, or as necessary based on site-specific analysis assessments, or other performance indicators. Reviews must be conducted by individuals independent of the security program and must include the plans, implementing procedures and local law enforcement commitments. Results of reviews shall be presented to senior management above the level of the security manager and findings must be entered in the site corrective action program.

Section 17 of the PSP describes that the physical security program is reviewed 12 months following initial implementation and at least every 24 months by individuals independent of both security program management and personnel who have a direct responsibility for implementation of the security program. The physical security program review includes, but is not limited to, an audit of the effectiveness of the physical security program, cyber security plans, implementing procedures, safety/security interface activities, the testing, maintenance, and calibration program, and response commitments by local, State, and Federal law enforcement authorities.

A review shall be conducted as necessary based upon site-specific analyses, assessments, or other performance indicators and as soon as reasonably practical, but no longer than 12 months, after changes occur in personnel, procedures, equipment, or facilities that potentially could adversely affect safety/security.

The results and recommendations of the physical security program review, management's finding on whether the physical security program is currently effective and any actions taken as a result of recommendations from prior program reviews are documented in a report to plant management and to appropriate corporate management at least one level higher than that having responsibility for the day-to-day plant operation. These reports are maintained in an auditable form and maintained for inspection.

Findings from the onsite physical security program reviews are entered into the facility corrective action program.

In RAI 13.6-36, the NRC staff requested that the applicant address the requirements of 10 CFR 73.58, “Safety/security requirements for nuclear power reactors.” In its response dated May 14, 2010, the applicant stated that management controls and processes used to establish and maintain an effective interface between nuclear safety and physical security are addressed by administrative procedures. The applicant committed to revise VEGP COL FSAR Section 13.5.1 to include the safety/security interface implementation process in the list of procedural instructions provided in plant administrative procedures.

On the basis of its review, the NRC staff finds that since the applicant will revise VEGP COL FSAR Section 13.5.1 to incorporate the requirements for safety/security interfaces, the response to RAI 13.6-36 meets the requirements of 10 CFR 73.58 and is, therefore, acceptable. The incorporation of changes to the VEGP COL FSAR Section 13.5.1 is being tracked as ***Confirmatory Item 13.6-2****.*

<u>Resolution of Standard Content Confirmatory Item 13.6-2</u>

Confirmatory Item 13.6-2 is an applicant commitment to revise its FSAR Section 13.5 regarding the requirements of safety/security interfaces. The staff verified that the VEGP COL FSAR was appropriately revised. As a result, Confirmatory Item 13.6-2 is now closed.

The NRC staff has reviewed the applicant’s description in PSP Section 17 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant’s description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP meets the requirements of 10 CFR 73.55(m), and is, therefore, acceptable.

During the review of the Levy Nuclear Plant, Units 1 and 2, COLA, the staff raised concerns in LNP RAI 13.06.01-1 regarding how the LNP applicant, once licensed, would analyze and identify changes in the site-specific conditions related to the AP1000's structures, systems, and components (SSCs) (described in certain technical reports), resulting from changes made to the LNP Units 1 and 2 COL between issuance of the COL and the security program implementation milestones provided in LNP FSAR Table 13.4-201 to ensure that the security plan continues to meet 10 CFR 73.55(b)(4). This LNP RAI also requested that the applicant clarify how the applicant, once licensed, will ensure that the as-built plant continues to meet all physical protection program design and performance criteria in 10 CFR 73.55 at the time the physical protection program is implemented.

In the staff’s safety review of LNP Units 1 and 2 COL FSAR Section 13.4.1.18, the staff noted the applicant’s responses and proposed changes to their application acceptable as follows:

In the Duke Energy Florida (DEF) response letter, “Revised Response to NRC RAI Letter 119 – Related to Standard Review Plan Section 13.6, Physical Security, for the Levy Nuclear Plant, Units 1 and 2, Combined License Application,” dated August 7, 2014, (ADAMS Accession Number ML14220A433), the applicant stated that a future revision of the LNP COL application will reflect the changes discussed in this response.

Associated LNP COL Application Revisions:

COLA Part 2, FSAR Chapter 13 will be revised to add text to Section 13.5.1, "Administrative Procedures" under the statement: "The plant administrative procedures provide procedural instructions for the following: ," 19th bullet as shown below. The left-hand margin annotation for this added text will be "LNP COL 13.5-1."

A process for implementing the safety/security interface requirements of 10 CFR 73.58.

A process is in effect at the time of issuance of the combined license and was developed using NRC endorsed industry guidance. This process is used to manage safety/security interface while the security procedures and emergency plan implementing procedures are being developed and implemented.

The staff finds that the response to RAI 13.06.01 meets the requirements of 10 CFR 73.55(b)(4), and is acceptable, because it provides a commitment to implement administrative procedures to manage the safety/security interface during the construction phase and throughout the operational phase.

The staff reviewed the applicant’s description in PSP Section 17 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. As set forth above, the applicant’s description in the PSP meets the requirements of 10 CFR 73.55(b)(4), and 10 CFR 73.55(m), and therefore is acceptable. The staff confirmed that the applicant incorporated the proposed changes to the LNP COL FSAR Section 13.5.1 in Revision 7 of the FSAR.

In November 13, 2014, letter, the WLS applicant endorsed the above response and changes to the LNP Units 1 and 2 COL application. The staff verified these same changes in the WLS Units 1 and 2 COL application and finds them acceptable.

13.6.4.1.18 Response Requirements

The provisions of 10 CFR 73.55(k) require, in part, that the applicant establish and maintain a properly trained, qualified, and equipped security force required to interdict and neutralize threats up to and including the DBT defined in 10 CFR 73.1, to prevent significant core damage and spent fuel sabotage. To meet this objective, the applicant must ensure that necessary equipment is in supply, working, and readily available. The applicant must ensure training has been provided to all armed members of the security organization who will be available onsite to implement the applicant’s protective strategy as described in the facility procedures and 10 CFR Part 73, Appendix C. The applicant must have facility procedures to reconstitute armed response personnel and have established working agreement(s) with LLEA. The applicant must have implemented a threat warning system to accommodate heightened security threats and coordination with NRC representatives.

PSP Section 18 describes an armed response team, as well as its responsibilities, training, and equipment, and the number of armed response force personnel required to be immediately available at all times to implement each site's protective strategy. The PSP provides for training in accordance with the requirements of 10 CFR Part 73, Appendix B that will ensure implementation of the site protective strategy in accordance with 10 CFR Part 73, Appendix C. Procedures are in place to reconstitute the armed response personnel as are agreements with LLEA. The PSP also describes procedures to manage the threat warning system.

In RAI 97, Question 13.06-44, the staff requested that the applicant clarify PSP Section 18, which details the minimum number of armed responders continuously in the protected area. The staff also requested that the applicant explain how this number correlates with the expected number detailed in Westinghouse TR 94, AP1000 Safeguards Assessment Report.

In a July 6, 2011, letter, the applicant provided an explanation of how they determined the minimum numbers of armed responders needed for the WLS site. The applicant also provided a metric showing the staffing relationship between Westinghouse TR 94, AP1000 Safeguards Assessment Report, and staffing positions and responsibility for WLS Site Units 1 and 2.

On the basis of its review, the staff finds the response to RAI 97, Question 13.06-44 acceptable. The applicant's metric provided the needed clarification on the minimum number of armed responders continuously in the protected area and the expected number detailed in Westinghouse TR 94, AP1000 Safeguards Assessment Report.

The staff reviewed the applicant's description in PSP Section 18 for the implementation of the site-specific physical protection program in accordance with NRC regulations and NUREG-0800 acceptance criteria. Since the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP meets the requirements of 10 CFR 73.55(k) and is, therefore, acceptable.

13.6.4.1.19 **Special Situations Affecting Security**

The following portion of this technical evaluation section is reproduced from VEGP SER Section 13.6.4.1.19:

> ***13.6.4.1.19 Special Situations Affecting Security***
>
> *The provisions of 10 CFR 73.58 require that each operating nuclear power reactor applicant with a license issued under 10 CFR Part 50 shall comply with the following requirements: the applicant shall assess and manage the potential for adverse effects on safety and security, including the site emergency plan, before implementing changes to plant configurations, facility conditions, or security; the scope of changes to be assessed and managed must include planned and emergent activities (such as, but not limited to, physical modifications, procedural changes, changes to operator actions or security assignments, maintenance activities, system reconfiguration, access modification or restrictions, and changes to the security plan and its implementation); where potential conflicts are identified, the applicant shall communicate them to appropriate personnel and take compensatory and/or mitigative actions to*

maintain safety and security under applicable Commission regulations, requirements, and license conditions.

Section 19 of the PSP includes requirements for assessments to manage increased risk of special situations affecting security.

Refueling/Major Maintenance

Section 19.1 of the PSP describes that, for refueling or major maintenance activities, the PSP describes that security procedures identify measures for implementation of actions prior to refueling or major maintenance activities. These measures include controls to ensure that a search is conducted prior to revitalizing an area, that protective barriers and alarms are fully operational, and post-maintenance performance testing to ensure operational readiness of equipment in accordance with 10 CFR 73.55(n)(8).

Construction and Maintenance

Section 19.2 of the PSP describes that during periods of construction and maintenance when temporary modifications are necessary, that the applicant will implement measures that provide for equivalency in the physical protective measures and features impacted by the activities, such that physical protection measures are not degraded. The process for making such changes or modifications is included in the facility procedures.

The NRC staff has reviewed the applicant's description in PSP Sections 19, 19.1, and 19.2 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP meets the requirements of 10 CFR 73.55(n)(8) and 10 CFR 73.58, and are, therefore, acceptable.

13.6.4.1.20 **Maintenance, Testing and Calibration**

The following portion of this technical evaluation section is reproduced from VEGP SER Section 13.6.4.1.20:

13.6.4.1.20 Maintenance, Testing and Calibration

In accordance with 10 CFR 73.55(n), the applicant is required to establish, maintain, and implement a maintenance, testing, and calibration program to ensure that security systems and equipment, including secondary and uninterruptible power supplies, are tested for operability and performance at predetermined intervals, maintained in operable condition, and have the capability of performing their intended functions. The regulation requires that the applicant describe their maintenance testing and calibrations program in the PSP, and that the implementing procedures describe the details and intervals for conducting these activities. Applicant procedures must identify criteria for documenting deficiencies in the corrective action program and ensuring data *protection in accordance with 10 CFR 73.21. The applicant must conduct periodic operability testing of the intrusion alarm system and must conduct performance testing in accordance with the PSP and implementing procedures. Communication equipment must be tested not less than daily, and search equipment must also be tested periodically. Procedures must be established for testing equipment located in hazardous areas, and procedures must be established for returning equipment to service after each repair.*

Sections 20.1 through 20.6 of the PSP describe the maintenance, testing and calibration program for security-related equipment. Section 20.1 states that the applicant shall conduct intrusion detection testing in accordance with recommended testing procedures described in RG 5.44," Perimeter Intrusion Alarm System." Each operational component required for the implementation of the security program is at a minimum, tested in accordance with 10 CFR 73.55(n), the PSP and implementing procedures.

The NRC staff has reviewed the applicant's description in PSP 20 and 20.1 through 20.6 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP meets the requirements of 10 CFR 73.55(n), and are, therefore, acceptable.

13.6.4.1.21 Compensatory Measures

The following portion of this technical evaluation section is reproduced from VEGP SER Section 13.6.4.1.21:

13.6.4.1.21 Compensatory Measures

The provisions of 10 CFR 73.55(o) require, in part, that the applicant shall identify criteria and measures to compensate for degraded or inoperable equipment, systems, and components to meet the requirements of this section. Compensatory measures must provide a level of protection that is equivalent to the protection that was provided by the degraded or inoperable, equipment, system, or components. Compensatory measures must be implemented within specific time frames necessary to meet the appropriate portions of 10 CFR 73.55(b) and described in the security plans.

Section 21 of the PSP identifies measures and criteria required to compensate for degraded or inoperable equipment, systems, and components in accordance with 10 CFR 73.55(o) to assure that the effectiveness of the physical protection system is not reduced by failure or other contingencies affecting the operation of the security-related equipment or structures. Sections 21.1 through 21.12 of the PSP address PA and vital area barriers, intrusion detection and alarm systems, lighting, fixed and non-fixed closed circuit television, play-back and recorded video systems, computer systems, access control devices, vehicle barrier systems, channeling barrier systems, and other security-related equipment.

The NRC staff has reviewed the applicant's description in PSP Sections 21 and 21.1 through 21.12, for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP meets the requirements of 10 CFR 73.55(o), and are, therefore, acceptable.

13.6.4.1.22 Records

The following portion of this technical evaluation section is reproduced from VEGP SER Section 13.6.4.1.22:

13.6.4.1.22 Records

The provisions of 10 CFR Part 26, 10 CFR 73.55(q), 10 CFR 73.56(k) and (o), 10 CFR Part 73, Appendix B. Section VI.H., Appendix C, Section II.C and 10 CFR 73.70, require that the applicant must retain and maintain all records required to be kept by the Commission regulations, orders, or license conditions until the Commission terminates the license for which the records were developed, and shall maintain superseded portions of these records for at least three years after the record is superseded, unless otherwise specified by the Commission. The applicant is required to keep records of contracts with any contracted security force that implements any portion of the onsite physical protection program for the duration of the contract. The applicant must make all records, required to be kept by the Commission, available to the Commission and the Commission may inspect, copy, retain and remove all such records, reports and documents, whether kept by the applicant or a contractor. Review and audit reports must be maintained and available for inspection for a period of three years.

Section 22.0 of the PSP addresses the requirements to maintain records. Sections 22.1 through 22.13 address each kind of record that the applicant will maintain and the duration of retention for each record. The following types of records are maintained in accordance with the above mention regulations: access authorization records; suitability, physical and psychological qualification records for security personnel; PA and vital area access control records; PA visitor access records; PA vehicle access; vital area access transaction records; vitalization and de-vitalization records; vital area access list reviews; security plans and procedures; security patrols, inspections and tests; maintenance; CAS and SAS alarm annunciation and security response records; local law enforcement agency records; records of audits and reviews; access control devices; security training and qualification records; firearms testing and maintenance records; and engineering analysis for the vehicle barrier system.

The NRC staff has reviewed the applicant's description in PSP Sections 22 and 22.1 through 22.13 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the PSP is consistent *with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP meets the requirements of 10 CFR 73.55(q), 10 CFR 73.55(o) and 10 CFR 73.70, and are, therefore, acceptable.*

13.6.4.1.23 Digital Systems Security

The following portion of this technical evaluation section is reproduced from VEGP SER Section 13.6.4.1.23:

13.6.4.1.23 Digital Systems Security

Section 23 of the PSP addresses digital systems security. The applicant stated in its PSP that it has implemented the requirements of 10 CFR 73.54 and maintains a cyber security plan that describes how it has provided high assurance that safety, security, and emergency preparedness functions are protected against the DBT.

The NRC staff's review of the cyber security plan is found Section 13.8 of this SER.

13.6.4.1.24 Temporary Suspension if Security Measures

The following portion of this technical evaluation section is reproduced from VEGP SER Section 13.6.4.1.24:

13.6.4.1.24 Temporary Suspension if Security Measures

The provisions of 10 CFR 73.55(p) allow the applicant to "suspend implementation of affected requirements of this section under the following conditions: In accordance with 10 CFR 50.54(x) and 50.54(y) of this chapter, the licensee may suspend any security measures under this section in an emergency when this action is immediately needed to protect the public health and safety and no action consistent with license conditions and technical specifications that can provide adequate or equivalent protection is immediately apparent. This suspension of security measures must be approved as a minimum by a licensed senior operator before taking this action. During severe weather when the suspension of affected security measures is immediately needed to protect the personal health and safety of security force personnel and no other immediately apparent action consistent with the license conditions and technical specifications can provide adequate or equivalent protection. This suspension of security measures must be approved, as a minimum, by a licensed senior operator, with input from the security supervisor or manager, before taking this action."

<u>Suspension of Security Measures in Accordance with 10 CFR 50.54(x) and (y)</u>

Section 24.1 of the PSP addresses suspension of security measures in accordance with 10 CFR 50.54(x) and 10 CFR 50.54(y). Specifically, the plan provides a description of the conditions under which suspension is permissible, *the authority for suspension, and the requirements for reporting such a suspension.*

Suspension of Security Measures during Severe Weather or Other Hazardous Conditions

As required in 10 CFR 73.55(p), suspension of security measures are reported and documented in accordance with the provisions of 10 CFR 73.71. This suspension of security measures must be approved, as a minimum, by a licensed senior operator, with input from the security supervisor or manager, before taking this action. Suspended security measures must be reinstated as soon as conditions permit.

Section 24.2 of the PSP provides that certain security measures may be temporarily suspended during circumstances such as imminent, severe or hazardous weather conditions, but only when such action is immediately needed to protect the personal health and safety of security force personnel and no other immediately apparent action consistent with the security measures can provide adequate or equivalent protection. Under the PSP, suspended security measures shall be restored as soon as practical.

The NRC staff has reviewed the applicant's description in PSP Sections 24, 24.1, and 24.2 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP meets the requirements of 10 CFR 73.55(p), and are, therefore, acceptable.

13.6.4.1.25 Appendix A Glossary of Terms and Acronyms

The following portion of this technical evaluation section is reproduced from VEGP SER Section 13.6.4.1.25:

13.6.4.1.25 Appendix A Glossary of Terms and Acronyms

Appendix A, "Glossary of Terms and Acronyms," was reviewed and found to be consistent with the NRC endorsed NEI 03-12, Revision 6 template.

13.6.4.1.26 Conclusions on the Physical Security Plan

The following portion of this technical evaluation section is reproduced from VEGP SER Section 13.6.4.1.26:

13.6.4.1.25 Conclusions on the Physical Security Plan

On the basis of the NRC staff's review described in Sections 13.6.4.1.1 through 13.6.4.1.25 of this SER, the PSP meets the requirements of 10 CFR 73.55(a) through (r). The target sets, Target Set Analysis and Site Protective Strategy are in the facility implementing procedures, which were not *subject to NRC staff review as part of this COL application and are, therefore, subject to future NRC inspection in accordance with 10 CFR 73.55(c)(7)(iv) and 10 CFR Part 73, Appendix C, Section II.B.5(iii). The NRC staff concludes that complete and procedurally correct implementation of the PSP will provide high assurance that activities involving special nuclear material are not inimical to the common defense and security and do not constitute an unreasonable risk to the public health and safety.*

13.6.4.2 Appendix B Training and Qualification Plan

The following portion of this technical evaluation section is reproduced from VEGP SER Section 13.6.4.2:

13.6.4.2 Appendix B Training and Qualification Plan

13.6.4.2.1 Introduction

13.6.4.2.1 Introduction

The provisions of 10 CFR 73.55(c)(4) state that the applicant establish, maintain, implement, and follow a T&QP that describes how the criteria set forth in 10 CFR Part 73, Appendix B will be implemented.

The provisions of 10 CFR 73.55(d)(3) state that the applicant may not permit any individual to implement any part of the physical protection program unless the individual has been trained, equipped, and qualified to perform their assigned duties and responsibilities in accordance with 10 CFR Part 73, Appendix B and the T&QP. Non-security personnel may be assigned duties and responsibilities required to implement the physical protection program and shall:

(i) Be trained through established applicant training programs to ensure each individual is trained, qualified, and periodically requalified to perform assigned duties.

(ii) Be properly equipped to perform assigned duties.

(iii) Possess the knowledge, skills, and abilities to include physical attributes, such as sight and hearing, required to perform their assigned duties and responsibilities.

In addition, 10 CFR Part 73, Appendix B, Section VI.D.2(a) states armed and unarmed individuals shall be requalified at least annually in accordance with the requirements of the Commission-approved T&QP.

The T&QP describes that it is written to address the requirements found in 10 CFR Part 73, Appendix B, Section VI. The objective of the plan is to provide a mechanism to ensure that members of the security organization, and all others who have duties and responsibilities in implementing the security requirements and protective strategy, are properly trained, equipped and qualified.

Deficiencies identified during the administration of T&QP requirements are documented in the site corrective action program.

The NRC staff has reviewed the introduction section in the T&QP and has determined that it includes all of the programmatic elements necessary to satisfy the requirements of 10 CFR 73.55 and 10 CFR Part 73, Appendix B, Section VI applicable to the T&QP. Additional section-by-section evaluations and discussions are found in the following paragraphs.

13.6.4.2.2 Employment Suitability and Qualification

The following portion of this technical evaluation section is reproduced from VEGP SER Section 13.6.4.2.2:

13.6.4.2.2 Employment Suitability and Qualification

The requirements for mental qualifications, documentation, and physical requalification for security personnel (applicant employee and contractor) are described in the following T&QP sections.

Suitability

The provisions of 10 CFR Part 73, Appendix B, Section VI.B.1(a) require, in part, that before employment, or assignment to the security organization, an individual shall: (1) possess a high school diploma or pass an equivalent performance examination designed to measure basic mathematical, language, and reasoning skills, abilities, and knowledge required to perform security duties and responsibilities; (2) attained the age of 21 for an armed capacity or the age of 18 for an unarmed capacity; (3) not have any felony convictions that reflect on the individual's reliability; and (4) individuals in an armed capacity would not be disqualified from possessing or using firearms or ammunition in accordance with applicable State or Federal law, to include 18 U.S.C. 922. Applicants shall use information that has been obtained during the completion of the individual's background investigation for unescorted access to determine suitability. Satisfactory completion of a firearms background check for the individual under 10 CFR 73.19 of this part will also fulfill this requirement. The provisions of 10 CFR Part 73, Appendix B, Section VI.B.1(b) require the qualification of each individual to perform assigned duties and responsibilities must be documented by a qualified training instructor and attested to by a security supervisor.

Section 2.1 of the T&QP details the requirements of qualifications for employment in the security organization that follows the regulation in 10 CFR Part 73, Appendix B, Section VI.B.1(a).

Physical Qualifications

The provisions of 10 CFR Part 73, Appendix B, Section VI.B.2 require, in part, that individuals whose duties and responsibilities are directly associated with the effective implementation of the Commission-approved security plans, applicant protective strategy, and implementing procedures, may not have any physical *conditions that would adversely affect their performance of assigned security duties and responsibilities.*

Section 2.2 of the T&QP details those individuals that are directly associated with implementation of the security plans. Protective strategy and procedures may not have any physical conditions that would adversely affect their performance of assigned security duties and responsibilities. All individuals that are found on the critical task matrix shall demonstrate the necessary physical qualifications prior to duty.

Physical Examination

It is stated in 10 CFR Part 73, Appendix B, Section VI.B.2(a)(2), that armed and unarmed individuals assigned security duties and responsibilities shall be subject to a physical examination designed to measure the individual's physical ability to perform assigned duties and responsibilities as identified in the Commission-approved security plans, applicant protective strategy, and implementing procedures.

The provisions of 10 CFR Part 73, Appendix B, Section VI.B.2(a)(3) state, in part, that the physical examination must be administered by a licensed health professional with the final determination being made by a licensed physician to verify the individual's physical capability to perform assigned duties and responsibilities.

The provisions of 10 CFR Part 73, Appendix B, Section VI.B.2(b) through (e) provide the minimum requirements that individuals must meet, and include requirements for vision, hearing, review of existing medical conditions, and examination for potential addictions.

The provisions of 10 CFR Part 73, Appendix B, Section VI.B.2(f) address medical examinations before returning to assigned duties following any incapacitation.

Section 2.3 of the T&QP describes the physical examinations for armed and unarmed individuals assigned security duties, as well as other individuals that implement parts of the physical protection program. Minimum requirements exist for physical examinations of vision, hearing, existing medical conditions, addiction or other physical requirements.

The NRC staff has reviewed the applicant's description in T&QP Sections 2.1, 2.2, and 2.3 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the T&QP meets the requirements of 10 CFR Part 73 Appendix B, Sections VI.B.1 and VI.B.2, and are, therefore, acceptable.

Medical Examinations and Physical Fitness Qualifications

The provisions of 10 CFR Part 73, Appendix B, Section VI.B.4(a) require, in part, that armed members of the security organization shall be subject to a medical examination by a licensed physician, to determine the individual's fitness to participate in physical fitness tests, and that the applicant shall obtain and retain a written certification from the licensed physician that no medical conditions were disclosed by the medical examination that would preclude the individual's ability to participate in the physical fitness tests or meet the physical fitness attributes or objectives associated with assigned duties.

The provisions of 10 CFR Part 73, Appendix B, Section VI.B.4(b) require, in part, that before assignment, armed members of the security organization shall demonstrate physical fitness for assigned duties and responsibilities by performing a practical physical fitness test. The physical fitness test must consider physical conditions such as strenuous activity, physical exertion, levels of stress, and exposure to the elements as they pertain to each individual's assigned security duties. The physical fitness qualification of each armed member of the security organization must be documented by a qualified training instructor and attested to by a security supervisor.

Section 2.4 of the T&QP is explicit in its requirements for medical examinations and physical qualifications.

The NRC staff has reviewed the applicant's description in T&QP Section 2.4 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the T&QP meets the requirements of 10 CFR Part 73, Appendix B, Section VI.B.4(a) and 10 CFR Part 73, Appendix B, Section VI.B.4(b), and is, therefore, acceptable.

Psychological Qualifications

General Psychological Qualifications

The provisions of 10 CFR Part 73, Appendix B, Section VI.B.3(a) require, in part, that armed and unarmed individuals shall demonstrate the ability to apply good judgment, mental alertness, the capability to implement instructions and assigned tasks, and possess the acuity of senses and ability of expression sufficient to permit accurate communication by written, spoken, audible, visible, or other signals required by assigned duties and responsibilities.

Section 2.5.1 of the T&QP details that individuals whose security tasks and jobs directly associated with the effective implementation of the security plan and protective strategy shall demonstrate the qualities in 10 CFR Part 73, Appendix B, Section VI.B.3(a).

Professional Psychological Examination

The provisions of 10 CFR Part 73, Appendix B, Section VI.B.3(b) require, in part, that a licensed psychologist, psychiatrist, or physician trained in part to identify emotional instability shall determine whether armed members of the security organization and alarm station operators in addition to meeting the requirement stated in paragraph (a) of this section, have no emotional instability that would interfere with the effective performance of assigned duties and responsibilities.

The provisions of 10 CFR Part 73, Appendix B, Section VI.B.3(c) require that a person professionally trained to identify emotional instability shall determine whether unarmed individuals, in addition to meeting the requirement stated in paragraph (a) of this section, have no emotional instability that would interfere with the effective performance of assigned duties and responsibilities.

Section 2.5.2 of the T&QP provides for the administration of psychological and emotional determination that will be conducted by appropriately licensed and trained individuals.

The NRC staff has reviewed the applicant's description in T&QP Sections 2.5.1 and 2.5.2 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the T&QP meets the requirements of 10 CFR Part 73, Appendix B, Sections VI.B.3(a), (b) and (c), and are, therefore, acceptable.

Documentation

The provisions of 10 CFR Part 73, Appendix B, Section VI.H.1 require, in part, the retention of all reports, records, or other documentation required by Appendix B and 10 CFR 75.55(q).

Section 2.6 of the T&QP describes that qualified training instructors create the documentation of training activities and that security supervisors attest to these records as required. Records are retained in accordance with Section 22 of the PSP.

The NRC staff has reviewed the applicant's description in T&QP Section 2.6 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the T&QP meets the requirements of 10 CFR Part 73, Appendix B, Section VI.H.1 and is, therefore, acceptable.

Physical Requalification

The provisions of 10 CFR Part 73, Appendix B, Section VI.B.5 require that: (a) at least annually, armed and unarmed individuals shall be required to demonstrate *the capability to meet the physical requirements of this appendix and the applicant's T&QP; and (b) the physical requalification of each armed and unarmed individual must be documented by a qualified training instructor and attested to by a security supervisor.*

Section 2.7 of the T&QP describes that physical requalification is conducted at least annually, and documented as described in the PSP.

The NRC staff has reviewed the applicant's description in T&QP Section 2.7 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the T&QP meets the requirements of 10 CFR Part 73, Appendix B, Section VI.B.5 and is, therefore, acceptable.

13.6.4.2.3 Individual Training and Qualification

Duty Training

The provisions of 10 CFR Part 73, Appendix B, Section VI.C.1 provide for duty training and qualification requirements. The regulation states, in part, that all personnel who are assigned to perform any security-related duty or responsibility shall be trained and qualified to perform assigned duties and responsibilities to ensure that each individual possesses the minimum knowledge, skills, and abilities required to effectively carry out those assigned duties and responsibilities. Each individual who is performing assigned duties and responsibilities identified in the commission-approved security plans shall be trained before assignment in accordance with the requirements of 10 CFR Part 73, Appendix B, and the T&QP and the PSP. Such personnel must be trained and qualified in the use of all equipment or devices required to effectively perform all assigned duties and responsibilities.

T&QP Section 3.1 details the requirements that individuals assigned duties must be trained in their duties, meet minimum qualifications, and be trained and qualified in all equipment or devices required prior to performing their duties.

The staff reviewed the applicant's description in T&QP Sections 3.0 and 3.1 for the implementation of the site-specific physical protection program in accordance with NRC regulations and NUREG-0800 acceptance criteria. Since the applicant's description in the T&QP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the T&QP meets the requirements of 10 CFR Part 73, Appendix B, Section VI.C.1 and is, therefore, acceptable.

On-the-job Training

The provisions of 10 CFR Part 73, Appendix B, Sections VI.C.2(a) through (c) provides requirements for on-the-job training. On-the-job training performance standards and criteria must ensure that each individual demonstrates the requisite knowledge, skills and abilities. Individuals who are assigned contingency duties must complete a minimum of 40 hours of on-the-job training.

On-the-job training for contingency activities and drills must include, but is not limited to, hands-on application of knowledge, skills, and abilities related to: (1) response team duties; (2) use of force; (3) tactical movement; (4) cover and concealment; (5) defensive positions; (6) fields-of-fire; (7) re-deployment; (8) communications (primary and alternate); (9) use of assigned equipment; (10) target sets; (11) table top drills; (12) command and control duties; (13) applicant's protective strategy.

The T&QP provides a comprehensive discussion of the applicant's approach to meeting the requirements for on-the-job training.

The staff reviewed the applicant's description in T&QP Section 3.2 for the implementation of the site-specific physical protection program in accordance with NRC regulations and NUREG-0800 acceptance criteria. Since the applicant's description in the T&QP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the T&QP meets the requirements of 10 CFR Part 73, Appendix B, Sections VI.C.2(a) through (c) and is, therefore, acceptable.

Critical Task Matrix

The provisions of 10 CFR Part 73, Appendix B, Section VI.C.2(b) require, in part, that each individual who is assigned duties and responsibilities identified in the NRC-approved security plans, licensee protective strategy, and implementing procedures shall, before assignment, demonstrate proficiencies in implementing the knowledge, skills and abilities to perform assigned duties.

The T&QP includes a critical task matrix as T&QP Table 1. This matrix addresses the means through which each individual will demonstrate the required proficiencies. Tasks that individuals must perform are listed in RG 5.75.

The staff reviewed the applicant's description in T&QP Section 3.3 for the implementation of the site-specific physical protection program in accordance with NRC regulations and NUREG-0800 acceptance criteria. Since the applicant's description in the T&QP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the T&QP meets the requirements of 10 CFR Part 73, Appendix B, Section VI.C.2(b) and is, therefore, acceptable.

Initial Training and Qualification Requirements

The provisions of 10 CFR Part 73, Appendix B, Sections VI.C.1(a) through (b) provide the requirements for duty training.

The provisions of 10 CFR Part 73, Appendix B, Section VI.D.1(a) provide the requirements for demonstration of qualification.

T&QP Section 3.4 details that individuals are trained and qualified prior to performing security-related duties within a security organization and must meet the minimum qualifying standards in T&QP Sections 3.4.1 and 3.4.2.

Written Examination

The provisions of 10 CFR Part 73, Appendix B, Section VI.D.1(b)(1) included in the PSP provide that written exams must include those elements listed in the Commission-approved T&QP to demonstrate an acceptable understanding of assigned duties and responsibilities, and will include the recognition of potential tampering involving both safety and security equipment and systems.

Hands on Performance Demonstration

The provisions of 10 CFR Part 73, Appendix B, Section VI.D.1(b)(2) require that armed and unarmed individuals shall demonstrate hands-on performance for assigned duties and responsibilities by performing a practical hands-on demonstration for required tasks. The hands-on demonstration must ensure that theory and associated learning objectives for each required task are considered and each individual demonstrates the knowledge, skills, and abilities required to effectively perform the task.

T&QP Sections 3.4.1 and 3.4.2 describe the measures that are implemented by the applicant that meet the requirements and as has otherwise been described in 10 CFR Part 73, Appendix B, Section VI.D.1(b)(2).

The staff reviewed the applicant's description in T&QP Sections 3.4, 3.4.1, and 3.4.2 for the implementation of the site-specific physical protection program in accordance with NRC regulations and NUREG-0800 acceptance criteria. Since the applicant's description in the T&QP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the T&QP meets the requirements of 10 CFR Part 73, Appendix B, Sections VI.C.1 and D.1 and is, therefore, acceptable.

Continuing Training and Qualification

The provisions of 10 CFR Part 73, Appendix B, Section VI.D.2 state, in part, that armed and unarmed individuals shall be re-qualified at least annually in accordance with the requirements of this appendix and the NRC-approved T&QP. The results of requalification must be documented by a qualified training instructor and attested by a security supervisor.

T&QP Section 3.5 provides discussion regarding the management of the requalification program to ensure that each individual is trained and qualified. In part, the applicant's plan provides that annual requalification may be completed up to 3 months before or 3 months after the scheduled date. However, the next annual training must be scheduled 12 months from the previously scheduled date rather than the date the training was actually completed.

The staff reviewed the applicant's description in T&QP Section 3.5 for the implementation of the site-specific physical protection program in accordance with NRC regulations and NUREG-0800 acceptance criteria. Since the applicant's description in the T&QP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the T&QP meets the requirements of 10 CFR Part 73, Appendix B, Section VI.D.2 and is, therefore, acceptable.

Annual Written Examination

The provisions of 10 CFR Part 73, Appendix B, Section VI.D.(b)(3) provide that armed individuals shall be administered an annual written exam that demonstrates the required knowledge, skills, and abilities to carry out assigned duties and responsibilities as an armed member of the security organization. The annual written exam must include those elements listed in the NRC-approved T&QP to demonstrate an acceptable understanding of assigned duties and responsibilities.

T&QP Section 3.5.1 provides that each individual will be tested, in part, with an annual written exam that, at a minimum, covers: the role of security personnel; use of deadly force; the requirements in 10 CFR 73.21; authority of private security personnel; power of arrest; search and seizure; offsite law enforcement response; tactics and tactical deployment and engagement.

The staff reviewed the applicant's description in T&QP Section 3.5.1 for the implementation of the site-specific physical protection program in accordance with NRC regulations and NUREG-0800 acceptance criteria. Since the applicant's description in the T&QP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the T&QP meets the requirements of 10 CFR Part 73, Appendix B, Section VI.D.1.(3) and is, therefore, acceptable.

Demonstration of Knowledge Skills and Abilities

The provisions of 10 CFR Part 73, Appendix B, Sections VI, A., B., C., D., (A.4, C.3(d), D.1(a), D.1(b)(2)) state, in part, that an individual must demonstrate required knowledge, skills and abilities, to carry out assigned duties and responsibilities.

T&QP Section 3.5.2 provides that all knowledge, skills and abilities will be demonstrated in accordance with a systematic approach to training (SAT) program as described in RG 5.75.

The staff reviewed the applicant's description in T&QP Section 3.5.2 for the implementation of the site-specific physical protection program in accordance with NRC regulations and NUREG-0800 acceptance criteria. Since the applicant's description in the T&QP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the T&QP meets the requirements of 10 CFR Part 73, Appendix B, Sections VI.A, B, C, and D and is, therefore, acceptable.

Weapons Training and Qualification

General Firearms Training

The provisions of 10 CFR Part 73, Appendix B, Section VI.E provide that armed members of the security organization shall be trained and qualified in accordance with the requirements of this appendix and the NRC-approved T&QP. Training must be conducted by certified firearms instructors who shall be recertified at least every 3 years. Applicants shall conduct annual firearms familiarization, and armed members of the security organization must participate in weapons range activities on a nominal 4 month periodicity.

T&QP Section 3.6.1 of the T&QP addresses the requirements in 10 CFR Part 73, Appendix B, Sections VI.E.1(d)(1) through (11) and includes the requirements for training in the use of deadly force and participation in weapons range activities on a nominal 4 month periodicity. Each armed member of the security organization is trained and qualified by a certified firearms instructor for the use and maintenance of each assigned weapon to include but not limited to, marksmanship, assembly, disassembly, cleaning, storage, handling, clearing, loading, unloading, and reloading, for each assigned weapon.

The staff reviewed the applicant's description in T&QP Section 3.6.1 for the implementation of the site-specific physical protection program in accordance with NRC regulations and NUREG-0800 acceptance criteria. Since the applicant's description in the T&QP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the T&QP meets the requirements of 10 CFR Part 73, Appendix B, Section VI.E.1 and is, therefore, acceptable.

General Weapons Qualification

The provisions of 10 CFR Part 73, Appendix B, Section VI.F.1 Weapons Qualification and Requalification Program require that qualification firing must be accomplished in accordance with NRC requirements and the NRC-approved T&QP for assigned weapons. The results of weapons qualification and requalification must be documented and retained as a record.

T&QP Section 3.6.2 of the T&QP provides that all armed personnel are qualified and re-qualified with assigned weapons. All weapons qualification and re-qualification will be documented and retained as a record.

The staff reviewed the applicant's description in T&QP Section 3.6.2 for the implementation of the site-specific physical protection program in accordance with NRC regulations and NUREG-0800 acceptance criteria. Since the applicant's description in the T&QP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the T&QP meets the requirements of 10 CFR Part 73, Appendix B, Section VI.F.1, and is, therefore, acceptable.

Tactical Weapons Qualification

The provisions of 10 CFR Part 73, Appendix B, Section VI.F.2 require that the applicant conduct tactical weapons qualification. The applicant T&QP must describe the firearms used, the firearms qualification program, and other tactical training required to implement the NRC-approved security plans, applicant protective strategy, and implementing procedures. Applicant-developed tactical qualification and requalification courses must describe the performance criteria needed to include the site specific conditions (such as lighting, elevation, fields-of-fire) under which assigned personnel shall be required to carry out their assigned duties.

T&QP Section 3.6.3 provides that a tactical qualification course of fire is used to assess armed security force personnel in tactical situations to ensure they are able to demonstrate required tactical knowledge, skills and abilities remain proficient.

The staff reviewed the applicant's description in T&QP Section 3.6.3 for the implementation of the site-specific physical protection program in accordance with NRC regulations and

NUREG-0800 acceptance criteria. Since the applicant's description in the T&QP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the T&QP meets the requirements of 10 CFR Part 73, Appendix B, Section VI.F.2 and is, therefore, acceptable.

Firearms Qualification Courses

The provisions of 10 CFR Part 73, Appendix B, Section VI.F.3 state, in part, that the applicant shall conduct the following qualification courses for each weapon used: (a) an annual daylight fire qualification course; and (b) an annual night fire qualification course.

Courses of Fire

The provisions of 10 CFR Part 73, Appendix B, Section VI.F.4 describe required courses of fire.

T&QP Section 3.6.4 provides a description of the firearms qualification scores for each courses of fire used to ensure armed members of the security organization are properly trained and qualified. Courses of fire are used individually for handguns, and semiautomatic rifles, and enhanced weapons.

The staff reviewed the applicant's description in T&QP Section 3.6.4 for the implementation of the site-specific physical protection program in accordance with NRC regulations and NUREG-0800 acceptance criteria. Since the applicant's description in the T&QP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the T&QP meets the requirements of 10 CFR Part 73, Appendix B, Section VI.F.3, and 10 CFR Part 73, Appendix B, Section VI.F.4 and is, therefore, acceptable.

Firearms Requalification

The provisions of 10 CFR Part 73, Appendix B, Section VI.F.5 provide that armed members of the security organization shall be re-qualified for each assigned weapon at least annually in accordance with NRC requirements and the NRC-approved T&QP, and the results documented and retained as a record. Firearms requalification must be conducted using the courses of fire outlined in 10 CFR Part 73, Appendix B, Sections VI.F.2, VI.F.3, and VI.F.4.

T&QP Section 3.6.5 describes that armed members of the security organization will re-qualify at least annually with each weapon assigned, using the courses of fire provided in the T&QP.

The staff reviewed the applicant's description in T&QP Section 3.6.5 for the implementation of the site-specific physical protection program in accordance with NRC regulations and NUREG-0800 acceptance criteria. Since the applicant's description in the T&QP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the T&QP meets the requirements of 10 CFR Part 73, Appendix B, Section VI.F.5 and is, therefore, acceptable.

Weapons, Personal Equipment and Maintenance

The provisions of 10 CFR Part 73, Appendix B, Section VI.G provide the requirements for weapons, personal equipment, and maintenance. These requirements provide that the applicant shall provide armed personnel with weapons that are capable of performing the function stated in the NRC-approved security plans, applicant protective strategy, and implementing procedures. In addition, the applicant shall ensure that each individual is equipped or has ready access to all personal equipment or devices required for the effective implementation of the NRC-approved security plans, applicant protective strategy, and implementing procedures.

T&QP Section 3.7 describes that personnel are provided with weapons and personal equipment necessary to meet the plans and the protective strategy. The equipment provided is described in T&QP Section 9.0, and maintenance is performed as described in T&QP Section 20.0. The staff's review of T&QP Section 9, "Security Personnel Training," and T&QP Section 20, "Maintenance, Testing, and Calibration," is in Sections 13.6.4.1.9 and 13.6.4.1.20 of this report.

The staff reviewed the applicant's description in T&QP Section 3.7 for the implementation of the site-specific physical protection program in accordance with NRC regulations and NUREG-0800 acceptance criteria. Since the applicant's description in the T&QP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the T&QP meets the requirements of 10 CFR Part 73, Appendix B, Section VI.G and is, therefore, acceptable.

Documentation

The provisions of 10 CFR Part 73, Appendix B, Section VI.H require that the applicant shall retain all reports, records, or other documentation required by this appendix in accordance with the requirements of 10 CFR 73.55(r). The applicant shall retain each individual's initial qualification record for 3 years after termination of the individual's employment and shall retain each re-qualification record for 3 years after it is superseded. The applicant shall document data and test results from each individual's suitability, physical, and psychological qualification and shall retain this documentation as a record for 3 years from the date of obtaining and recording these results.

T&QP Section 3.8 provides that records are retained in accordance with T&QP Section 22 "Records." The T&QP also describes how the applicant will retain each individual's initial qualification record for 3 years after termination of the individual's employment and shall retain each re-qualification record for 3 years after it is superseded.

The staff reviewed the applicant's description in T&QP Section 3.8 for the implementation of the site-specific physical protection program in accordance with NRC regulations and NUREG-0800 acceptance criteria. Since the applicant's description in the T&QP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the T&QP meets the requirements of 10 CFR Part 73, Appendix B, Section VI.H and is, therefore, acceptable.

13.6.4.2.4 Performance Evaluation Program

The following portion of this technical evaluation section is reproduced from VEGP SER Section 13.6.4.2.4:

13.6.4.2.4 Performance Evaluation Program

10 CFR Part 73, Appendix B, Section VI.C.3, Performance Evaluation Program

(a) Applicants shall develop, implement and maintain a performance evaluation program that is documented in procedures, which describes how the applicant will demonstrate and assess the effectiveness of their onsite physical protection program and protective strategy, including the capability of the armed response team to carry out their assigned duties and responsibilities during safeguards contingency events. The performance evaluation program and procedures shall be referenced in the applicant's T&QP.

(b) *The performance evaluation program shall include procedures for the conduct of tactical response drills and force-on-force exercises designed to demonstrate and assess the effectiveness of the applicant's physical protection program, protective strategy and contingency event response by all individuals with responsibilities for implementing the SCP. The performance evaluation program must be designed to ensure, in part, that each member of each shift who is assigned duties and responsibilities required to implement the SCP and applicant protective strategy participates in at least one tactical response drill on a quarterly basis and one force-on-force exercise on an annual basis.*

Section 4 of the T&QP details the performance evaluation program consistent with the requirements of 10 CFR Part 73, Appendix B, Sections VI.C.3(a) through (m). Additional details of the performance evaluation program are described in the facility procedures.

The NRC staff has reviewed the applicant's description in T&QP Section 4 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the T&QP meets the requirements of 10 CFR Part 73, Appendix B, Section VI.C.3 and is, therefore, acceptable.

13.6.4.2.5 Definitions

The provisions of 10 CFR Part 73, Appendix B, Section VI.J state, in part, that terms defined in 10 CFR Part 50, 10 CFR Part 70 and 10 CFR Part 73 have the same meaning when used in this appendix. Definitions are found in the PSP, Appendix A, "Glossary of Terms and Acronyms." [On the basis of its review, the NRC staff finds that the definitions sections of the PSP meet the requirements of 10 CFR 73.2, and are, therefore, acceptable.]

Included in this section of the T&QP is the Critical Task Matrix, which is considered SGI and has not been included in this SER.

The NRC staff has reviewed the applicant's description in T&QP of the Critical Task Matrix tasks for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the T&QP meets the requirements of 10 CFR Part 73, Appendix B, and are, therefore, acceptable.

13.6.4.2.6 Conclusion on the Training and Qualification Plan

On the basis of the NRC staff's review described in Sections 13.6.4.2.1 through 13.6.4.2.5 of this SER, the T&QP meets the requirements of 10 CFR Part 73, Appendix B. The target sets, Target Set Analysis and Site Protective Strategy are in the facility implementing procedures, which were not subject to NRC staff review as part of this COL application and are, therefore, subject to future NRC inspection in accordance with 10 CFR 73.55(c)(7)(iv) and 10 CFR Part 73, Appendix C, Section II.B.5(iii). The NRC staff concludes that complete and procedurally correct implementation will provide high assurance that activities involving special nuclear material are not inimical to the common defense and security and do not constitute an unreasonable risk to the public health and safety.

13.6.4.3 Appendix C Safeguards Contingency Plan

The following portion of this technical evaluation section is reproduced from VEGP SER Section 13.6.4.3.1:

13.6.4.3.1 Background Information

This category of information identifies the perceived dangers and incidents that the plan addresses and a general description of how the response is organized.

<u>Purpose of the Safeguards Contingency Plan</u>

The provisions of 10 CFR Part 73, Appendix C, Section II.B.1.b state that the applicant should discuss general goals, objectives and operational concepts underlying the implementation of the SCP.

Section 1.1 of the SCP describes the purpose and goals of the SCP, including guidance to security and management for contingency events.

<u>Scope of the Safeguards Contingency Plan</u>

The provisions of 10 CFR Part 73, Appendix C, Section II.B.1.c delineate the types of incidents that should be covered by the applicant in the SCP, how the onsite response effort is organized and coordinated to effectively respond to a safeguards contingency event and how the onsite response for safeguards *contingency events has been integrated into other site emergency response procedures.*

Section 1.2 of the SCP details the scope of the SCP to analyze and define decisions and actions of security force personnel, as well as facility operations personnel, for achieving and maintaining safe shutdown.

Perceived Danger

The provisions of 10 CFR Part 73, Appendix C, Section II.B.1 require that, consistent with the DBT specified in 10 CFR 73.1(a)(1), the applicant shall identify and describe the perceived dangers, threats, and incidents against which the SCP is designed to protect.

Section 1.3 of the SCP outlines the threats used to design the physical protection systems.

The applicant adequately addresses perceived danger, provides a purpose of the plan, and describes the scope of the plan.

Definitions

Section 1.4 of the SCP describes that a list of terms and their definitions used in describing operational and technical aspects of the approved SCP as required by 10 CFR Part 73, Appendix C, Section II.B.1.d is found in Appendix A of the PSP.

The NRC staff has reviewed the applicant's description in SCP Sections 1, 1.1, 1.2, 1.3, and 1.4 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the SCP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the SCP meets the requirements of 10 CFR Part 73, Appendix C, Section II.B and are, therefore, acceptable.

13.6.4.3.2 Generic Planning Base

The following portion of this technical evaluation section is reproduced from VEGP SER Section 13.6.4.3.2:

As required in 10 CFR Part 73, Appendix C, Section II.B.2, this section of the plan defines the criteria for initiation and termination of responses to security events, to include the specific decisions, actions, and supporting information needed to respond to each type of incident covered by the approved SCP.

Situations Not Covered by the Contingency Plan

Section 2.1 of the SCP details the general types of conditions that are not covered in the plan.

Situations Covered by the Contingency Plan

The provisions of 10 CFR Part 73, Appendix C, Section II.B.2.a require, in part, that the plan identify those events that will be used for signaling the beginning or aggravation of a safeguards contingency according to how they are perceived initially by the applicant's personnel. Applicants shall ensure detection of unauthorized activities and shall respond to all alarms or other indications signaling a security event, such as penetration of a PA, vital area, or unauthorized barrier penetration (vehicle or personnel); tampering, bomb threats, or other threat warnings—either verbal, such as telephoned threats, or implied, such as escalating civil disturbances.

The provisions of 10 CFR Part 73, Appendix C, Section II.B.2.b require, in part, that the plan define the specific objective to be accomplished relative to each identified safeguards contingency event. The objective may be to obtain a level of awareness about the nature and severity of the safeguards contingency to prepare for further responses; to establish a level of response preparedness; or to successfully nullify or reduce any adverse safeguards consequences arising from the contingency.

The provisions of 10 CFR Part 73, Appendix C, Section II.B.2.c require, in part, that the applicant identify the data, criteria, procedures, mechanisms and logistical support necessary to achieve the objectives identified.

Section 2.2 of the SCP describes in detail the specific situations covered by the SCP, including objectives and information required for each.

The NRC staff has reviewed the applicant's description in SCP Sections 2, 2.1 and 2.2 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the SCP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the SCP meets the requirements of 10 CFR Part 73, Appendix C Section II.B.2 and are, therefore, acceptable.

13.6.4.3.3 Responsibility Matrix

The provisions of 10 CFR Part 73, Appendix C, Section II.B.4 state that this category of information consists of the detailed identification of responsibilities and specific actions to be taken by the applicant's organizations and/or personnel in response to safeguards contingency events. To achieve this result the applicant must address the following.

- The provisions of 10 CFR Part 73, Appendix C, Section II.B.4.a require, in part, that the applicant develop site procedures that consist of matrixes detailing the organization and/or personnel responsible for decisions and actions associated with specific responses to safeguards contingency events. The responsibility matrix and procedures must be referenced in the applicant's SCP.

- The provisions of 10 CFR Part 73, Appendix C, Section II.B.4.b require, in part, that the responsibility matrix procedures shall be based on the events outlined in the applicant's generic planning base and include specific objectives to be accomplished, description of responsibilities for decisions and actions for each event, and overall description of response actions each responding entity.

- The provisions of 10 CFR Part 73, Appendix C, Section II.B.4.c require, in part, that responsibilities are to be assigned in a manner that precludes conflict of duties and responsibilities that would prevent the execution of the SCP and emergency response plans.
- The provisions of 10 CFR Part 73, Appendix C, Section II.B.4.d require, in part, that the applicant ensure that predetermined actions can be completed under the postulated conditions.

SCP Section 3 includes the responsibility matrix, as required by 10 CFR Part 73, Appendix C, Section II.B.4.a. The responsibility matrix integrates the response capabilities of the security organization (described in SCP Section 4) with the background information relating to decision/actions and organizational structure (described in SCP Section 1) as required by 10 CFR Part 73, Appendix C, Section II.B.4.a. The responsibility matrix provides an overall description of the response actions and their interrelationships, as required by 10 CFR Part 73, Appendix C, Section II.B.4.a. Responsibilities and actions have been predetermined to the maximum extent possible and assigned to specific entities to preclude conflicts that would interfere with or prevent the implementation of the SCP or the ability to protect against the DBT of radiological sabotage as required by 10 CFR Part 73, Appendix C, Section II.B.4.a. In part, the applicant shall ensure that predetermined actions can be completed under the postulated conditions as required by 10 CFR Part 73, Appendix C, Section II.B.4.d.

The staff reviewed the applicant's description in SCP Section 3 for the implementation of the site-specific physical protection program in accordance with NRC regulations and NUREG-0800 acceptance criteria. Since the applicant's description in the SCP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the SCP meets the requirements of 10 CFR Part 73, Appendix C, Section II.B.4 and is, therefore, acceptable.

13.6.4.3.4 Licensee Planning Base

The provisions of 10 CFR Part 73, Appendix C, Section II.B.3 require, in part, that the applicant planning base include factors affecting the SCP specific for each facility.

Licensee Organization

The provisions of 10 CFR Part 73, Appendix C, Section II.B.3.a require in part, that the SCP describe the organization's chain of command and delegation of authority during safeguards contingency events, to include a general description of how command and control functions will be coordinated and maintained.

Duties/Communication Protocols

SCP Section 4.1.1 details the duties and communications protocols of each member of the security organization responsible for implementing any portion of the applicant's protective strategy, which will allow for coordination and maintenance of command and control functions as required by 10 CFR Part 73, Appendix C, Section II.B.3.a.

Security Chain of Command/Delegation of Authority

SCP Section 4.1.2 P describes in detail the chain of command and delegation of authority during normal operations is discussed in the PSP. The chain of command and delegation of authority during contingency events is also described in the responsibility matrix portions of the SCP. The chain of command and delegation of authority during normal operations is discussed in the PSP. Accordingly, the staff concludes that the applicant has described the chain of command and delegation of authority during contingency events as required by 10 CFR Part 73, Appendix C, Section II.B.3.a.

Physical Layout

The provisions of 10 CFR Part 73, Appendix C, Section II.B.3(b) require, in part, that the SCP include a site map depicting the physical structures located on the site, including onsite independent spent fuel storage installations, and a description of the structures depicted on the map. Plans must also include a description and map of the site in relation to nearby towns, transportation routes (e.g., rail, water, and roads), pipelines, airports, hazardous material facilities, and pertinent environmental features that may have an effect upon coordination of response activities. Descriptions and maps must indicate main and alternate entry routes for law enforcement or other offsite response and support agencies and the location for marshaling and coordinating response activities.

SCP Section 4.2 references PSP Section 1.1 for layouts of the OCA, PA, vital areas, site maps, and descriptions of site features. The staff confirmed that these layouts, maps, and descriptions include the detailed information required by 10 CFR Part 73, Appendix C, Section II.B.3.b and described above.

Safeguards Systems

The provisions of 10 CFR Part 73, Appendix C, Section II.B.3.c require, in part, that the SCP include a description of the physical security systems that support and influence how the applicant will respond to an event in accordance with the DBT described in 10 CFR 73.1(a). The description must begin with onsite physical protection measures implemented at the outermost perimeter, and must move inward through those measures implemented to protect target set equipment.

SCP Section 4.3 describes that safeguards systems are described in PSP Sections 9, 11, 12, 13, 15 and 16, and in facility implementing procedures/documents. SCP Section 8 describes how physical security systems will be used to respond to a threat at the site, as required by 10 CFR Part 73, Appendix C, Section II.B.3.c. As further required by 10 CFR Part 73, Appendix C, Section II.B.3.c, the SCP description begins with physical protection measures proposed at the outermost facility perimeter, and moves inward through those measures proposed protect target set equipment.

Law Enforcement Assistance

The provisions of 10 CFR Part 73, Appendix C, Section II.B.3.d require, in part, that the applicant provide a listing of available law enforcement agencies and a general description of their response capabilities and their criteria for response and a discussion of working agreements or arrangements for communicating with these agencies.

SCP Section 4.4 states in detail the role of LLEA in the site protective strategy. In accordance with 10 CFR Part 73, Appendix C, Section II.B.3.d, these details include LLEA response capabilities, LLEA criteria for response, and the working agreements or arrangements for communicating with these LLEAs. Additional details regarding LLEA are included in PSP Section 8 and SCP Section 5.6.

Policy Constraints and Assumptions

The provisions of 10 CFR Part 73, Appendix C, Section II.B.3.e require, in part, that the SCP include a discussion of State laws, local ordinances, and company policies and practices that govern applicant response to incidents and must include, but is not limited to, the following: (1) use of deadly force; (2) recall of off-duty employees; (3) site jurisdictional boundaries; and (4) use of enhanced weapons, if applicable.

SCP Section 4.5 details the site security policies, including the use of deadly force provisions for the recall of off-duty employees, site jurisdictional boundaries, and authority to request offsite assistance, as required by 10 CFR Part 73, Appendix C, Section II.B.3.e.

Administrative and Logistical Considerations

The provisions of 10 CFR Part 73, Appendix C, Section II.B.3.f require, in part, that the applicant provide descriptions of applicant practices, which influence how the security organization responds to a safeguards contingency event to include, but is not limited to, a description of the procedures that will be used for ensuring that equipment needed to facilitate response will be readily accessible, in good working order, and in sufficient supply.

SCP Section 4.6 outlines administrative duties of the Security Manager, Security Shift Team Leader, facility procedures and administrative forms.

The staff reviewed the applicant’s description in SCP Sections 4, 4.1, 4.1.1, 4.1.2, and 4.2 through 4.6 for the implementation of the site-specific physical protection program in accordance with NRC regulations and NUREG-0800 acceptance criteria. Since the applicant’s description in the SCP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the SCP meets the requirements of 10 CFR Part 73, Appendix C, Section II.B.3 and is, therefore, acceptable.

13.6.4.3.5 Response Capabilities

This section outlines the response by the applicant to threats to the facility. As set forth below, the applicant described in detail how they protect against the DBT with onsite and offsite organizations, consistent with the regulations in 10 CFR 50.54(p)(1) and (hh)(1), 10 CFR 73.55(k), 10 CFR Part 73, Appendix B, Section VI and 10 CFR Part 73, Appendix C, Section II.B.3. In addition, 10 CFR Part 73, Appendix C, “Introduction,” states, in part, it is important to note that an applicant’s SCP is intended to be complementary to any emergency plans developed pursuant to 10 CFR Part 50, Appendix E, “Emergency Planning and Preparedness for Production and Utilization Facilities”; and 10 CFR 52.79, “Contents of Applications; Technical Information and Final Safety Analysis Report.”

Response to Threats

SCP Section 5.1 describes how the protective strategy is designed to defend the facility against all aspects of the DBT. Each organization has defined roles and responsibilities.

Armed Response Team

SCP Section 5.2 notes individuals from the Responsibility Matrix and their role in the site protective strategy. This section also notes the minimum number of individuals and their contingency equipment for implementation of the protective strategy. The applicant described the armed response team consistent with 10 CFR 73.55(k)(4), (5), (6), and (7); 10 CFR Part 73, Appendix B, Section VI; and 10 CFR Part 73, Appendix C, Section II.B.3.

Supplemental Security Officer

SCP Section 5.3 describes in detail the role of supplemental security officers in the site protective strategy. The applicant described the use of supplemental security officers, consistent with the requirements in 10 CFR 73.55(k)(4).

Facility Operations Response

SCP Section 5.4 details the role of operations personnel in the applicant's protective strategy, including responsibilities, strategies, and conditions for operator actions as discussed in 10 CFR 50.54(hh).

Emergency Plan Response

SCP Section 5.5 notes the integration of the Emergency Plan with the site's protective strategy, and gives some examples of how the Emergency Plan can influence the protective strategy as discussed in 10 CFR 73.55(b)(11).

Local Law Enforcement Agencies (LLEA)

SCP Section 5.6 documents the current agreements with applicable LLEA, and therefore meets the requirements of 10 CFR 73.55(k)(9) and 10 CFR Part 73, Appendix C, Section II.B.3.d and lists the LLEAs that will respond to the site as a part of the protective strategy. Details on the response of the LLEA are located in PSP Section 8.

State Response Agencies

SCP Section 5.7 documents the current agreements with applicable LLEA and, therefore, meets the requirements of 10 CFR 73.55(k)(9) and 10 CFR Part 73, Appendix C, Section II.B.3.d and lists the State response agencies that will respond to the site as a part of the protective strategy. Furthermore, SCP Section 5.7 provides a general description of the LLEA response capability and meets the corresponding portions of 10 CFR 73.55(k)(9).

Federal Response Agencies

SCP Section 5.8 documents the current agreements with applicable LLEA and, therefore, meets the requirements of 10 CFR 73.55(k)(9) and 10 CFR Part 73, Appendix C, Section II.B.3.d and lists the Federal response agencies that will respond to the site as a part of the protective strategy. Furthermore. SCP Section 5.7 provides a general description of the LLEA response capability and meets the corresponding portions of 10 CFR 73.55(k)(9).

Response to ISFSI Events

SCP Section 5.9 meets the requirements of 10 CFR 73.55(k)(9) and 10 CFR Part 73, Appendix C, Section II.B.3.d describes the Response Requirements for ISFSI as a part of the protective strategy.

The staff reviewed the applicant's description in SCP Sections 5.0 through 5.9 for the implementation of the site-specific physical protection program in accordance with NRC regulations and NUREG-0800 acceptance criteria. Since the applicant's description in the SCP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the SCP meets the requirements of 10 CFR 50.54(p)(1) and (hh); 10 CFR 73.55(k); 10 CFR Part 73, Appendix B, Section VI; and 10 CFR Part 73, Appendix C, Section II.B.3 and is, therefore, acceptable. In addition, Appendix C, "Introduction," states, in part, that it is important to note that an applicant's SCP is intended to be complementary to any emergency plans developed pursuant to 10 CFR Part 50, Appendix E and 10 CFR 52.17.

13.6.4.3.6 Defense in Depth

The following portion of this technical evaluation section is reproduced from VEGP SER Section 13.6.4.3.6:

> ***13.6.4.3.6 Defense-in-Depth***
>
> *Section 6 of the SCP lists site physical security characteristics, programs, and the strategy elements that illustrate the defense-in-depth nature of the site protective strategy as required in 10 CFR 73.55(b)(3).*
>
> *The NRC staff has reviewed the applicant's description in SCP Section 6 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the SCP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the SCP meets the requirements of 10 CFR 73.55(b)(3) and is, therefore, acceptable.*

13.6.4.3.7 Primary Security Functions

The following portion of this technical evaluation section is reproduced from VEGP SER Section 13.6.4.3.7:

> *Section 7 of the SCP details the primary security functions of the site, and their roles in the site protective strategy. It also notes the development of target sets, and their function in the development of the site's protective strategy.*
>
> *The NRC staff has reviewed the applicant's description in SCP Section 7 for the implementation of the site-specific physical protection program in accordance*

with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the SCP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the SCP meets the requirements of 10 CFR 10 CFR 73.55(b) and is, therefore, acceptable.

13.6.4.3.8 Protective Strategy

The provisions of 10 CFR Part 73, Appendix C, Section II.B.3.c(v) require that applicants develop, implement and maintain a written protective strategy that shall: (1) be designed to meet the performance objectives of 10 CFR 73.55(a) through (k); (2) identify predetermined actions, areas of responsibilities, and timelines for the deployment of armed personnel; (3) include measures that limit the exposure of security personnel to possible attack; (4) include a description of the physical security systems and measures that provide defense-in-depth; (5) describe the specific structure and responsibilities of the armed response organization; and (6) provide a command and control structure.

SCP Section 8 describes the site protective strategy.

The staff reviewed the applicant's description in SCP Section 8 for the implementation of the site-specific physical protection program in accordance with NRC regulations and NUREG-0800 acceptance criteria. Since the applicant's description in the SCP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the SCP meets the requirements of 10 CFR Part 73, Appendix C, Section II.B.3.c(v) and is, therefore, acceptable.

13.6.4.3.9 Conclusions on the Safeguards Contingency Plan

The following portion of this technical evaluation section is reproduced from VEGP SER Section 13.6.4.3.9:

13.6.4.3.9 Conclusions on the Safeguards Contingency Plan

On the basis of the NRC staff's review described in Sections 13.6.4.3.1 through 13.6.4.3.8 of this SER, the SCP meets the requirements of 10 CFR Part 73, Appendix C, in accordance with the DBT of radiological sabotage as stated in 10 CFR 73.1. The target sets, Target Set Analysis and Site Protective Strategy are in the facility implementing procedures, which were not subject to NRC staff review as part of this COL application and are, therefore, subject to future NRC inspection in accordance with 10 CFR 73.55(c)(7)(iv) and 10 CFR Part 73, Appendix C, Section II.B.5(iii). The NRC staff concludes that complete and procedurally correct implementation of the SCP will provide high assurance that activities involving special nuclear material are not inimical to the common defense and security and do not constitute an unreasonable risk to the public health and safety.

13.6.5 Post Combined License Activities

For the reasons discussed in the technical evaluation section above, the staff finds the following license condition acceptable:

- License Condition (13-12) – No later than 12 months after issuance of the COL, the licensee shall submit to the Director of NRO, a schedule that supports planning for and conduct of NRC inspection of the physical security programs. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until the physical security program has been fully implemented.

13.6.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant addressed the required information relating to physical security, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

The staff concludes that the relevant information presented in the WLS COL FSAR is acceptable based on the applicable regulations specified in Section 13.6.4 of this report. The staff based its conclusion on the following:

- STD COL 13.6-1, as related to the physical protection program, is acceptable based on the following discussion. The staff's review of the WLS Units 1 and 2 PSP, T&QP, and SCP focused on ensuring the necessary programmatic elements are included in these plans to provide high assurance that activities involving special nuclear material are not inimical to the common defense and security and do not constitute an unreasonable risk to the public health and safety.

  The staff determined that these plans include the necessary programmatic elements that, when effectively implemented, will provide the required high assurance. The burden to effectively implement these plans remains with the applicant. Effective implementation is dependent on the procedures and practices the applicant develops to satisfy the programmatic elements of its PSP, T&QP, and SCP. The target set analysis and site protective strategy are in facility implementing procedures which were not subject to staff review as part of this COL application and are, therefore, subject to future NRC inspection in accordance with 10 CFR 73.55(c)(7)(iv) and 10 CFR Part 73, Appendix C, Section II.B.5(iii). As provided by the applicant's PSP Section 3, a performance evaluation program will be implemented that periodically tests and evaluates the effectiveness of the overall protective strategy. This program provides that deficiencies be corrected. In addition, NRC inspectors will conduct periodic force-on-force exercises that will test the effectiveness of the applicant's protective strategy. Based on the results of the applicant's own testing and evaluation, NRC baseline inspections and force-on-force exercises, enhancements to the applicant's PSP, T&QP, and SCP may be necessary to ensure the overall protective strategy can be effectively implemented. As such, the staff approval of the applicant's PSP, T&QP, and SCP is limited to the programmatic elements necessary to provide the required high assurance as stated above. Should deficiencies be identified with the programmatic elements of these plans as a result of the periodic applicant or NRC conducted drills or exercises that test the effectiveness of the overall protective strategy, the applicant shall correct the plans to address these deficiencies in a timely manner and the applicant should notify the NRC of these plan changes in accordance with the requirements of

10 CFR 50.54(p) or 10 CFR 50.90, “Application for amendment of license, construction permit, or early site permit.”

The COL applicant’s security plan information is withheld from public disclosure in accordance with the provisions of 10 CFR 73.21.

13.6.A Site-Specific ITAAC for Physical Security

This section does not exist in either the AP-1000 DCD or the WLS COL FSAR. The staff has added this section to the SER in order to address issues regarding the applicant’s site-specific ITAAC for physical security.

13.6.A.1 Introduction

WLS COLA Part 10, “Proposed License Conditions and ITAAC,” Appendix B, “Inspections, Tests, Analysis, and Acceptance Criteria” describes the license conditions for the plant’s physical protection systems or features to provide physical protection of the site-specific protective strategy and elements of a site security program. The COL application incorporates by reference AP1000 DCD Tier 1 Section 2.6.9, including plant layout and configurations of barriers, and lists ITAAC related to the site-specific design for achieving detection, assessment, communications, delay, and response for physical protection against potential acts of radiological sabotage and theft of special nuclear material.

The design bases or supporting security analyses and assumptions related to the design descriptions of security-related features incorporated by reference from the AP1000 DCD are in TR-94, APP-GW-GLR-066. Descriptions of site-specific security structures, programs and contingency measures are in the WLS PSP, which includes the site PSP, T&QP, and the SCP.

13.6.A.2 Summary of Application

WLS COL FSAR, Revision 11, Section 14.3 incorporates by reference AP1000 DCD, Revision 19, Section 14.3. WLS COLA, Part 10, incorporates by reference AP1000 DCD Tier 1, Section 2.6.9, which includes the physical security-inspections, tests, analyses, and acceptance criteria (PS-ITAAC) that are within the scope of the AP1000 standard design. Site-specific PS-ITAAC that are outside the scope of AP1000 DCD Tier 1, Section 2.6.9 are provided in WLS COLA Part 10, Appendix B, Table 2.6.9-2.

In addition, in WLS COL FSAR Section 14.3, the applicant provided the following:

Supplemental Information

- STD SUP 14.3-1

The applicant provided supplemental information related to physical security in STD SUP 14.3-1 in WLS COL FSAR Section 14.3.2.3.2.

License Condition

- Part 10, License Condition 1

The applicant provided a license condition in WLS COLA, Revision 9, Part 10, which will incorporate the ITAAC identified in the tables in WLS COLA, Part 10, Appendix B. The staff evaluated this license condition in Chapter 1 of this report.

13.6.A.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of NRC regulations are given in 10 CFR Part 73. The regulation includes specific security and performance requirements that, when adequately implemented, are designed to protect nuclear power reactors against acts of radiological sabotage, prevent the theft or diversion of special nuclear material, and protect safeguards information against unauthorized release.

The provisions of 10 CFR 52.80, Subpart A require that information submitted for a COL include the proposed ITAAC that the licensee shall perform, and the acceptance criteria that are necessary and sufficient to provide reasonable assurance that, if the ITAAC are met, the facility has been constructed and will operate in conformity with the COL, the provisions of the Atomic Energy Act of 1954, as amended, and NRC regulations.

The WLS Units 1 and 2 design descriptions, commitments, and acceptance criteria for the security features, including the plant's layout and determination of vital equipment and areas, for a certified design are based on physical protection systems or hardware provided for meeting requirements of the following NRC regulations:

- 10 CFR Part 50, "Domestic Licensing of Production and Utilization Facilities"10 CFR Part 52, "Licenses, Certifications, and Approvals for Nuclear Power Plants"10 CFR 73.1(a)(1), "Radiological Sabotage"
- 10 CFR 73.55, "Requirements for physical protection of licensed activities in nuclear power reactors against radiological sabotage," Appendix B, "General Criteria for Security Personnel"; Appendix C, "Nuclear Power Plant Safeguards Contingency Plans"; Appendix G, "Reportable Safeguards Events"; and Appendix H, "Weapons Qualification Criteria"
- 10 CFR Part 74, "Material control and accounting of special nuclear material"
- 10 CFR 100.21(f), "Non-seismic siting criteria"

Regulatory requirements and acceptance criteria related to physical protection systems or hardware are identified in NUREG-0800, Section 14.3.12.

Regulatory guidance documents that are applicable to this evaluation are:

- RG 1.91, “Evaluations of Explosions Postulated to Occur at Transportation Routes Near Nuclear Power Plants,” Revision 1
- RG 1.206, “Combined License Applications for Nuclear Power Plants”
- RG 4.7, “General Site Suitability Criteria for Nuclear Power Stations,” Revision 2
- RG 5.7, Entry/Exit Control for Protected Areas, Vital Areas, and Material Access Areas,” Revision 1
- RG 5.12, “General Use of Locks in the Protection and Control of Facilities and Special Nuclear Materials”
- RG 5.44, “Perimeter Intrusion Alarm Systems,” Revision 3
- RG 5.62, “Reporting of Safeguards Events,” Revision 1
- RG 5.65, “Vital Area Access Controls, Protection of Physical Protection System Equipment and Key and Lock Controls”
- RG 5.66, “Access Authorization Program for Nuclear Power Plants”
- Information Notice 86-83, “Underground Pathways into Protected Areas, Vital Areas, and Controlled Access Areas,” September 19, 1986
- Regulatory Information Summary (RIS) 2005-04, “Guidance on the Protection of Unattended Openings that Intersect a Security Boundary or Area,” April 14, 2005. (Exempt from public disclosure in accordance with 10 CFR 2.390, “Public inspections, exemptions, requests for withholding.”)

The COL applicant is required to describe commitments for establishing and maintaining a physical protection system (engineered and administrative controls), organization, programs, and procedures for implementing a site-specific strategy that, if adequately implemented, provide high assurance for protection of the plant against the DBT. The site-specific physical protection system described must be reliable and available and implement the concept of defense-in-depth protection in order to provide a high assurance of protection. The security operational programs and the physical protection system are required to meet the specific performance requirements of 10 CFR Part 26, “Fitness for Duty Programs”; 10 CFR 73.54, “Protection of Digital Computer and Communication Systems and Networks”; 10 CFR 73.55; 10 CFR 73.56, “Personnel access authorization requirements for nuclear power plants”; 10 CFR 73.57, “Requirements for criminal history records checks of individuals granted unescorted access to a nuclear power facility or access to Safeguards Information”; and 10 CFR 73.58. Physical protection hardware within the scope of the AP1000 design is addressed in the AP1000 DCD.

13.6.A.4 Technical Evaluation

The staff reviewed WLS COL FSAR Section 14.3 and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to ITAAC for physical security. The results of the staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this report provides a discussion of the strategy used by the staff to perform one technical review for each standard issue outside the scope of the DC and use this review to evaluate subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5 to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from responses to RAIs.

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.

- The staff verified that the site-specific differences were not relevant.

The staff completed its review and concluded that the evaluation performed for the standard content is directly applicable to the WLS COL application. This standard content material is identified in this report by use of italicized, double-indented formatting. The staff confirmed that the July 6, 2011, WLS Letter No. 097 contained the same technical information provided in the June 11, 2010, VEGP letter discussed in the standard content material below.

The following portion of this technical evaluation section is reproduced from VEGP SER Section 13.6.A.4:

> *Supplemental Information*
>
> - *STD SUP 14.3-1*
>
> *STD SUP 14.3-1 adds the following after DCD Section 14.3.2.2 as new Section 14.3.2.3.2:*
>
> > *Generic PS-ITAAC have been developed in a coordinated effort between the NRC and the Nuclear Energy Institute (NEI) as outlined in Appendix C.II.I-C of Regulatory Guide 1.206. These generic ITAAC have been tailored to the AP1000 design and site-specific security requirements.*
>
> *In Part 10, Appendix B of the VEGP Units 3 and 4 COL application, SNC describes the ITAAC for the plant's physical protection systems or features to provide physical protection of the site-specific protective strategy and elements of a site security program. The COL application incorporates by reference Tier 1 Section 2.6.9 of the AP1000 DCD, including plant layout and configurations of barriers, and listed ITAAC related to the site-specific design for achieving detection, assessment, communications, delay, and response for physical*

protection against potential acts of radiological sabotage and theft of special nuclear material. DCD Tier 1 Section 2.6.9 includes the physical security ITAAC that are in the scope of the AP1000 standard design. Site-specific physical security ITAAC that are outside the scope of AP1000 DCD Tier 1 Section 2.6.9 are provided in Table 2.6.9-2 of Appendix B to Part 10 of the VEGP COL application.

The NRC staff's evaluation of the PS-ITAAC (STD SUP 14.2-1) is documented in the Sections 13.6.A.4.1 through 13.6.A.4.3 of this SER.

13.6.A.4.1 Detection and Assessment Hardware

The applicant submitted the following ITAAC for detection and assessment hardware in their letter dated June 11, 2010, "Response to Request for Additional Information Letter No. 047, Supplement 2, Physical Security Inspections, Tests, Analyses, and Acceptance Criteria," This letter was used to complete the evaluation below.

1. *The external walls, doors, ceiling, and floors in the location within which the last access control function for access to the protected area is performed are bullet resistant to at least Underwriters Laboratory Ballistic Standard 752, Level 4. (Item 6 in Appendix A to Section 14.3.12 of NUREG-0800.)*

2. *Physical barriers for the protected area perimeter are not part of vital area barriers. (Item 2.a in Appendix A to Section 14.3.12 of NUREG-0800.)*

3.

    a) *Isolation zones exist in outdoor areas adjacent to the physical barrier at the perimeter of the protected area that allows 20 feet of observation on either side of the barrier. (Item 3.a in Appendix A to Section 14.3.12 of NUREG-0800.)*

    b) *Where permanent buildings do not allow a 20-foot observation distance on the inside of the protected area, the building walls are immediately adjacent to, or an integral part of, the protected area barrier. (Item 3.c in Appendix A to Section 14.3.12 of NUREG-0800.) The isolation zones are monitored with intrusion detection equipment that provides the capability to detect and assess unauthorized persons. (Item 3.b in Appendix A to Section 14.3.12 of NUREG-0800.)*

4. *The intrusion detection and assessment equipment at the protected area perimeter:*

    a) *Detects penetration or attempted penetration of the protected area barrier and concurrently alarms in both the Central Alarm Station and Secondary Alarm Station. (Item 4.a in Appendix A to Section 14.3.12 of NUREG-0800.)*

b) *The intrusion detection and assessment equipment at the protected area perimeter remains operable from an uninterruptible power supply in the event of the loss of normal power. (Item 4.c in Appendix A to Section 14.3.12 of NUREG-0800.)*

6. *An access control system with numbered picture badges is installed for use by individuals who are authorized access to protected areas without escort. (Item 9 in Appendix A to Section 14.3.12 of NUREG-0800*.)

8.

a) *Penetrations through the protected area barrier are secured and monitored. (Item 2.b in Appendix A to Section 14.3.12 of NUREG-0800.)*

b) *Unattended openings (such as underground pathways) that intersect the protected area boundary or vital area boundary will be protected by a physical barrier and monitored by intrusion detection equipment or provided surveillance at a frequency sufficient to detect exploitation. (Item 2.c in Appendix A to Section 14.3.12 of NUREG-0800.)*

On the basis of its review the NRC staff determined that the applicant has adequately revised Table 2.6.9-2 for Part 10 to the VEGP COL application PS-ITAAC items 2(a), 2(b), 2 (c), 3(a), 3(b), 3(c), 4(a), 4(c), 6(partially), and 9 identified in Appendix A to Section 14.3.12 of NUREG-0800.

The VEGP COL application references the AP1000 DCD, which addressed NUREG-0800, Section 14.3.12 PS-ITAAC 4(b), 5, 6 (partially), 10, 11(a), 11(b), 11(c) and 14. The staff has determined that PS-ITAAC 6, described in NUREG-0800, Section 14.3.12 has been fully addressed between the VEGP submission and the AP1000 DCD.

In a supplemental response to RAI 14.3.12-1, the applicant stated:

The information contained in SRP ITAAC number 11(d) is redundant to existing ITAAC in the AP1000 Design Certification Document (DCD). AP1000 DCD security ITAAC numbers 1, 4, 5(a), 5(b), 5(c), 13(a), 13(b), 13(c), and 15(b) demonstrate that the central and secondary alarm stations are equal and redundant, by being constructed, located, protected, and equipped to the standards for the central alarm station.

In RAI SRP 14.3.12-NSIR-7, Revision 1, Westinghouse stated:

No corresponding ITAAC has been provided for SRP 14.3.12 ITAAC number 11(d). The information contained in SRP ITAAC number 11(d) is redundant to existing ITAACs. AP1000 security ITAAC numbers 1, 4, 5(a), 5(b), 5(c), 13, and 15(b) demonstrate that the central and secondary alarm stations are constructed, located, protected, and equipped to the standards for the central alarm station.

On the basis of its review, the NRC staff determined that the applicant has adequately shown that NUREG-0800, Section 14.3.12 detection and assessment hardware ITAAC 11(d) is addressed.

13.6.A.4.2 Delay or Barrier Design

The applicant submitted the following ITAAC for Delay or Barrier Design in their "Response to Request for Additional Information Letter No. 047, Supplement 2, Physical Security Inspections, Tests, Analyses, and Acceptance Criteria," Dated June 11, 2010. This letter was used to complete the evaluation below.

5. *Access control points are established to:*

    a) *Control personnel and vehicle access into the protected area. (Item 8.a in Appendix A to Section 14.3.12 of NUREG-0800.)*

    b) *Detect firearms, explosives, and incendiary devices at the protected area personnel access points. (Item 8.b in Appendix A to Section 14.3.12 of NUREG-0800.)*

7. *Access to vital equipment physical barriers requires passage through the protected area perimeter barrier. (Item 1.b in Appendix A to Section 14.3.12 of NUREG-0800.)*

On the basis of its review, the NRC staff determined that the applicant has adequately addressed NUREG-0800, Section 14.3.12 delay or barrier design PS-ITAAC 1(b)(partially),8(a) and 8(b).

The VEGP COL application references the AP1000 DCD, which addressed NUREG-0800, Section 14.3.12 PS-ITAAC 1(a), 1(b)(partially), 7, 13(a) and 13(b). The staff has determined that PS-ITAAC 1(b) described in NUREG-0800, Section 14.3.12 has been fully addressed between the VEGP submission and the AP1000 DCD.

13.6.A.4.3 Systems, Hardware, or Features Facilitating Security Response and Neutralization

The applicant submitted the following ITAAC for Systems, Hardware, or Features Facilitating Security Response and Neutralization in their "Response to Request for Additional Information Letter No. 047, Supplement 2, Physical Security Inspections, Tests, Analyses, and Acceptance Criteria," Dated June 11, 2010. This letter was used to complete the evaluation below.

9. *Emergency exits through the protected area perimeter are alarmed and secured with locking devices to allow for emergency egress. (Item 15 in Appendix A to Section 14.3.12 of NUREG-0800.)*

On the basis of its review, the NRC staff determined that the applicant has adequately addressed NUREG-0800, Section 14.3.12 delay or barrier design PS-ITAAC 15(partially).

The VEGP COL application references the AP1000 DCD, which addressed NUREG-0800, Section 14.3.12 PS-ITAAC 12, 15(partially) 16(a), 16(b) and 16(c). The staff has determined that PS-ITAAC 15 described in NUREG-0800, Section 14.3.12 has been fully addressed between the VEGP submission and the AP1000 DCD.

On the basis of its review, the staff finds that since the applicant revised WLS COL FSAR Part 10 to incorporate the requirements for PS-ITAAC, the response to RAI 14.03.12-1, 2 and 3 has adequately addressed NUREG-0800, Section 14.3.12, and is, therefore, acceptable.

13.6.A.5 Post Combined License Activities

For the reasons discussed in the technical evaluation section above, the staff proposes to include the following ITAAC for physical security:

- The licensee shall perform and satisfy the ITAAC defined in Table 13.6A-1, "Site Specific Physical Security."

13.6.A.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant addressed the required information relating to PS-ITAAC, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

The staff concludes that the relevant information presented in WLS COL FSAR and the additional information received in the July 6, 2011, letter is acceptable based on the applicable regulations specified in Section 13.6.A.4 of this report. The staff based its conclusion on the following:

- STD SUP 14.3-1, as related to PS-ITAAC, is acceptable based on the following discussion. The staff finds that the applicant adequately describes the physical security systems or provides and/or facilitates the implementation of the site-specific protective strategy and security programs. The applicant adequately describes the site-specific PS-ITAAC for meeting the requirements of 10 CFR 73.55 and provides the technical bases for establishing a PS-ITAAC for the protection against acts of radiological sabotage and theft of special nuclear material. The applicant includes systems and features as stated in WLS COL FSAR Chapter 13 and referenced TRs. The applicant provided adequate descriptions of objectives, prerequisites, test methods, data required, and acceptance criteria for security related ITAAC for the approval of the WLS COL.

Table 13.6.A 1 – Site Specific Physical Security Inspections, Tests, Analyses, and Acceptance Criteria

Design Commitment	Inspections, Tests, and Analyses	Acceptance Criteria
1. The external walls, doors, ceiling, and floors in the location within which the last access control function for access to the protected area is performed are bullet- resistant to at least Underwriters Laboratory Ballistic Standard 752, level 4.	Type test, analysis, or a combination of type test and analysis will be performed for the external walls, doors, ceilings, and floors in the location within which the last access control function for access to the protected area is performed.	The external walls, doors, ceilings, and floors in the location within which the last access control function for access to the protected area is performed are bullet- resistant to at least Underwriters Laboratory Ballistic Standard 752, level 4.
2. Physical barriers for the protected area perimeter are not part of vital area barriers.	An inspection of the protected area perimeter barrier will be performed.	Physical barriers at the perimeter of the protected area are separated from any other barrier designated as a vital area barrier.
3. a) Isolation zones exist in outdoor areas adjacent to the physical barrier at the perimeter of the protected area that allows 20 feet of observation on either side of the barrier. Where permanent buildings do not allow a 20-foot observation distance on the inside of the protected area, the building walls are immediately adjacent to, or an integral part of, the protected area barrier.	Inspections will be performed of the isolation zones in outdoor areas adjacent to the physical barrier at the perimeter of the protected area.	Isolation zones exist in outdoor areas adjacent to the physical barrier at the perimeter of the protected area and allow 20 feet of observation and assessment of the activities of people on either side of the barrier. Where permanent buildings do not allow a 20-foot observation and assessment distance on the inside of the protected area, the building walls are immediately adjacent to, or an integral part of, the protected area barrier and the 20-foot observation and assessment distance does not apply.

b) The isolation zones are monitored with intrusion detection equipment that provides the capability to detect and assess unauthorized persons.	Inspections will be performed of the intrusion detection equipment within the isolation zones.	The isolation zones are equipped with intrusion detection equipment that provides the capability to detect and assess unauthorized persons.
4. The intrusion detection and assessment equipment at the protected area perimeter: a) detects penetration or attempted penetration of the protected area barrier and concurrently alarms in both the central alarm station and secondary alarm station, and b) remains operable from an uninterruptible power supply in the event of the loss of normal power.	Tests, inspections or a combination of tests and inspections of the intrusion detection and assessment equipment at the protected area perimeter and its uninterruptible power supply will be performed.	The intrusion detection and assessment equipment at the protected area perimeter: a) detects penetration or attempted penetration of the protected area barrier and concurrently alarms in the central alarm station and secondary alarm station, and b) remains operable from an uninterruptible power supply in the event of the loss of normal power.

5. Access control points are established to: a) control personnel and vehicle access into the protected area. b) detect firearms, explosives, and incendiary devices at the protected area personnel access points.	Tests, inspections, or combination of tests and inspections of installed systems and equipment at the access control points to the protected area will be performed.	The access control points for the protected area: a) are configured to control personnel and vehicle access. b) include detection equipment that is capable of detecting firearms, incendiary devices, and explosives at the protected area personnel access points.
6. An access control system with numbered picture badges is installed for use by individuals who are authorized access to protected areas and vital areas without escort.	A test of the access control system with numbered picture badges will be performed.	The access authorization system with numbered picture badges can identify and authorize protected area and vital area access only to those personnel with unescorted access authorization.
7. Access to vital equipment physical barriers requires passage through the protected area perimeter barrier.	Inspection will be performed to confirm that access to vital equipment physical barriers requires passage through the protected area perimeter barrier.	Vital equipment is located within a protected area such that access to vital equipment physical barriers requires passage through the protected area perimeter barrier.

8. a) Penetrations through the protected area barrier are secured and monitored.	Inspections will be performed of penetrations through the protected area barrier.	Penetrations and openings through the protected area barrier are secured and monitored.
b) Unattended openings (such as underground pathways) that intersect the protected area boundary or vital area boundary will be protected by a physical barrier and monitored by intrusion detection equipment or provided surveillance at a frequency sufficient to detect exploitation.	Inspections will be performed of unattended openings that intersect the protected area boundary or vital area boundary.	Unattended openings (such as underground pathways) that intersect the protected area boundary or vital area boundary are protected by a physical barrier and monitored by intrusion detection equipment or provided surveillance at a frequency sufficient to detect exploitation.
9. Emergency exits through the protected area perimeter are alarmed and secured with locking devices to allow for emergency egress.	Tests, inspections, or a combination of tests and inspections of emergency exits through the protected area perimeter will be performed.	Emergency exits through the protected area perimeter are alarmed and secured by locking devices that allow prompt egress during an emergency.

13.7 Fitness for Duty

13.7.1 Introduction

Pursuant to 10 CFR 52.79(a)(44), COL applications must include a description of the fitness for duty program required by 10 CFR Part 26, “Fitness for Duty Programs,” and its implementation. The FFD program is designed to provide reasonable assurance that: (1) individuals are trustworthy and reliable as demonstrated by the avoidance of substance abuse; (2) individuals are not under the influence of any substance, legal or illegal, or mentally or physically impaired from any cause, which in any way adversely affects their ability to safely and competently perform their duties; (3) measures are established and implemented for the early detection of individuals who are not fit to perform their duties; (4) the construction site is free from the presence and effects of illegal drugs and alcohol; (5) the work places are free from the presence and effects of illegal drugs and alcohol; and (6) the effects of fatigue and degraded alertness on an individual's ability to safely and competently perform his or her duties are managed commensurate with maintaining public health and safety.

13.7.2 Summary of Application

WLS COL FSAR Section 13.7 is a new section added after AP1000 DCD Section 13.6. The references that are currently in AP1000 DCD Section 13.7 have been redistributed to other WLS COL FSAR sections. There is no information associated with the FFD program incorporated by reference from the AP1000 DCD.

In addition, in WLS COL FSAR Section 13.7, the applicant provided the following:

Supplemental Information

- STD SUP 13.7-1

The applicant provided standard supplemental information in WLS COL FSAR Section 13.7 describing the FFD program for both the construction phase and the operating phase of the units. The construction phase program will be consistent with NEI 06-06, "Fitness for Duty Program Guidance for New Nuclear Power Plant Construction Sites," and the construction phase program will be implemented prior to onsite construction of safety- and security-related SSCs. The operations phase program will be consistent with 10 CFR Part 26.

License Conditions

- Part 10, License Condition 6

The applicant proposed a license condition to provide a schedule to support NRC inspection of operational programs included in WLS COL FSAR Table 13.4-201 including the FFD program.

13.7.3 Regulatory Basis

The applicable regulatory requirements for STD SUP 13.7-1 are as follows:

- 10 CFR Part 26, "Fitness for Duty Programs"
- 10 CFR 52.79(a)(44)

13.7.4 Technical Evaluation

The staff reviewed WLS COL FSAR Section 13.7 to ensure that the COL application represents the complete scope of information relating to this review topic.[1] The staff's review confirmed that the information in the application addresses the required information relating to the FFD program.

Section 1.2.3 of this report provides a discussion of the process used by the staff to perform one technical review for each standard issue outside the scope of the DC and use this review to evaluate subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5 to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from responses to RAIs.

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.

- The staff verified that the site-specific differences were not relevant.

The staff completed its review and concluded that the evaluation performed for the standard content is directly applicable to the WLS COL application. This standard content material is identified in this report by use of italicized, double-indented formatting. Instead of confirming that all responses to RAIs identified in the corresponding standard content evaluation were endorsed by the WLS applicant (which is a typical step when comparing the two applications), the staff provides its evaluation of similar RAIs issued to WLS, following the standard content material. The one confirmatory item in the standard content material retains the number assigned in the VEGP SER, and is also addressed following the standard content material.

The following portion of this technical evaluation section is reproduced from VEGP SER Section 13.7.4:

> *Supplemental Information*
>
> - *STD SUP 13.7-1*
>
> *The applicant provided a new Section 13.7 in the VEGP COL FSAR describing the FFD program. STD SUP 13.7-1 added the following text to Section 13.7:*
>
>> *The Fitness for Duty (FFD) Program (Program) is implemented and maintained in two phases; the construction phase program and the operating phase program. The construction and operations phase programs are implemented as identified in* [FSAR] *Table 13.4-201.*
>>
>> *The construction phase program is consistent with NEI 06-06 (*[FSAR] *Reference 201). The workforce population subject to random testing during construction is determined on a weekly basis by averaging the total number of active construction badges over each preceding seven-day period. The random selection from each week's workforce population is identified by a standard computer-generated random number generator using this number of active badges as the range of numbers considered in the weekly random testing selection.*
>>
>> *The operations phase program is consistent with 10 CFR Part 26.*

The staff notes that Reference 201 in the above text refers to Revision 4 of NEI 06-06.

The NRC staff's review of STD SUP 13.7-1 included the following: (1) the adequacy of the FFD program for the construction phase; (2) the adequacy of the FFD program for the operations phase; and (3) the implementation schedule proposed by the applicant for both the construction phase and operations phase FFD operational programs.

The NRC staff issued three RAIs to obtain further clarification on the applicant's FFD Program. The first two RAIs discussed below are associated with the resolution of STD SUP 13.7-1.

In RAI 13.6-33, the staff asked how the applicant intends to update its FFD program for the construction phase. NEI 06-06 provides examples of the FFD program that is required and, if this guidance is endorsed by the NRC, will provide an acceptable method of complying with the NRC's regulations. If the NRC endorses NEI 06-06, does the applicant intend to update its FFD program for the construction phase to comply with NEI 06-06? If future revisions to NEI 06-06 are endorsed by the NRC, does the applicant intend to update its FFD program for the construction phase to comply with certain clarifications, additions, and exceptions in these future, endorsed revisions, as necessary?

The applicant replied that it submitted an FFD Program for NRC approval as part of the Limited Work Authorization (LWA) request, and that the program is now being implemented as part of the construction activities. If NEI 06-06 is endorsed by the NRC, SNC plans to transition to a program that follows the guidance in NEI 06-06. The COL application currently commits to NEI 06-06, Revision 4, and will be changed in a future revision to commit to NEI 06-06, Revision 5. The applicant will evaluate substantial changes in subsequent revisions to NEI 06-06 and modify the construction phase FFD program to incorporate those substantial changes determined to be appropriate.

The applicant's response to RAI 13.6-33, as well as its supplemental response, revises Section 13.7 to address the issues discussed above. The relevant portion of the proposed revised text, to be included in a future revision of the VEGP COL FSAR, is included below:

> *The Fitness for Duty Program (FFD) is implemented and maintained in multiple and progressive phases dependent on the activities, duties, or access afforded to certain individuals at the construction site. In general, two different FFD programs will be implemented: a construction FFD program and an operations FFD program. The construction and operations phase programs are illustrated in* [FSAR] *Table 13.4-201.*
>
> *The construction FFD program is consistent with NEI 06-06 (*[FSAR] *Reference 201). NEI 06-06 applies to persons constructing or directing the construction of safety- and*

> *security-related structures, systems, or components performed onsite where the new reactor will be installed and operated. Management and oversight personnel, as further described in NEI 06-06, and security personnel prior to the receipt of special nuclear material in the form of fuel assemblies (with certain exceptions) will be subject to the operations FFD program that meets the requirements of 10 CFR Part 26, Subparts A through H, N, and O. At the establishment of a protected area, all persons who are granted unescorted access will meet the requirements of an operations FFD program. Prior to issuance of a Combined License, the construction FFD program at a new reactor construction site for those subject to Subpart K will be reviewed and revised as necessary should substantial revisions occur to either NEI 06-06 following NRC endorsement or the requirements of 10 CFR Part 26.*

The staff notes that Reference 201 in the above text refers to Revision 5 of NEI 06-06.

In RAI 13.6-34, the staff asked the applicant to: (1) describe how FSAR Table 13.4-201, Item 15, related to the security operational program, comports with 10 CFR 26.3, "Scope," and 10 CFR 26.4, and the guidance provided in the NRC's letter to NEI dated December 2, 2009, entitled "Status of U.S. Nuclear Regulatory Commission Review and Endorsement of NEI 06-06, 'Fitness for Duty Program Guidance for New Nuclear Power Plant Construction Sites,'" and (2) provide site-specific information to clearly and sufficiently describe the applicant's FFD program. This information would include, but is not limited to, any deviations or exceptions to the requirements of 10 CFR Part 26 as further described in NEI 06-06.

The applicant stated that the response to RAI 13.6-33 provided the changes to the COL application that will describe the FFD program required by 10 CFR Part 26. Site-specific information is also provided in that response to clarify which program will be used to cover the various classifications of workers that must be covered in accordance with 10 CFR Part 26. The applicant's response to RAI 13.6-35 (below) revises FSAR Table 13.4-201, Item 20 to address the guidance provided in the NRC's December 2, 2009 letter. The proposed revision to Item 20 of FSAR Table 13.4-201, to be included in a future revision of the VEGP COL FSAR, is included below.

Item	Program Title	Program Source (required by)	FSAR Section	Implementation Milestone	Implementation Requirements
20.	*Fitness for Duty (FFD) Program for Construction (workers and first-line supervisors)*	*10 CFR 26.4(f)*	*13.7*	*Prior to initiating 10 CFR Part 26 construction activities*	*10 CFR Part 26, Subpart K*
	FFD Program for Construction (management and oversight personnel)	*10 CFR 26.4(e)*	*13.7*	*Prior to initiating 10 CFR Part 26 construction activities*	*10 CFR Part 26, Subparts A - H, N, and O*
	FFD Program for Security Personnel	*10 CFR 26.4(e)(1)*	*13.7*	*Prior to initiating 10 CFR Part 26 construction activities*	*10 CFR Part 26, Subparts A - H, N, and O*
		10 CFR 26.4(a)(5) or 26.4(e)(1)		*Prior to the earlier of:* *A. Licensee's receipt of SNM in the form of fuel assemblies, or* *B. Establishment of a protected area, or* *C. The 10 CFR 52.103(g) finding*	*10 CFR Part 26, Subparts A - I, N, and O*
	FFD Program for FFD Program personnel	*10 CFR 26.4(g)*	*13.7*	*Prior to initiating 10 CFR Part 26 construction activities*	*10 CFR Part 26, Subparts A, B, D - H, N, O, and C per licensee's discretion*
	FFD Program for persons required to physically report to the Technical Support Center (TSC) or Emergency Operations Facility (EOF)	*10 CFR 26.4(c)*	*13.7*	*Prior to the conduct of the first full-participation emergency preparedness exercise under 10 CFR Part 50, App. E, Section F.2.a*	*10 CFR Part 26, Subparts A - I, N, and O, except for §§ 26.205 – 209*

Item	Program Title	Program Source (required by)	FSAR Section	*Implementation* Milestone	Requirements
	FFD Program for Operation	*10 CFR 26.4(a) and (b)*	*13.7*	*Prior to the earlier of:* *A. Establishment of a protected area, or* *B. The 10 CFR 52.103(g) finding*	*10 CFR Part 26, Subparts A - I, N, and O, except for individuals listed in § 26.4(b), who are not subject to §§ 26.205 – 209*

In its December 2, 2009, letter to NEI, the NRC stated that during the review and approval process for NEI 06-06, the applicant should provide the following statements in its application:.

- *NEI 06-06, Revision 5 was used in the development of the construction site FFD program.*
- *The applicant will review and revise its construction site FFD program as necessary to ensure that it comports with the NRC-endorsed version of NEI 06-06.*
- *If the NRC staff's review of NEI 06-06 results in substantive changes to the most recent, docketed FFD program description provided by the applicant, the applicant must amend its application to reflect the changes.*

The applicant's proposed revisions to FSAR Section 13.7 satisfactorily address the three items described above. The December 2, 2009, letter also provided implementation milestones for consideration by applicants. The staff confirmed that the proposed revisions to FSAR Table 13.4-201, Item 20, include all of the implementation milestones in the December 2, 2009, letter.

Therefore, based on the staff's acceptance of the proposed revisions to FSAR Section 13.7 and to FSAR Table 13.4-201, Item 20, as noted above, the NRC staff concludes that the applicant has satisfactorily addressed STD SUP 13.7-1 by providing sufficient information on the FFD program for both the construction phase and the operating phase of the units. The inclusion of this information in a future revision of the VEGP COL FSAR is ***Confirmatory Item 13.7-1****.*

<u>*Resolution of VEGP Site-Specific Confirmatory Item 13.7-1*</u>

Confirmatory Item 13.7-1 is an applicant commitment to revise its FSAR Section 13.7 and Table 13.4-201 regarding the FFD program for the construction phase and the operating phase of the units. The staff verified that the VEGP COL FSAR was appropriately revised. As a result, Confirmatory Item 13.7-1 is now closed.

License Conditions

In RAI 13.6-35, the staff asked the applicant if proposed License Condition 3, A.1, and G.7, described in Part 10 of the COL application comports with FSAR Table 13.4-201, Item 15, which itemizes the aspects of the security operational program.

The staff further evaluated the need for License Condition 3, A.1 and G.7, for the VEGP COL application and determined it was not needed because the implementation milestones for FFD are governed by 10 CFR Part 26. The staff communicated this information to SNC, which then submitted Supplement 1 to its response to this RAI, removing this license condition for FFD.

- *Part 10, License Condition 6*

The applicant proposed a license condition in Part 10 of the VEGP COL application to provide a schedule to support the NRC's inspection of operational programs, including the FFD program.

The proposed license condition is consistent with the policy established in SECY 05-0197, "Review of Operational Programs in a Combined License Application and Generic Emergency Planning Inspections, Tests, Analyses, and Acceptance Criteria," for operational programs and is acceptable.

Evaluation of WLS RAI Responses

The staff issued one RAI to the WLS applicant that mirrored the RAI 13.6-33 issued to the VEGP applicant, and one RAI that was not common to VEGP was issued.

The staff's evaluation of the responses provided by the WLS applicant to the two RAIs related to the FFD program is discussed below. The applicant responded to RAI 98, Question 13.07-1 on September 21, 2011, and to RAI 99, Question 13.07-2.

In RAI 98, Question 13.07-1, the staff requested that the applicant the following:

> Under 10 CFR 52.79(a)(44), the Applicant's FSAR must contain a description of the fitness for duty (FFD) program required by 10 CFR Part 26 and its implementation. How does the Applicant intend to update its FFD program for the construction phase? NEI 06-06 provides examples of the FFD program that is required and, if this guidance is endorsed by the NRC, will provide an acceptable method of complying with the NRC's regulations. If the NRC endorses NEI 06-06, does the Applicant intend to update its FFD program for the construction phase to comply with NEI 06-06? If future revisions to NEI 06-06 are endorsed by the NRC, does the Applicant intend to update its FFD program for the construction phase to comply with certain clarifications, additions, and exceptions in these future, endorsed revisions, as necessary?

In a September 22, 2011, response to RAI 98, Question 13.07-1, the applicant stated that its FFD Program will be developed based on the guidance given in NEI 06-06, Revision 5, and that subsequent revisions to NEI 06-06 would be subject to review by the applicant at that time for incorporation of any changes determined to be appropriate. The relevant portion of the revised text is included below:

> The Fitness for Duty Program (FFD) is implemented and maintained in multiple and progressive phases dependent on the activities, duties, or access afforded to certain individuals at the construction site.
>
> In general, two different FFD programs will be implemented: a construction FFD program and an operations FFD program. The construction and operations phase programs are outlined in Table 13.4-201.
>
> The construction FFD program is consistent with NEI 06-06 ([FSAR] Reference 201). NEI 06-06 applies to persons constructing or directing the construction of safety- and security-related structures, systems, or components performed onsite where the new reactor will be installed and operated. Management and oversight personnel, as further described in NEI 06-06 and security personnel prior to the receipt of special nuclear material in the form of fuel assemblies (with certain exceptions) will be subject to the operations FFD program that meets the requirements of 10 CFR Part 26, Subparts A through H, N, and 0. At the establishment of a protected area, all persons who are granted unescorted access will meet the requirements of an operations FFD program.
>
> The operations phase program is consistent with 10 CFR Part 26.

The staff considers RAI 98, Question 13.07-1 resolved by submittal of WLS COL FSAR, Revision 4.

In RAI 99, Question 13.07-2, the staff requested that applicant "provide site-specific information to clearly and sufficiently describe your FFD program in terms of the scope and level of detail to enable the staff to make a decision of acceptability."

In a November 22, 2011, response to RAI 99, Question 13.07-2, the applicant stated they "have not entered into a contract with a specific contractor for engineering, construction, and procurement at this time for the Lee site. Thus, the site-specific details for FFD programs have not been fully organized down to the details at the contractor level at this time. FSAR Section 13.7 has been updated to reflect the current plan for FFD programs in scope and level of detail for the Lee site known at this time." The following is the applicant's response to RAI 99, Question 13.07-2:

> This update is supplementing the previous changes made per Duke Energy's Response to Letter 098, RAI 13.7-1, dated September 21, 2011
>
> The Fitness for Duty Program (FFD) is implemented and maintained in multiple and progressive phases dependent on the activities, duties, or access afforded to certain individuals at the construction site.
>
> In general, two different FFD programs will be implemented: a construction FFD program and an operations FFD program. The construction and operations phase programs are outlined in Table 13.4-201.

The construction FFD program is consistent with NEI 06-06 ([FSAR] Reference 201). NEI 06-06 applies to persons constructing or directing the construction of safety- and security-related structures, systems, or components performed onsite where the new reactor will be installed and operated. Management and oversight personnel, as further described in NEI 06-06, and security personnel prior to the receipt of special nuclear material in the form of fuel assemblies (with certain exceptions) will be subject to the operations FFD program that meets the requirements of 10 CFR Part 26, Subparts A through H, N, and 0.

At the establishment of a protected area, all persons who are granted unescorted access will meet the requirements of an operations FFD program. Prior to issuance of a Combined License, the Duke-approved construction FFD program (elements Subpart K) will be reviewed and revised, as necessary, should substantial revisions occur to NEI 06-06 following NRC endorsement of the requirements of 10 CFR Part 26.

The following site-specific information is provided:

- The construction site is defined in the Physical Security Plan, Appendix E. and is under control of the Primary Site Contractor. The 10 CFR Part 26 requirements are implemented for the construction site area based on the description provided in Table 13.4-201.

- Construction Workers and First Line Supervisors (Primary Site Contractor employees and subcontractors) are covered by a Duke-approved Construction FFD Program (elements Subpart K).

- Duke employees and Duke subcontractor's construction management and oversight personnel are covered by a Duke Operations FFD Program and the Primary Site Contractor's employees and the Primary Site Contractor's subcontractors, construction management, and oversight personnel are covered by a Duke-approved FFD Program (elements Subpart A-H, N, and O).

- Duke security personnel are covered by a Duke Operations FFD Program and the Primary Site Contractor's security personnel are covered by a Duke-approved FFD Program (elements Subpart A-H, N, and O). This coverage is applicable from the start of construction activities to the earlier of (1) the receipt of SNM in the form of fuel assemblies, (2) The establishment of a protected area, or (3) the 10 CFR 52.103(g) finding.

- The Duke FFD Program personnel are covered by a Duke Operations FFD program and the Primary Site Contractor's FFD Program personnel are covered by a Duke-approved FFD Program (elements Subpart A, B, D-H, N, O, and C per licensee's discretion).

- Duke security personnel protecting fuel assemblies are covered by a Duke Operations FFD Program (Elements Subpart A-I, N and O).

- Personnel required to physically report to the Technical Support Center (TSC) or Emergency Operations Facility (EOF), when that requirement is in effect, are covered by a Duke Operations FFD program (elements Subpart A- I, N, and O, except for -§ 26.205 - 209)

The applicant stated that site-specific information would be reflected in a future revision to the WLS COL FSAR. The staff confirmed that the applicant has made the appropriate changes in Revision 9 of the WLS COL FSAR and considers this issue resolved.

13.7.5 Post Combined License Activities

For the reasons discussed in the technical evaluation section above, the staff finds the following license condition acceptable:

- License Condition (13-13) – The licensee shall submit to the Director of NRO, a schedule, no later than 12 months after issuance of the COL, that supports planning for and conduct of NRC inspection of the FFD operational program. The schedule shall be updated every 6 months until 12 months before scheduled fuel load, and every month thereafter until the FFD operational program has been fully implemented.

13.7.6 Conclusion

The staff reviewed WLS COL FSAR Section 13.7 along with the applicant’s proposed revision to this section. The staff’s review confirmed that the applicant’s proposed revision to WLS COL FSAR Section 13.7 has adequately addressed the required information related to the FFD portion of the WLS COL FSAR Section 13.7 and is consistent with the applicable requirements of 10 CFR Part 26 and 10 CFR 52.79(a)(44). In addition, the applicant provided a commitment to NEI “Fitness for Duty Program Guidance for New Nuclear Power Plant Construction Sites,” NEI 06-06, Revision 5, August 2009, therefore the staff, finds it acceptable.

13.8 Cyber Security

This section does not exist in either the AP1000 DCD or the WLS COL FSAR. The staff has added this section to this report to address issues regarding cyber security.

13.8.1 Introduction

In a July 29, 2011, letter to the NRC, Duke submitted Revision 2 of the Cyber Security Plan (CSP) for WLS Units 1 and 2. The CSP applies to all critical digital assets (CDAs) required for WLS operation. In the submittal, the applicant described how the requirements of 10 CFR 73.54, “Protection of Digital Computer and Communication Systems and Networks,” will be implemented to protect digital computer and communications systems and networks associated with the following functions from those cyber attacks, up to and including the DBT described in 10 CFR 73.1, “Purpose and Scope.” The scope of 10 CFR 73.54 includes CDAs associated with the following:

- safety-related and important-to-safety functions

- security functions
- emergency preparedness functions, including offsite communications
- support systems and equipment which, if compromised, would adversely impact safety, security, or emergency preparedness functions

13.8.2 Summary of Application

The applicant addresses cyber security in WLS COL FSAR Section 13. WLS COL FSAR, Revision 11, Section 13.6 incorporates by reference AP1000 DCD, Revision 19, Section 13.6. The applicant's CSP includes deviations from RG 5.71, "Cyber Security Programs for Nuclear Facilities." The staff evaluated these deviations.

In addition, in WLS COL FSAR Section 13.6, the applicant provided the following:

AP1000 COL Information Item

- STD COL 13.6-5

The applicant provided additional information in STD COL 13.6-5 to address COL Information Item 13.6-5, which provides information related to the cyber security program.

License Conditions

- Part 10, License Condition 3, Item G.10

The applicant proposed a license condition in WLS COLA Part 10, which requires the applicant to implement the cyber security program prior to initial fuel load.

- Part 10, License Condition 6

The applicant proposed a license condition in WLS COLA Part 10 to provide a schedule to support NRC inspection of operational programs included in WLS COL FSAR Table 13.4-201 including the cyber security program.

13.8.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

The applicable regulatory requirements for cyber security are as follows:

- 10 CFR 73.1, "Purpose and scope"
- 10 CFR 73.54, "Protection of digital computer and communication systems and networks"
- 10 CFR 73.55, "Requirements for physical protection of licensed activities in nuclear power reactors against radiological sabotage," paragraphs (a)(1), (b)(8), and (m)

- 10 CFR 73.58, “Safety/security interface requirements for nuclear power reactors”
- 10 CFR Part 73, “Physical protection of plants and materials,” Appendix G, “Reportable Safeguards Events”

The applicable regulatory guidance for cyber security is RG 5.71.

13.8.4 Technical Evaluation

The staff reviewed WLS COL FSAR Section 13.6 and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The staff’s review confirmed that the information in the application and incorporated by reference addresses the required information relating to cyber security. The results of the staff’s evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

The staff’s review of the WLS CSP focused on ensuring that the necessary programmatic elements are included in this plan to provide high assurance that activities involving special nuclear material are not inimical to the common defense and security and do not constitute an unreasonable risk to the public health and safety. The staff reviewed the WLS CSP to ensure the necessary programmatic elements that, when effectively implemented, will provide the required high assurance of adequate protection. Effective implementation is dependent on the procedures and practices the applicant develops to satisfy the programmatic elements of its CSP. The facility implementing procedures are subject to future NRC inspection.

Section 1.2.3 of this report provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review to evaluate subsequent COL applications. To ensure that the staff’s findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5 to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from responses to RAIs.
- The staff confirmed that the July 29, 2011, WLS submittal transmitting its CSP was identical to the June 14, 2010, VEGP submittal transmitting its CSP, with the only exceptions being to the title of the units and the identification of the position charged with oversight of the program.
- The staff verified that the site-specific differences were not relevant.

The staff completed its review and concluded that the evaluation performed for the standard content is directly applicable to the WLS COL application. This finding included verifying that the difference in the position charged with oversight of the program (the General Manager, Organizational Effectiveness at WLS and Vice President of Nuclear Operations Support at VEGP) does not affect the staff's conclusions regarding the applicant's CSP. This standard content material is identified in this SER by use of italicized, double-indented formatting. The one confirmatory item in the standard content material retains the number assigned in the VEGP SER.

The following portion of this technical evaluation section is reproduced from VEGP SER Section 13.8.4:

> _AP1000 COL Information Item_
>
> - *STD COL 13.6-5*
>
> *The NRC staff reviewed STD COL 13.6-5 related to COL Information Item 13.6-5, which identifies the need for a COL applicant to address cyber security. STD COL 13.6-5 supplemented Section 13.6 of the VEGP COL FSAR by stating the following text is to be added after Section 13.6 of the VEGP ESP SSAR:*
>
> > *The Cyber Security Plan is submitted to the Nuclear Regulatory Commission as a separate licensing document to fulfill the requirements contained in 10 CFR 52.79(a)(36) and 10 CFR 73.54. The Cyber Security Plan will be maintained in accordance with the requirements of 10 CFR 52.98. The Plan is withheld from public disclosure pursuant to 10 CFR 2.390.*
>
> *Section 13.6 of the VEGP COL FSAR also refers to FSAR Table 13.4-201, "Operational Programs Required by NRC Regulations," as providing the milestone for implementing the cyber security program.*
>
> *The VEGP applicant submitted its Revision 0 of its CSP in a letter dated June 14, 2010, to demonstrate that the cyber security program will provide high assurance that digital computer and communication systems and networks are adequately protected against cyber attacks, up to and including the DBT as described in 10 CFR 73.1. The CSP has been withheld from public disclosure pursuant to 10 CFR 2.390(d)(1). In its review of this plan, the NRC staff used the guidance in RG 5.71 to determine if the regulatory requirements described in Section 13.8.3 of this SER are satisfied.*
>
> *The applicant described the cyber security program based on 10 CFR 73.54, including the audit of the effectiveness of the cyber security program as required by 10 CFR 73.55(m), submittal of CSPs and the establishment, maintenance and implementation of a cyber security program required by 10 CFR 73.55(a)(1) and 10 CFR 73.55(b)(8) and reporting requirements in 10 CFR Part 73, Appendix G. The implementation milestones for this program are included in VEGP COL FSAR Table 13.4-201.*
>
> *As detailed in the remainder of this SER section, the CSP has been reviewed by the NRC staff for format and content utilizing the NRC CSP template in RG 5.71, and found to include all features considered essential for such a program, and is acceptable. In particular, it has been found to comply with the Commission's regulations including 10 CFR 73.54, 10 CFR 73.55(a)(1), 10 CFR 73.55(b)(8),*

10 CFR 73.55(m), and 10 CFR Part 73, Appendix G and conforms to the NRC CSP template set forth in RG 5.71.

*The applicant has committed to incorporate this CSP into a future revision of the VEGP COL application to address NRC requirements in 10 CFR 73.54. This action will be tracked as **Confirmatory Item 13.8-1**.*

Resolution of VEGP Site-Specific Confirmatory Item 13.8-1

Confirmatory Item 13.8-1 is an applicant commitment to include the CSP into a future revision of the VEGP COL application. The staff verified that the VEGP COL application was appropriately revised. As a result, Confirmatory Item 13.8-1 is now closed.

13.8.4.1 Establishment of Cyber Security Program

The VEGP CSP describes how SNC will establish a cyber security program to achieve high assurance that the VEGP digital computer and communication systems and networks associated with safety, security, and emergency preparedness, including offsite communications and support systems and equipment which if compromised would adversely impact safety, security and/or emergency preparedness (SSEP) functions, and their digital assets, hereafter defined as CDAs, are adequately protected against cyber attacks up to and including the DBT. RG 5.71 provides a method that the staff considers acceptable for complying with this regulation. SNC complies with the requirements of 10 CFR 73.54 by providing a CSP that follows the template in Appendix A of RG 5.71, except as noted in Attachment A, "Vogtle Electric Generating Plant Units 3 and 4 Cyber Security Plan Deviations from Regulatory Guide RG 5.71." The VEGP CSP included:

> *Within the scope of the NRC's cyber security rule at 10 CFR 73.54, systems or equipment that perform important to safety functions include structures, systems, and components (SSCs) in the balance of plant (BOP) that could directly or indirectly affect reactivity at a nuclear power plant and could result in an unplanned reactor shutdown or transient. Additionally, these SSCs are under the licensee's control and include electrical distribution equipment out to the first inter-tie with the offsite distribution system.*

The VEGP CSP included a deviation from the guidance to clarify that systems or equipment that perform important to safety functions include SSCs in the balance of plant (BOP) that could directly or indirectly affect reactivity and could result in an unplanned reactor shutdown or transient. This deviation is consistent with Commission policy.

The NRC staff reviewed the VEGP CSP against the template in RG 5.71 and the staff requirements memorandum (SRM), CMWCO-10-0001, "Regulation of Cyber Security at Nuclear Power Plants," dated October 21, 2010.

The applicant states in the VEGP CSP that its security program complies with 10 CFR 73.54 by:

1) *establishing and implementing defensive strategies consistent with the defensive model, described in Section 3.1.5, including the security controls described in Sections 3.1, 3.2, and 3.3.*

2) *maintaining the program, as described in Section 4.*

Based on the above review, the NRC staff finds that establishment of a cyber security program described in Section 1 of the VEGP CSP is acceptable.

The following SER Sections 13.8.4.2 through 13.8.4.23 correlate to specific sections in Appendix A to RG 5.71. These SER sections use the same headings as the corresponding Appendix A sections, and include the Appendix A numbering system in the titles. SER Section 13.8.4.24 addresses each of the deviations identified in the applicant's CSP.

13.8.4.2 Security Assessment and Authorization (Section A.3.1.1 of Appendix A to RG 5.71)

Section 3.1.1 of the VEGP CSP states that the following will be reviewed every 24 months:

- *A formal documented security planning, assessment, and authorization policy that describes the purpose, scope, roles, responsibilities, management commitments, and coordination among departments and the implementation of the security program and the controls applied in accordance with Section 3.1.6*

- *A formal documented procedure to facilitate the implementation of the cyber security program and the security assessment*

The NRC staff reviewed the above and found that evaluation of the program elements every 24 months is not consistent with Section C.3.1.1 of RG 5.71. The time period between evaluations is 12 months longer than the time period provided in brackets in RG 5.71. However, this 24-month time period conforms to 10 CFR 73.54(g), requiring the applicant to review the cyber security program as a component of the physical security program in accordance with the requirements of 10 CFR 73.55(m), including the periodicity requirements. The requirement of 10 CFR 73.55(m) is that at minimum the applicant review each element of the physical protection program at least every 24 months.

Based on the above review, the NRC staff finds that the security assessment and authorization described in Section 3.1.1 of the VEGP CSP is acceptable.

13.8.4.3 Cyber Security Team (Section A.3.1.2 of Appendix A to RG 5.71)

Section 3.1.2 of the VEGP CSP states that a cyber security team, composed of individuals with broad knowledge, will be established and maintained and that the broad knowledge of the team will include the following areas:

- *Information and digital system technology; this includes cyber security, software development, offsite communications, computer system administration, computer engineering, and computer networking.*

- *Nuclear facility operations, engineering, and safety; this includes overall facility operations and plant technical specification compliance.*

- *Physical security and emergency preparedness; this includes the site's physical security and emergency preparedness systems and programs.*

This section of the VEGP CSP also enumerates the roles and responsibilities of the cyber security team. Aside from the deviations discussed below, this section of the VEGP CSP conforms to the CSP template wording provided in Section A.3.1.2 of RG 5.71.

The VEGP CSP includes several deviations from the text of RG 5.71:

1) *The first deviation clarifies that the cyber security team (CST) will be responsible for “overseeing” preparation of documentation of cyber security controls and that, in fact, non-team members (such as vendor personnel) may perform some of these actions, under the supervision of the CST. This clarification is acceptable to the staff since the responsibility to ensure compliance with 10 CFR 73.54 remains with the CST.*

2) *The second deviation changes the CST responsibility from “assuring the retention” of assessment documentation to “establishing the retention policy” for assessment documentation. Again, the deviation is acceptable to the staff since the responsibility to ensure compliance with 10 CFR 73.54 remains with the CST.*

3) *The third and final deviation seeks to change the basis for CST determinations being made in a free and objective manner. The RG 5.71 wording states that the CST should be free to make determinations that are not constrained by “operational goals.” The deviation changes the respective sentence to say “…by business goals.” Again, the deviation is acceptable to the staff since it maintains the same objective of keeping financial considerations out of decision making regarding cyber security.*

Based on the above review, the NRC staff finds that the CST described in Section 3.1.2 of the VEGP CSP is acceptable.

13.8.4.4 Identification of Critical Digital Assets (Section A.3.1.3 of Appendix A to RG 5.71)

Section 3.1.3 of the VEGP CSP states that to identify the critical systems (CSs) at VEGP, the CST identified and documented plant systems, equipment, communication systems, and networks that are associated with the SSEP functions described in 10 CFR 73.54(a)(1), as well as the support systems associated with these SSEP functions in accordance with the approved plant licensing basis.

The VEGP CSP also states that the CST identified and documented CDAs that have a direct, supporting, or indirect role in the proper functioning of CSs.

The steps outlined in the VEGP CSP essentially match the corresponding steps described in RG 5.71 for this same activity. The only difference between the corresponding section in RG 5.71 and the VEGP CSP is the addition of the modifying phrase: "…and defined in the approved plant licensing basis."

10 CFR 73.54(a)(1) requires that the licensee protect digital computer and communication systems and networks associated with: (i) safety-related and important-to-safety functions; (ii) security functions; (iii) emergency preparedness functions, including offsite communications; and (iv) support systems and equipment which, if compromised, would adversely impact SSEP functions.

This deviation is acceptable because SNC proposes to use its licensing basis to identify CSs that are associated with SSEP functions, as 10 CFR 73.54 requires. This statement includes the first step in RG 5.71 to analyze digital computer and communication systems and networks to determine if they include CDAs.

Based on the above review, the NRC staff finds the applicant's proposal, described in Section 3.1.3 of the VEGP CSP, to use 10 CFR 73.54(a)(1) and its licensing basis to identify CDAs to be acceptable.

13.8.4.5 Reviews and Validation Testing (Section A.3.1.4 of Appendix A to RG 5.71)

Section 3.1.4 of the VEGP CSP states that the VEGP CST will be responsible for conducting a review, performing validation activities, and for each CDA, the CST determined:

- *its direct and indirect connectivity pathways*
- *infrastructure interdependencies*
- *the application of defensive strategies, including defensive models, security controls, and other defensive measures*

- *The CSP also requires that the CST validate the above activities through comprehensive walkdowns, which include a range of activities that conform to those activities specified in RG 5.71 for this purpose.*

The CSP also requires that the CST validate the above activities through comprehensive walkdowns, which include a range of activities that conform to those activities specified in RG 5.71 for this purpose.

The requirements, processes and procedures described in this section of the VEGP CSP conform to, and encompass all of the same specifications, outlined in the comparable section of RG 5.71.

Based on the above review, the NRC staff finds that reviews and validation testing described in Section 3.1.4 of the VEGP CSP is acceptable.

13.8.4.6 Defense-In-Depth Protective Strategies (Section A.3.1.5 of Appendix A to RG 5.71)

Section 3.1.5 of the VEGP CSP states that the defensive strategy consists of the defensive model described in Section C.3.2 of RG 5.71, and the detailed defensive architecture of Appendix C, Section 6, defense-in-depth controls in Appendix C, Section 7, and security controls applied in accordance with Section 3.1.6 of the VEGP CSP with one deviation to its defensive architecture. The VEGP defensive architecture, including the deviation is consistent with the security model described in RG 5.71, which provides for isolation of safety-related and security CDAs.

Based on the above review, the NRC staff finds that the defense-in-depth protective strategies described in Section 3.1.5 of the VEGP CSP are acceptable.

13.8.4.7 Application of Security Controls (Section A.3.1.6 of Appendix A to RG 5.71)

Section 3.1.6 of the VEGP CSP states that VEGP Units 3 and 4 established defense-in-depth protective strategies by applying and documenting the following:

- *the defensive model described in Section 3.2 of RG 5.71 (discussed in SER Section 13.8.4.6)*

- *the physical and administrative security controls established by the VEGP Units 3 and 4 Physical Security Program and physical barriers, such as locked doors, locked cabinets, and locating CDAs in the VEGP Units 3 and 4 protected area or vital areas, which are part of the overall security controls used to protect CDAs from attacks*

- *verification of the effectiveness of the implemented operational and management controls described in Appendix C to RG 5.71 and implemented alternatives to the Appendix C controls for each CDA*

- *the technical controls described in Appendix B to RG 5.71 and the operational and management controls described in Appendix C to RG 5.71, consistent with the process described below*

The VEGP CSP deviates from RG 5.71, Section C.3.3 Security Controls and Appendix A.3.1.6, by stating that when a control from Appendices B and C of RG 5.71 is not implemented, the licensee will implement alternate control(s) that "do not provide less protection than the corresponding" control in the appendix. This deviation is consistent with the method used in RG 5.71, which states that controls should provide equal or better protection,

The VEGP CSP also deviates from RG 5.71 by stating that when a control can be proved to be unnecessary, the applicant will perform an analysis demonstrating that the control is not necessary, and will provide a documented justification. Although RG 5.71 specifically calls for an attack vector analysis, and the VEGP CSP does not specifically commit to performing an attack vector analysis, the VEGP CSP does commit to justifying the non-applicability of a control by demonstrating that the attack vector does not exist. This provides for the same outcome as RG 5.71.

Based on the above review, the NRC staff finds that the application of security controls described in Section 3.1.6 of the VEGP CSP is acceptable.

13.8.4.8 Incorporating the Cyber Security Program into the Physical Protection Program (Section A.3.2 of Appendix A to RG 5.71)

Section 3.2 of the VEGP CSP states that the licensee will provide the management interfaces necessary to appropriately coordinate physical and cyber security activities, as follows:

- *establish an organization that is responsible for cyber security and is independent from operations*

- *document physical and cyber security interdependencies*

- *develop policies and procedures to coordinate management of physical and cyber security controls*

- *incorporate unified policies and procedures to secure CDAs from attacks up to and including the DBT*

- *coordinate acquisition of physical or cyber security services, training, devices, and equipment*

- *coordinate interdependent physical and cyber security activities and training with physical and cyber security personnel*
- *integrate and coordinate incident response capabilities with physical and cyber incident response personnel*
- *train senior management regarding the needs of both disciplines*
- *periodically exercise the entire security organization using realistic scenarios combining both physical and cyber simulated attacks*

The VEGP CSP deviates from RG 5.71 by not creating a unified security organization. The commitment to provide for appropriate management interfaces to coordinate the physical and cyber security organizations provides for a level of integration equivalent to a unified organization.

Based on the above review, the NRC staff finds that the incorporation of the cyber security program into the physical protection program described in Section 3.2 of the VEGP CSP is acceptable.

13.8.4.9 Policies and Implementing Procedures (Section A.3.3 of Appendix A to RG 5.71)

Section 3.3 of the VEGP CSP states that the licensee will develop policies and procedures to address the security controls in Appendices B and C to RG 5.71 and review and approve issues and uses, and revise the same according to Section 4 of the CSP. The CSP will also establish specific responsibilities for the positions described in Section 10.10 of Appendix C to RG 5.71, with the following deviation.

The CSP states that this will occur "in accordance with the security control application process in Section 3.1.6 of this Plan." This process requires the applicant to justify and demonstrate that any deviation from the controls in RG 5.71 provide no less protection than the corresponding control in Appendices B and C; therefore, the VEGP CSP will require the same level of protection as the corresponding commitment in RG 5.71.

Based on the above review, the NRC staff finds that the policies and implementing procedures described in Section 3.3 of the VEGP CSP are acceptable.

13.8.4.10 Maintaining the Cyber Security Program (Section A.4 of Appendix A to RG 5.71)

Section 4 of the VEGP CSP states that the applicant will establish the programmatic elements necessary to maintain security throughout the life cycle of the CDAs, and that the applicant has implemented these elements. For new assets, SNC commits to follow the process described in Section 4.2.

Section 4 of the VEGP CSP is nearly identical to Section C.4 of RG 5.71, with the deviation of replacing the bracketed text [Licensee/Applicant] *with VEGP Units 3 and 4, and by including the caveat that the operational and management controls are applied following the process described in Section 3.1.6. The process described in Section 3.1.6 allows the licensee/applicant to not apply a control if it can demonstrate that the control is not necessary by justifying that the attack vector associated with the control does not exist. This approach is consistent with the method used in RG 5.71, and does not reduce the protection to the plant.*

Based on the above review, the NRC staff finds that the maintenance of the cyber security program described in Section 4 of the VEGP CSP is acceptable.

13.8.4.11 Continuous Monitoring and Assessment (Section A.4.1 of Appendix A to RG 5.71)

Section 4.1 of the VEGP CSP states that the licensee will continue to monitor security controls for effectiveness; will ensure that they remain in place throughout the life cycle of the CDA; and will verify that rogue assets are not connected to the infrastructure.

The VEGP CSP includes a single deviation from Section A.4.1 of RG 5.71. The RG states that "[Licensee/Applicant] *continuously monitors security controls consistent with Appendix C to RG 5.71," whereas the VEGP CSP states that "VEGP Units 3 and 4 continues to monitor security controls consistent with Appendix C to RG 5.71."*

This deviation is consistent with the method in RG 5.71, which calls for periodic assessments, which is consistent with the statement "continues to monitor."

Based on the above review, the NRC staff finds that the ongoing monitoring and assessment described in Section 4.1 of the VEGP CSP is acceptable.

13.8.4.12 Periodic Assessment of Security Controls (Section A.4.1.1 of Appendix A to RG 5.71)

Section 4.1.1 of the VEGP CSP states that the licensee will periodically assess that security controls implemented for each CDA remain robust, resilient, and effective in place throughout the life cycle, at least every 24 months.

The NRC staff reviewed the above and found that this period of assessment is not consistent with RG 5.71. The time period between evaluations is 12 months longer than the time period provided in RG 5.71. However, this 24-month time period conforms to 10 CFR 73.54(g) requiring the licensee/applicant to review the cyber security program as a component of the physical security program in accordance with the requirements of 10 CFR 73.55(m), including the periodicity requirements. The requirements of 10 CFR 73.55(m) are that, at a minimum, the licensee/applicant review each element of the physical protection program, which includes the cyber security program, at least every 24 months.

Furthermore, the VEGP CSP states that controls will be reviewed according to the requirements of the security controls if that period of review occurs more often. This is also consistent with the method provided in RG 5.71.

Based on the above review, the NRC staff finds that the periodic assessment of security controls described in Section 4.1.1 of the VEGP CSP is acceptable.

13.8.4.13 Effectiveness Analysis (Section A.4.1.2 of Appendix A to RG 5.71)

Section 4.1.2 of the VEGP CSP states that the licensee will monitor and measure the effectiveness of the cyber security program and its security controls to ensure that both are implemented correctly, operating as intended, and continuing to provide high assurance that CDAs are protected against cyber attacks. The licensee commits to verifying the effectiveness of the security controls every 24 months, or in accordance with the specific requirements of the implemented security controls, whichever is more frequent.

The NRC staff reviewed the above and found that this period of verification is inconsistent with RG 5.71. The time period between evaluations is 12 months longer than the time period provided in RG 5.71. However, this 24-month time period conforms to 10 CFR 73.54(g) requiring the applicant to review the cyber security program as a component of the physical security program in accordance with the requirements of 10 CFR 73.55(m), including the periodicity requirements. The requirements of 10 CFR 73.55(m) are that, at a minimum, the applicant review each element of the physical protection program, which includes the cyber security program, at least every 24 months.

Furthermore, the VEGP CSP states that verification will also occur according to the requirements of the security controls if that period of verification occurs more often. This is also consistent with the method provided in RG 5.71.

Based on the above review, the NRC staff finds that the effectiveness analysis described in Section 4.1.2 of the VEGP CSP is acceptable.

13.8.4.14 Vulnerability Assessments and Scans (Section A.4.1.3 of Appendix A to RG 5.71)

Section 4.1.3 of the VEGP CSP states vulnerability assessments will be performed as specified in the security controls in Appendices B and C of RG 5.71 to identify new vulnerabilities that have the potential to impact the effectiveness of the cyber security program and the security of the CDAs. The applicant also commits to address vulnerabilities that could cause CDAs to become compromised or could have an adverse impact on SSEP functions. Section 13.1 of Appendix C of RG 5.71 provides that vulnerability assessments should occur no less frequently than once a quarter, at random intervals, and when new potential vulnerabilities are reported and identified.

Section A.4.1.3 of RG 5.71 states that vulnerability assessments will occur no less frequently than quarterly, whereas the VEGP CSP states that this will occur, *"as specified in the implemented security controls in Appendices B and C to RG 5.71 and implemented alternatives to the Appendices B and C controls." The process SNC has committed to in Section 3.1.6 of the VEGP CSP requires SNC, if it does not implement the controls in Appendices B and C, to demonstrate that an alternate control does not provide less protection than the corresponding control in Appendices B and C.*

Therefore, if SNC does not implement the security control in Section 13.1, or deviates from the requirement for a quarterly vulnerability assessment, it will ensure that this deviation does not provide less protection than performing quarterly vulnerability assessments, and will provide an analysis that demonstrates that the attack vector does not exist and will document this justification for inspection.

Based on the above review, the NRC staff finds that the vulnerability assessments and scans described in Section 4.1.3 of the VEGP CSP are acceptable.

13.8.4.15 Change Control (Section A.4.2 of Appendix A to RG 5.71)

Section 4.2 of the VEGP CSP states that the licensee will systematically plan, approve, test, and document changes to the environment of the CDAs, the addition of CDAs to the environment, and changes to existing CDAs in a manner that provides a high level of assurance that the SSEP functions are protected from cyber attacks. The CSP also commits that the program establish that changes made to CDAs use the design control and configuration management procedures or other procedural processes to ensure that the existing security controls are effective and that any pathway that can be exploited to compromise a CDA is protected from cyber attacks.

The VEGP CSP does not deviate from Section A.4.2 of RG 5.71.

Based on the above review, the NRC staff finds that the change control process described in Section 4.2 of the VEGP CSP is acceptable.

13.8.4.16 Configuration Management (Section A.4.2.1 of Appendix A to RG 5.71)

Section 4.2.1 of the VEGP CSP states that the licensee will implement and document a change management process as described in Section 4.2 of the VEGP CSP. Further, it commits to implement and document the applied configuration management controls described in Appendix C, Section 11 to RG 5.71 following the process described in Section 3.1.6 of the CSP.

The VEGP CSP does not specifically commit to apply the security controls in Section 11 of Appendix C of RG 5.71; however, it does commit to apply the process in Section 3.1.6 of the CSP. The commitment in Section 4.2.1 is consistent with Section A.4.2.2 of RG 5.71 as the applicant has committed, if it does not implement the security controls in Section 11 of RG 5.71, either to *implement alternative controls that do not provide less protection than what is in Section 11, or to demonstrate that this control is unnecessary by demonstrating that the attack vectors associated with Section 11 to Appendix C of RG 5.71 do not exist for VEGP.*

Based on the above review, the NRC staff finds that the configuration management process described in Section 4.2.1 of the VEGP CSP is acceptable.

13.8.4.17 Security Impact Analysis of Changes and Environment (Section A.4.2.2 of Appendix A to RG 5.71)

Section 4.2.2 of the VEGP CSP states that the applicant will perform a security impact analysis in accordance with Section 4.1.2 before implementing a design or configuration change to a CDA or, when changes to the environment occur, to manage potential risks introduced by the changes. The CSP also commits to evaluate, document, and incorporate into the security impact analysis safety and security interdependencies of other CDAs or systems, as well as updates, and documents the following:

- *the location of the CDA and connected assets*
- *connectivity pathways (direct and indirect)*
- *infrastructure interdependencies*
- *application of defensive strategies, including defensive models, security controls, and others*
- *defensive strategy measures*
- *plant-wide physical and cyber security policies and procedures that secure CDAs from a cyber attack, including attack mitigation and incident response and recovery*

The VEGP CSP commits to perform these impact analyses as part of the change approval process to assess the impacts of the changes on the security posture of CDAs and security controls, as described in Section 4.1.2 of the VEGP CSP, and to address any identified gaps to protect CDAs from cyber attack, up to and including the DBT as described in Section 4.2.6.

Finally, Section 4.2.2 states that the licensee will manage CDAs for the cyber security of SSEP functions through an ongoing evaluation of threats and vulnerabilities and implementation of each of the applied security controls provided in Appendix B or C of RG 5.71 and implement alternatives to the Appendices B and C controls during all phases of the life cycle. Additionally, SNC has established and documented procedures for screening, evaluating, mitigating, and dispositioning threat and vulnerability notifications received from credible sources. Dispositioning includes implementation of security controls to mitigate newly reported or discovered threats and vulnerabilities.

The language in Section 4.2.2 of the VEGP CSP is identical to that in Section A.4.2.2 of RG 5.71 and includes no deviations.

Based on the above review, the NRC staff finds that the security impact analysis of changes and environment described in Section 4.2.2 of the VEGP CSP is acceptable.

13.8.4.18 Security Reassessment and Authorization (Section A.4.2.3 of Appendix A to RG 5.71)

Section 4.2.3 of the VEGP CSP states that the licensee will have implemented, documented, and maintained a process that ensures that modifications to CDAs are evaluated before implementation so that security controls remain effective and that any pathway that can be exploited to compromise the modified CDA is addressed to protect CDAs and SSEP functions from cyber attacks. This section further states that the VEGP cyber security program establishes that additions and modifications are evaluated, using a proven and accepted method, before implementation to provide high assurance of adequate protection against cyber attacks, up to and including DBTs, using the process described in Section 4.1.2 of the VEGP CSP.

The licensee also commits to disseminate, review, and update the following when a CDA modification is conducted:

- *a formal, documented security assessment and authorization policy, which addresses the purpose, scope, roles, responsibilities, management commitment, coordination among entities, and compliance to reflect all modifications or additions*
- *a formal, documented procedure to facilitate the implementation of the security reassessment and authorization policy and associated controls*

The VEGP CSP does not deviate from Section A.4.2.3 of RG 5.71.

Based on the above review, the NRC staff finds that the security reassessment and authorization described in Section 4.2.3 of the VEGP CSP is acceptable.

13.8.4.19 Updating Cyber Security Practices (Section A.4.2.4 of Appendix A to RG 5.71)

Section 4.2.4 of the VEGP CSP states that the licensee reviews, updates and modifies cyber security policies, procedures, practices, existing cyber security controls, detailed descriptions of network architecture (including logical and physical diagrams), information on security devices, and any other information associated with the state of the cyber security program or the applied security controls provided in Appendices B and C to RG 5.71 and implemented alternatives to the Appendices B and C controls when changes occur to CDAs or the environment.

This information includes the following:

- *plant- and corporate-wide information on the policies, procedures, and current practices related to cyber security*
- *detailed network architectures and diagrams*
- *configuration information on security devices or CDAs*
- *new plant- or corporate-wide cyber security defensive strategies or security controls being developed and policies, procedures, practices, and technologies related to their deployment*
- *the site's physical and operational security program*
- *cyber security requirements for vendors and contractors*
- *identified potential pathways for attacks*
- *recent cyber security studies or audits (to gain insight into areas of potential vulnerabilities); and identified infrastructure support systems (e.g., electrical power; heating, ventilation, and air conditioning; communications; fire suppression) whose failure or manipulation could impact the proper functioning of CSs*

The VEGP CSP does not deviate from Section A.4.2.4 of RG 5.71.

Based on the above review, the NRC staff finds that updating of cyber security practices described in Section 4.2.4 of the VEGP CSP is acceptable

13.8.4.20 Review and Validation Testing of a Modification or Addition of a Critical Digital Asset (Section A.4.2.5 of Appendix A to RG 5.71)

The VEGP CSP Section 4.2.5 states the licensee will conduct and document the results of reviews and validation tests of each CDA modification and addition using the process described in Section 3.1.4 of the VEGP CSP.

The VEGP CSP does not deviate from Section A.4.2.5 of RG 5.71.

Based on the above review, the NRC staff finds that the Review and Validation Testing of Modifications or Additions of a Critical Digital Asset described in Section 4.2.5 of VEGP CSP is acceptable.

13.8.4.21 Application of Security Controls Associated with a Modification or Addition (Section A.4.2.6 of Appendix A to RG 5.71)

Section 4.2.6 of the VEGP CSP states that when new CDAs are introduced into the environment of VEGP, the licensee:

- *deploys the CDA into the appropriate level of the defensive model described in Section 3.1.5 of this plan;*

- *applies the technical controls identified in Appendix B to RG 5.71 and the operational and management controls described in Appendix C to RG 5.71 in a manner consistent with the process described in Section 3.1.6 of this plan*

- *confirms that the implemented operational and management controls described in Appendix C to RG 5.71, and implemented alternatives to the Appendix C controls, are effective for the CDA*

The plan also commits that when CDAs are modified, the licensee:

- *verifies that the CDA is deployed into the proper level of the defensive model described in Section 3.1.5 of this plan*

- *performs a security impact analysis, as described in Section 4.2.2 of this plan*

- *verifies that the technical controls identified in Appendix B to RG 5.71 and the operational and management controls described in Appendix C to RG 5.71 are addressed in a manner consistent with the process described in Section 3.1.6 of this plan*

- *verifies that the applied security controls discussed above are implemented effectively, consistent with the process described in Section 4.1.2 of this plan*

- *confirms that the implemented operational and management controls discussed in Appendix C to RG 5.71 and implemented alternatives to the Appendix C controls are effective for the CDA*

The VEGP CSP deviates from Section 4.2.6 of RG 5.71 by modifying the phrase "applies the technical controls identified in Appendix B to RG 5.71 in a manner consistent with the process described in Section 3.2 of RG 5.71," to read "applies the technical controls identified in Appendix B to RG 5.71 and the operational and management controls described in Appendix C to RG 5.71 in a manner consistent with the process described in Section 3.1.6 of this plan." This is consistent with RG 5.71 as the VEGP CSP commits to following the process in Section 3.1.6 of the VEGP CSP, which requires that controls are applied, an alternative that provides equivalent protection is provided, or the licensee demonstrates that the control is not necessary.

The VEGP CSP also deviates from Section A.4.2.6 of RG 5.71 with the modification of this phrase, "verifies that the security controls discussed above are implemented effectively, consistent with the process described in Section 4.1.2 of this plan" to read "verifies that the applied security controls *discussed above are implemented effectively, consistent with the process described in Section 4.1.2 of this plan."*

This deviation is consistent with the method used in RG 5.71. RG 5.71 assumes that all the controls in Appendices B and C will be applied; whereas, the VEGP CSP commits that if a control is not applied, there will be no reduction in protection as compared to the corresponding control. This method is also captured in RG 5.71 and, therefore, the VEGP CSP is consistent with RG 5.71.

Based on the above review, the NRC staff finds that the application of security controls associated with a modification or addition described in Section 4.2.6 of the VEGP CSP is acceptable.

13.8.4.22 Cyber Security Program Review (Section A.4.3 of Appendix A to RG 5.71)

Section 4.3 of the VEGP CSP states that the applicant has established the necessary measures and governing procedures to implement periodic reviews of applicable program elements, in accordance with the requirements of 10 CFR 73.55(m). Specifically, the VEGP CSP calls for a review of the program's effectiveness at least every 24 months. In addition, reviews are to be conducted as follows:

- *within 12 months following initial implementation of the program*
- *as necessary, based upon site-specific analyses, assessments, or other performance indicators*
- *as soon as reasonably practical, but no longer than 12 months after changes occur in personnel, procedures, equipment, or facilities that potentially could adversely affect cyber security*
- *by individuals independent of those personnel responsible for program management, and any individual who has direct responsibility for implementing the program*

This deviates from RG 5.71 in the specific wording, but includes the same commitments. Specifically, RG 5.71 states that the licensee reviews the program's effectiveness at least every 24 months. In addition, reviews are conducted as follows:

- *within 12 months of the initial implementation of the program*
- *within 12 months of a change to personnel, procedures, equipment, or facilities that potentially could adversely affect security*
- *as necessary based upon site-specific analyses, assessments, or other performance indicators*

- *by individuals independent of those personnel responsible for program implementation and management*

Based on the above review, the NRC staff finds that the cyber security program review described in Section 4.3 of the VEGP CSP is acceptable.

13.8.4.23 Document Control and Records Retention and Handling (Section A.5 of Appendix A to RG 5.71)

Section 5 of the VEGP CSP states the necessary measures and governing procedures to ensure that sufficient records of items and activities affecting cyber security are developed, reviewed, approved, issued, used, and revised to reflect completed work. VEGP will retain records and supporting technical documentation required to satisfy the requirements of 10 CFR 73.54 and 10 CFR 73.55, "Requirements for Physical Protection of Licensed Activities in Nuclear Power Reactors against Radiological Sabotage," until the NRC terminates the facility's operating license. Records are retained to document access history, as well as to discover the source of cyber attacks or other security-related incidents affecting CDAs or SSEP functions, or both. VEGP Units 3 and 4 will retain superseded portions of these records for at least three years after the record is superseded, unless otherwise specified by the NRC.

This deviates from RG 5.71 by not specifically detailing the types of records, but instead describes that records will be retained to document access history and information needed to discover the source of cyber attacks and incidents. This is consistent with what is included in RG 5.71, Section 5, and includes all the performance-based characteristics and commitments of that section.

Based on the above review, the NRC staff finds that the document control and records retention handling described in Section 5 of the VEGP CSP is acceptable.

13.8.4.24 Deviations Taken to RG 5.71, Sections C.1 Through C.5

The VEGP CSP states that the plan deviates from Regulatory Positions C.1 through C.5 of RG 5.71, as noted in Attachment A to the CSP. It also deviates from Section A.1 of Appendix A of RG 5.71. For that reason, the staff considers that the full evaluation of the CSP must include a review of the deviations taken to those sections of RG 5.71 as listed in the VEGP CSP. This section of the SER lists those 69 specific deviations and their evaluated security impact. The following deviations were provided in a table, as part of Attachment A to the CSP.

13.8.4.24.1 RG 5.71, Section C.2, fourth paragraph, first sentence (page 8)

SNC added the term "adequately" to the phrase "…systems and equipment are protected from cyber attack." Since 10 CFR 73.54 specifically makes that same statement, the staff found no reason to object to that clarification. The objective is to provide adequate protection to the identified CDAs.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.2 RG 5.71, Section C.2, fourth paragraph, twelfth bullet, third sub-bullet (page 8)

SNC clarifies that its overall design is based on the Westinghouse AP1000 design and states that the AP1000 DCD commits to Revision 1 of RG 1.152, "Criteria for Digital Computers in Safety Systems of Nuclear Power Plants." Since the applicant is required to have a cyber security program that meets the performance objectives outlined in 10 CFR 73.54 and is not obliged to achieve that requirement exclusively through the example provided by RG 5.71, this clarification, in and of itself, was not considered by the staff as deviating from the requirements established by the rule,

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.3 RG 5.71, Section C.2, fifteenth bullet (page 8)

The deviation states that the required policies and procedures have not yet been written, reviewed, and approved, and, thus, are not currently available for inspection and review.

The NRC requires that these policies and procedures be completed and available for review by the completion of the CSP implementation schedule proposed by the applicant, since CSP inspections would not occur until that time. The requirements of 10 CFR 73.55(a)(4) and proposed License Condition 6 provide the necessary controls associated with developing the required policies and procedures of the CSP.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.4 RG 5.71, Section C.3, Figure 1 (Page 10)

The deviation changes the arrows on the left side of Figure 1 from "Continuous Monitoring" to "Ongoing Monitoring."

The NRC intended monitoring to occur periodically, and when required, based on certain inputs into the process. SNC states that "continuous" might imply that monitoring was perpetual and not event driven. This was not the staff's intent with the term "continuous." The staff accepts the use of the term "ongoing" to better reflect the intent of this diagram.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.5 RG 5.71, Section C.3, third paragraph, first sentence (Page 10)

The VEGP CSP changes the statement, "An acceptable method to establish a cyber security program at a facility is by performing the following, (1) analyze the digital computer and communication systems and networks, …" to "An acceptable method to establish a cyber security program at a facility is by performing the following: (1) identify critical systems and critical digital assets as described in Section C.3.1.3, (2) analyze the digital computer and communication systems and networks..."

This deviation is acceptable because SNC proposes to use its licensing basis to identify CSs that are associated with SSEP functions, as 10 CFR 73.54 requires. This statement includes the first step in RG 5.71 to analyze digital computer and communication systems and networks to determine if they include CDAs.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.6 RG 5.71, Section C.3.1, first paragraph, first sentence (page 11)

The VEGP CSP changes the statement, "Consistent with the requirements of 10 CFR 73.54(b)(1), a licensee must conduct a site-specific analysis of digital computer and communication systems and networks to identify CDAs, which are those assets that, if compromised, could adversely impact the SSEP functions of nuclear facilities." to "Consistent with the requirements of 10 CFR 73.54(b)(1), a licensee must conduct a site-specific analysis of digital computer and communication systems and networks to identify CDAs, which are those assets that, if compromised, could adversely impact the CSs of nuclear facilities."

SNC defines a CS as:

> *An analog or digital technology-based system in or outside of the plant that performs or is associated with a safety-related, important-to-safety, security, or emergency preparedness function. These critical systems include, but are not limited to, plant systems, equipment, communication systems, networks, offsite communications, or support systems or equipment, that perform or are associated with a safety-related, important-to-safety, security, or emergency preparedness function as defined by the approved plant licensing basis.*

This definition ties CSs to SSEP functions; therefore, the change is consistent with the method used in RG 5.71, as this means that CSs are all those assets associated with SSEP functions, and, therefore, could adversely impact those SSEP functions.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.7 RG 5.71, Section C.3.1, first paragraph, second bullet (page 11)

The VEGP CSP includes a deviation to correct an editorial omission in RG 5.71. Page 11 of RG 5.71 states that:

An acceptable method for identifying and documenting CDAs is as follows:

- *obtain authorization for security assessment*
- *define roles and responsibilities cyber personnel and form the cyber security team*
- *identify and document CDAs at the facility*
- *review and validate configurations of CDAs*

The VEGP CSP corrects the second bullet to read:

- *define roles and responsibilities of cyber personnel and form the cyber security team*

This deviation which supplies the omitted "of" is consistent with the intent of the referenced bullet.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.8 RG 5.71, Section C.3.1.2, third paragraph, second bullet (page 13)

The VEGP CSP changes the second bullet on Page 13 of RG 5.71 from:

> *documenting all key observations, analyses, and findings during the assessment process so that this information can be used as a basis for applying security controls;*

to:

> *documenting all key observations, analyses, and findings during the assessment process so that this information can be used as a basis for addressing security controls;*

This deviation is acceptable because RG 5.71 allows a licensee to address, as opposed to apply, security controls if it follows the process in Appendix A, Section 3.1.6 of RG 5.71, which is to apply the control, apply an alternative that provides no less protection than the corresponding security control, or to demonstrate that the control is not necessary because the attack vector, root cause, or vulnerability associated with the control does not exist.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.9 RG 5.71, Section C.3.1.2, third paragraph, sixth bullet (page 13)

The VEGP CSP changes the sixth bullet on Page 13 from:

- *preparing documentation and overseeing implementation of the cyber security controls provided in Appendices B and C to this guide, documenting the basis for not implementing certain cyber security controls provided in Appendix B, or documenting the basis for the implementation of alternate or compensating measures in lieu of any cyber security controls provided in Appendix B; and*

to:

- *overseeing documentation and implementation of the cyber security controls provided in Appendices B and C to this guide, documenting the basis for not implementing certain cyber security controls provided in Appendix B and C, or documenting the basis for the implementation of alternate or compensating measures in lieu of any cyber security controls provided in Appendix B and C; and*

This deviation is acceptable because overseeing the documentation and implementation of security controls by qualified personnel is an approved method. Further, the extension of this method in Appendix C is also acceptable as the licensee has committed to follow the process in Appendix A, Section 3.1.6 of RG 5.71.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.10 RG 5.71, Section C.3.1.2, third paragraph, seventh bullet (page 13)

The VEGP CSP includes a deviation from RG 5.71 that changes bullet 7 from:

> *assuring the retention of all assessment documentation, including notes and supporting information, in accordance with 10 CFR 73.54(h) and the record retention and handling requirements specified in Section C.5 of this guide.*

to:

> *establishing the retention policy of all assessment documentation, including notes and supporting information, in accordance with 10 CFR 73.54(h) and the record retention and handling requirements specified in Section C.5 of this guide.*

This deviation is acceptable as the licensee has committed to establish the retention policy. Although this may be done by a different team, and not the CST, it is consistent with the intent of RG 5.71.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.11 RG 5.71, Section C.3.1.2, fourth paragraph, first sentence (page 13)

The VEGP CSP deviates from RG 5.71 by changing this sentence:

> *The licensee's CST needs to have the authority to conduct an objective assessment, make determinations that are not constrained by operational goals (e.g., cost),*

to:

> *The licensee's CST needs to have the authority to conduct an objective assessment, make determinations that are not constrained by business goals (e.g., cost),*

This deviation is acceptable because the intent of this statement in RG 5.71 is to ensure that cost is not used as a factor in making determinations about the adequacy of security controls, vulnerabilities, identifying CSs and CDAs, and carrying out other assessment functions of the CST.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.12 RG 5.71, Section C.3.1.3, second paragraph (page 14)

The VEGP CSP deviates from RG 5.71 by changing the identification process from CDAs to CSs. This deviation is acceptable because the VEGP CSP commits to continue identifying CSs by identifying digital computers, networks, communication systems and support systems that perform and are associated with SSEP functions, as well as support systems and equipment that, if compromised, would adversely impact the plant's SSEP functions.

This is consistent with the process in RG 5.71, which identifies CDAs through the same process. The licensee further describes CDAs as a CS or part of a CS; therefore, the use of the term CS as opposed to CDA is also consistent with the method used in RG 5.71.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.13 RG 5.71, Section C.3.1.3, fifth paragraph, first sentence (page 15)

The VEGP CSP deviates from RG 5.71 by making an editorial correction to RG 5.71. This involves changing:

> *With the identification of the all the CSs ...*

to:

> *With the identification of all the CSs ...*

This change is acceptable because it accomplishes the intent of this phrase in RG 5.71 eliminating the unnecessary "the."

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.14 RG 5.71, Section C.3.1.3, fifth paragraph, second sentence (page 15)

The VEGP CSP deviates from RG 5.71 by changing the following statement from:

> *A CDA may be a component of a CS ...*

to:

> *A CDA may be a complete CS or component of a CS, ...*

This deviation is acceptable because this statement is factually true. A CDA may be a complete CS and the deviation does not change the level of protection provided by the method outlined in RG 5.71.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.15 RG 5.71, Section C.3.1.3, fifth paragraph, fifth sentence (page 15)

The VEGP CSP deviates from RG 5.71 by including additional documentation to help identify CSs and CDAs. Specifically VEGP includes "other licensing basis" documents to identify CSs and CDAs.

This deviation is in line with the intent of using existing documentation to identify CSs and CDAs. This section of RG 5.71 describes "helpful information sources for identifying CSs and CDAs" and is not an exhaustive list, nor is it the only method SNC has committed to use to identify CSs and CDAs. Specifically, SNC has committed to identify all digital computers, networks and communication systems associated with SSEP functions, which is what 10 CFR 73.54 requires.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.16 RG 5.71, Section C.3.1.3, eighth paragraph, first bullet (page 16)

The VEGP CSP deviates from RG 5.71 by stating that CDAs may be an entire CS. As previously discussed in Section 13.8.4.24.14 of this SER, it is true that a CDA may be an entire CS; therefore, this definition does not adversely impact either the method used in RG 5.71 or the protection that RG 5.71 provides.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.17 RG 5.71, Section C.3.1.3, eighth paragraph, second bullet (page 16)

The VEGP CSP deviates from RG 5.71 by stating that CDAs may be an entire CS. As previously discussed in Sections 13.8.4.24.14 and 13.8.4.24.16 of this SER, it is true that a CDA may be an entire CS; therefore, this definition does not adversely impact either the method used in RG 5.71 or the protection that RG 5.71 provides.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.18 RG 5.71, Section C.3.2, first paragraph, first sentence (page 18)

The VEGP CSP deviates from RG 5.71 by providing an editorial correction to RG 5.71. Specifically, the VEGP CSP changes the following sentence from:

> *As stated in 10 CFR 73.54(c)(2), the licensee must design its cyber security program to apply and maintain integrate defense-in-depth protective strategies to ensure the capability to detect, prevent, respond to, mitigate, and recover from cyber attacks.*

to:

> *As stated in 10 CFR 73.54(c)(2), the licensee must design its cyber security program to apply and maintain integrated defense-in-depth protective strategies to ensure the capability to detect, prevent, respond to, mitigate, and recover from cyber attacks.*

This deviation captures the intent of this sentence in RG 5.71 by correcting "integrate" to "integrated."

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.19 RG 5.71, Section C.3.2, second paragraph, fourth sentence (page 18)

The VEGP CSP deviates from RG 5.71 by pointing to an editorial error in RG 5.71. Specifically, the VEGP CSP changes the following sentence from:

> *Therefore, defense-in-depth is achieved not only by implementing multiple security boundaries, but also by instituting and maintaining a robust program of security controls that assess, protect, respond, prevent, detect, and mitigates an attack on a CDA and with recovery.*

to:

> *Therefore, defense-in-depth is achieved not only by implementing multiple security boundaries, but also by instituting and maintaining a robust program of security controls that assess, protect, respond, prevent, detect, and mitigate an attack on a CDA and with recovery.*

This deviation captures the intent of this sentence in RG 5.71 by correcting "mitigates" to "mitigate." Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.20 RG 5.71, Section C.3.2, third paragraph, first sentence (page 18)

The VEGP CSP deviates from RG 5.71 by pointing to an editorial error in RG 5.71. Specifically, the VEGP CSP changes the following sentence from:

> *For example, if a failure in prevention were to occur (e.g., a violation of policy) or if protection mechanisms were to be bypassed (e.g., by a new virus that is not yet identified as a cyber attack), mechanisms would still in place to detect and respond to an unauthorized alteration in an impacted CDA, mitigate the impacts of this alteration, and recover normal operations of the impacted CDA before an adverse impact.*

to:

> *For example, if a failure in prevention were to occur (e.g., a violation of policy) or if protection mechanisms were to be bypassed (e.g., by a new virus that is not yet identified as a cyber attack), mechanisms would still be in place to detect and respond to an unauthorized alteration in an impacted CDA, mitigate the impacts of this alteration, and recover normal operations of the impacted CDA before an adverse impact.*

This is acceptable because the change to add the word "be" to the phrase "would still be in place to detect" captures the intent of this sentence by supplying the "be" omitted from RG 5.71.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.21 RG 5.71, Section C.3.2.1, Figure 5 (Page 19)

The VEGP CSP includes a defensive architecture, which deviates from the example provided in RG 5.71. The proposed architecture is acceptable because it provides defense-in-depth, communication isolation for safety and security systems, and multiple nondeterministic boundaries for nonsafety/nonsecurity CDAs. This provides adequate protection for CDAs and ensures that appropriate isolation and boundary protection exists for all CDAs where appropriate.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.22 RG 5.71, Section C.3.2.1, third paragraph (page 19)

The VEGP CSP deviates from RG 5.71 by modifying the characteristics of an acceptable defensive architecture by stating that the architecture includes CSs and CDAs configured in accordance with Section 5 of Appendix B, and Sections 6 and 7 of Appendix C in accordance with the security control application process described in Section 3.3. As previously discussed in Section 13.8.4.24.9 of this SER, the use of the security control application process to address controls is consistent with RG 5.71.

SNC has committed to apply the security control, demonstrate that alternative controls provide no less protection than the corresponding control, or demonstrate through analysis that the attack vector the control addresses does not exist; therefore, the control is not necessary.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.23 RG 5.71, Section C.3.2.1, third paragraph, first bullet (page 19)

The VEGP CSP deviates from RG 5.71 by modifying the example defensive architecture to match the architecture to be used in the AP1000. This deviation is acceptable because it provides the appropriate isolation of safety and security CDAs, and adequate boundaries for nonsafety/nonsecurity CDAs.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.24 RG 5.71, Section C.3.2.1, third paragraph, second bullet (page 19)

The VEGP CSP deviates from RG 5.71 by modifying the example defensive architecture to match the architecture to be used in the AP1000. As previously discussed in Section 13.8.4.6, this deviation is acceptable because it provides the appropriate isolation of safety and security CDAs, and adequate boundaries for nonsafety/nonsecurity CDAs. This is consistent with the defensive model in RG 5.71, as the VEGP defensive architecture provides boundaries for safety systems that are deterministic.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.25 RG 5.71, Section C.3.2.1, third paragraph, third bullet (page 19)

The VEGP CSP deviates from RG 5.71 regarding communications from digital assets at lower security levels to digital assets at higher security levels. This deviation is acceptable because the defensive architecture prevents specific *communication from lower security levels to specific higher security levels. This is consistent with the defensive model in RG 5.71.*

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.26 RG 5.71, Section C.3.2.1, third paragraph, new second bullet (page 19)

The VEGP CSP deviates from RG 5.71 regarding remote access. This is consistent with the guidance in Section C.7 of RG 5.71, which also states that remote access to CDAs at the highest level be prevented.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.27 RG 5.71, Section C.3.2.1, third paragraph, new sixth bullet (page 19)

The VEGP CSP deviates from RG 5.71 by including in its defensive architecture a statement from Section C.7 of RG 5.71 for validating data (software updates, new firmware, etc.) using a method at or above the level of security the CDA that will have data transferred to it. This concept is already acceptable in RG 5.71 and is also included in the defensive architecture, although in a different section of the document. This is consistent with the method used in RG 5.71 and does not adversely impact the protection provided.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable

13.8.4.24.28 RG 5.71, Section C.3.2.1, third paragraph, seventh bullet (page 19)

The VEGP CSP deviates from RG 5.71 by changing the commitment to eliminate applications, services and protocols not necessary to support the design-basis function of the CDAs to eliminate, disable, or render these inoperable. This is consistent with the method in RG 5.71, because in some cases these elements cannot be eliminated, but rather may have to be disabled or otherwise rendered inoperable. In each case, the result is the same. The asset is only configured to perform its design-based function and nothing more, which produces no less protection than the method in RG 5.71.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable. RG 5.71, Section C.3.2.1, third paragraph, new sixth bullet (page 19)

13.8.4.24.29 RG 5.71, Section C.3.2.1, third paragraph, eighth bullet (page 19)

The VEGP CSP deviates from RG 5.71 by eliminating the requirement to configure CDAs and boundary protection systems in accordance with Section 5 of Appendix B and Sections 6 and 7 of Appendix C. However, the VEGP CSP does commit to this in the preamble statement as described in

Section 13.8.4.24.22 of this SER. Therefore, the VEGP CSP provides the same commitment to perform this as does RG 5.71, albeit in a different part of the same section.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.30 RG 5.71, Section C.3.2.1, fourth paragraph (page 19

The VEGP CSP deviates from RG 5.71 by deleting the paragraph that commits to applying the security controls. However, the VEGP security plan commits, in Section 3.1.6, to address these controls and is, therefore, consistent with the method used in RG 5.71. The deleted paragraph is, therefore, unnecessary in the VEGP CSP to achieve the same commitment.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.31 RG 5.71, Section C.3.2.1, Prior to fifth paragraph (page 19)

The VEGP CSP deviates from the RG 5.71 defensive architecture. The VEGP architecture is described in Section 13.8.4.6 of this SER.

Based on the review and assessment in Section 13.8.4.6, the NRC staff finds that this deviation is acceptable.

13.8.4.24.32 RG 5.71, Section C.3.3, first paragraph, second sentence (page 20)

The VEGP CSP deviates from RG 5.71 by changing the following sentence:

> *A cyber compromise of CDAs would adversely impact nuclear facilities' SSEP functions that are necessary for protecting public health and safety.*

to:

> *A cyber compromise of CDAs could adversely impact nuclear facilities' SSEP functions that are necessary for protecting public health and safety.*

This deviation is consistent with the intent of RG 5.71, which implies that a compromise could lead to adverse impact and possible radiological sabotage. The intent of the paragraph is to establish the impact that could occur if a CDA were compromised. The security controls are designed around worst case scenarios, and the change in the VEGP CSP from "would" to "could" maintains this logic.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.33 RG 5.71, Section C.3.3, third paragraph, fourth sentence (page 20)

The VEGP CSP deviates from RG 5.71 by making an editorial correction to RG 5.71. This involves changing the statement:

> *Thus to provide high assurance that CDAs are protected from cyber attacks, potential cyber risks of these CDAs must be addressed known potential cyber risks.*

to:

> *Thus to provide high assurance that CDAs are protected from cyber attacks, potential cyber risks of these CDAs must be addressed for known potential cyber risks.*

This is acceptable because the change captures the intent of this sentence by supplying the "for" omitted from RG 5.71.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.34 RG 5.71, Section C.3.3, third paragraph, first sentence (page 20)

The VEGP CSP deviates from RG 5.71 by adding Appendix C to the list of controls that may be addressed using the method in Section 3.1.6 of Appendix A. This is consistent with the intent of RG 5.71, which assumes that all the controls in Appendix C can be implemented as written. However, if the controls can be addressed to demonstrate that an alternative control provides no less protection than the comparable control in Appendix C, or that the control is not necessary by demonstrating that the attack vector does not exist, this would meet the intent of RG 5.71.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.35 RG 5.71, Section C.3.3, third paragraph, first bullet (page 20)

The VEGP CSP deviates from RG 5.71 by adding Appendix C to the list of controls that may be addressed using the method in Section 3.1.6 of Appendix A. This is consistent with the intent of RG 5.71, which assumes that all the controls in Appendix C can be implemented as written. However, if the controls can be addressed to demonstrate that an alternative control provides no less protection than the comparable control in Appendix C, or that the control is not necessary by demonstrating that the attack vector does not exist, this would meet the intent of RG 5.71.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.36 RG 5.71, Section C.3.3, third paragraph, second bullet (page 20)

The VEGP CSP deviates from RG 5.71 by stating that alternative controls will not provide equal or better protection to the corresponding control, but rather that they will not provide less protection than the corresponding control. This is consistent with the method used in RG 5.71; providing an alternative that does not provide less protection, and does not adversely impact the security program. Therefore, this change in commitment will provide an adequate level of protection and is consistent with the method used in RG 5.71.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.37 RG 5.71, Section C.3.3, third paragraph, second bullet, second sub-bullet (page 20)

The VEGP CSP deviates from RG 5.71 by changing the statement:

> *performing and documenting the attack vector and attack tree analyses of the CDA and alternative countermeasures to confirm that the countermeasures provide the same or greater protection as the corresponding security control in Appendix B.*

to:

> *performing and documenting an attack vector and attack tree analysis of the CDA and alternative countermeasures to confirm countermeasures provide no decrease in the effectiveness of protection as compared to the corresponding security control identified in Appendix B or C.*

This deviation is acceptable because whether the licensee performs a single analysis or multiple analyses, the method is comparable provided that it will demonstrate that there is no decrease in protection. Further, the modification of the second part of the sentence is also acceptable because the intent of this method in RG 5.71 is to ensure that alternative controls do not provide less protection than the corresponding control. Therefore, a commitment to ensure that alternatives do not provide less protection produces a comparable level of protection as stating that the alternatives provide equal or better protection. Finally, the addition of the Appendix C controls to this method is acceptable because the licensee has committed to apply the control, apply an alternative that provides no less protection than the comparable control or not to apply the control and demonstrate that the attack vector does not exist.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.38 RG 5.71, Section C.3.3, third paragraph, second bullet, third sub-bullet (page 20)

The VEGP CSP deviates from RG 5.71 in a similar manner to deviations in Section 13.8.4.24.37 of this SER by changing the commitment to implement alternative countermeasures that provide at least the same degree of protection as the corresponding security control in Appendix B, to implementing alternative controls to provide no decrease in the effectiveness of protection as compared to the corresponding security control identified in Appendices B and C of RG 5.71.

This method is consistent with the method in RG 5.71 as it also meets the criteria for the performance based characteristics of 10 CFR 73.54. As long as the implemented alternative control does not provide less protection than the corresponding control in RG 5.71, the intent of this section of RG 5.71 has been met. Alternative controls are considered to be adequate only if they provide equivalent protection, and the VEGP CSP commits to that minimum standard.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.39 RG 5.71, Section C.3.3, third paragraph, third bullet (page 20)

The VEGP CSP deviates from RG 5.71 by not stating that SNC will specifically perform an attack vector and attack tree analysis to demonstrate that one of the specific security controls is not necessary. SNC does commit to performing an analysis to demonstrate that the attack vector does not exist (i.e., is not applicable), thereby obviating the need for a specific security control.

This method is consistent with the method in RG 5.71 as it commits to demonstrating a conclusion, specifically, that the attack vector does not exist. If the licensee can demonstrate this, and not use an attack vector or attack tree analysis, the results are still the same and, therefore, the method would produce a result that does not provide less protection than the method in RG 5.71.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.40 RG 5.71, Section C.3.3, fourth paragraph, second sentence (page 20)

The VEGP CSP deviates from RG 5.71 by making an editorial correction to RG 5.71. This involves changing the statement:

> *When a security control is determined to have an adverse affect, alternate controls should be used by the licensee to protect the CDA from cyber attack up to and including the DBT consistent with the process described above.*

to:

> *When a security control is determined to have an adverse effect, alternate controls should be used by the licensee to protect the CDA from cyber attack up to and including the DBT consistent with the process described above.*

This is acceptable because the change captures the intent of this sentence in RG 5.71, by correcting "affect" to "effect."

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.41 RG 5.71, Section C.3.3, fifth paragraph, second sentence (page 21)

The VEGP CSP deviates from RG 5.71 by making an editorial correction to RG 5.71. This involves changing the statement:

> *If these effectiveness or vulnerability analyses identify a gap in the cyber security program, the licensee may need to implement additional security measures and controls not provided in Appendixes B and C.*

to:

> *If these effectiveness or vulnerability analyses identify a gap in the cyber security program, the licensee may need to implement additional security measures and controls not provided in Appendices B and C.*

This change is acceptable because it captures the intent of this sentence in RG 5.71, by correcting "Appendixes" to "Appendices."

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.42 RG 5.71, Sections C.3.3.1.1 through C.3.3.1.5, first paragraph and last bullet (pages 21 and 22)

The VEGP CSP deviates from RG 5.71 by stating that it will not apply all of the security controls in RG 5.71, but rather will address them. The VEGP CSP already commits to the RG 5.71 process, which is:

a) applying controls;

b) applying an alternative control that does not provide less protection than the corresponding control; or

c) not applying a control, but demonstrating that the corresponding attack vector does not exist.

The intent of RG 5.71 is to address the controls in Appendices B and C. This can be accomplished in accordance with Section 3.1.6 of Appendix A, to which SNC has committed.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.43 RG 5.71, Section C.3.3.1.1, first paragraph, second bullet, fourth sub-bullet (page 21)

The VEGP CSP deviates from RG 5.71 by committing to audit CDAs at an interval defined for the CDA, or within 5 days following revocation of an individual's unescorted access, due to a lack of trustworthiness or reliability, or as soon as reasonably practical upon changes in personnel. Although this method uses a different frequency than the method in RG 5.71, which calls for annual assessments, or assessments immediately upon changes in personnel, this frequency does meet the requirements of 10 CFR 73.55(m), which allows the licensee to define these intervals based on its own assessments of need.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.44 RG 5.71, Sections C.3.3.2.1 through C.3.3.2.5, first paragraph and last bullet (pages 23 and 24)

The VEGP CSP deviates from RG 5.71 in a fashion similar to the deviation cited in Section 13.8.4.24.42 of this SER by committing not to apply the controls, but rather to address them. As previously stated, this deviation is consistent with the method in RG 5.71, and also meets the intent of the RG, provided that the licensee follows the process in Section 3.1.6 of Appendix A, to which SNC has committed.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.45 RG 5.71, Sections C.3.3.2.6 through C.3.3.2.9, first paragraph and last bullet (pages 24-26)

The VEGP CSP deviates from RG 5.71 in a fashion similar to the deviation cited in Sections 13.8.4.24.42 and 13.8.4.24.44 of this SER by committing to apply the controls, but rather to address them. As previously stated, this deviation is consistent with the method in RG 5.71, and also meets the intent of the RG, provided that the licensee follows the process in Section 3.1.6 of Appendix A, to which SNC has committed.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.46 RG 5.71, Section C.3.3.2.9, first paragraph, first bullet (page 25)

The VEGP CSP deviates from RG 5.71 by making an editorial correction to RG 5.71. This involves changing the first bullet:

- *develop, disseminate, and annually review and update the configuration management policy and program which defines the purpose of the nuclear facility's configuration management policy, scope, roles, requirements, responsibilities, and management commitments necessary to provide, with high assurance, that (1) when a modification to a CDA does not reduce the existing security and (2) any unauthorized or inadvertent modification of a CDA is prevented.*

to:

- *develop, disseminate, and annually review and update the configuration management policy and program which defines the purpose of the nuclear facility's configuration management policy, scope, roles, requirements, responsibilities, and management commitments necessary to provide, with high assurance, that (1) a modification to a CDA does not reduce the existing security and (2) any unauthorized or inadvertent modification of a CDA is prevented.*

This is acceptable because it captures the intent of this sentence in RG 5.71, by striking the word "when" after "(1)." This editorial mistake will be corrected in a future revision.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.47 RG 5.71, Section C.3.3.3.1, first paragraph and last bullet (page 26)

The VEGP CSP deviates from RG 5.71 in a fashion similar to the deviations cited in Sections 13.8.4.24.42, 13.8.4.24.44 and 13.8.4.24.45 of this SER, and by committing not to apply the controls, but rather to address them. As previously stated, this deviation is consistent with the method in RG 5.71, and also meets the intent of RG 5.71, provided that the licensee follows the process in Section 3.1.6 of Appendix A, to which SNC has committed.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.48 RG 5.71, Section C.3.3.3.1, second paragraph (page 26)

The VEGP CSP deviates from RG 5.71 by committing to Revision 1 of RG 1.152 and not Revision 2 of RG 1.152 as stated in RG 5.71. The results of the NRC *staff's technical evaluation of the digital instrumentation and controls design of the AP1000 are documented in Chapter 7 of NUREG-1793 and its supplements. SNC's use of the defensive architecture as discussed in Section 13.8.4.6 is acceptable to the staff.*

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.49 RG 5.71, Section C.3.3.3.2, first paragraph, second sentence (page 26)

The VEGP CSP deviates from RG 5.71 by committing to provide adequate protection of high assurance against cyber attacks. Although this commitment is worded differently than the commitment provided in RG 5.71, it does meet the requirement of 10 CFR 73.54(a), which states that licensees "shall provide high assurance that digital computer and communication systems and networks are adequately protected against cyber attacks, up to and including the design basis threat as described in 10 CFR 73.1."

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.50 RG 5.71, Section C.3.4, second paragraph, first sentence (page 26)

The VEGP CSP deviates from RG 5.71 as described in Section 13.8.4.8 of this SER by committing not to integrate management of physical and cyber security, but rather to provide the management interfaces necessary to appropriately coordinate the physical and cyber security activities. The VEGP CSP includes a commitment to establish an organization that is responsible for cyber security and is independent of operations. The combination of an independent organization responsible for cyber security, and management coordination between physical and cyber security meets the requirements of the rule and does not provide less protection than the method described in RG 5.71.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.51 RG 5.71, Section C.3.4, second paragraph, first bullet (page 27)

The VEGP CSP deviates from RG 5.71 as also described in Section 13.8.4.8 of this SER by committing not to form a unified security organization, but rather to establish a cyber security organization that is responsible for cyber security and is independent from operations. The combination of an independent organization responsible for cyber security, and management coordination as described in Section 13.8.4.24.50 of this SER between physical and cyber security meets the requirements of the rule, and does not provide less protection than the method described in RG 5.71.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.52 RG 5.71, Section C.4, first paragraph, first sentence (page 27)

The VEGP CSP deviates from RG 5.71 by changing the phrase:

> *Once the security program is in place...*

to:

> *Once the cyber security program is in place...*

This deviation is acceptable because the CSP only applies to the applicant's cyber security program.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.53 RG 5.71, Section C.4, first paragraph, first bullet (page 28)

The VEGP CSP deviates from RG 5.71 as previously described in Section 13.8.4.11 of this SER by changing the phrase "continuous monitoring and assessment" to "ongoing monitoring and assessment." This description is consistent with the method in RG 5.71 by establishing intervals for these assessments, which include the same elements as in RG 5.71, and meeting the periodicity requirements of 10 CFR 73.55(m).

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.54 RG 5.71, Section C.4.1, section heading and first paragraph, first sentence (page 28)

The VEGP CSP deviates from RG 5.71 as previously described in Sections 13.8.4.11 and 13.8.4.24.53 of this SER by changing the phrase "continuous monitoring and assessment" to "ongoing monitoring and assessment." This description is consistent with the method in RG 5.71 by establishing intervals for these assessments, which include the same elements in RG 5.71 and meeting the periodicity requirements of 10 CFR 73.55(m).

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.55 RG 5.71, Section C.4.1, second paragraph, first sentence (page 28)

The VEGP CSP deviates from RG 5.71 as previously described in Sections 13.8.4.11, 13.8.4.24.53 and 13.8.4.24.54 of this SER by changing the phrase "continuous monitoring and assessment" to "ongoing monitoring and assessment." This description is consistent with the method in RG 5.71 by establishing intervals for these assessments, which include the same elements as in RG 5.71 and meeting the periodicity requirements of 10 CFR 73.55(m).

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.56 RG 5.71, Section C.4.1, second paragraph, first bullet (page 28)

The VEGP CSP deviates from RG 5.71 by making an editorial correction to RG 5.71. This involves changing the phrase:

> *ongoing assessments of verify that the security controls...*

to:

> *ongoing assessments to verify that the security controls."*

This change is acceptable because it captures the intent of this sentence in RG 5.71, by substituting "to" for "of."

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.57 RG 5.71, Section C.4.1, third paragraph, first and second sentences (page 28)

The VEGP CSP deviates from RG 5.71 as previously described in Sections 13.8.4.11, 13.8.4.24.53, 13.8.4.24.54 and 13.8.4.24.55 of this SER by changing the phrase "continuous monitoring and assessment" to "ongoing monitoring and assessment." This description is consistent with the method in RG 5.71 by establishing intervals for these assessments, which include the same elements as in RG 5.71, and meeting the periodicity requirements of 10 CFR 73.55(m).

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.58 RG 5.71, Section C.4.1.1, first paragraph, second sentence (page 28)

Section 3.1.1 of the VEGP CSP states that status of security controls will be verified in accordance with the requirements of 10 CFR 73.55(m).

The NRC staff reviewed the above and found that reviewing security controls in accordance with 10 CFR 73.55(m) is in accordance with RG 5.71. The time period between evaluations may be longer than the time period provided in RG 5.71. However, this period cannot exceed 24 months, which conforms to 10 CFR 73.54(g), requiring the applicant to review the cyber security program as a component of the physical security program in accordance with the requirements of 10 CFR 73.55(m), including the periodicity requirements. The requirements of 10 CFR 73.55(m) are that, at minimum, the applicant review each element of the physical protection program at least every 24 months.

The licensee has also committed to address C.13 of Appendix C to RG 5.71, "Security Assessment and Risk Management," which calls for vulnerability assessments on a quarterly basis. SNC commits to apply this control, apply an alternative that provides no less protection than C.13, or demonstrate that any attack vectors associated with vulnerabilities that may be discovered through quarterly assessments do not exist. The VEGP CSP also includes addressing controls that specifically include defined verification periods and that detect when some controls are not working correctly.

This, coupled with the CSP conforming to requirements of 10 CFR 73.55(m), which includes an initial assessment within 12 months of the program inception, and as necessary based on site-specific analyses, assessments, or other performance indicators, provides a level of protection consistent with the method in RG 5.71.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.59 RG 5.71, Section C.4.1.2, first paragraph, third sentence (page 29)

Section 3.1.1 of the VEGP CSP states that effectiveness of security controls will be verified in accordance with the requirements of 10 CFR 73.55(m). As previously discussed in Section 13.8.4.12 of this SER, the NRC staff reviewed the above and found that the period of effectiveness analysis is comparable with that of RG 5.71.

The time period between evaluations is 12 months longer than the time period provided in RG 5.71. However, this 24-month time period conforms to 10 CFR 73.54(g) requiring the applicant to review the cyber security program as a component of the physical security program in accordance with the requirements of 10 CFR 73.55(m), including the periodicity requirements. The requirements of 10 CFR 73.55(m) are that, at minimum, the applicant review each element of the physical protection program, which includes the cyber security program, at least every 24 months and within 12 months of the implementation of the program, or within 12 months when changes that may adversely impact the security program occur.

Furthermore, the VEGP CSP states that controls will be reviewed according to the requirements of the security controls if that period of review occurs more often. This is also consistent with the method provided in RG 5.71.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.60 RG 5.71, Section C.4.1.3, first paragraph, second sentence (page 29)

VEGP CSP Section 4.1.3 deviates from RG 5.71 by stating that vulnerability assessments will occur periodically. RG 5.71, Section C.4.1.3 states that vulnerability assessments will occur no less frequently than on a quarterly basis.

As previously described in Section 13.8.4.14 of this SER, the VEGP CSP states vulnerability assessments will be performed as specified in the security controls in Appendices B and C of RG 5.71, and when new vulnerabilities that could affect the effectiveness of the cyber security program and the security of the CDAs are identified. The licensee also commits to addressing vulnerabilities that could cause CDAs to become compromised or could have an adverse impact on SSEP functions. Section 13.1 of Appendix C of RG 5.71, which VEGP commits to address in accordance with the process in Section 3.1.6 of Appendix A, provides that vulnerability assessments should occur no less frequently than once a quarter, at random intervals, and when new potential vulnerabilities are reported and identified. SNC has not deviated from the interval.

The process the applicant has committed to in Section 3.1.6 of the VEGP CSP requires SNC, if it does not implement Section 13.1 of Appendix C, to implement an alternate control that does not provide less protection than the corresponding control in Appendices B and C, or to demonstrate that any attack vectors associated with vulnerabilities that may be discovered through quarterly assessments do not exist.

Therefore, if SNC does not implement the security control in Appendix C, Section 13.1 of RG 5.71, or deviates from the guidance for a quarterly vulnerability assessment, it will ensure that this deviation does not provide less protection than performing quarterly vulnerability assessments, and will provide an analysis that demonstrates that the attack vector does not exist and will document this justification for inspection.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.61 RG 5.71, Section C.4.2, first paragraph, second sentence (page 30)

The VEGP CSP deviates from RG 5.71 by committing not to implement the security controls in Section 11 of Appendix C of RG 5.71, but rather to address those controls in accordance with Section C.3.3 of RG 5.71.

As previously described in Section 13.8.4.7 of this SER, the VEGP CSP deviates from RG 5.71 by committing to address security controls rather than committing to apply them. The VEGP CSP states that when a control from Appendices B and C of RG 5.71, such as Section 11 of Appendix C, is not implemented that the licensee will implement alternate control(s) that "do not provide less protection that the corresponding" control in the appendix. This *deviation is consistent with the method used in RG 5.71, which states that controls should provide equal or better protection.*

As also previously discussed in Section 13.8.4.7 of this SER, the VEGP CSP deviates from RG 5.71 by stating that when a control can be proven to be unnecessary, the applicant will perform an analysis demonstrating that the control is not necessary, and will provide a documented justification. Therefore, SNC commits that in addressing the security controls in Appendix C, Section 11 of RG 5.71 that it will either apply the control, apply an alternative that does not provide less protection or will demonstrate that the control is not necessary because the attack vectors do not exist. This method is consistent with the method used in RG 5.71, which also allows for controls to be addressed.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.62 RG 5.71, Section C.4.2.1, first paragraph, third sentence (page 30)

The VEGP CSP deviates from RG 5.71 in a manner similar to the previous deviation in Section 13.8.4.24.61 of this SER. Specifically, that configuration management will be used to ensure that each of the controls is addressed in Appendices B and C of RG 5.71, as opposed to implemented. This method is consistent with the method in RG 5.71, as the applicant commits to follow the process in Section C.3.3 of RG 5.71, which requires that the applicant implement the control, apply an alternative control that does not provide less protection than the corresponding control in RG 5.71, or demonstrate that the attack vector associated with the control does not exist. Therefore, the VEGP CSP method will provide no less protection than the method provided for in RG 5.71.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.63 RG 5.71, Section C.4.2.1, second paragraph, third sentence (page 30)

The VEGP CSP deviates from RG 5.71 by including the statement, "in accordance with the process described in Section C.3.3 of this guide." As previously discussed in Section 13.8.4.14 of this SER, the method in Section C.3.3 is consistent with the method in RG 5.71, which requires that the licensee either implement the control, apply an alternative control that does not provide less protection than the corresponding control in RG 5.71, or demonstrate that the attack vector associated with the control does not exist. Therefore, the VEGP CSP method will provide no less protection than the method provided for in RG 5.71.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.64 RG 5.71, Section C.4.3, second paragraph (page 31)

The VEGP CSP deviates from RG 5.71, as previously discussed in Section 13.8.4.22 of this SER, by stating that the applicant has established the necessary measures and governing procedures to implement periodic reviews of applicable program elements, in accordance with the requirements of 10 CFR 73.55(m). Specifically, the VEGP CSP calls for a review of the program's effectiveness at least every 24 months. In addition, reviews are to be conducted as follows:

- *within 12 months following initial implementation of the program*
- *as necessary based upon site-specific analyses, assessments, or other performance indicators*
- *as soon as reasonably practical, but no longer than 12 months, after changes occur in personnel, procedures, equipment, or facilities that potentially could adversely affect cyber security*
- *by individuals independent of those personnel responsible for program management and any individual who has direct responsibility for implementing the program*

This deviates from RG 5.71 in the specific wording, but includes the same commitments as RG 5.71. Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.65 RG 5.71, Section C.5, second paragraph, second and third sentences (page 32)

As previously discussed in Section 13.8.4.23, the VEGP CSP deviates from RG 5.71 documentation retention commitments. Specifically, VEGP CSP Section 5 states the records are retained to document access history and information needed to discover the source of cyber attacks and incidents. The VEGP CSP deletes the phrase:

> *Records required for retention include, but are not limited to, digital records, log files, audit files, and nondigital records that capture, record, and analyze network and CDA events.*

The VEGP CSP commits to retaining all access history records, records to discover the source of cyber attacks or other security-related incidents affecting CDAs or SSEP functions, or both. This is consistent with what is included in RG 5.71 Section 5, as it includes all the performance-based characteristics and commitments of that section.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.66 RG 5.71, Glossary (Page 35)

The VEGP CSP's definition of a CDA deviates from the definition provided in RG 5.71. Specifically, the VEGP CSP deviates by stating that a CDA can be a CS or a subcomponent of a CS. This definition does not materially change the use of the term, and is correct: A CDA can be a CS. This definition is consistent with the definition in RG 5.71. The VEGP CSP, by the use of this definition, does not provide for less protection than RG 5.71, nor does this reduce the scope of the assets required to be protected under the rule.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.67 RG 5.71, Glossary (Page 35)

The VEGP CSP deviates from the definition of a CS in RG 5.71 by adding the caveat "as defined by the plant licensing basis." RG 5.71 states that a CS is an analog or digital technology based system in or outside the plant that performs or is associated with a safety-related, important-to-safety, security, or emergency preparedness function. These CSs include, but are not limited to, plant systems, equipment, communication systems, networks, offsite communications, or support systems or equipment, that perform or are associated with safety-related, important-to-safety, security, or emergency preparedness functions.

The addition of the phrase "as defined by the plants' licensing basis," limits the scope of the functions to those that are defined by the licensing basis. As previously discussed in Section 13.8.4.4 of this SER, the staff ~~was concerned that this modifier might cause the licensee to exclude CSs, which ought to be included, according to the rule~~ [found this modification acceptable]. *10 CFR 73.51(a)(1) requires that the licensee protect digital computer and communication systems and networks associated with: (i) safety-related and important-to-safety functions; (ii) security functions; (iii) emergency preparedness functions, including offsite communications; and (iv) support systems and equipment, which if compromised would adversely impact SSEP functions. However, further reviews resulted in the staff finding that the VEGP CSP scoping discussion adequately described a process to include all CDAs within the scope of 10 CFR 73.54(a)(1).*

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.68 RG 5.71, Glossary (Page 35)

The VEGP CSP deviates from the RG 5.71 definition of cyber attack by replacing the phrase "conducted by threat agents having either malicious or non-malicious intent" with the phrase "conducted by threat agents." The NRC staff finds this deviation to be acceptable because deletion of the intent of a threat agent, be it malicious or non-malicious, still provides a commitment to protect against threats by threat agents.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.69 RG 5.71, Appendix A, Introduction (Page A-1)

The VEGP CSP deviates from the RG 5.71 scope discussion by including within scope systems or equipment that perform important to safety functions including SSCs in the BOP that could directly or indirectly affect reactivity at a nuclear power plant and could result in an unplanned reactor shutdown or transient. Additionally, these SSCs are under the licensee's control and include electrical distribution equipment out to the first inter tie with the offsite distribution system. The NRC staff finds this deviation to be acceptable because it is consistent with Commission policy.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

License Conditions

- *Part 10, License Condition 2, COL Item 13.6-5 and License Condition 3, Item G.10*

The applicant proposed two license conditions in Part 10 of the VEGP COL application, which will require the applicant to implement the cyber security program prior to initial fuel load.

In a letter dated October 22, 2010, the applicant provided supplemental information which proposed to amend the milestone included in Part 2, FSAR Table 13.4-201 to implement the cyber security program prior to receipt of fuel onsite (protected area.) The NRC staff finds the proposed implementation milestone for the cyber security program (security prior to receipt of fuel onsite (protected area)) appropriate and in accordance with the requirement in 10 CFR 73.55(a)(4). Therefore the staff finds that the proposed License Conditions 2 and 3 are not necessary.

- *Part 10, License Condition 6*

The applicant proposed a license condition in Part 10 of the VEGP COL application to provide a schedule to support the NRC's inspection of operational programs, including the cyber security program. Although the CSP is not identified as an operational program in SECY-05-0197, the proposed license condition is consistent with the policy established in SECY-05-0197 for operational programs in general, and is acceptable.

13.8.5 Post Combined License Activities

For the reasons discussed in the technical evaluation section above, the staff finds the following license condition proposed by the applicant acceptable:

- License Condition (13-14) – No later than 12 months after issuance of the COL, the licensee shall submit to the Director of NRO a schedule that supports planning for and conduct of NRC inspection of the cyber security program implementation. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until the cyber security program has been fully implemented.

13.8.6 Conclusion

The staff reviewed the WLS COL application and checked the referenced DCD. The staff's review confirmed that the applicant addressed the required information relating to cyber security, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

The staff reviewed the CSP for format and content using the NRC CSP template in RG 5.71, and noted that it includes all features considered essential to such a program. In particular, the staff noted it complies with applicable NRC regulations including 10 CFR 73.1, 10 CFR 73.54, 10 CFR 73.55(a)(1), 10 CFR 73.55(b)(8), 10 CFR 73.55(m), and 10 CFR Part 73, Appendix G.

14.0 INITIAL TEST PROGRAM

The initial test program covers structures, systems, and components (SSCs) and design features for both the nuclear portion of the facility and the balance of plant. The information provided addresses the major phases of the test program, including preoperational tests, initial fuel loading and initial criticality, low-power tests, and power ascension tests. The scope of the initial test program, as well as general plans for accomplishing the test program, are described in sufficient detail to demonstrate that due consideration has been given to matters that normally require advance planning.

The technical aspects of the initial test program are described in sufficient detail to show that: (1) the test program adequately verifies the functional requirements of plant SSCs; and (2) the sequence of testing is such that the safety of the plant does not depend on untested SSCs. In addition, measures are described to ensure that: (1) the initial test program is accomplished with adequate numbers of qualified personnel; (2) adequate administrative controls will be established to govern the initial test program; (3) the test program is used, to the extent practicable, to train and familiarize the plant's operating and technical staff in the operation of the facility; and (4) the adequacy of plant operating and emergency procedures is verified, to the extent practicable, during the period of the initial test program.

This chapter also provides information on the inspections, tests, analyses and acceptance criteria (ITAAC) that are proposed to demonstrate that, when the ITAAC are performed and the acceptance criteria met, the facility has been constructed and will operate in conformance with the combined license (COL), the Atomic Energy Act, and Nuclear Regulatory Commission (NRC) regulations.

14.1 Specific Information to be Included in Preliminary/Final Safety Analysis Reports (Related to RG 1.206, Section C.III.1, Chapter 14, C.I.14.1, "Specific Information To Be Addressed for the Initial Plant Test Program")

Section 14.1 of the William States Lee III Nuclear Station (WLS) COL Final Safety Analysis Report (FSAR), Revision 11, incorporates by reference, with no departures or supplements, Section 14.1, "Specific Information to be Included in Preliminary/Final Safety Analysis Reports," of Revision 19 of the AP1000 Design Control Document (DCD). The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.[1] The NRC staff's review confirmed that there is no outstanding issue related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793, "Final Safety Evaluation Report Related to Certification of the AP1000 Standard Design," and its supplements.

[1] See Section 1.2.2 for a discussion of the staff's review related to verification of the scope of information to be included in a COL application that references a design certification (DC).

14.2 Specific Information to be Included in Standard Safety Analysis Reports (Related to RG 1.206, Section C.III.1, Chapter 14, C.I.14.2, “Initial Plant Test Program”)

14.2.1 Summary of Test Program and Objectives

14.2.1.1 *Introduction*

This section describes the major phases of the initial test program as well as the general prerequisites and specific objectives to be achieved for each phase.

14.2.1.2 *Summary of Application*

Section 14.2 of the WLS COL FSAR, Revision 11, incorporates by reference Section 14.2 of the AP1000 DCD, Revision 19. Section 14.2 of the DCD includes Section 14.2.1.

In addition, in WLS COL FSAR Section 14.2.1, the applicant provided the following:

AP1000 COL Information Item

- STD COL 14.4-3

The applicant provided additional information in standard (STD) COL 14.4-3 to address the COL holder’s responsibility for development of a site-specific startup administrative manual (procedure) that will include the administrative procedures and requirements that will govern the activities associated with the plant’s initial test program. Also added was information related to first of a kind testing features.

Additionally, the applicant described how the initial test program is applied to the facility. This information was provided to supplement the information incorporated by reference from the AP1000 DCD.

14.2.1.3 *Regulatory Basis*

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the test program summary and objectives are given in Section 14.2 of NUREG-0800, “Standard Review Plan for the Review of Safety Analysis Reports for Nuclear Power Plants (LWR Edition).”

The applicable regulatory requirements for the information being reviewed in this section are Title 10 of the *Code of Federal Regulations* (10 CFR) 52.79(a)(28) and Criterion XI of Appendix B, “Quality Assurance Criteria for Nuclear Power Plants and Fuel Reprocessing Plants” to 10 CFR Part 50, “Domestic licensing of production and utilization facilities.”

Regulatory Guide (RG) 1.68, Revision 3, "Initial Test Program for Water-Cooled Nuclear Power Plants," provides guidance on how to comply with Criterion XI of Appendix B to 10 CFR Part 50.

14.2.1.4 *Technical Evaluation*

The NRC staff reviewed Section 14.2.1 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the initial test program summary and objectives. The results of the NRC staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this safety evaluation report (SER) provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and to use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (Vogtle Electric Generating Plant (VEGP), Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from requests for additional information (RAIs).

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed

- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the WLS COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the Bellefonte Nuclear Plant (BLN), Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from Section 14.2.1.4 of the VEGP SER:

> *AP1000 COL Information Item*
>
> - *STD COL 14.4-3*
>
> *The NRC staff reviewed STD COL 14.4-3 related to COL Information Item 14.4-3 included in the VEGP COL FSAR. The applicant provided additional information*

to address COL Information Item 14.4-3 and to supplement the information addressed in the AP1000 DCD.

COL Information Item 14.4-3 states:

> *The Combined License holder is responsible for a site-specific startup administration manual (procedure), which contains the administration procedures and requirements that govern the activities associated with the plant initial test program, as identified in Subsection 14.2.3.*

This commitment was also captured as COL Action Item 14.4-3 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:

> *The COL applicant is responsible for preparing a startup administrative manual which contains the administrative procedures and standards that govern the activities associated with the plant initial test program.*

STD COL 14.4-3 was not explicitly evaluated in Section 14.2.1.4 of the BLN SER. However, portions of the evaluation material in Section 14.2.1.4 of the BLN SER are directly applicable to this COL item. Therefore, the NRC staff used this evaluation material, identified below as standard content material, in the disposition of STD COL 14.4-3, as it relates to the initial test program summary and objectives.

The staff reviewed Section 14.2.1 and requested that as part of RAI 14.2-12, dated December 8, 2008, the applicant describe how the BLN test program meets the objectives in Section 14.2.1 of the AP1000 DCD, Revision 17. In its January 22, 2009, response to this RAI, the applicant proposed to revise Section 14.2.1 of the BLN COL FSAR to supplement Section 14.2.1 of the AP1000 DCD, Revision 17. The applicant stated in its response that Section 14.2 of the BLN COL FSAR describes the controls that will be implemented in the site-specific startup administrative manual (procedure). The applicant also described the testing of first-of-a-kind design features and the use of operating experience (OE) from previous first-of-a-kind tests performed on other AP1000 plants. Additionally, the applicant proposed to develop administrative controls for crediting previously performed testing of first-of-a-kind AP1000 design features.

The staff determined that the proposed changes adequately clarify the objectives of the initial test program, consistent with the guidance in RG 1.68. Therefore, the staff finds this change acceptable. The applicant will revise the BLN COL FSAR to include the proposed administrative controls. This item is identified as ***Confirmatory Item 14.2-1****, pending NRC review and approval of the revised BLN COL FSAR.*

Resolution of Standard Content Confirmatory Item 14.2-1

The staff verified that the VEGP applicant has incorporated into its FSAR the proposed administrative controls identified as Confirmatory Item 14.2-1 in the staff's SER for the BLN COL. On this basis, Confirmatory Item 14.2-1 is resolved.

14.2.1.5 *Post Combined License Activities*

There are no post-COL activities related to this section.

14.2.1.6 *Conclusion*

The NRC staff reviewed the application and checked the referenced DCD. The NRC staff's review confirmed that the application addressed the required information relating to the initial test program summary and objectives and there is no outstanding information to be addressed in the WLS COL FSAR related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the information presented in the WLS COL FSAR is acceptable because it meets the requirements of 10 CFR 52.79(a)(28) and Criterion XI of Appendix B to 10 CFR Part 50. The staff based its conclusions on the following:

- STD COL 14.4-3 is acceptable because it provides an adequate description of the administrative requirements associated with the test program objectives that will be implemented during the conduct of the initial test program.

14.2.2 Organization, Staffing, and Responsibilities (Related to RG 1.206, Section C.III.1, Chapter 14, C.I.14.2.2, "Organization and Staffing")

14.2.2.1 *Introduction*

The organization used to manage, supervise, or execute all phases of the initial test program is described. This description includes the organizational responsibilities and authorities, the degree of participation of each organizational unit in the implementation of the initial test program, and personnel training, experience, and qualification requirements.

14.2.2.2 *Summary of Application*

Section 14.2 of the WLS COL FSAR, Revision 11, incorporates by reference Section 14.2 of the AP1000 DCD, Revision 19. Section 14.2 of the DCD includes Section 14.2.2.

WLS COL FSAR Section 14.2.2 addresses the plant test and operations organization (PT&O) and other organizations that will participate in the implementation of the initial test program.

In addition, in WLS COL FSAR Section 14.2.2, the applicant provided the following:

AP1000 COL Information Item

- STD COL 14.4-1

The applicant provided additional information in STD COL 14.4-1 to provide a description of the organization, staffing, and responsibilities related to the initial test program.

14.2.2.3 *Regulatory Basis*

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the organization, staffing, and responsibilities are given in Section 14.2 of NUREG-0800.

The applicable regulatory requirements for the information being reviewed in this section are 10 CFR 52.79(a)(28) and Criterion XI of Appendix B to 10 CFR Part 50. RG 1.68 provides guidance on how to comply with Criterion XI of Appendix B to 10 CFR Part 50.

14.2.2.4 *Technical Evaluation*

The NRC staff reviewed Section 14.2.2 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the initial test program organization, staffing, and responsibilities. The results of the NRC staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5 to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.

- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the WLS COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the BLN Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from Section 14.2.2.4 of the VEGP SER:

> *<u>AP1000 COL Information Item</u>*
>
> - *STD COL 14.4-1*
>
> *The NRC staff reviewed STD COL 14.4-1 related to COL Information Item 14.4-1 included under Section 14.2.2 of the BLN COL FSAR. The applicant provided information to replace the existing information in AP1000 DCD Section 14.2.2 with a description of the organization, staffing, and responsibilities related to the initial test program. This information was provided to address COL Information Item 14.4-1 in the AP1000 DCD, Revision 17. COL Information Item 14.4-1 states:*
>
> > *The specific staff, staff responsibilities, authorities, and personnel qualifications for performing the AP1000 initial test program are the responsibility of the Combined License applicant. This test organization is responsible for the planning, executing, and documenting of the plant initial testing and related activities that occur between the completion of plant/system/component construction and commencement of plant commercial operation. Transfer and retention of experience and knowledge gained during initial testing for the subsequent commercial operation of the plant is an objective of the test program.*
>
> *This commitment was also captured as COL Action Item 14.4-1 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:*
>
> > *The COL applicant will establish the specific staff, staff responsibilities, authorities, and personnel qualifications for performing the AP1000 initial test program.*
>
> *To address STD COL 14.4-1, the applicant described the PT&O organization in Section 14.2.2 of the BLN COL FSAR. The applicant stated that the PT&O organization will be responsible for the implementation of the initial test program, including the construction and installation, preoperational, and startup testing phases. In addition, the applicant described the responsibilities, interfaces, and authorities of the positions in the PT&O organization, including the following:*

- *Manager in charge of the PT&O organization, responsible for staffing the PT&O organization, developing procedures for the preoperational and startup test phases, managing the initial test program, implementing the initial test program schedule, and manage contracts associated with the initial test program.*

- *Functional Manager in charge of the PT&O support, responsible for the implementation of plans, schedules, and development and approval of test procedures.*

- *PT&O Engineers, responsible for the development of system test procedures.*

- *Functional manager in charge of startup, responsible for the management of preoperational and startup testing. Activities include participation in the Joint Test Working Group (JTWG), preparation of the detailed schedule for preoperational and startup test activities, coordination of vendor participation in the initial test program, supervising and directing startup engineers, and developing periodic progress reports.*

- *Startup Engineers, responsible for coordinating testing activities, identifying special or temporary equipment or services needed to support testing, ensuring compliance with administrative controls, and reviewing and evaluating test results.*

- *PT&O organization personnel qualifications and training program description.*

The staff reviewed the applicant's proposed resolution to COL Information Item 14.4-1 addressing organizational and staffing responsibilities for the initial test program. In its review, the staff identified areas where additional information was needed.

In RAIs 14.2-5 and 14.2-6, dated May 15, 2008, the staff requested that the applicant supplement the information incorporated by reference from Section 14.2.2 of the AP1000 DCD, Revision 17, and provide a description of the responsibilities, authorities, interfaces, and qualifications requirements of the organizations responsible for the overall administration of the initial test program, consistent with the guidance in RG 1.206 and Section 14.2 of NUREG-0800. In its response to RAIs 14.2-5 and 14.2-6, dated June 26, 2008, the applicant stated that Section 14.4 of the BLN COL FSAR incorporated by reference Section 14.4.3 of the AP1000 DCD and no further changes to the BLN COL FSAR were needed. However, the staff determined that the information included in BLN COL FSAR was insufficient. Therefore, the staff asked the applicant in RAI 14.2-12, dated December 8, 2008, to provide information regarding the organization(s) that will be in charge of the overall administration, technical direction, coordination, and implementation of the initial test program.

Specifically, the staff requested that the applicant provide organizational descriptions of the principal management positions (including any augmenting organizations) responsible for planning, executing, and documenting preoperational and startup testing activities. RAI 14.2-12 stated that this description should include the authorities, responsibilities and interfaces, and the degree of participation of each identified organizational unit. Additionally, the staff requested that the applicant describe training and qualification requirements for organizations responsible for implementing the initial test program.

In its response to RAI 14.2-12 dated January 22, 2009, the applicant proposed to include in Section 14.2.2 of the BLN COL FSAR, a description of the following organizational groups that will participate in the implementation of the initial test program:

- *The JTWG, including details of the key responsibilities, authorities, and interfaces*
- *The Site Construction Group (Architect-Engineer), including participating organizations, authorities, interfaces, and functional responsibilities*
- *The Site Preoperational Test Group, including participating organizations, authorities, interfaces, and functional responsibilities*
- *The Site Startup Test Group, including participating organizations, authorities, interfaces, and functional responsibilities*

In addition, the applicant proposed to include information related to the education, training, experience, and qualification requirements of supervisory personnel, test personnel, and other major participating organizations responsible for implementing the initial test program and developing testing, operating, and emergency procedures. This description would include administrative provisions for the establishment of a training program consistent with the criteria described in Three Mile Island (TMI) Action Plan Item I.G.1, (NUREG-0737, "Clarification of TMI Action Plan Requirements") and considerations for staffing effects that could result from overlapping initial test programs at multi-unit sites.

The staff reviewed the proposed organizational description provided by the applicant as part of the response to RAI 14.2-12. The applicant proposed to describe its overall responsibility for the conduct of the initial test program and also proposed to include a description of the major organizations that will be responsible for the administration and technical direction of the initial test program. To this end, the applicant proposed to include in Section 14.2.2.3 of the BLN COL FSAR the functions, responsibilities, and composition of the JTWG. Specifically, the JTWG will be composed of representatives from the plant's operations group, Westinghouse, the Architect-Engineer, and representatives from the test support groups. The applicant proposed to include a description of *the responsibilities, authorities, and interfaces of these organizations. The JTWG will provide oversight of the implementation of the initial test program, including planning, scheduling, and performance of preoperational and startup testing. Also, the JTWG will review, evaluate, and approve administrative and test procedures, and will review and evaluate construction, preoperational, and startup test results and test turnover packages. The applicant proposed to revise the BLN COL FSAR to include the proposed organizational description.*

Additionally, the applicant proposed to include a description of the responsibilities, authorities, and interfaces of supporting organizations including the Site Construction Group (Architect-Engineer), the Site Preoperational Test Group, and the Site Startup Test Group. A description of each proposed test group follows.

Section 14.2.2.4 of the BLN COL FSAR would be revised to describe the Site Construction Group (Architect-Engineer). The Site Construction Group will be composed, as necessary, of members from the construction group, the construction services group, the construction services procurement group, and the construction services quality group. The Site Construction Group will provide oversight of construction installation and testing, vendor interface and procurement associated with support testing activities, and turnover of tested equipment, systems, and testing documentation to the Site Preoperational Test Group.

Section 14.2.2.5 of the BLN COL FSAR would be revised to describe the Site Preoperational Test Group. The Site Preoperational Test Group will consist of engineering leads and preoperational test teams, and will accept turnover of systems and equipment from the construction organization, and plan, scope, schedule, and oversee testing of plant systems. Additionally, the Site Preoperational Test Group will coordinate tagging and maintenance of systems, will provide coordination with other participating organizations, and will resolve open items and exceptions identified during the implementation of the preoperational test program.

Section 14.2.2.6 of the BLN COL FSAR would be revised to describe the Site Startup Test Group. The Site Startup Test Group will include engineering leads and startup test teams, and will be responsible for the acceptance of SSCs for integrated testing. In addition, the Site Startup Test Group will manage and oversee the testing of plant SSCs to support the plant power ascension test program, and will accept and turn over startup test packages to the site licensee.

The applicant also proposed to include information in Section 14.2.2.2 of the BLN COL FSAR to address training and qualification requirements for individuals and organizations implementing the initial test program. The response stated that the training organization will develop procedures to implement a training and qualification program in accordance with the requirements of the licensee quality assurance program and in coordination with Westinghouse. This training and *qualification program will be used to confirm that test personnel have adequate training, qualification, and certification. In addition, the proposed training and qualification program will confirm that experienced and qualified personnel are available to develop testing, operating, and emergency procedures. The proposed training and qualification program will also provide supplemental operator training in accordance with TMI Action Plan Item I.G.1. The response stated that the site-specific startup administrative manual will contain measures to verify that personnel formulating and conducting test activities are not the same personnel who designed or are responsible for satisfactory performance of systems or design features under test. In addition, the startup administrative manual will provide controls for the consideration of staffing effects that could result from overlapping initial test programs at multi-unit sites.*

The staff determined that the proposed changes adequately define the organizations that will carry out the initial test program, describe the authorities, responsibilities, and interfaces, and delineate training and qualification requirements for organizations participating in the implementation of the initial test program, consistent with the guidance in RG 1.68. Additionally, Section 1.0, Table 1.9-201 of the BLN COL FSAR includes a commitment to RG 1.8, Revision 3, "Qualification and Training of Personnel for Nuclear Power Plants," which provides training and qualification requirements for nuclear power plant personnel, including personnel participating in initial test program activities. The applicant will revise the BLN COL FSAR to include the proposed administrative controls. Therefore, the staff finds this change acceptable. This is identified as ***Confirmatory Item 14.2-2****, pending NRC review and approval of the revised BLN COL FSAR.*

Resolution of Standard Content Confirmatory Item 14.2-2

The staff verified that the VEGP applicant has incorporated into its FSAR the proposed administrative controls identified as Confirmatory Item 14.2-2 in the staff's SER for the BLN COL. On this basis, Confirmatory Item 14.2-2 is resolved.

Evaluation of Additional Information

In its letter dated November 11, 2010, the VEGP applicant provided additional information on the training and qualification requirements for nonsupervisory test engineers participating in initial test program activities. In the standard content evaluation presented above for STD COL 14.4-1, the staff notes that RG 1.8 is referenced by the applicant as providing the training and qualification requirements for nuclear power plant personnel, including personnel participating in initial test program activities. In the November 11, 2010, letter, the applicant stated that VEGP COL FSAR Section 14.2.2.2 would be revised to state that acceptable qualifications for nonsupervisory test engineers will follow the guidance provided in RG 1.28 as discussed in VEGP COL FSAR Appendix 1AA, i.e., Appendix 2A-1 of American Society of Mechanical Engineers

(ASME) NQA-1-1994, "Quality Assurance Requirements for Nuclear Facility Applications."

The use of ASME NQA-1-1994 is endorsed in Section 17.5 of NUREG-0800 as providing an acceptable means for complying with 10 CFR Part 50, Appendix B, Criterion II, "Quality Assurance Program." Specifically, Item T of Part II of Section 17.5 of NUREG-0800 references ASME NQA-1-1994 in its guidance on training and qualification for personnel associated with inspection and testing activities. Therefore, the staff finds acceptable the proposed changes to VEGP COL FSAR Section 14.2.2.2, as stated in the applicant's November 11, 2010, letter. The planned VEGP COL application changes will be tracked as ***VEGP Confirmatory Item 14.2-1.***

<u>*Resolution of VEGP Standard Content Confirmatory Item 14.2-1*</u>

VEGP Confirmatory Item 14.2-1 is an applicant commitment to revise its FSAR to specify the qualifications for test engineers. The staff verified that VEGP COL FSAR Section 14.2.2.2 was appropriately updated. As a result, VEGP Confirmatory Item 14.2-1 is now closed. The applicant indicated that the proposed changes to its FSAR Section 14.2.2.2 is expected to be standard for the subsequent COL applicants. Since Confirmatory Item 14.2-1 already exists as a standard confirmatory item in this SER, the staff designated this standard confirmatory item as VEGP Confirmatory Item 14.2-1.

14.2.2.5 *Post Combined License Activities*

There are no post-COL activities related to this section.

14.2.2.6 *Conclusion*

The NRC staff reviewed the application and checked the referenced DCD. The NRC staff's review confirmed that the application addressed the required information relating to the initial test program organization, staffing, and responsibilities and there is no outstanding information to be addressed in the WLS COL FSAR related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that, the information presented in the WLS COL FSAR is acceptable because it meets the requirements of 10 CFR 52.79(a)(28) and Criterion XI of Appendix B to 10 CFR Part 50. The staff based its conclusions on the following:

- STD COL 14.4-1 is acceptable because it provides an adequate description of the organizational responsibilities and authorities, the degree of participation of each organizational unit in the implementation of the initial test program, and personnel training, experience, and qualification requirements and meets the guidance in RG 1.68.

14.2.3 Test Specifications and Test Procedures (Related to RG 1.206, Section C.III.1, Chapter 14, C.I.14.2.3, “Test Procedures,” C.I.14.2.4, “Conduct of Test Program,” C.I.14.2.5, “Review, Evaluation, and Approval of Test Results,” and C.I.14.2.6, “Test Records”)

14.2.3.1 *Introduction*

Test specifications and test procedures address the process used to develop, review, and approve individual test procedures, including the organizational units or personnel that are involved in performing these activities and their respective responsibilities.

“Conduct of Test Program” describes the administrative controls that govern the conduct of each major phase of the test program. This description includes the administrative controls used to ensure that the necessary prerequisites are satisfied for each major phase and for individual tests. Controls to be followed during plant modifications or maintenance tasks that are determined to be necessary to conduct the test program are also described, as well as the methods used to ensure retesting following such modifications or maintenance.

“Review of Test Results” describes the specific controls to be established for the review, evaluation, and approval of test results by appropriate personnel and/or organizations. This description includes specific controls to be established to ensure notification of affected and responsible organizations or personnel when test acceptance criteria are not met, as well as the controls established to resolve such matters.

In addition, administrative controls to identify and cross-reference each test (or portion thereof) required to be completed before initial fuel loading to satisfy ITAAC in accordance with 10 CFR 52.99(a) are discussed.

14.2.3.2 *Summary of Application*

Section 14.2 of the WLS COL FSAR, Revision 11, incorporates by reference Section 14.2 of the AP1000 DCD, Revision 19. Section 14.2 of the DCD includes Section 14.2.3.

In addition, in WLS COL FSAR Sections 14.2 and 14.4, the applicant provided the following:

AP1000 COL Information Items

- STD COL 14.4-2

The applicant provided additional information in STD COL 14.4-2 to address COL holder responsibility for the development of test specifications and test procedures.

- STD COL 14.4-3

The applicant provided additional information in STD COL 14.4-3 to address COL holder responsibility for the development of a site-specific startup administrative manual (procedure) that will include the administrative procedures and requirements that will govern the activities associated with the plant's initial test program.

- STD COL 14.4-4

The applicant provided additional information in STD COL 14.4-4 to address COL holder responsibility for the review and evaluation of test results.

Supplemental Information

- STD SUP 14.2-5

The applicant provided additional information in STD Supplement (SUP) 14.2-5 to address administrative requirements for the preparation of work requests.

- STD SUP 14.2-6

The applicant provided additional information in STD SUP 14.2-6 to address administrative requirements for turnover of systems and components during the construction phase.

- STD SUP 14.2-7

The applicant provided additional information in STD SUP 14.2-7 to address administrative controls for the conduct of modifications during the initial test program.

- STD SUP 14.2-8

The applicant provided additional information in STD SUP 14.2-8 to address administrative controls for the conduct of maintenance during the initial test program.

In addition, in Part 10 of the WLS COL application, the applicant provided the following information:

License Conditions

- Part 10, License Condition 2, Items 14.4-2, 14.4-3 and 14.4-4

The proposed license conditions will require the licensee to complete the actions described in STD COL 14.4-2 and STD COL 14.4-4 prior to fuel loading and STD COL 14.4-3 prior to initiation of the test program.

- Part 10, License Condition 6

The proposed license condition will require the licensee to provide a schedule to support NRC inspections of operational programs including a submittal for approved preoperational and startup test procedures.

- Part 10, License Condition 8

The proposed license condition will require the licensee to report any changes to the initial test program (ITP) within one month of such a change.

14.2.3.3 *Regulatory Basis*

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the test specifications and test procedures, conduct of test program, and review and evaluation of test results are given in Section 14.2 of NUREG-0800.

The applicable regulatory requirements for the information being reviewed in this section are 10 CFR 52.79(a)(28) and Criterion XI of Appendix B to 10 CFR Part 50. RG 1.68 provides guidance on how to comply with Criterion XI of Appendix B to 10 CFR Part 50.

14.2.3.4 *Technical Evaluation*

The NRC staff reviewed Section 14.2.3 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the test specifications and procedures, conduct of test program, and review and evaluation of test results. The results of the NRC staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.

- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the WLS COL application. This standard content material is

identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the BLN Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from Section 14.2.3.4 of the VEGP SER:

> *<u>AP1000 COL Information Items</u>*
>
> - *STD COL 14.4-2, addressing test specifications and test procedures.*
>
> *The NRC staff reviewed STD COL 14.4-2 related to COL Information Item 14.4-2 included in the BLN COL FSAR. The applicant provided information to address COL Information Item 14.4-2 and to supplement the information addressed in the AP1000 DCD, Revision 17. COL Information Item 14.4-2 states:*
>
>> *The Combined License holder will provide the Preoperational and Startup Procedures to the NRC prior to each planned test in accordance with the requirements of DCD Subsection 14.2.3.*
>>
>> *The following words represent the original Combined License Information Item commitment:*
>>
>>> *The Combined License applicant is responsible for providing test specifications and test procedures for the preoperational and startup tests, as identified in Subsection 14.2.3, for review by the NRC.*
>
> *The commitment was also captured as COL Action Item 14.4-2 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:*
>
>> *The COL applicant will develop test specifications and procedures for the preoperational and startup tests for review by the NRC.*
>
> *The staff reviewed the applicant's proposed resolution of COL Information Item 14.4-2.*
>
> *In reviewing Section 14.2 of the BLN COL FSAR, Revision 0, the applicant did not provide a description of the methodology used to develop test specifications and procedures; did not provide a description of the controls to ensure the participation of the design organization(s), the COL applicant, architect-engineer(s), and other major contractors, subcontractors, and vendors, as applicable; and did not discuss the qualification or experience requirements for personnel participating in the development of test specifications and test procedures. In RAI 14.2-8, the staff requested that the applicant provide information regarding the methodology that will be used for the generation,*

review, and approval of preoperational and startup test procedures. Additionally, the staff requested that the applicant explain which provisions in the application ensure the availability of approved test procedures for review by NRC inspectors at least 60 days before their intended use, and ensure timely notification to the NRC of changes in approved test procedures that have been made available for NRC review.

In its response to RAI 14.2-8 dated June 26, 2008, the applicant stated that Section 14.2.3 of the AP1000 DCD provided administrative controls to ensure that approved test procedures will be provided to the NRC about 60 days prior to the scheduled performance of preoperational tests, such as test for systems and components that perform safety-related functions, and tests of systems and components that are non-safety-related but perform defense-in-depth functions. The staff found this response acceptable. However, the applicant did not provide a description of the administrative controls to be used to develop, review, and approve preoperational and startup test procedures. In RAI 14.2-12, dated December 8, 2008, the staff requested that the applicant provide such a description in the BLN COL FSAR.

In its response to RAI 14.2-12 dated January 22, 2009, the applicant proposed to include in Section 14.2.3 of the BLN COL FSAR the following administrative controls that will be prescribed in the site-specific startup administrative manual for the development, review, and approval of test specifications and test procedures:

- *Provisions to ensure that the appropriate technical information required for the preparation of test procedures is included, including prerequisites, format and content, objectives, test conditions, and acceptance criteria*

- *Provisions to ensure the participation of the design organization in the development of detailed test procedures*

- *Provisions to ensure that personnel developing and reviewing test procedures have the appropriate technical background and experience*

- *Provisions to ensure the availability of test procedures to the NRC onsite inspectors approximately 60 days prior to their intended use*

*The staff reviewed the applicant's response to this RAI and determined that the proposed changes provide the general methods and administrative provisions to control procedure development, review, and approval, including the responsibilities of the various organizations participating in this process, consistent with the guidance in RG 1.68. The applicant will revise the BLN COL FSAR to include the proposed administrative controls. Therefore, the staff finds the proposed change acceptable. This is identified as **Confirmatory Item 14.2-3**, pending NRC review and approval of the revised BLN COL FSAR.*

The applicant identified COL Information Item 14.4-2 as an activity that cannot be fully resolved prior to issuance of the COL. In BLN COL FSAR, Part 10, "License Conditions and ITAAC," License Condition 2, "COL Holder Items," the applicant proposed Item 14.4-2 to address the development of test specifications and test procedures. Additionally, the applicant proposed License Condition 6, "Operational Program Readiness," addressing implementation schedules to support planning for and conduct of NRC staff inspections of operational programs. Because the initial test program is identified as an operational program, the applicant provided implementation milestones consistent with the guidance contained in RG 1.206. To address the availability of test specifications and test procedures, Item d. of License Condition 6 requires a submittal schedule for preoperational and startup test procedures.

Since development of test specifications and test procedures will require detailed plant-specific design information and close coordination with design organizations, the staff determined that it is acceptable to develop detailed preoperational and startup test specifications and test procedures during the post-COL phase (See Section 14.2.3.5). Therefore, the staff finds acceptable proposed License Condition 2, Item 14.4-2. Concerns remain regarding the adequacy of administrative controls in License Condition 6, Item d., for the development of test specifications and test procedures. This is identified as ***Open Item 14.2-1.***

In RAI 14.2-11, the NRC staff requested that the applicant provide additional information regarding the provisions that will identify and cross-reference all or part of each test that is required to be completed before initial fuel loading and that is designed to satisfy ITAAC. The staff requested that the applicant revise Section 14.2 of the BLN COL FSAR to address this issue. In its September 3, 2008, response to RAI 14.2-11, the applicant stated that test procedures (or sections thereof) will be cross-referenced to ITAACs. In addition, activities related to ITAAC closure will include references to test procedures in order to facilitate NRC review and acceptance. The applicant stated that Chapter 14 of the BLN COL FSAR would be revised to include development of a cross-reference list between ITAACs and test procedures and/or sections of procedures. The staff confirmed that this change was incorporated in Revision 1 of the BLN COL FSAR. Section 14.4.2 of the BLN COL FSAR states that a cross-reference list will be developed between ITAACs and test procedures and/or sections of test procedures. The staff finds this change acceptable. This resolves RAI 14.2-11.

<u>Resolution of Standard Content Confirmatory Item 14.2-3</u>

The staff verified that the VEGP applicant has incorporated into its FSAR the proposed administrative controls identified as Confirmatory Item 14.2-3 in the staff's SER for the BLN COL. On this basis, Confirmatory Item 14.2-3 is resolved.

<u>Resolution of Standard Content Open Item 14.2-1</u>

Part 10 of the VEGP COL application, proposed License Condition 6, "Operational Program Readiness," describes the process for submitting to the appropriate Director of the NRC a schedule that will support planning for and conduct of NRC inspections of operational programs. The applicant also included, in Item c. of License Condition 6 (which corresponds to Item d. of License Condition 6 in the BLN COL application), administrative provisions for the submittal of approved preoperational and startup test procedures to NRC onsite inspectors in accordance with Section 14.2.3 of the FSAR. Following the evaluation of Item d. of License Condition 6 in the BLN COL application, as documented in the BLN SER, the staff has determined on closer examination that proposed License Condition 2, Item 14.4-2, will result in adequate administrative controls for the development of detailed test specifications and test procedures. On this basis, the staff finds that Item c. in proposed License Condition 6 of Part 10 of the VEGP COL application is acceptable and Open Item 14.2-1 is therefore resolved.

The following portion of this technical evaluation section is reproduced from Section 14.2.3.4 of the BLN SER:

- *STD COL 14.4-3, addressing the conduct of test program*

The NRC staff reviewed STD COL 14.4-3 related to COL Information Item 14.4-3 included in the BLN COL FSAR. The applicant provided additional information to address COL Information Item 14.4-3 and to supplement the information addressed in the AP1000 DCD, Revision 17. COL Information Item 14.4-3 states:

> *The Combined License holder is responsible for a site-specific startup administration manual (procedure), which contains the administration procedures and requirements that govern the activities associated with the plant initial test program, as identified in Subsection 14.2.3.*
>
> *The following words represent the original COL information item commitment:*
>
> > *The Combined License applicant is responsible for a startup administration manual (procedure), which contains the administration procedures and requirements that govern the activities associated with the plant initial test program, as identified in Subsection 14.2.3.*

This commitment was also captured as COL Action Item 14.4-3 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:

> *The COL applicant is responsible for preparing a startup administrative manual which contains the administrative procedures and standards that govern the activities associated with the plant initial test program.*

In Section 14.4 of the BLN COL FSAR, the applicant incorporated by reference Section 14.4.3 of the AP1000 DCD, Revision 17. This section provided a summary overview of the administrative process and program controls to be utilized in the conduct of the AP1000 Startup Test Program at a licensed AP1000 operational plant site. It also provided a general description of responsibilities and activities related to the testing of plant equipment in the period between system turnover until plant acceptance.

The staff reviewed the information provided to address COL Information Item 14.4-3 related to the conduct of the initial test program in the BLN COL FSAR. In its review, the staff identified areas where additional information was needed. A description of the specific issues follows.

In RAI 14.2-4, the staff requested that the applicant supplement the information incorporated by reference from Section 14.4.3 of the AP1000 DCD, Revision 17, and to provide a description of the administrative controls that will be implemented during the conduct of the initial test program, consistent with the guidance in RG 1.206 and Section 14.2 of NUREG-0800. In its response to RAI 14.2-4 dated June 26, 2008, the applicant stated that Section 14.4 of the BLN COL FSAR incorporated by reference Section 14.4.3 of the AP1000 DCD and no further changes to the BLN COL FSAR were needed. However, the staff determined that the information included in BLN COL FSAR was insufficient. Therefore, in RAI 14.2-12 dated December 8, 2008[SIC], the staff requested the applicant include a set of administrative controls for the conduct of the initial test program in Section 14.2 of the BLN COL FSAR.

In its response to RAI 14.2-12 dated January 22, 2009 and March 26, 2009, the applicant proposed to include in Section 14.2.3.1 of the BLN COL FSAR a description of the administrative controls for the control of testing activities. The proposed controls will include measures for procedure verification, work control, system turnover, conduct of modifications, and conduct of maintenance activities during the initial test program.

Section 14.2.3.1.1 would be revised to provide administrative controls for the verification of approved test procedures. The response stated that this section will include measures to consider design and licensing changes made after the development of test procedures to ensure that these changes are incorporated in approved test procedures. In addition, the applicant stated that available information regarding operating experience (OE) will be factored in the development of individual test procedures. Test deficiencies, nonconformances, exceptions, and failures will be tracked using the applicant's corrective action *program. The applicant also proposed controls to involve design organizations in the resolution of design-related problems that result in, or contribute to, a failure to meet test acceptance criteria. In its description, the applicant assigned responsibilities for the review of test procedures, test execution, data collection and recording, and for the review and evaluation of test results prior to commencing each major phase of the initial test program.*

The following supplemental items were not in Revision 1 of the BLN FSAR and are addressed for the first time in this SER for the VEGP COL application. However, portions of the standard evaluation material in the BLN SER under the evaluation of STD COL 14.4-3 are directly applicable to the new STD SUP items identified in the VEGP FSAR. Therefore, the NRC staff used this evaluation material, identified below as standard content material, in the disposition of these supplemental items.

<u>*Supplemental Information*</u>

- *STD SUP 14.2-5*

The applicant provided additional information in STD SUP 14.2-5 to address administrative requirements for the preparation of work requests.

The following portion of this technical evaluation section is reproduced from Section 14.2.3.4 of the BLN SER:

Section 14.2.3.1.2 would be revised to provide administrative measures for the control of work requests and controls for the control of tagging requests. Specifically, the response stated that the applicant will be responsible for the preparation of work requests and for supervising minor repairs and modifications, changes to equipment settings, and disconnecting and reconnecting of electrical terminations. Additionally, the Startup Group will provide for the coordination of construction-related work requests. The applicant also stated that the Startup Test Engineers may perform independent verification of work requests. These activities will be controlled by administrative procedures.

- *STD SUP 14.2-6*

The applicant provided additional information in STD SUP 14.2-6 to address administrative requirements for turnover of systems and components during the construction phase.

The following portion of this technical evaluation section is reproduced from Section 14.2.3.4 of the BLN SER.

Section 14.2.3.1.3 would be revised to provide controls for system turnover during the conduct of the test program. The response proposed guidelines that will be used to define the boundary and interfaces between related *systems/subsystems and to generate boundary scope documents. The response also proposed a systematic turnover process that includes requirements for the following:*

- *Documenting inspections performed by the construction organization (e.g., highlighted drawings showing areas inspected)*
- *Documenting results of construction testing*
- *Determining the construction related inspections and tests that need to be completed before preoperational testing begins. Any open items are evaluated for acceptability before commencing preoperational testing.*
- *Developing and implementing plans for correcting adverse conditions and open items, and means for tracking such conditions and items*
- *Verifying completeness of construction and documentation of incomplete items*

- *STD SUP 14.2-7*

The applicant provided additional information in STD SUP 14.2-7 to address administrative controls for the conduct of modifications during the initial test program.

The following portion of this technical evaluation section is reproduced from Section 14.2.3.4 of the BLN SER:

Section 14.2.3.1.4 would be revised to include controls for modifications during the conduct of the test program. The response also proposed measures for retesting activities following such modifications. In its description, the applicant stated that modifications will be documented in test procedures and will contain restoration steps to confirm satisfactory restoration to the required configuration. Additionally, modifications will be reviewed to determine the scope of post-modification testing activities. Finally, the response stated that retesting for modifications will be documented and verified to ensure the validity of preoperational testing and ITAAC.

- *STD SUP 14.2-8*

The applicant provided additional information in STD SUP 14.2-8 to address administrative controls for the conduct of maintenance during the initial test program.

The following portion of this technical evaluation section is reproduced from Section 14.2.3.4 of the BLN SER:

Section 14.2.3.1.5 would be revised to include controls for corrective or preventive maintenance during the conduct of the initial test program. The response proposed that the applicant will review maintenance activities to determine post-maintenance testing to be performed. Additionally, post-maintenance testing will be conducted and documented, and its results verified to maintain the validity of preoperational testing and ITAAC.

The following portion of this technical evaluation section is reproduced from Section 14.2.3.4 of the BLN SER, and is applicable to all four STD SUP items discussed above.

The staff reviewed the applicant's response to this RAI and determined that this change provides an adequate set of administrative measures to control the conduct of the initial test program, consistent with the guidance in RG 1.68, RG 1.206, and Section 14.2 of NUREG-0800. The applicant will revise the BLN COL FSAR to include the proposed administrative controls. Therefore, the staff finds this change acceptable. This is identified as ***Confirmatory Item 14.2-4****, pending NRC review and approval of the revised BLN COL FSAR.*

In addition to the administrative controls for the conduct of the initial test program, the applicant identified COL Information Item 14.4-3 as an activity that cannot be fully resolved prior to issuance of the COL. In BLN COL FSAR, Part 10, "License Conditions and ITAAC," License Condition 2, "COL Holder Items," the applicant proposed Item 14.4-3 to address the development of a site-specific startup administrative manual. This site-specific startup administrative manual will contain the administration procedures and requirements that govern the activities associated with the plant initial test program, as described in Section 14.2 of the BLN COL FSAR. The applicant stated that the startup administrative manual will be provided to the NRC prior to initiating the initial test program. Additionally, in Part 10 of the BLN COL FSAR, proposed License Condition 8, "Startup Testing," the applicant discussed the process for making changes to the initial test program described in Chapter 14 of the Bellefonte COL FSAR. The applicant stated that any changes to the initial startup test program made in accordance with the provisions of 10 CFR 50.59 or Section VIII of Appendix D to 10 CFR Part 52 shall be reported in accordance with 50.59(d) within one month of such change.

The staff determined that it is acceptable to develop a site-specific startup administrative manual, which will contain the administrative procedures and standards that govern the activities associated with the plant initial test program, during the post-COL phase (see Section 14.2.3.5). Therefore, the staff finds acceptable proposed License Condition 2, Item 14.4-3. Concerns remain regarding the adequacy of administrative controls for changing the test program as described in License Condition 8. This is identified as ***Open Item 14.2-2.***

Resolution of Standard Content Confirmatory Item 14.2-4

The staff verified that the VEGP applicant has incorporated into its FSAR, as STD SUP 14.2-5 through STD SUP 14.2-8, the proposed administrative controls identified as Confirmatory Item 14.2-4 in the staff's SER for the BLN COL. On this basis, Confirmatory Item 14.2-4 is resolved.

Resolution of Standard Content Open Item 14.2-2

Part 10 of the VEGP COL application, proposed License Condition 8, "Startup Testing," describes the process for initiating changes to the initial test program. The applicant proposed to notify the NRC of any change made to the startup test program described in Chapter 14 of the VEGP COL FSAR in accordance with provisions of 10 CFR 50.59(d) or Section VIII of Appendix D, "Design Certification Rule for the AP1000 Design," *to 10 CFR Part 52, "Licenses, certifications and approvals for nuclear power plants," within one month of such change. Following the evaluation of License Condition 8 in the BLN COL application, as documented in the BLN SER, the staff has determined, based on closer examination, that proposed License Condition 8 provides adequate administrative controls for notifying the NRC of changes to the test program, consistent with regulatory requirements in 10 CFR 50.59(d) and Section VIII of Appendix D to 10 CFR Part 52. On this basis, the staff determined that the applicant adequately addressed Open Item 14.2-2, and it is, therefore, resolved.*

The following portion of this technical evaluation section is reproduced from Section 14.2.3.4 of the BLN SER:

AP1000 COL Information Item

- *STD COL 14.4-4, addressing the review and evaluation of test results*

The NRC staff reviewed STD COL 14.4-4 related to COL Information Item 14.4-4 included under Section 14.2.3.2 of the BLN COL FSAR. The applicant provided additional information to address COL Information Item 14.4-4 as described in the AP1000 DCD, Revision 17. COL Information Item 14.4-4 states:

> *The combined license holder is responsible for review and evaluation of individual test results as well as final review of overall test results and for review of selected milestones or hold points within the test phases. Test exceptions or results which do not meet acceptance criteria are identified to the affected and responsible design organizations, and corrective actions and retests, as required, are performed.*

The commitment was also captured as COL Action Item 14.4-4 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:

> *The COL applicant or holder is responsible for review and evaluation of individual test results.*

In Section 14.2.3.2 of the BLN COL FSAR, the applicant provided specific administrative controls for the review and evaluation of test results. The applicant stated that the startup engineer is responsible for reviewing and evaluating the test data, test results, and verifying that the acceptance criteria have been met. The applicant also stated that test results will be reviewed and approved by the JTWG. The applicant included provisions to identify and notify the responsible design organizations when test exceptions or results do not meet acceptance criteria. The applicant also discussed the utilization of the corrective action program for tracking test results that do not meet the acceptance criteria, and for providing corrective action and retests, as required. Additionally, the applicant provided controls for the review of preoperational and startup test results, and for the retention of test reports.

While reviewing Section 14.2.3.2, the staff was unable to find provisions to ensure that retesting required for modification or maintenance remains in compliance with ITAAC. In RAI 14.2-10, the staff requested that the applicant provide additional information regarding the provisions to ensure that retesting remains in compliance with ITAAC. The staff requested that the applicant revise Section 14.2.3.2 of the BLN COL FSAR to include such provisions. In its September 3*, 2008, response to the staff's RAI, the applicant stated that normal maintenance, repairs, and design changes are controlled by the configuration control process in conjunction with the quality assurance and corrective action programs. These processes will provide for the review of changes that could have an impact on ITAAC. The staff confirmed that Section 14.2.3.2 of the BLN COL FSAR, Revision 1, was amended to include provisions to verify that the results of retesting do not invalidate ITAAC. The staff finds this change acceptable. This resolves RAI 14.2-10.*

In RAI 14.2-12, dated December 8, 2008, the staff requested that the applicant supplement Section 14.2.3.2 of the BLN COL FSAR by adding additional administrative controls to be implemented for the review, evaluation, and approval of test results, consistent with the guidance in RG 1.206. In its January 22, 2009, response to the staff's RAI, the applicant proposed controls and assigned responsibilities for the review of each major phase of the initial test program. Specifically, the applicant proposed to develop controls to assure that results of the preoperational and startup test phases will be reviewed and evaluated by qualified personnel from the PT&O and the JTWG organizations and approved by the plant manager. Also, the review of test results will include participation from design and construction organizations. Following each major phase of the initial test program, and before proceeding to the next stage of testing, the applicant will review test results to ensure that all required tests have been completed and that testing for the next major phase will be conducted in a safe manner. Additionally, the applicant proposed to develop controls to prepare *startup test results in accordance with RG 1.16, “Reporting of Operating Information – Appendix A Technical Specifications.”*

The staff reviewed the applicant’s response to RAI 14.2-12 and determined that the proposed changes provide administrative provisions to control the review, evaluation, and approval of test results, consistent with the guidance in RG 1.68, RG 1.206, and Section 14.2 of NUREG-0800. Therefore, the staff finds this change acceptable. The applicant will revise the BLN COL FSAR to include the proposed administrative controls. This is identified as ***Confirmatory Item 14.2-5****, pending NRC review and approval of the revised BLN COL FSAR.*

In addition to the administrative controls for the review, evaluation, and approval of test results, the applicant identified COL Information Item 14.4-4 as an activity that cannot be fully resolved prior to issuance of the COL. In BLN COL FSAR, Part 10, “License Conditions and ITAAC,” proposed License Condition 2, “COL Holder Items,” the applicant proposed Item 14.4-4 to address the review and evaluation of test results. The applicant stated that the COL holder will be responsible for the review and evaluation of test results, as well as the final review of overall test results and for the review of selected milestones or hold points within the test phases. In addition, the applicant stated that test exceptions or results which do not meet acceptance criteria will be identified to the affected and responsible design organizations, and corrective actions and retests, as required, will be performed.

Since test results will not be available until a facility is built, the staff determined that it is appropriate and acceptable for the COL holder to review and evaluate individual test results during the post-COL phase (see Section 14.2.3.5). The staff reviewed the proposed license condition and determined that the applicant provided sufficient administrative controls for the review and evaluation of test results, consistent with the guidance contained in RG 1.68, RG 1.206, and Section 14.2 of NUREG-0800.

Test Records

In its response to RAI 14.2-12, the applicant proposed to supplement the information incorporated by reference from Section 14.2.3.3 of the AP1000 DCD, Revision 17. The applicant stated that startup test reports will be generated and will describe and summarize the completion of tests during the initial test program. These proposed reports will address each test described in the BLN COL FSAR, describe measured values of operating conditions or characteristics from the initial test program as compared to design or specification values, and describe corrective actions and information required by license conditions. The applicant also described the frequency of such reports. Specifically, these proposed reports will be submitted 9 months following initial criticality, 90 days after completion of the test program, or 90 days after the start of commercial operations. The applicant also stated that in the event that one report does not cover these three events (i.e., initial criticality, completion of the *test program, and start of commercial operations), supplemental reports will be submitted every three months until all three events are completed.*

The staff reviewed the applicant's response to RAI 14.2-12 and determined that the proposed changes provide a set of administrative provisions to generate test reports, consistent with the guidance in RG 1.68, RG 1.206, and Section 14.2 of NUREG-0800. Therefore, the staff finds this change acceptable. The applicant will revise the BLN COL FSAR to include the proposed administrative controls. This is identified as ***Confirmatory Item 14.2-6****, pending NRC review and approval of the revised BLN COL FSAR.*

The staff determined that the supplemental information provided by the applicant described an acceptable method for activities related to test specifications and test procedures, conduct of the initial test program, and review, evaluation, and approval of test results, consistent with the guidance in RG 1.68 and RG 1.206. Therefore, the staff finds this change to be acceptable.

<u>*Resolution of Standard Content Confirmatory Items 14.2-5 and 14.2-6*</u>

The staff verified that the VEGP applicant has incorporated into its FSAR the proposed administrative controls identified as Confirmatory Items 14.2-5 and 14.2-6 in the staff's SER for the BLN COL. On this basis, Confirmatory Items 14.2-5 and 14.2-6 are resolved.

<u>*Evaluation of Revised License Condition 2, Items 14.4-3 and 14.4-4*</u>

In a letter dated October 15, 2010, the applicant proposed revisions to Items 14.4-3 and 14.4-4 of License Condition 2. Item 14.4-3 (evaluated above as part of the four SUP items) and Item 14.4-4 (evaluated above as part of STD COL 14.4-4) are considered unnecessary by the applicant as they can be adequately addressed by other proposed license conditions. The applicant proposed to replace the current text for Item 14.4-3 with, "Note - addressed by proposed License Conditions #3 and #6," and proposed to replace the current text for Item 14.4-4 with, "Note - addressed by proposed License Condition #9."

The text of Item 14.4-3 of License Condition 2 proposed to be deleted by the applicant's October 15, 2010, letter states that a site-specific startup administration manual (procedure), which includes the administration procedures and requirements that govern the activities associated with the plant's initial test program, would be provided prior to initiating the plant initial test program. Proposed License Condition 3 requires the operational program that addresses startup testing to be implemented prior to beginning the testing, and the proposed revision to Item c of License Condition 6 (evaluated above) would add the site-specific startup administrative manual to the items for which a schedule of availability would be provided to the NRC. The staff agrees that the combination of proposed License Condition 3 and proposed License Condition 6 *(as revised) will accomplish the goal of the text that is currently in Item 14.4-3 of License Condition 2.*

The text of Item 14.4-4 of License Condition 2 that is proposed to be deleted by the applicant's October 15, 2010, letter states that prior to initial fuel load, the licensee is responsible for review and evaluation of individual test results, as well as final review of overall test results and for review of selected milestones or hold points within the test phases. Test exceptions or results that do not meet acceptance criteria are identified to the affected and responsible design organizations, and corrective actions and retests are performed. The applicant stated that the proposed revision to License Condition 9 (which was initially proposed by the applicant in a letter dated June 18, 2010) also requires review and evaluation of individual test results, and that test exceptions or results that do not meet acceptance criteria are identified to the affected and responsible organizations, and corrective actions and retests, as required, are performed. The proposed revision would specifically add the review and evaluation of test results for those tests conducted during preoperational testing and for those conducted during power ascension (i.e., above low-power testing (defined as less than 5 percent rated thermal power [RTP])) up to and including testing at 100 percent RTP. This condition would then cover the entire startup testing program and would be retitled as "Startup Program Test Results." The staff agrees that the proposed revisions to License Condition 9 will accomplish the goal of the text that is currently in Item 14.4-4 of License Condition 2. Proposed License Condition 9 is evaluated by the staff in Section 14.2.8 of this SER.

14.2.3.5 *Post Combined License Activities*

The license condition language in this section has been clarified from previously considered language. In a letter dated March 22, 2016 (ADAMS Accession No. ML16084A099), the applicant did not identify any concerns with the clarified license condition language. The changes do not affect the staff's above analysis of the conditions, and therefore, for the reasons discussed in the technical evaluation section above, the staff finds the following license conditions acceptable:

- License Condition (14-1) – No later than 12 months after issuance of the COL, the licensee shall submit to the Director of NRO, or the Director's designee, a schedule for implementation of the approved preoperational and startup procedures (including the site-specific startup administration manual). The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until this license condition has been fully implemented. The schedule shall identify the completion of or implementation of the pre-operational and startup procedures (including the site-specific startup administration manual) identified in FSAR Section 14.2.3 (before initiating the initial test program).

- License Condition (14-2) – Within one month of change, any changes to the Initial Startup Test Program described in Chapter 14 of the WLS COL FSAR made in accordance with the provisions of 10 CFR 50.59 or Section VIII of Appendix D to 10 CFR Part 52 shall be reported in accordance with 10 CFR 50.59(d).

14.2.3.6 *Conclusion*

The NRC staff reviewed the application and checked the referenced DCD. The NRC staff's review confirmed that the applicant addressed the required information relating to the test specifications and procedures, and there is no outstanding information to be addressed in the WLS COL FSAR related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the information presented in the WLS COL FSAR is acceptable because it meets the requirements of 10 CFR 52.79(a)(28) and Criterion XI of Appendix B to 10 CFR Part 50. The staff based its conclusions on the following:

- STD COL 14.4-2 is acceptable because it provides an adequate description of the administrative controls for the development, review, and approval of individual test specifications and test procedures that will be implemented during the conduct of the initial test program and meets the guidance in NUREG-0800, Section 14.2.

- STD COL 14.4-3 is acceptable because it provides an adequate description of the administrative controls for the development of a site-specific administrative manual (procedure) that will be implemented during the conduct of each major phase of the initial test program and meets the guidance in NUREG-0800, Section 14.2.

- STD COL 14.4-4 is acceptable because it provides an adequate description of the administrative controls for the review, evaluation, and approval of test results by qualified personnel, and the resolution of test exceptions or tests that do not meet the acceptance criteria during each major phase of the initial test program and meets the guidance in NUREG-0800, Section 14.2 and RG 1.68.

- STD SUP 14.2-5 is acceptable because it provides an adequate description of the administrative controls for work and tagging requests that will be implemented during the conduct of the initial test program and meets the guidance in NUREG-0800, Section 14.2.

- STD SUP 14.2-6 is acceptable because it provides an adequate description of the administrative controls for system turnover in an orderly and well-coordinated manner during the conduct of the initial test program and meets the guidance in NUREG-0800, Section 14.2.

- STD SUP 14.2-7 is acceptable because it provides an adequate description of the administrative controls for plant modifications and repairs identified as a result of plant testing and meets the guidance in NUREG-0800, Section 14.2.

- STD SUP 14.2-8 is acceptable because it provides an adequate description of the administrative controls for corrective or preventive maintenance that will be implemented during the conduct of the initial test program and meets the guidance in NUREG-0800, Section 14.2.

14.2.4 Compliance of Test Program with Regulatory Guides

Section 14.2 of the WLS COL FSAR, Revision 11, incorporates by reference, with no departures or supplements, Section 14.2.4, “Compliance of Test Program with Regulatory Guides,” of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.[1] The NRC staff’s review confirmed that there is no outstanding issue related to this section. The results of the NRC staff’s technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

14.2.5 Utilization of Operating Experience (Related to RG 1.206, Section C.III.1, Chapter 14, C.I.14.2.8, “Utilization of Reactor Operating and Testing Experiences in Development of Test Program”)

14.2.5.1 *Introduction*

The design, testing, startup, and OE from previous pressurized water reactor plants is utilized in the development of the initial preoperational and startup test program for the AP1000 plant. It is also the responsibility of the COL applicant to utilize the reactor operating and testing experience in different aspects of the testing program.

14.2.5.2 *Summary of Application*

Section 14.2 of the WLS COL FSAR, Revision 11, incorporates by reference Section 14.2 of the AP1000 DCD, Revision 19. Section 14.2 of the DCD includes Section 14.2.5.

In addition, in WLS COL FSAR Section 14.2.5 and in Part 10 of the application, the applicant provided the following:

Supplemental Information

- STD SUP 14.2-4

The applicant provided supplemental information to describe the utilization of operating experience in the development of plant administrative procedures.

License Conditions

The applicant provided license conditions in Part 10 of its application that endorsed the standard content license conditions of the RCOL. The specific number of a proposed WLS license condition in some instances is different from the RCOL number. For these instances the corresponding WLS Part 10, license condition number is provided in square brackets. For example, RCOL Part 10, License Condition 7 equals WLS Part 10, License Condition 9 (noted below).

- Part 10, License Condition 2, Item 14.4-6

The proposed license condition addresses first-plant-only and three-plant-only tests.

- Part 10, License Condition 7 [WLS Part 10, License Condition 9]

The proposed license condition addresses first-plant-only and three-plant-only tests.

14.2.5.3 *Regulatory Basis*

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the utilization of operating and testing experience are given in Section 14.2 of NUREG-0800.

The applicable regulatory requirements for the information being reviewed in this section are 10 CFR 52.79(a)(28) and Criterion XI of Appendix B to 10 CFR Part 50. RG 1.68 provides guidance on how to comply with Criterion XI of Appendix B to 10 CFR Part 50.

14.2.5.4 *Technical Evaluation*

The NRC staff reviewed Section 14.2.5 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the utilization of operating and testing experience. The results of the NRC staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.

- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the WLS COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the BLN Units 3 and 4 COL application. Any confirmatory items in the standard content material retain the numbers assigned in the VEGP SER.

The following portion of this technical evaluation section is reproduced from Section 14.2.5.4 of the VEGP SER:

> *Supplemental Information*
>
> - *STD SUP 14.2-4*
>
> *The applicant provided supplemental information to describe the utilization of operating experience in the development of plant administrative procedures.*
>
> *STD SUP 14.2-4 was not in Revision 1 of the BLN FSAR and is addressed for the first time in this SER for the VEGP COL application. However, portions of the standard evaluation material in Section 14.2.5.4 of the BLN SER are directly applicable to the new STD SUP item identified in the VEGP FSAR. Therefore, the NRC staff used this evaluation material, identified below as standard content material, in the disposition of STD SUP 14.2-4.*
>
> *Section 14.2.5 of the AP1000 DCD provided a summary overview of the administrative controls to be utilized for the development of preoperational and startup test programs for the AP1000 plant. As part of RAI 14.2-12, dated December 8, 2008, the NRC staff requested that the applicant supplement the BLN COL FSAR to describe how OE information will be used in developing and executing test procedures. In its January 22, 2009, response to the staff's RAI, the applicant proposed to revise the information in Section 14.2.5 of the BLN COL FSAR. The response stated that administrative procedures will be used for the control and evaluation of OE information. Specifically, the response proposed the use of OE during test procedure preparation, including the sources and types of information reviewed. Sources of OE reported and described include NRC reports, Institute of Nuclear Power Operations reports, and Significant Operating Event Reports. The response stated that Section 14.2.5 of the BLN COL FSAR would include a summary of the principal conclusions from a review of operating and testing experiences at other reactor facilities and their effect on the applicant's test program.*
>
> *The staff determined that the information proposed by the applicant describes an acceptable method for the consideration of reactor operating and testing*

*experience, and discussed the principal conclusions from a review of operating and testing experience and its inclusion into the initial test program description, consistent with the guidance in RG 1.68 and RG 1.206. Therefore, the staff finds this change acceptable. The applicant will revise the BLN COL FSAR to include the proposed administrative controls. This is identified as **Confirmatory Item 14.2-7**, pending NRC review and approval of the revised BLN COL FSAR.*

Resolution of Standard Content Confirmatory Item 14.2-7

The staff verified that the VEGP applicant has incorporated into its FSAR, in response to STD SUP 14.2-4, the proposed administrative controls identified as Confirmatory Item 14.2-7 in the staff's SER for the BLN COL. On this basis, Confirmatory Item 14.2-7 is resolved.

License Conditions

- *Part 10, License Condition 2, Item 14.4-6*

The following portion of this technical evaluation section is reproduced from Section 14.2.5.4 of the BLN SER:

In BLN COL FSAR, Part 10, "License Conditions and ITAAC," proposed License Condition 2, "COL Holder Items," the applicant proposed Item 14.4-6 to address first-plant-only and three-plant-only tests. The applicant stated that the COL holder for the first plant and the first three plants will perform the tests listed in Section 14.2.5 of the BLN COL FSAR. For subsequent plants, the COL applicant shall provide a justification that the results of the first-plant only tests or first-three-plant tests are applicable to the subsequent plant. In addition, COL holders referencing the results of the tests will provide the report prior to preoperational testing.

The staff reviewed the proposed license condition and determined that the applicant provided sufficient administrative controls for the performance of first-plant-only and three-plant-only tests, consistent with the guidance contained in RG 1.68, RG 1.206, and Section 14.2 of NUREG-0800. In addition, since test activities will not start until a facility is built, the staff determined that it is appropriate and acceptable for the COL holder to conduct these first-plant-only and three-plant-only tests during the post-COL phase (see Section 14.2.5.5).

Evaluation of Revised License Condition 2, Item 14.4-6

In a letter dated October 15, 2010, the VEGP applicant proposed a revision to License Condition 2, Item 14.4-6. Item 14.4-6 is considered unnecessary by the applicant as it can be adequately addressed by other proposed license conditions. The applicant proposed to replace the current text for Item 14.4-6 with, "Note - addressed by proposed License Conditions #7 and #9."

The text of Item 14.4-6 proposed to be deleted by the applicant's October 15, 2010, letter states the licensee(s) for the first plant and the first three plants will perform the tests listed in Section 14.2.5 of the VEGP COL FSAR. For subsequent plants, either tests listed in Section 14.2.5 shall be performed or the licensee shall provide a justification to the NRC, prior to fuel load, that the results of the first-plant-only tests or first-three-plant tests are applicable to the subsequent plant. The licensee(s) for the first AP1000 plant (or first-three-plants) will perform the tests defined during preoperational and startup testing as identified in Sections 14.2.9 and 14.2.10 of the VEGP COL FSAR.

The applicant stated that the October 15, 2010, proposed revisions to License Conditions 7 and 9 (both license conditions were initially proposed by the applicant in a letter dated June 18, 2010) adequately address the 3 parts of Item 14.4-6. Proposed License Condition 7 provides details on first-plant-only and three-plant-only tests and proposed License Condition 9 requires review and evaluation of individual test results, and that test exceptions or results that do not meet acceptance criteria are identified to the affected and responsible organizations, and corrective actions and retests, as required, are performed. The October 15, 2010, proposed revision to License Condition 9 would specifically add the review and evaluation of test results for those tests conducted during preoperational testing and for those conducted during power ascension (i.e., above low-power testing (<5 percent RTP) up to and including testing at 100 percent RTP). The October 15, 2010, proposed revision to License Condition 7 will address the written notifications for the pertinent testing.

The staff agrees that the proposed revisions to License Conditions 7 and 9 will accomplish the goal of the text that is currently in Item 14.4-6 of License Condition 2. Proposed License Condition 7 is evaluated by the staff later in this SER section. Proposed License Condition 9 is evaluated by the staff in Section 14.2.8 of this SER.

- *Part 10, License Condition 7 [WLS Part 10, License Condition 9]*

In its letter dated June 18, 2010, as revised by letter dated October 15, 2010, the applicant proposed License Condition 7, providing additional details on first-plant-only and three-plant-only tests. Certain design features of the AP1000 plant will be subjected to special tests to establish unique phenomenological performance parameters of the AP1000 design. Because of the standardization of the AP1000 design, these special tests (designated as first-plant-only tests and first-three-plant-only tests) are not required on subsequent plants. These tests will be controlled through license conditions to ensure that relevant test results are reviewed, evaluated, and approved by the designated licensee management before proceeding with the next testing phase. Accordingly, the applicant proposed the following license condition:

First-Plant-Only and First-Three-Plant-Only Testing

A licensee shall provide written identification of the applicable references for documentation for the completion of the testing to the Director of the Office of New Reactors (or equivalent NRC management) within thirty (30) calendar days of the licensee confirmation of acceptable test results.

Subsequent plant licensees crediting completion of testing by the first-plant or by the first-three plants shall provide a report referencing the applicable documentation identified by the first (or first three) plant(s) confirming the testing to the Director of the Office of New Reactors (or equivalent NRC management). This report shall be provided to NRC either prior to initiation of pre-operational testing, or within sixty (60) days of the identification of the documentation for the completion of the testing by the first plant (or third plant, as appropriate), whichever is later.

The NRC staff reviewed the proposed license condition and concludes that it contains some of the necessary attributes to achieve sufficient oversight by licensee management and assure adequate and timely notification to the NRC. However, the NRC staff plans to impose additional conditions in the areas addressed by proposed License Condition 7 to ensure that the relevant requirements in Section 14.2 of the AP1000 DCD are met.

14.2.5.5 *Post Combined License Activities*

The license condition language in this section has been clarified from previously considered language. In a letter dated March 22, 2016 (ADAMS Accession No. ML16084A099), the applicant did not identify any concerns with the clarified license condition language. The changes do not affect the staff's above analysis of the conditions, and therefore, for the reasons discussed in the technical evaluation section above, the staff finds the following license condition acceptable:

- License Condition (14-3) – The licensee shall perform the design-specific pre-operational tests identified below:
    1. In-Containment Refueling Water Storage Tank (IRWST) Heatup Test (first plant test as identified in AP1000 Design Control Document (DCD), Rev. 19, Section 14.2.9.1.3 Item (h));
    2. Pressurizer Surge Line Stratification Evaluation (first plant test as identified in AP1000 DCD, Rev. 19, Section 14.2.9.1.7 Item (d));
    3. Reactor Vessel Internals Vibration Testing (first plant test as identified in AP1000 DCD, Rev. 19, Section 14.2.9.1.9);
    4. Core Makeup Tank Heated Recirculation Tests (first three plants test as identified in AP1000 DCD, Rev. 19, Section 14.2.9.1.3 Items (k) and (w)); and
    5. Automatic Depressurization System Blowdown Test (first three plants test as identified in AP1000 DCD, Rev. 19, Section 14.2.9.1.3 Item (s)).

  The licensee shall notify the Director of NRO, or the Director's designee, in writing, upon successful completion of the design specific pre-operational tests.

14.2.5.6 *Conclusion*

The NRC staff reviewed the application and checked the referenced DCD. The NRC staff's review confirmed that the applicant addressed the required information relating to the utilization of operating and testing experience, and there is no outstanding information to be addressed in the WLS COL FSAR related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the information presented in the WLS COL FSAR is acceptable, because it meets the requirements of 10 CFR 52.79(a)(28) and Criterion XI of Appendix B to 10 CFR Part 50. The staff based its conclusions on the following:

- STD SUP 14.2-4 is acceptable because it provides an adequate description of the administrative procedures that will be implemented to utilize operating experience in the development of plant administrative procedures during the conduct of the initial test program and meets the guidance in NUREG-0800, Section 14.2.

14.2.6 Use of Plant Operating and Emergency Procedures (Related to RG 1.206, Section C.III.1, Chapter 14, C.I.14.2.9, "Trial Use of Plant Operating and Emergency Procedures")

14.2.6.1 *Introduction*

To the extent practicable throughout the preoperational and initial startup test program, test procedures utilize operating, emergency, and abnormal procedures where applicable in the performance of tests. The use of these procedures is intended to do the following:

1. Provide the specific procedure or illustrate changes that may be required.
2. Provide training of plant personnel in the use of these procedures.

3. Increase the level of knowledge of plant personnel on the systems being tested.

A testing procedure utilizing an operating, emergency, or abnormal procedure references the procedure directly, or extracts a series of steps from the procedure in a way that is optimal to accomplishing the above goals while efficiently performing the specified testing.

14.2.6.2 *Summary of Application*

Section 14.2 of the WLS COL FSAR, Revision 11, incorporates by reference Section 14.2 of the AP1000 DCD, Revision 19. Section 14.2 of the DCD includes Section 14.2.6.

In addition, in WLS COL FSAR Section 14.2.6, the applicant provided the following:

AP1000 COL Information Item

- STD COL 14.4-3

The applicant provided additional information in STD COL 14.4-3 to address COL holder responsibility for the development of a site-specific startup administrative manual (procedure) that will include the administrative procedures and requirements that will govern the activities associated with the plant's initial test program.

14.2.6.3 *Regulatory Basis*

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the use of plant operating and emergency procedures are given in Section 14.2 of NUREG-0800.

The applicable regulatory requirements for the information being reviewed in this section are 10 CFR 52.79(a)(28) and Criterion XI of Appendix B to 10 CFR Part 50. RG 1.68 provides guidance on how to comply with Criterion XI of Appendix B to 10 CFR Part 50.

14.2.6.4 *Technical Evaluation*

The NRC staff reviewed Section 14.2.6 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to plant operating and emergency procedures. The results of the NRC staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.

- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the WLS COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the BLN Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from Section 14.2.6.4 of the VEGP SER:

> *<u>AP1000 COL Information Item</u>*
>
> - *STD COL 14.4-3*
>
> *STD COL 14.4-3 was not explicitly evaluated in Section 14.2.6.4 of the BLN SER. However, the standard evaluation material in Section 14.2.6.4 of the BLN SER is directly applicable to this COL item. Therefore, the NRC staff used this evaluation material, identified below as standard content material, in the disposition of STD COL 14.4-3, as it relates to plant operating and emergency procedures.*
>
> *Section 14.2.6 of the AP1000 DCD stated that plant normal, abnormal, and emergency operating procedures will be used when performing preoperational and startup tests. As part of RAI 14.2-12, dated December 8, 2008, the staff requested that the applicant supplement the information incorporated by reference and describe how, and to what extent, the plant operating, emergency, and surveillance procedures will be trial-tested during the initial test program. In its January 22, 2009, response to the staff's RAI, the applicant proposed a method to develop, trial-test, and correct plant operating and emergency procedures during the initial test program. The response stated that preoperational and start up test procedures, normal, abnormal, and emergency procedures, and alarm response procedures, will be verified, validated, and implemented. The response proposed to describe administrative measures for*

the trial use of procedures in human machine interface testing as part of the control room design finalization. The response also proposed that controls would include the development of operating and emergency procedures to support human factors engineering, operational task analysis, training simulator development, and verification and validation of procedures and training material.

The response also proposed to include Section 14.2.6.1, "Operator Training and Participation during Certain Initial Tests," in the BLN COL FSAR. The response proposed administrative controls that will provide for the participation of plant operators and shift crews in plant changes, off-normal events, test program schedule, and selected startup tests. The response also proposed measures to ensure that unexpected plant or system responses will be reviewed, evaluated, and their results factored into the operator training program. The response stated that the operator training program will satisfy the criteria described in TMI Action Plan Item I.G.1 of NUREG-0737.

The staff determined that the information proposed by the applicant describe an acceptable method for the trial use of plant operating, emergency, and surveillance procedures, consistent with the guidance in RG 1.68 and RG 1.206. Therefore, the staff finds this change acceptable. The applicant will revise the BLN COL FSAR to include the proposed administrative controls. This is identified as ***Confirmatory Item 14.2-8****, pending NRC review and approval of the revised BLN COL FSAR.*

Resolution of Standard Content Confirmatory Item 14.2-8

The staff verified that the VEGP applicant has incorporated into its FSAR the proposed administrative controls identified as Confirmatory Item 14.2-8 in the staff's SER for the BLN COL. On this basis, Confirmatory Item 14.2-8 is resolved.

14.2.6.5 *Post Combined License Activities*

There are no post-COL activities related to this section.

14.2.6.6 *Conclusion*

The NRC staff reviewed the application and checked the referenced DCD. The NRC staff's review confirmed that the applicant addressed the required information relating to the use of plant operating and emergency procedures, and there is no outstanding information to be addressed in the WLS COL FSAR related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the information presented in the WLS COL FSAR is acceptable because it meets the requirements of 10 CFR 52.79(a)(28) and Criterion XI of Appendix B to 10 CFR Part 50. The staff based its conclusions on the following:

- STD COL 14.4-3 is acceptable because it provides an adequate description of the administrative measures for the trial use of plant operating, emergency, and surveillance procedures that will be implemented during the conduct of the initial test program and meets the guidance in NUREG-0800, Section 14.2 and RG 1.68.

14.2.7 Initial Fuel Loading and Initial Criticality

Section 14.2 of the WLS COL FSAR, Revision 11, incorporates by reference, with no departures or supplements, Section 14.2.7, "Initial Fuel Loading and Initial Criticality," of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.[1] The NRC staff's review confirmed that there is no outstanding issue related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

14.2.8 Test Program Schedule (Related to RG 1.206, Section C.III.1, Chapter 14, C.I.14.2.11, "Test Program Schedule")

14.2.8.1 *Introduction*

This section describes administrative controls for the development of a schedule, relative to the fuel loading date, for conducting each major phase of the test program. Each test required to be completed before initial fuel loading is identified.

14.2.8.2 *Summary of Application*

Section 14.2 of the WLS COL FSAR, Revision 11, incorporates by reference Section 14.2 of the AP1000 DCD, Revision 19. Section 14.2 of the DCD includes Section 14.2.8.

In addition, in WLS COL FSAR, Section 14.2.8, the applicant provided the following:

Supplemental Information

- STD SUP 14.2-1

The applicant provided supplemental information to address the site-specific initial test program schedule.

In addition, in Part 10 of the WLS COL application, the applicant provided the following:

License Conditions

The applicant provided license conditions in Part 10 of its application that endorsed the standard content license conditions of the RCOL. The specific number of a proposed WLS license condition in some instances is different from the RCOL number. For these instances the corresponding WLS Part 10, license condition number is provided in square brackets. For example, RCOL Part 10, License Condition 9 is WLS Part 10, License Condition 10 (noted below).

- Part 10, License Condition 3

The proposed license condition addresses the initial test program implementation milestones.

- Part 10, License Condition 6

The proposed license condition addresses reporting requirements to the NRC regarding the initial test program.

- Part 10, License Condition 7

The proposed license condition addresses first-plant-only and first-three-plant-only testing.

- Part 10, License Condition 9 [WLS Part 10, License Condition 10]

The proposed license condition addresses the power-ascension test phase.

14.2.8.3 *Regulatory Basis*

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the test program schedule are given in Section 14.2 of NUREG-0800.

The applicable regulatory requirements for the information being reviewed in this section are 10 CFR 52.79(a)(28) and Criterion XI of Appendix B to 10 CFR Part 50. RG 1.68 provides guidance on how to comply with Criterion XI of Appendix B to 10 CFR Part 50.

14.2.8.4 *Technical Evaluation*

The NRC staff reviewed Section 14.2.8 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the test program schedule. The results of the NRC staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP

Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.

- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the WLS COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the BLN Units 3 and 4 COL application. Any confirmatory items in the standard content material retain the numbers assigned in the VEGP SER.

The following portion of this technical evaluation section is reproduced from Section 14.2.8.4 of the VEGP SER:

Supplemental Information

- *STD SUP 14.2-1*

The applicant provided supplemental information to address the site-specific initial test program schedule.

The following portion of this technical evaluation section is reproduced from Section 14.2.8.4 of the BLN SER:

Test Program Schedule

As part of RAI 14.2-12, dated December 8, 2008, the staff requested that the applicant supplement the information incorporated by reference and describe the methodology that will be used to develop a schedule for conducting each major phase of the initial test program and for the development of test procedures. In its January 22, 2009, response to the staff's RAI, the applicant proposed to include information that further describes the administrative controls that will be used to develop a test program schedule. The applicant proposed controls for the development of a site-specific schedule that will address each major phase of the test program and will consider the organizational impact on overlapping test program schedules for multi-unit sites. The applicant also discussed the administrative measures in the startup administrative manual related to the test procedure development schedule and the initial test program schedule. The *applicant proposed specific controls for the development of detailed plant operating and emergency procedures, the availability of approved test procedures for review by NRC inspectors, and for the notification to the NRC of changes to approved test procedures. The response also stated that schedule milestones for the development of plant operating procedures are presented in Table 13.4-201 of the BLN COL FSAR. Finally, the response stated that operating and emergency procedures will be available for use both prior to the start of licensed operator training as well as during the initial test program implementation.*

The staff determined that the information proposed by the applicant described the methodology that will be used to develop a schedule, relative to the fuel loading date, for conducting each major phase of the test program, and for the development of test procedures, consistent with the guidance in RG 1.68 and RG 1.206. Therefore, the staff finds this change acceptable. The applicant will revise the BLN COL FSAR to include the proposed administrative controls. This is identified as ***Confirmatory Item 14.2-9****, pending NRC review and approval of the revised BLN COL FSAR.*

Operational Programs Required by the Regulations

In Section 13.4, Table 13.4-201, of the BLN COL FSAR, the applicant provided information to address the implementation of operational programs. The applicant identified the initial test program as an operational program and provided implementation milestones for each major phase of the test program. Additionally, the applicant stated that the initial test program will be implemented in three phases, namely the construction test program phase, the preoperational test program phase, and the startup test program phase. The construction test program phase will start prior to the first construction test being conducted. It will be followed by the preoperational test phase, which will start prior to the first preoperational test. Finally, the startup test phase is identified, and the applicant stated that it will start prior to initial fuel load. The staff reviewed the proposed milestones and determined that they adequately describe the implementation of each major phase of the initial test program and are, therefore, acceptable.

Resolution of Standard Content Confirmatory Item 14.2-9

The staff verified that the VEGP applicant has incorporated into its FSAR, in response to STD SUP 14.2-1, the proposed administrative controls identified as Confirmatory Item 14.2-9 in the staff's SER for the BLN COL. On this basis, Confirmatory Item 14.2-9 is resolved.

<u>*License Conditions*</u>

- *Part 10, License Conditions 3 and 6*

The following portion of this technical evaluation section is reproduced from Section 14.2.8.4 of the BLN SER:

In Part 10 of the BLN COL FSAR, License Condition 3, "Operational Program Implementation," the applicant proposed a license condition for the implementation of operational programs as described in Table 13.4-201 of the FSAR. This license condition included implementation milestones for the initial test program, namely E.1, F.1, and H.1. Specifically:

- *Milestone E.1 states that for construction testing, the licensee will implement the construction testing phase of the initial test program prior to the first construction test being conducted.*

- *Milestone F.1 states that for preoperational testing, the licensee will implement the preoperational testing phase of the initial test program prior to the first preoperational test being conducted.*

- *Milestone H.1 states that for startup testing, the licensee will implement the startup testing phase prior to initial fuel load.*

In Part 10 of the BLN COL FSAR, proposed License Condition 6, "Operational Program Readiness," the applicant states:

> *The licensee shall submit to the appropriate Director of the NRC, a schedule, no later than 12 months after issuance of the COL, that supports planning for and conduct of the NRC inspection of the operational programs listed in the operation program FSAR Table 13.4-201. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until either the operation programs in the FSAR table have been fully implemented or the plant has been placed in commercial service.*

The staff reviewed the BLN COL FSAR Table 13.4-201, and notes that the initial test program is listed as an operational program.

The staff determined that the proposed license conditions adequately describe the implementation of each major phase of the initial test program, consistent with the guidance contained in RG 1.68, RG 1.206, and Section 14.2 of NUREG-0800. In addition, since test activities will not start until a facility is built; the staff determined that it is appropriate and acceptable for the COL holder to submit a schedule, which will contain implementation details of operational programs, during the post-COL phase (see Section 14.2.8.5).

- *Part 10, License Condition 9 [WLS Part 10, License Condition 10]*

Certain milestones within the startup testing phase of the initial test program (i.e., pre-critical testing, criticality testing, and low-power testing) will need to be controlled through license conditions to ensure that relevant test results are reviewed, evaluated, and approved by the designated licensee management before proceeding with the power ascension test phase.

In its second letter dated June 18, 2010[2], as revised by letter dated October 15, 2010, the applicant proposed License Condition 9, providing additional detail on the power-ascension test phase. Specifically, the applicant proposed the following license condition:

> *<u>Pre-operational Testing</u>*
>
> *Following completion of pre-operational testing, the licensee shall review and evaluate individual test results. Test exceptions or results which do not meet acceptance criteria are identified to the affected and responsible organizations, and corrective actions and retests, as required, are performed.*
>
> *<u>Pre-critical and Criticality Testing</u>*
>
> 1. *Following completion of pre-critical and criticality testing, the licensee shall review and evaluate individual test results. Test exceptions or results which do not meet acceptance criteria are identified to the affected and responsible organizations, and corrective actions and retests, as required, are performed.*
>
> 2. *The licensee shall provide written notification to the Director of the Office of New Reactors (or equivalent NRC management) within fourteen (14) calendar days of completion of the pre-critical and criticality testing.*
>
> *<u>Low-Power (<5% RTP) Testing</u>*
>
> 1. *Following completion of low-power (<5% RTP) testing, the licensee shall review and evaluate individual test results. Test exceptions or results which do not meet acceptance criteria are identified to the affected and responsible organizations, and corrective actions and retests, as required, are performed.*

[2] The first letter dated June 18, 2010, provided proposed License Condition 7, which is evaluated in Section 14.2.5 of this SER.

2. *The licensee shall provide written notification to the Director of the Office of New Reactors within fourteen (14) calendar days of completion of the low power testing.*

At-Power (5%-100% RTP) Testing

1. *Following completion of at-power testing (at or above 5% RTP up to and including testing at 100% RTP), the licensee shall review and evaluate individual test results. Test exceptions or results which do not meet acceptance criteria are identified to the affected and responsible organizations, and corrective actions and retests, as required, are performed.*

2. *The licensee shall provide written notification to the Director of the Office of New Reactors (or equivalent NRC management) within fourteen (14) calendar days of completion of the at-power testing.*

The NRC staff reviewed the proposed license condition and concludes that it contains some of the necessary attributes to achieve sufficient oversight by licensee management and assure adequate and timely notification to the NRC. However, the NRC staff plans to impose additional conditions in the areas addressed by proposed License Condition 9 to ensure that the relevant guidance of RG 1.68 and the relevant requirements of Criterion XI of Appendix B to 10 CFR Part 50 are met.

14.2.8.5 *Post Combined License Activities*

The license condition language in this section has been clarified from previously considered language. In a letter dated March 22, 2016 (ADAMS Accession No. ML16084A099), the applicant did not identify any concerns with the clarified license condition language. The changes do not affect the staff's above analysis of the conditions, and therefore, for the reasons discussed in the technical evaluation section above, the staff finds the following license conditions acceptable:

- License Condition (14-4) – The licensee shall implement the initial test program or applicable portions thereof as described in the milestones below:
  1. Construction Test Program implemented before the first construction test;
  2. Preoperational Test Program implemented before the first preoperational test; and
  3. Startup Test Program implemented before initial fuel load.

- License Condition (14-5) – No later than 12 months after issuance of the COL, the licensee shall submit to the Director of NRO, or the director's designee, a schedule that supports planning for and conduct of NRC inspections of the Initial Test Program (ITP). The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until the ITP has been fully implemented.

- License Condition (14-6) –

  Pre-operational Testing

  1. The licensee shall review and evaluate the results of the tests identified in License Condition (14-3) and confirm that these test results are within the range of acceptable values predicted or otherwise confirm that the tested systems perform their specified functions in accordance with AP1000 DCD Rev. 19, Section 14.2.9.
  2. The licensee shall notify the Director of NRO, or the Director's designee, in writing, upon successful completion of the design specific pre-operational tests identified in License Condition (14-3); and
  3. The licensee shall notify the Director of NRO, or the Director's designee, in writing, upon the successful completion of all the ITAAC.

  Nuclear Fuel Loading and Pre-critical Testing

  1. Until the submission of the notification required by "Pre-operational Testing," item 2, above, the licensee shall not load fuel into the reactor vessel;
  2. Upon submission of the notification required by "Pre-operational Testing," item 2, above, and upon a Commission finding in accordance with 10 CFR 52.103(g) that all the acceptance criteria in the ITAAC are met, the licensee is authorized to perform pre-critical tests in accordance with the conditions specified herein;
  3. The licensee shall perform the pre-critical tests identified in AP1000 DCD Rev. 19, Section 14.2.10.1;
  4. The licensee shall review and evaluate the results of the tests identified in "Nuclear Fuel Loading and Pre-critical Testing," item 3, above, and confirm that these test results are within the range of acceptable values predicted or otherwise confirm that the tested systems perform their specified functions in accordance with AP1000 DCD Rev. 19, Section 14.2.10; and
  5. The licensee shall notify the Director of NRO, or the Director's designee, in writing, upon successful completion of the pre-critical tests identified in "Nuclear Fuel Loading and Pre-critical Testing," item 3, above.

  Initial Criticality and Low-Power Testing

  1. Upon submission of the notification required by "Nuclear Fuel Loading and Pre-critical Testing," item 5, above, the licensee is authorized to operate the facility at reactor steady-state core power levels not to exceed 5-percent thermal power in accordance with the conditions specified herein;

2. The licensee shall perform the initial criticality and low-power tests identified in AP1000 DCD Rev. 19, Sections 14.2.10.2 and 14.2.10.3, respectively, the Natural Circulation (first plant test) identified in AP1000 DCD Rev. 19, Section 14.2.10.3.6, and the Passive Residual Heat Removal Heat Exchanger (first plant test) identified in AP1000 DCD Rev. 19, Section 14.2.10.3.7;
3. The licensee shall review and evaluate the results of the tests identified in "Initial Criticality and Low-Power Testing," item 2, above, and confirm that these test results are within the range of acceptable values predicted or otherwise confirm that the tested systems perform their specified functions in accordance with AP1000 DCD Rev. 19, Section 14.2.10.2 and 14.2.10.3; and
4. The licensee shall notify the Director of NRO, or the Director's designee, in writing, upon successful completion of initial criticality and low-power tests identified in "Initial Criticality and Low-Power Testing," item 2, above, including the design-specific tests identified therein.

Power Ascension Testing

1. Upon submission of the notification required by "Initial Criticality and Low-Power Testing," item 4, above, the licensee is authorized to operate the facility at reactor steady-state core power levels not to exceed 100-percent thermal power in accordance with the conditions specified herein, but only for the purpose of performing power ascension testing;
2. The licensee shall perform the power ascension tests identified in the AP1000 DCD Rev. 19, Section 14.2.10.4, the Rod Cluster Control Assembly Out of Bank Measurements (first plant test) identified in AP1000 DCD, Rev. 19, Section 14.2.10.4.6, and the Load Follow Demonstration (first plant test) identified in AP1000 DCD, Rev. 19, Section 14.2.10.4.22;
3. The licensee shall review and evaluate the results of the tests identified in "Power Ascension Testing," item 2, above, and confirm that these test results are within the range of acceptable values predicted or otherwise confirm that the tested systems perform their specified functions in accordance with AP1000 DCD Rev.19, Section 14.2.10.4; and
4. The licensee shall notify the Director of NRO, or the Director's designee, in writing, upon successful completion of power ascension tests identified in "Power Ascension Testing," item 2, above, including the design-specific tests identified therein.

Maximum Power Level

Upon submission of the notification required by "Power Ascension Testing," item 4, above, the licensee is authorized to operate the facility at steady state reactor core power levels not to exceed 3400 MW thermal (100-percent thermal power), as described in the FSAR, in accordance with the conditions specified herein.

14.2.8.6 *Conclusion*

The NRC staff reviewed the application and checked the referenced DCD. The NRC staff's review confirmed that the applicant addressed the required information relating to the test program schedule, and there is no outstanding information to be addressed in the WLS COL FSAR related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the information presented in the WLS COL FSAR is acceptable, because it meets the requirements of 10 CFR 52.79(a)(28) and Criterion XI of Appendix B to 10 CFR Part 50. The staff based its conclusions on the following:

- STD SUP 14.2-1 is acceptable because it provides an adequate description of the administrative measures for the development of a site-specific initial test program schedule and meets the guidance in NUREG-0800, Section 14.2 and RG 1.68.

14.2.9 Preoperational Test Descriptions (Related to RG 1.206, Section C.III.1, Chapter 14, C.I.14.2.12, "Individual Test Descriptions")

14.2.9.1 *Introduction*

This section includes test abstracts for each individual test conducted during the initial test program. The abstracts: (1) identify each test by title; (2) specify the prerequisites and major plant operating conditions necessary for each test (such as power level and mode of operation of major control systems); (3) provide a summary description of the test objectives and method, significant parameters, and plant performance characteristics to be monitored; and (4) provide a summary of the acceptance criteria established for each test to ensure that the test verifies the functional adequacy of the SSCs involved in the test. The abstracts also include sufficient information to justify the specified test method if such method does not subject the SSC under test to representative design operating conditions. In addition, the abstracts identify pertinent precautions for individual tests, as necessary (e.g., minimum flow requirements or reactor power level that must be maintained).

14.2.9.2 *Summary of Application*

Section 14.2 of the WLS COL FSAR, Revision 11, incorporates by reference Section 14.2 of the AP1000 DCD, Revision 19. Section 14.2 of the DCD includes Section 14.2.9.

In addition, in WLS COL FSAR, the applicant provided the following:

Departures

- WLS DEP 6.4-2

The applicant provided additional information in Section 14.2.9 of the WLS COL FSAR about WLS DEP 6.4-2 related to design changes affecting how the temperature and humidity in the main control room are maintained within the limits for reliable human performance. This information, as well as related WLS DEP 6.4-2 information appearing in other chapters of the FSAR, is reviewed in Section 21.3 of this SER.

AP1000 COL Information Items

- STD COL 14.4-5

The applicant provided additional information in STD COL 14.4-5 to address interface requirements.

- STD COL 3.9-5

The applicant provided additional information in STD COL 3.9-5 to address initial testing of the pressurizer surge line piping.

Supplemental Information

- STD SUP 14.2-2

The applicant provided additional information in STD SUP 14.2-2 to address the development of administrative procedures that will be implemented during the preoperational testing activities.

14.2.9.3 *Regulatory Basis*

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the preoperational test descriptions are given in Section 14.2 of NUREG-0800.

The applicable regulatory requirements for the information being reviewed in this section are 10 CFR 52.79(a)(28) and Criterion XI of Appendix B to 10 CFR Part 50. RG 1.68 provides guidance on how to comply with Criterion XI of Appendix B to 10 CFR Part 50.

14.2.9.4 *Technical Evaluation*

The NRC staff reviewed Section 14.2.9 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the preoperational test descriptions. The results of the NRC staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.

- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the WLS COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the BLN Units 3 and 4 COL application. Any confirmatory items in the standard content material retain the numbers assigned in the VEGP SER.

The following portion of this technical evaluation section is reproduced from Section 14.2.9.4 of the VEGP SER:

> *<u>AP1000 COL Information Items</u>*
>
> - *STD COL 14.4-5*
>
> *The NRC staff reviewed STD COL 14.4-5 related to COL Information Item 14.4-5, which addresses interface requirements. The applicant provided additional information in Sections 14.2.9 and 14.2.10 of the VEGP COL FSAR to address COL Information Item 14.4-5. COL Information Item 14.4-5 states:*
>
> > *The Combined License applicant is responsible for testing that may be required of structures and systems which are outside the scope of this design certification. Test Specifications and acceptance criteria are provided by the responsible design organizations as identified in subsection 14.2.3 [of the AP1000 DCD]. The interfacing systems to be considered for testing are taken from Table 1.8-1 [of the AP1000 DCD] and include as a minimum, the following:*
> >
> > - *Storm drains*
> > - *Site specific seismic sensors*
> > - *Offsite [alternating current] ac power systems*
> > - *Circulating water heat sink*

- *Raw and sanitary water systems*
- *Individual equipment associated with the fire brigade*
- *Portable personnel monitors and radiation survey instruments*
- *Equipment associated with the physical security plan*

The commitment was also captured as COL Action Item 14.4-5 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:

> *The COL applicant is responsible for testing that may be required of structures and systems that are outside the scope of the design certification.*

The following portion of this technical evaluation section is reproduced from Section 14.2.9.4 of the BLN SER. Some of the text in the BLN SER associated with STD COL 14.4-5 has been relocated to the evaluation of STD SUP 14.2-2, as discussed below.

In its review of the information provided by the applicant to address COL Information Item 14.4-5, the staff noted that the seismic monitoring system testing described in Section 14.2.9.4.15 of the AP1000 DCD also applies to the site-specific seismic sensors.

The applicant also provided information regarding the following systems:

- *storm drains (Section 14.2.9.4.22)*
- *offsite ac power systems (Section 14.2.9.4.23)*
- *raw water systems (Section 14.2.9.4.24)*
- *sanitary drainage system (Section 14.2.9.4.25)*
- *fire brigade support equipment (Section 14.2.9.4.26)*
- *portable personnel monitors and radiation survey instruments (Section 14.2.9.4.27)*
- *cooling tower(s) (Section 14.2.10.4.29)*

The staff notes that information provided relative to equipment associated with the Physical Security Plan will be reviewed in Chapter 13 of this SER.

As part of RAI 14.2-1, the staff requested that the applicant provide additional information in the test abstract related to the offsite ac power systems. Specifically, Section 14.2.9.4.23 of the BLN COL FSAR states that the offsite ac power system components undergo a series of individual component and integrated system preoperational tests to verify that the offsite ac power system performs in accordance with the associated component design specifications. The individual component and integrated tests include:

a. *Availability of ac and direct current (dc) power to the switchyard equipment is verified.*

b. Operation of high voltage (HV) circuit breakers is verified.

c. Operation of HV disconnect switches and ground switches is verified.

d. Operation of substation transformers is verified.

e. Operation of current transformers, voltage transformers, and protective relays is verified.

f. Operation of switchyard equipment controls, metering, interlocks, and alarms that affect plant offsite ac power system performance is verified.

g. Design limits of switchyard voltages and stability are verified.

h. Under simulated fault conditions, proper function of alarms and protective relaying circuits is verified.

The staff asked in its RAI that the above list should include the following items:

- *Operation of instrumentation and control alarms used to monitor switchyard equipment status*
- *Proper operation and load carrying capability of breakers, switchgear, transformers, and cables*
- *Proper operation of the automatic transfer capability of the preferred power supply to the maintenance power supply through the reserve auxiliary transformer*
- *Operation of main generator in islanding mode is verified to ensure that the onsite power system equipment including the Class 1E battery chargers and uninterruptible power supplies can withstand the voltage spike from the generator following isolation from the grid.*
- *Switchyard interface agreement and protocols are verified.*

The staff requested that the applicant revise Section 14.2.9.4.23 to include the above items, or justify their exclusion.

In its June 26, 2008, response to RAI 14.2-1, the applicant agreed to add the above tests to BLN COL FSAR Section 14.2.9.4.23, except for verifying the proper operation of the generator in islanding mode. The applicant stated that this islanding mode test does not belong to this BLN COL FSAR section. This test is specified by Westinghouse as a load rejection test from 100 percent power in AP1000 DCD Section 14.2.10.4.21. That section will verify proper operation of equipment utilized in the generator islanding mode by a combination of the *purchase specifications for the equipment and verification of satisfactory performance after the load reject test from 100 percent power. The applicant proposed to revise BLN COL FSAR Chapter 14, Section 14.2.9.4.23 by adding the following to the end of the existing Section 14.2.9.4.23 in the sequence indicated:*

i. Operation of instrumentation and control alarms used to monitor switchyard equipment status.

j. Proper operation and load carrying capability of breakers, switchgear, transformers, and cables, and verification of these items by a non-testing means such as a [quality control] QC nameplate check of as-built equipment where testing would not be practical or feasible.

k. Verification of proper operation of the automatic transfer capability of the preferred power supply to the maintenance power supply through the reserve auxiliary transformer.

l. Switchyard interface agreement and protocols are verified.

With the addition of above offsite ac power system tests to the existing Section 14.2.9.4.23, the staff finds that the offsite ac power system testing performed under BLN COL FSAR Chapter 14, Section 14.2.9.4.23 will demonstrate the energization and proper operation of the as-installed switchyard components. In addition, the staff concurs with the applicant that verification of proper operation of the generator in islanding mode is part of AP1000 DCD Section 14.2.10.4.21, "100 Percent Load Rejection." Therefore, the staff finds the applicant's response acceptable. This is ***Confirmatory Item 14.2-11****, pending NRC review and approval of the revised BLN COL FSAR.*

As part of RAI 14.2-2, the staff also requested that the applicant provide additional information to the test abstract related to the offsite ac power systems. The staff stated that the AP1000 DCD provides interface requirements for the transmission switchyard and onsite power system in accordance with 10 CFR 52.79(b). Specifically, Summary Table 1.8-1, "Plant Interfaces with the Remainder of Plant," requires the COL applicant to address offsite ac requirements (Item 8.2) for steady-state load, inrush kVA for motors, nominal voltage, allowable voltage regulation, nominal allowable frequency fluctuation, maximum frequency decay rate, and limiting under-frequency value for the reactor coolant pump (RCP). It further requires the offsite transmission system analysis (Item 8.3) for loss of the AP1000 unit or the largest unit, for voltage operating range, for maintaining transient stability, and for the RCP bus voltage to remain above the voltage required to maintain the flow assumed in Chapter 15 analyses for a minimum of three seconds following a turbine trip. The staff requested that the applicant discuss how the preoperational test performed under Section 14.2.9.4.23 (General Test Methods and Acceptance Criteria) for BLN verifies all requirements cited in Sections 8.2 and 8.3 of the AP1000 DCD.

In its June 26, 2008, response to RAI 14.2-2, the applicant stated that site interface requirements in AP1000 DCD Table 1.8-1, Items 8.2 (offsite ac requirements) and 8.3 (offsite transmission system and stability analyses) are verified not just by BLN COL FSAR Section 14.2.9.4.23 (preoperational test for offsite ac power systems) alone, but a combination of analyses and testing as described below:

- *The site interface parameters identified in AP1000 DCD Table 1.8-1, Items 8.2 and 8.3, as provided by Westinghouse, are used as input parameters or acceptance criteria in the Grid Stability Analysis performed.*

- *The Offsite AC Power Systems tests detailed in BLN COL FSAR Section 14.2.9.4.23, as modified by the applicant's response to RAI 14.2-1, require specific preoperational testing of as-installed switchyard components as described in BLN COL FSAR Section 8.2 to demonstrate proper operation of the design capabilities and protective features of those components.*

- *The tests detailed in AP1000 DCD Section 14.2.9.4.21, Main, Unit Auxiliary and Reserve Auxiliary Transformer Test, demonstrate the energization of the transformers and the proper operation of associated protective relaying, alarms, and control devices.*

- *The tests detailed in AP1000 DCD Section 14.2.9.2.15, Main AC Power System Testing, verify power availability to support proper operation of required electrical loads.*

- *The 100 percent load reject test described in AP1000 DCD Section 14.2.10.4.21 provides for an integrated plant response and verification of the demands placed on the electrical distribution system when the plant is separated from the grid.*

The staff has reviewed BLN COL FSAR Section 14.2.9.4.23 and AP1000 DCD Sections 14.2.9.4.21, 14.2.9.2.15, and 14.2.10.4.21 cited by the applicant for proper operation of components and the interface parameters required for the grid stability and offsite transmission system analyses. The staff concurs with the applicant that the site interface requirements in AP1000 DCD Table 1.8-1, Items 8.2 and 8.3 can be verified by the combination of analyses and testing described above. Therefore, the NRC staff finds the applicant's response to be acceptable. This resolves RAI 14.2-2.

In RAI 14.2-9, the staff requested that the applicant provide additional information in the test abstract related to the fire brigade support equipment test abstract in Section 14.2.9.4.26 of the BLN COL FSAR. Specifically, RG 1.189, Regulatory Position 3.4.2, Hydrants and Hose Houses, states that "threads compatible with those used by local fire departments should be provided on all hydrants, hose *couplings, and standpipe risers. Alternatively, a sufficient number of hose thread adapters may be provided." The importance of ensuring that installed plant fire equipment be compatible with the equipment used by local fire departments warrants the inclusion of installed plant fire equipment (hydrants, hoses, couplings, and standpipe risers) in the initial test program to verify either the compatibility of threads or the provision of an adequate supply of hose thread adaptors that will be readily available in the event of a fire. The staff requested that the applicant revise Section 14.2.9.4.26 to address this issue. In addition, with respect to BLN COL FSAR Section 14.2.9.4.26(c), the staff requested that the applicant specifically identify any portable "communication equipment" that is credited for fire brigade use. In a letter dated June 30, 2008, the applicant proposed to add the requirement to verify fire equipment hose thread compatibility in Section 14.2 in a future revision of the BLN COL FSAR. The staff confirmed that the applicant addressed the relevant information in Revision 1 of the BLN COL FSAR, and there is no outstanding information expected to be addressed related to this section. This resolves RAI 14.2-9.*

In RAI 12.3-12.4-5, the staff requested that the applicant provide additional information related to the portable personnel monitors and radiation survey instruments test abstract contained in Section 14.2.9.4.27 of the BLN COL FSAR. Specifically, the staff requested the applicant to provide information regarding the accuracy and overall performance of portable survey instruments addressed in standard ANSI N42.17A-1989, and information related to the calibration and maintenance of portable radiation survey instruments addressed in ANSI N323A-1997. The staff also requested that the applicant revise Section 14.2 of the BLN COL FSAR to address this issue. In a letter dated September 22, 2008, the applicant proposed to revise Section 14.2.9.4.27 by providing additional text to the general method and acceptance criteria. Specifically, the applicant proposed that the portable monitors and instrument test shall include provisions for verifying proper functioning of monitors and instruments to respond to radiation as required and proper operatability [sic] *of instrumentation controls, battery, and alarms as applicable. Further, the applicant proposed to revise Appendix 1AA to Chapter 1, to include the updated version of ANSI N323A cited in the exception to Regulatory Guide 8.6. The staff reviewed the applicant's response and found the proposed changes acceptable. Further, the staff confirmed that the applicant addressed the relevant information in Revision 1 of the BLN COL FSAR, and there is no outstanding information expected to be addressed related to this section. This resolves RAI 12.3-12.4-5.*

Resolution of Standard Content Confirmatory Item 14.2-11

The staff verified that the VEGP applicant has incorporated into its FSAR the proposed administrative controls identified as Confirmatory Item 14.2-11 in the staff's SER for the BLN COL. On this basis, Confirmatory Item 14.2-11 is resolved.

- *STD COL 3.9-5*

In a letter dated July 2, 2010 and supplemented by letter dated August 6, 2010, the VEGP applicant identified changes to be made to VEGP COL FSAR Section 14.2.9 involving the initial testing of the pressurizer surge line piping. This COL item is primarily addressed in Section 3.9.3 of the VEGP COL FSAR and that portion is reviewed by the NRC staff in Section 3.12 of this SER. The portion of STD COL 3.9-5 addressed in FSAR Section 14.2 and evaluated in this SER section, is the discussion of the test abstract to identify the standard operating conditions for surge line thermal monitoring instrumentation verification and data gathering that complies with NRC Bulletin 88-11, "Pressurizer Surge Line Thermal Stratification." The staff notes that this proposed testing is to be done on the first AP1000 unit placed in operation.

*The NRC staff has compared the purpose, prerequisites, and general test methods and acceptance criteria provided by the VEGP applicant in the test abstract for the pressurizer surge line piping, to the guidance in NRC Bulletin 88-11. The staff concludes that sufficient information on the test procedure has been provided to assure that the test results will quantify the extent of thermal stratification, thermal stripping and piping deflections, as recommended in Bulletin 88-11. Therefore, the staff finds that the portion of STD COL 3.9-5 relevant to the preoperational testing of the pressurizer surge line piping to be acceptable. The incorporation of the planned changes to the VEGP COL FSAR will be tracked as **VEGP Confirmatory Item 14.2-2**.*

<u>Resolution of VEGP Standard Content Confirmatory Item 14.2-2</u>

VEGP Confirmatory Item 14.2-2 is an applicant commitment to revise its FSAR to specify surge line monitoring test procedures. The staff verified that the VEGP COL FSAR was appropriately updated. As a result, VEGP Confirmatory Item 14.2-2 is now closed. The applicant indicated that the proposed changes to its FSAR are expected to be standard for the subsequent COL applicants. Since Confirmatory Item 14.2-2 already exists as a standard confirmatory item in this SER, the staff designated this standard confirmatory item as VEGP Confirmatory Item 14.2-2.

<u>Supplemental Information</u>

- *STD SUP 14.2-2*

The applicant provided additional information in STD SUP 14.2-2 to address the development of administrative procedures that will be implemented during the preoperational testing activities.

STD SUP 14.2-2 was not in Revision 1 of the BLN FSAR and is addressed for the first time in this SER for the VEGP COL application. However, portions of the standard evaluation material in Section 14.2.9.4 of the BLN SER are directly *applicable to the new STD SUP item identified in the VEGP FSAR. Therefore, the NRC staff used this evaluation material, identified below as standard content material, in the disposition of STD SUP 14.2-2.*

As part of the response to RAI 14.2-12, the applicant proposed to supplement Section 14.2.9 of the AP1000 DCD, Revision 17, with additional administrative controls that will be implemented during preoperational testing activities. The response stated that the control of systems that need to be returned to the construction organization for modifications, repairs, or to correct a new problem will be through administrative procedures. These procedures will also provide directions for the following activities:

- *Release control of systems and/or components to construction*
- *Documentation of the actual work performed and the impact on testing*
- *Identification of required testing to restore the system to an identified status (operability, functionality, availability), as well as the identification of re-performance tests based on the impact of the work performed*
- *Authorizations and tracking of operability and unavailability determinations*
- *Verification activities to ensure that retests stay in compliance with ITAAC commitments*

The staff reviewed this supplemental information related to preoperational test descriptions and determined that it provided adequate administrative controls for an orderly turnover of plant systems when these have to be returned to the construction organization. Therefore, the staff finds this information acceptable. The applicant will revise the BLN COL FSAR to include the proposed administrative controls. This is identified as ***Confirmatory Item 14.2-10****, pending NRC review and approval of the revised BLN COL FSAR.*

Resolution of Standard Content Confirmatory Item 14.2-10

The staff verified that the VEGP applicant has incorporated into its FSAR, in response to STD SUP 14.2-2, the proposed administrative controls identified as Confirmatory Item 14.2-10 in the staff's SER for the BLN COL. On this basis, Confirmatory Item 14.2-10 is resolved.

14.2.9.5 *Post Combined License Activities*

There are no post-COL activities related to this section.

14.2.9.6 *Conclusion*

The NRC staff reviewed the application and checked the referenced DCD. The NRC staff's review confirmed that the applicant addressed the required information relating to the preoperational test descriptions, and there is no outstanding information to be addressed in the WLS COL FSAR related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the information presented in the WLS COL FSAR is acceptable because it meets the requirements of 10 CFR 52.79(a)(28) and Criterion XI of Appendix B to 10 CFR Part 50. It also meets the guidance in NUREG-0800, Section 14.2 and RG 1.68.

The staff based its conclusions on the following:

- WLS DEP 6.4-2, related to design changes affecting how the temperature and humidity in the main control room are maintained within the limits for reliable human performance, is reviewed and found acceptable by the staff in Section 21.3 of this SER.

- STD COL 14.4-5 is acceptable because it provides an adequate description of testing of structures and systems that are outside the scope of the DC.

- STD COL 3.9-5, as it applies to the test abstract for the surge line thermal monitoring, is acceptable because it provides assurance that the test results will quantify the extent of thermal stratification, thermal stripping and piping deflections, as recommended in Bulletin 88-11.

- STD SUP 14.2-2 is acceptable because it provides an adequate description for the development of administrative controls that will be implemented during the preoperational testing activities.

14.2.10 Startup Test Procedures (Related to RG 1.206, Section C.III.1, Chapter 14, C.I.14.2.12, "Individual Test Descriptions")

14.2.10.1 *Introduction*

Startup test procedures address the tests that comprise the startup phase of the test program. For each test, a general description is provided for test objective, test prerequisites, test description, and test performance criteria, where applicable. In describing a test, the operating and safety-related characteristics of the plant to be tested and evaluated are identified. Where applicable, the relevant performance criteria for the test are discussed. Some of the criteria relate to the value of process variables assigned in the design or analysis of the plant, component systems, and associated equipment. Other criteria may be associated with expectations relating to the performance of systems.

14.2.10.2 *Summary of Application*

Section 14.2 of the WLS COL FSAR, Revision 11, incorporates by reference Section 14.2 of the AP1000 DCD, Revision 19. Section 14.2 of the DCD includes Section 14.2.10.

In addition, in WLS COL FSAR Section 14.2.10, the applicant provided the following:

AP1000 COL Information Item

- STD COL 14.4-5

The applicant provided additional information in STD COL 14.4-5 to address interface requirements. This COL item is evaluated by the staff in Section 14.2.9 of this SER.

Supplemental Information

- STD SUP 14.2-3

The applicant provided additional information in STD SUP 14.2-3 to address the development of administrative controls that will be implemented during power ascension testing activities.

14.2.10.3 *Regulatory Basis*

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the startup test procedures are given in Section 14.2 of NUREG-0800.

The applicable regulatory requirements for the information being reviewed in this section are 10 CFR 52.79(a)(28) and Criterion XI of Appendix B to 10 CFR Part 50. RG 1.68 provides guidance on how to comply with Criterion XI of Appendix B to 10 CFR Part 50.

14.2.10.4 *Technical Evaluation*

The NRC staff reviewed Section 14.2.10 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the startup test procedures. The results of the NRC staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.

- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the WLS COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the BLN Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from Section 14.2.10.4 of the VEGP SER:

Supplemental Information

- *STD SUP 14.2-3*

The applicant provided additional information in STD SUP 14.2-3 to address the development of administrative controls that will be implemented during power ascension testing activities.

STD SUP 14.2-3 was not in Revision 1 of the BLN FSAR and is addressed for the first time in this SER for the VEGP COL application. However, the standard evaluation material in Section 14.2.9.4 of the BLN SER is directly applicable to the new STD SUP item identified in the VEGP FSAR. Therefore, the NRC staff used this evaluation material, identified below as standard content material, in the disposition of STD SUP 14.2-3.

As part of the response to RAI 14.2-12, the applicant proposed supplemental information in Section 14.2.10 of the BLN COL FSAR, with additional administrative controls that will be implemented during power ascension testing activities consistent with the guidance in RG 1.68 and NUREG-0800. The applicant proposed to discuss a power ascension test plan that will provide controls for operations during the power ascension test phase, including the following:

- *Verification of core performance parameters*
- *Verification of adequate calibration of nuclear instrumentation*
- *Controls for high flux trips consistent with TS requirements*
- *Conduct of surveys of plant systems and equipment*

- *Checks for unexpected radioactivity in process systems and effluents*
- *Perform reactor coolant leak checks*
- *Controls for reviews of testing at each power plateau*

Additionally, the applicant proposed to provide controls for the extrapolation of tests at lower power levels in order to determine the acceptability of performing the test at higher power levels. The applicant proposed to describe measures for the use of surveillance test procedures to document portions of tests, and the use of initial test program tests to satisfy TS surveillance requirements.

The staff reviewed this proposed supplemental information related to the power ascension test phase and determined that it provided adequate administrative controls for activities during power ascension testing. Therefore, the staff finds this information acceptable. The applicant will revise the BLN COL FSAR to include the proposed administrative controls. This is identified as ***Confirmatory Item 14.2-12****, pending NRC review and approval of the revised BLN COL FSAR.*

Resolution of Standard Content Confirmatory Item 14.2-12

The staff verified that the VEGP applicant has incorporated into its FSAR, in response to STD SUP 14.2-3, the proposed administrative controls identified as Confirmatory Item 14.2-12 in the staff's SER for the BLN COL. On this basis, Confirmatory Item 14.2-12 is resolved.

14.2.10.5 *Post Combined License Activities*

There are no post-COL activities related to this section.

14.2.10.6 *Conclusion*

The NRC staff reviewed the application and checked the referenced DCD. The NRC staff's review confirmed that the applicant addressed the required information relating to the startup test procedures, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the information presented in the WLS COL FSAR is acceptable because it meets the requirements of 10 CFR 52.79(a)(28) and Criterion XI of Appendix B to 10 CFR Part 50. The staff based its conclusions on the following:

- STD SUP 14.2-3 is acceptable because it provides an adequate description of the administrative controls associated with the activities that will be implemented during the power ascension testing phase of the initial test program and meets the guidance in NUREG-0800, Section 14.2 and RG 1.68.

14.3 Certified Design Material (Related to RG 1.206, Section C.III.1, Chapter 14, C.I.14.3, "Inspections, Tests, Analyses, and Acceptance Criteria")

14.3.1 Introduction

This section addresses the selection criteria and processes used to develop the WLS Certified Design Materials (CDMs). It specifically addresses the site-specific inspections, tests, analyses, and acceptance criteria (SS-ITAAC). The COL applicant provides its proposed selection methodology and criteria for establishing the ITAAC that are necessary and sufficient to provide reasonable assurance that the facility has been constructed and will be operated in conformity with the license and the Commission's rules and regulations.

The applicant proposes, in addition to the ITAAC incorporated by reference from the AP1000 DCD, SS-ITAAC to provide reasonable assurance that the facility has been constructed and will operate in conformance with the applicable regulations.

14.3.2 Summary of Application

Section 14.3 of the WLS COL FSAR, Revision 11, incorporates by reference Section 14.3 of the AP1000 DCD, Revision 19.

In addition, in WLS COL FSAR Section 14.3, the applicant provided the following:

Departures

- WLS DEP 3.2-1

The applicant revised DCD Table 14.3-2, "Design Basis Accident Analysis," Sheets 7 and 8 of 17, as new WLS COL FSAR Table 14.3-202, Sheets 1 and 2, providing additional information about WLS DEP 3.2-1 related to design modifications to and performance of the condensate return portion of the Passive Core Cooling System. This information, as well as related WLS DEP 3.2-1 information appearing in other chapters of the WLS COL FSAR, is reviewed in Section 21.1 of the SER.

- WLS DEP 6.4-1

The applicant provided additional information in Section 14.3 of the WLS COL FSAR about WLS DEP 6.4-1 related to design changes affecting habitability of the main control room and changes to the calculated doses to control room operators. This information, as well as related WLS DEP 6.4-1 information appearing in other chapters of the FSAR, is reviewed in Section 21.2 of this SER.

- WLS DEP 6.4-2

The applicant provided additional information in Section 14.3 of the WLS COL FSAR about WLS DEP 6.4-2 related to design changes affecting how the temperature and humidity in the main control room are maintained within the limits for reliable human performance. This information, as well as related WLS DEP 6.4-2 information appearing in other chapters of the FSAR, is reviewed in Section 21.3 of this SER.

- WLS DEP 7.3-1

The applicant provided additional information in Section 14.3 of the WLS COL FSAR about WLS DEP 7.3-1 related to required design changes for the PMS source range neutron flux doubling logic to comply with the requirements of IEEE Std. 603-1991, Clause 6.6. This information, as well as related WLS DEP 7.3-1 information appearing in other chapters of the FSAR, is reviewed in Section 21.5 of this SER.

AP1000 COL Information Items

- STD COL 3.6-1

The applicant provided additional information in STD COL 3.6-1 to provide its plan for completing the pipe rupture hazard analysis.

- STD COL 3.9-7

The applicant provided additional information in STD COL 3.9-7 to provide its plan for completing the piping design.

- WLS COL 2.5-17

The applicant provided additional information in WLS COL 2.5-17 in WLS COL FSAR Section 14.3.3.1, "Waterproof Membrane ITAAC." This section references the design of the waterproof membrane beneath the nuclear island basemat that is described in AP1000 DCD Section 3.4.1.1.1.1.

Supplemental Information

- STD SUP 14.3-1

The applicant provided supplemental information in STD SUP 14.3 1 in WLS COL FSAR Section 14.3.2.3, "Site Specific ITAAC (SS-ITAAC)," and Section 14.3.2.3.3, "Other Site-Specific Systems." Section 14.3.2.3 describes the SS-ITAAC, and Section 14.3.2.3.3 identifies the Transmission Switchyard and Offsite Power System as meeting the ITAAC selection criteria. This section describes the SS-ITAAC.

- WLS SUP 14.3-2

The applicant provided supplemental information in WLS SUP 14.3-2 in WLS COL FSAR Section 14.3.2.3.3, "Other Site-Specific Systems," discussing the ITAAC screening summary for site-specific systems.

14.3.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the CDM are given in Section 14.3 of NUREG-0800.

The applicable regulatory requirements for SS-ITAAC are in 10 CFR 52.80(a) and 10 CFR 52.97, "Issuance of combined licenses."

The regulatory basis for STD COL 3.6-1 and STD COL 3.9-7 are provided in NUREG-0800.

14.3.4 Technical Evaluation

The NRC staff reviewed Section 14.3 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the CDMs. The results of the NRC staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.

- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the WLS COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the BLN Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from Section 14.3.4 of the VEGP SER:

<u>*AP1000 COL Information Items*</u>

- *STD COL 3.6-1 and STD COL 3.9-7*

The portion of STD COL 3.6-1 addressed in VEGP COL FSAR Section 14.3 is the discussion of the ITAAC established to provide reasonable assurance that the design portion of the pipe rupture hazard analysis will be conducted in conformity with the license and the Commission's rules and regulations. The portion of STD COL 3.9-7 addressed in VEGP COL FSAR Section 14.3 is the discussion of the ITAAC established to provide reasonable assurance that the piping design is completed appropriately for applicable systems.

In a letter dated March 18, 2010, as revised by letter dated April 23, 2010, in response to an open item in the NRC staff's SER for BLN (Open Item 3.6-1 in BLN SER Section 3.6.4), the VEGP applicant provided proposed revisions to the VEGP COL application related to the pipe rupture hazard analysis ITAAC. In addition, the applicant provided information related to the piping design ITAAC.

The VEGP applicant proposed to expand FSAR Section 14.3.3 to include, as part of STD COL 3.6-1 and STD COL 3.9-7, a description of the ITAAC established to provide reasonable assurance that the design portion of the pipe rupture hazard analysis and piping design will be conducted in conformity with the license and the Commission's rules and regulations. The applicant proposed revision of two license conditions in Part 10 of the COL application to address when the information would be available for staff review and expanding Appendix B of Part 10 to include the two ITAAC associated with review of the pipe rupture hazard analysis and the piping design. STD COL 3.6-1 and STD COL 3.9-7 are evaluated by the staff in Sections 3.6 and 3.12 respectively, of this SER, including the proposed pipe rupture hazard analysis ITAAC and piping design ITAAC.

- WLS COL 2.5-17

The NRC staff reviewed WLS COL 2.5-17 in WLS COL FSAR Section 14.3.3.1 related to waterproof membrane ITAAC. The staff's review of this ITAAC is documented in Section 3.8.5 of this SER.

<u>Supplemental Information</u>

- STD SUP 14.3-1, addressing SS-ITAAC

- WLS SUP 14.3-2, addressing ITAAC screening summary for additional site-specific systems

The following portion of this technical evaluation section is reproduced from Section 14.3.4 of the VEGP SER:

> *The following portion of this technical evaluation section is reproduced from Section 14.3 of the BLN SER. This portion of the BLN SER combined the evaluation of STD SUP 14.3-1 and BLN SUP 14.3-2. The NRC staff concludes that the evaluation of BLN SUP 14.3-2 applies to VEGP SUP 14.3-2, based on the similarities of these two plant-specific supplemental items.*

The NRC staff concludes that the evaluation of BLN SUP 14.3-2 and VEGP SUP 14.3-2 applies to WLS SUP 14.3-2, based on the similarities of these three plant-specific supplemental items.

The following portion of this technical evaluation section is reproduced from Section 14.3.4 of the VEGP SER:

> *As part of STD SUP 14.3-1 and BLN SUP 14.3-2, the applicant provided:*
>
> - *Site-specific ITAAC selection criteria*
> - *Site-specific ITAAC selection methodology*
> - *Site-specific ITAAC screening summary*
>
> *A table of ITAAC entries was provided for each site-specific system described in the BLN COL FSAR that meets the selection criteria, and that is not included in the certified design. The COL applicant adopted the same selection criteria and methodology as the AP1000 DCD for establishing the SS-ITAAC. The selection criteria and methodology contained in the AP1000 DCD was accepted by the NRC as described in NUREG-1793. Therefore, the staff finds the applicant's use of this criteria and methodology appropriate and acceptable. The ITAAC are provided in tables with information for the following three columns: design commitment; inspection, tests, analyses; and acceptance criteria.*
>
> *Emergency Planning-ITAAC (EP-ITAAC) are discussed in the application as required for inclusion in accordance with 10 CFR 52.80(a). The site-specific EP-ITAAC are based on the generic ITAAC provided in Appendix C.II.1-B of RG 1.206. The staff's review of the current set of EP-ITAAC and the information related to this ITAAC is contained in Chapter 13.6 [13.3] of the SER.*
>
> *Physical Security-ITAAC (PS-ITAAC) are discussed in the application as required for inclusion in accordance with 10 CFR 52.80(a). The site-specific PS-ITAAC are based on the generic ITAAC provided in Appendix C.II.1-C of RG 1.206. The NRC staff's review of the current set of PS-ITAAC and the information related to this ITAAC is contained in Chapter 13.4 [13.6] of the SER.*
>
> *The NRC staff reviewed the supplemental information relating to ITAACs included under Section 14.3.2 of the BLN COL. The applicant identified no additional site-specific systems meeting the ITAAC selection criteria. With the exception of the Transmission Switchyard and Offsite Power System, the staff*

agrees no additional site-specific ITAAC are required in accordance with 10 CFR 52.80(a).

In RAI-14.3-1, the staff asked the applicant to justify the omission of site-specific ITAAC for transmission switchyard and the offsite power system. Subsequently, in a letter dated May 11, 2009, the applicant agreed to include an ITAAC in the BLN COL FSAR for transmission switchyard and the offsite power system. The information related to this ITAAC is evaluated in Chapter 8 of the SER. This is Confirmatory Item 14.3-1, pending NRC review and approval of the revised BLN COL FSAR.

Resolution of Standard Content Confirmatory Item 14.3-1

Confirmatory Item 14.3-1 required the applicant to update its FSAR to include proposed ITAAC for the offsite power system. The NRC staff provides its evaluation of the proposed ITAAC for the offsite power system in Section 8.2.A of this SER. The NRC staff verified that the VEGP COL application was appropriately updated. As a result, Confirmatory Item 14.3-1 is resolved.

14.3.5 Post Combined License Activities

The SS-ITAAC in the previous section of this SER are considered post-COL activities and discussed in the individual SER sections as stated above.

14.3.6 Conclusion

The NRC staff reviewed the application and checked the referenced DCD. The NRC staff's review confirmed that the applicant addressed the required information relating to the test program schedule, and there is no outstanding information to be addressed in the WLS COL FSAR related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the information presented in the WLS COL FSAR is acceptable because it meets the requirements of 10 CFR 52.80(a) and 10 CFR 52.97. The staff based its conclusions on the following:

- WLS DEP 3.2-1, related to design modifications to the condensate return portion of the Passive Core Cooling System, is reviewed and found acceptable by the staff in Section 21.1 of this SER.

- WLS DEP 6.4-1, related to design changes affecting habitability of the main control room and changes to the calculated doses to control room operators, is reviewed and found acceptable by the staff in Section 21.2 of this SER.

- WLS DEP 6.4-2, related to design changes affecting how the temperature and humidity in the main control room are maintained within the limits for reliable human performance, is reviewed and found acceptable by the staff in Section 21.3 of this SER.

- WLS DEP 7.3-1, related to required design changes for the PMS source range neutron flux doubling logic to comply with the requirements of IEEE Std. 603-1991, Clause 6.6, is reviewed and found acceptable by the staff in Section 21.5 of this SER.

- STD SUP 14.3-1, WLS SUP 14.3-2 and WLS COL 2.5-17 are acceptable because the ITAAC specified for the site-specific systems provide adequate assurance that these systems have been constructed and will be operated in conformity with the license and the Commission's rules and regulations.

15.0 ACCIDENT ANALYSIS

The evaluation of the safety of a nuclear power plant includes analyses of the plant's responses to postulated disturbances in process variables and postulated equipment failures or malfunctions. Such safety analyses provide a significant contribution to the selection of limiting conditions for operation, limiting safety system settings, and design specifications for components and systems from the standpoint of public health and safety. These analyses are a focal point of the combined license (COL) reviews. In Chapter 15 of the Final Safety Analysis Report (FSAR), the COL applicant discussed the applicable transient and accident analyses to justify its conformance to the applicable regulations.

The U.S. Nuclear Regulatory Commission (NRC) staff's review of William States Lee III Nuclear Station (WLS) COL FSAR Chapter 15 follows the format in WLS Chapter 15.

15.0 Accident Analysis (Related to Regulatory Guide (RG) 1.206, Section C.III.1, Chapter 15, C.I.15.1, "Transient and Accident Classification," C.I.15.2, "Frequency of Occurrence," C.I.15.3, "Plant Characteristics Considered in the Safety Evaluation," C.I.15.4, "Assumed Protection System Actions," and C.I.15.5, "Evaluation of Individual Initiating Events")

15.0.1 Introduction

Design basis transient and accident analyses are required as a part of an evaluation of the safety of a nuclear power plant to evaluate the plant's responses to postulated disturbances in process variables and postulated equipment failures or malfunctions. The safety analyses provide a significant contribution to the determination of limiting conditions for operation, limiting safety system settings, and design specifications for plant components and systems to protect public health and safety.

15.0.2 Summary of Application

Section 15.0 of the WLS COL FSAR, Revision 11, incorporates by reference Section 15.0 of the AP1000 Design Control Document (DCD), Revision 19.

Departures

- WLS DEP 3.2-1

The applicant provided additional information about WLS DEP 3.2-1 in Section 15.0.13 of the FSAR related to the performance of the condensate return portion of the Passive Core Cooling System. This information, as well as related WLS DEP 3.2-1 information appearing in other chapters of the FSAR, is reviewed in Section 21.1 of this report.

- WLS DEP 6.4-1

The applicant provided additional information in Section 15.0.11 of the WLS COL FSAR about WLS DEP 6.4-1 related to design changes affecting habitability of the main control room and changes to the calculated doses to control room operators. This information, as well as related

WLS DEP 6.4-1 information appearing in other chapters of the FSAR, is reviewed in Section 21.2 of this SER.

AP1000 COL Information Item

- STD COL 15.0-1

In letters dated November 4, 2010, and April 25, 2011, the applicant endorsed Vogtle Electric Generating Plant (VEGP) letters dated May 21, 2010, October 29, 2010, and February 8, 2011. In these letters, the applicant proposed Standard (STD) COL 15.0-1, adding new text to WLS COL FSAR Section 15.0. STD COL 15.0-1 was provided in a response to a request for additional information (RAI) related to the AP1000 design certification (DC) amendment review. Specifically, in its response dated May 6, 2009, to NRC RAI AP1000 DCD RAI-SRP15.0-SRSB-02, Westinghouse proposed COL Information Item 15.0-1 to provide documentation of the plant calorimetric uncertainty methodology. RAI-SRP15.0-SRSB-02 noted that the AP1000 DCD assumes a 2 percent power uncertainty for the initial condition for most transients and accidents. However, a 1 percent power uncertainty is assumed for the initial reactor power for the large-break loss-of-coolant accident (LOCA) in AP1000 DCD Section 15.6.5.4A, as well as the mass and energy release calculation in AP1000 DCD Sections 6.2.1.3 and 6.2.1.4. In response to this RAI, Westinghouse proposed a new COL information item to be included in a future revision to AP1000 DCD Section 15.0.15. COL Information Item 15.0-1 states:

> Following selection of the actual plant operating instrumentation and calculation of the instrumentation uncertainties of the operating plant parameters prior to fuel load, the Combined License holder will calculate the primary power calorimetric uncertainty. The calculations will be completed using an NRC acceptable method and confirm that the safety analysis primary power calorimetric uncertainty bounds the calculated values.

License Conditions

- License Condition 2, Item 15.0-1

In Part 10 of the COL application, the applicant provided License Condition 2 to address numerous COL items, including COL Information Item 15.0-1 related to documentation of plant calorimetric uncertainty methodology. The license condition for COL Information Item 15.0-1 is addressed by ITAAC Table 2.5.4-2, Item 4.

- License Condition 6, Items (j) and (k)

In Part 10 of the COL application, the applicant provided License Condition 6 to provide schedules to NRC to support NRC inspection of operational programs and other applicant activities, including activities related to power calorimetric uncertainty.

Inspections, Tests, Analyses and Acceptance Criteria

In Part 10 of the COL application, the applicant provided an ITAAC to address the instrumentation to measure feedwater flow and the calculation methodology for plant calorimetric uncertainty.

15.0.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793, "Final Safety Evaluation Report Related to Certification of the AP1000 Standard Design," and its supplements.

Title 10 of the *Code of Federal Regulations* (10 CFR) Part 50, "Domestic licensing of production and utilization facilities," Appendix K, "ECCS [Emergency Core Cooling System] Evaluation Models," specifies that an assumed power level lower than 1.02 times the licensed power level (but not less than the licensed power level) may be used provided the proposed alternative value has been demonstrated to account for uncertainties due to power level instrumentation error. The review guidance in Section 15.0 of NUREG-0800, "Standard Review Plan for the Review of Safety Analysis Reports for Nuclear Power Plants," Section I.3, "Plant Characteristics in the Safety Evaluation," states in part that "the reviewer also ensures that the application specifies the permitted fluctuations and uncertainties associated with reactor system parameters and assumes the appropriate conditions, within the operating band, as initial conditions for transient analysis."

15.0.4 Technical Evaluation

The NRC staff reviewed Section 15.0 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to accident analysis. The results of the NRC staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this safety evaluation report (SER) provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.

[1] See Section 1.2.2 for a discussion of the staff's review related to verification of the scope of information to be included in a COL application that references a DC.

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.

- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the WLS COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting.

The following portion of this technical evaluation section is reproduced from Section 15.0.4 of the VEGP SER:

> *AP1000 COL Information Item*
>
> - *STD COL 15.0-1*
>
> *In a letter dated May 21, 2010, as revised by a letter dated October 29, 2010, the VEGP applicant submitted information to address COL Information Item 15.0-1. In these letters, the applicant stated that the plant operating instrumentation for feedwater flow measurement would be the Caldon/Cameron LEFM CheckPlus™ system and referenced the NRC staff's final safety evaluation that approved the Caldon topical report, ER-157P, Revision 8, "Supplement to Topical Report ER-80P: Basis for a Power Uprate with the LEFM Check or Checkplus™ System." The NRC staff has previously approved several plant applications of the Caldon/Cameron CheckPlus™ LEFM system to support a power measurement uncertainty lower than 1 percent. This AP1000 COL information item supports the 1 percent power uncertainty. The NRC staff's review herein focused on ensuring that the generically approved Caldon/Cameron topical reports are properly implemented for the VEGP COL application. The NRC staff verified compliance with the applicable conditions in the NRC staff's safety evaluations approving the topical reports. The NRC staff's review also confirmed that appropriate license conditions and ITAAC were established for those items that cannot be resolved prior to issuance of the COL.*
>
> *Compliance with Caldon/Cameron Topical Report ER-80P*
>
> *NRC staff approval of the Caldon/Cameron topical report ER-80P (safety evaluation (SE) dated March 8, 1999) established four criteria to be satisfied by each applicant or licensee. The VEGP applicant addressed each criterion as described below.*
>
>> *Criterion 1*
>>
>> *Discuss maintenance and calibration procedures that will be implemented with the incorporation of the LEFM, including processes and contingencies for inoperable LEFM instrumentation and the effect on thermal power measurements and plant operation.*

The VEGP applicant stated that calibration and maintenance programs would be developed in accordance with the Caldon/Cameron LEFM technical manuals and recommendations. Preventative Maintenance (PM) tasks would be periodically performed within the plant control system and support systems to provide continued reliability. Plant instrumentations that affect the power calorimetric, including the Caldon/Cameron LEFM CheckPlus™ inputs, would be monitored by plant system engineering personnel. These instruments would be included in the plant PM program for periodic calibration. The NRC staff finds these measures acceptable.

The VEGP applicant stated when the Caldon/Cameron LEFM CheckPlus™ flow meter becomes inoperable beyond the allowed outage time; the plant would be operated at de-rated conditions. De-rated operation is appropriate at power levels consistent with a 2 percent power uncertainty. With the plant operating at 100 percent load with 1 percent uncertainty, a de-rating to 99 percent maintains a 2 percent uncertainty. When the LEFM CheckPlus™ is inoperable, plant calorimetric power would be monitored with the use of feedwater venturi elements. An inoperable LEFM would not leave the plant in a condition where steady-state operation would be immediately compromised since it would not directly impact the calibration of the nuclear instrumentation utilized for power level related trips or safety system actuations. Thus, procedures require confirmation of the availability of alternate instrumentation (i.e., the feedwater venturi instrumentation) and initiation of the above described reduction in power within 48 hours. These measures are consistent with the operating plants. The NRC staff finds that operation with an inoperable Caldon/Cameron CheckPlus™ has been acceptably addressed.

Criterion 2

For plants that currently have LEFMs installed, provide an evaluation of the operational and maintenance history of the installed instrumentation and confirmation that the installed instrumentation is representative of the LEFM system and bounds the analyses and assumptions set forth in TR ER-80P.

The VEGP applicant stated that, since this application represents construction of a new plant with no previously installed LEFM equipment, this item is not applicable. The NRC staff finds the VEGP applicant's response acceptable.

Criterion 3

Confirm that the methodology used to calculate the uncertainty of the LEFM in comparison to the current feedwater instrumentation is based on accepted plant setpoint methodology (with regard to the development of instrument uncertainty). If an alternative approach is used, the application should be justified and applied to both venturi and ultrasonic flow measurement instrumentation installations for comparison.

The VEGP applicant stated that the uncertainty of the LEFM would be calculated in accordance with the Westinghouse methodology as applied in the Beaver Valley Power Station Units 1 and 2 License Amendment Request Nos. 289 and 161, which was approved by the NRC staff in a letter dated September 24, 2001, titled, "Beaver Valley Power Station, Unit Nos. 1 and 2 (BVPS-1 and 2) – Issuance of Amendment Re: 1.4-Percent Power Uprate and Revised BVPS-2 Heatup and Cooldown Curves." The NRC staff reviewed this SE and found that the calculation methodology complies with the recommendations of American National Standards Institute/Independent Safety Assessment (ANSI/ISA) Standard 67.04-2000, "Setpoints for Nuclear Safety-Related Instrumentation," and Regulatory Guide (RG) 1.105, "Setpoints for Safety-Related Instrumentation," Revision 2. In these calculations, uncertainties for the parameters that are not statistically independent are arithmetically summed to produce groups that are independent of each other, which can be statistically combined. Then, all independent parameters/groups that contribute to the power measurement uncertainty are combined using a square root of sum of squares (SRSS) approach to determine the overall power measurement uncertainty. This methodology has been reviewed and approved by the NRC staff for Westinghouse pressurized-water reactors (PWRs) (e.g., Beaver Valley), and is also acceptable for AP1000, which is a Westinghouse-designed PWR. The staff finds the AP1000 design sufficiently similar to other Westinghouse PWR designs that have been approved such that the methodology applies to both designs. Therefore, the NRC staff finds that the VEGP applicant's response acceptable.

> *Criterion 4*
>
> *Licensees for plant installations where the ultrasonic meter (including LEFM) was not installed with flow elements calibrated to a site specific piping configuration (flow profiles and meter factors not representative of the plant specific installation), should provide additional justification for use. This justification should show that the meter installation is either independent of the plant specific flow profile for the stated accuracy, or that the installation can be shown to be equivalent to known calibrations and plant configurations for the specific installation including the propagation of flow profile effects at higher Reynolds numbers. Additionally, for previously installed calibrated elements, the licensee should confirm that the piping configuration remains bounding for the original LEFM installation and calibration assumptions.*

The VEGP applicant stated that its application represents construction of a new plant with no previously installed flow metering equipment. The AP1000 main feedwater flow measurement instrumentation, consistent with the use of normalized flow meters, would be required to be calibrated at a certified test laboratory in hydraulic model geometry consistent with the AP1000 plant design. The LEFM commissioning process (i.e., installation acceptance testing) would confirm that the actual instrument performance is consistent with the *assumptions of the uncertainty calculation. The NRC staff finds this response acceptable.*

Compliance with Caldon/Cameron Topical Report ER-157P, Revision 8

The VEGP applicant addressed the five SE conditions found in the NRC SE for ER-157P, Revision 8, dated August 16, 2010, as described below.

> *Condition 1*
>
> *Continued operation at the pre-failure power level for a pre-determined time and the decrease in power that must occur following that time are plant-specific and must be acceptably justified.*

The VEGP applicant stated that a failure of the ultrasonic flow meter (UFM) will result in the use of the feedwater venturi as the input into the calorimetric calculation. Since the contingency is not based on continued reliance on the CheckPlus™ system, the NRC staff finds the VEGP applicant's response acceptable.

> *Condition 2*
>
> *A CheckPlus operating with a single failure is not identical to an LEFM Check. Although the effect on hydraulic behavior is expected to be negligible, this must be acceptably quantified if a licensee wishes to operate using the degraded CheckPlus at an increased uncertainty.*

The VEGP applicant stated that a degraded UFM resulting in an instrument uncertainty greater than the values assumed in the AP1000 calorimetric uncertainty calculation would be considered a failure and subject to compensatory actions as discussed above in response to Caldon/Cameron topical report (ER-80P) Criterion 1. Since the applicant does not intend to operate using a degraded CheckPlus™, *the NRC staff finds the VEGP applicant's response acceptable.*

> *Condition 3*
>
> *An applicant with a comparable geometry can reference the above Section 3.2.1 [of the SE for ER-157P] finding to support a conclusion that downstream geometry does not have a significant influence on CheckPlus calibration. However, CheckPlus test results do not apply to a Check and downstream effects with use of a CheckPlus with disabled components that make the CheckPlus comparable to a Check must be addressed. An acceptable method is to conduct applicable Alden Laboratory tests.*

The VEGP applicant stated that the AP1000 feedwater flow measurement instrumentation would be located in piping with downstream geometry more favorable than the arrangements referenced in Section 3.2.1 of the SE for ER-157P. Therefore, the effects of downstream piping geometry are not considered to have a significant influence on the accuracy of the UFM. Because the flow measurement instrumentation would be located in piping with favorable downstream geometry, the NRC staff finds the VEGP applicant's response acceptable.

> *Condition 4*
>
> *An applicant that requests a MUR [measurement uncertainty recapture] with the upstream flow straightener configuration discussed in Section 3.2.2 [of the SE for ER-157P] should provide justification for claimed CheckPlus uncertainty that extends the justification provided in Reference 17 [Letter from E. Hauser dated March 19, 2010]. Since the Reference 17 evaluation does not apply to the Check, a comparable evaluation must be accomplished if a Check is to be installed downstream of a tubular flow straightener.*

The VEGP applicant stated that the AP1000 UFM installation would not utilize an upstream flow straightener. Therefore, this condition is not applicable to the AP1000 design. The NRC staff finds the VEGP applicant's response acceptable.

> *Condition 5*
>
> *An applicant assuming large uncertainties in steam moisture content should have an engineering basis for the distribution of the uncertainties or, alternatively, should ensure that their calculations provide margin sufficient to cover the differences shown in Figure 1 of Reference 18 [Letter from E. Hauser dated March 18, 2010].*

The VEGP applicant stated that this AP1000 application of the CheckPlus™ LEFM is to support a 1 percent overall power uncertainty, as compared to lower than 0.5 percent typically justified for operating plants using CheckPlus™. The result of this application of the LEFM at a higher uncertainty (i.e., lower accuracy) is that the assumed steam separator/dryer performance becomes less of a relative contribution to the overall uncertainty. Furthermore, an engineering basis for the AP1000 moisture content assumption is in the calorimetric uncertainty calculation. Because the steam separator/dryer performance uncertainty is a relatively small contribution to the overall uncertainty of 1 percent, the NRC staff finds the VEGP applicant's response acceptable.

Based on its review of the VEGP applicant's responses, the NRC staff finds that the licensee has acceptably addressed all applicable conditions specified in the NRC staff's SEs for the Caldon/Cameron topical reports. Hence, the NRC staff finds that the Caldon/Cameron topical reports, ER-80P and ER-157P, are *acceptable for referencing in the VEGP COL application and that the applicant has adequately addressed COL Information Item 15.0-1.*

License Conditions

- *License Condition 2, Item 15.0-1*

In a letter dated May 21, 2010, the applicant proposed adding Item 15.0-1 to License Condition 2 that would confirm that the plant operating instrumentation installed for feedwater flow measurement is a Caldon/Cameron LEFM CheckPlus™ system. In its October 29, 2010, letter, the applicant revised Item 15.0-1 to state that the documentation of plant calorimetric uncertainty methodology would be addressed as a plant-specific ITAAC item in lieu of License Condition 2. The staff finds the use of ITAAC to confirm proper documentation of plant calorimetric uncertainty methodology to be acceptable. The plant-specific ITAAC item proposed by the applicant is evaluated below.

- *License Condition 6*

In a letter dated October 29, 2010, the applicant proposed adding new line items to proposed License Condition 6, associated with the power calorimetric uncertainty instrumentation. Specifically, the applicant proposed to add the following two items:

- *The availability of documented instrumentation uncertainties to calculate a power calorimetric uncertainty (prior to initial fuel load).*

- *The availability of administrative controls to implement maintenance and contingency activities related to the power calorimetric uncertainty instrumentation (prior to initial fuel load).*

The two items under License Condition 6 are needed because documentation for the actual instrument uncertainties would only be available after the equipment is procured and tested and administrative controls would not be available until after the equipment is procured, which would be after the COL license is issued. The staff finds the first item acceptable because, when combined with the methodology in the proposed ITAAC, it would allow the staff to confirm that the procured equipment results in a power uncertainty of no more than 1 percent prior to the start of plant operation. The staff finds the second item acceptable because it would allow the staff to confirm that the administrative controls are in place to meet ER-80P Criterion 1 prior to the start of plant operation. These items correspond to License Condition 15-1 in the following section.

Inspections, Tests, Analyses and Acceptance Criteria

In a letter dated October 29, 2010, the applicant proposed ITAAC associated with the plant calorimetric uncertainty methodology. The proposed ITAAC item is repeated in Table 15.0-1 of this SER. This ITAAC would confirm that: (1) the installed feedwater flow measurement device is the Caldon CheckPlus™ LEFM;

(2) the power calorimetric uncertainty calculation for that instrumentation is based on an acceptable Westinghouse methodology as described above in Criterion 3 for ER-80P and the uncertainty values in the calculation for that instrumentation are not lower than those for the actual installed instrumentation; and (3) the calculated calorimetric power uncertainty measurement values are bounded by the 1 percent uncertainty value assumed for the initial reactor power in the safety analysis. The proposed ITAAC would allow the NRC staff to confirm, prior to initial fuel load, that the necessary conditions for STD COL 15.0-1 (COL Information Item 15.0-1) have been satisfied. Therefore, the NRC staff found the proposed ITAAC acceptable.

The incorporation of the planned changes to the VEGP COL FSAR detailed in the applicant's letters dated May 21, 2010, and October 29, 2010 will be tracked as ***Confirmatory Item 15.0-1****.*

Resolution of Standard Content Confirmatory Item 15.0-1

Confirmatory Item 15.0-1 is an applicant commitment to revise its FSAR Section 15.0 to address COL Information Item STD COL 15.0-1. The staff verified that the VEGP COL FSAR was appropriately revised. As a result, Confirmatory Item 15.0-1 is now closed.

Evaluation of Additional Information Submitted by Applicant

In a letter dated February 6, 2011, submitted in response to a January 24, 2011, letter from the ACRS, the applicant provided additional information related to the flow meter instrumentation, including proposed changes to the FSAR. The applicant stated that, prior to installation, the LEFM CheckPlus^{TM} system will be calibrated at a certified facility with a test model representative of plant piping configurations. After installation in the plant, the LEFM CheckPlus^{TM} system will be tested in accordance with the LEFM CheckPlus^{TM} system commissioning procedure developed by Cameron to confirm that the actual instrument performance is consistent with the assumption of the uncertainty calculation. The staff found these changes acceptable because they clarified the applicant commitment regarding calibration and testing of the instrument. The staff verified that the VEGP COL FSAR was revised to include the proposed changes.

15.0.5 Post Combined License Activities

For the reasons discussed in the technical evaluation section above, the staff proposes to include the following ITAAC:

- The licensee shall perform and satisfy the plant calorimetric uncertainty and plant instrumentation performance analysis ITAAC defined in SER Table 15.0-1, “Power Calorimetric Uncertainty Methodology.”

For the reasons discussed in the technical evaluation section above, the staff finds the following license condition acceptable:

- License Condition (15-1) – No later than 12 months after issuance of the COL, the licensee shall submit to the Director of Office of New Reactors a schedule that supports planning for and conduct of NRC inspections of license calculations for power calorimetric uncertainty and administrative controls to implement maintenance and contingency activities related to the power calorimetric uncertainty instrumentation. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until the license condition has been fully implemented. This schedule shall address:
    - The availability of documented instrumentation uncertainties to calculate a power calorimetric uncertainty (prior to initial fuel load).
    - The availability of administrative controls to implement maintenance and contingency activities related to the power calorimetric uncertainty instrumentation (prior to initial fuel load).

15.0.6 Conclusion

The NRC staff reviewed the application and checked the referenced DCD. The NRC staff's review confirmed that the applicant addressed the required information relating to accident analysis and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the WLS COL application is acceptable and meets the NRC regulations. The staff based its conclusion on the following:

- WLS DEP 3.2-1, related to design modifications to the condensate return portion of the passive core cooling system, is reviewed and found acceptable by the staff in Section 21.1 of this SER.
- WLS DEP 6.4-1, related to design changes affecting habitability of the main control room and changes to the calculated doses to control room operators, is reviewed and found acceptable by the staff in Section 21.2 of this SER.
- STD COL 15.0-1 is acceptable because the applicant has demonstrated that the conditions identified by the NRC in its generic evaluation have been satisfied for the use of the Caldon/Cameron LEFM CheckPlus™ system for WLS Units 1 and 2. In addition, ITAAC and a license condition have been put in place to allow the staff to verify the plant calorimetric uncertainty methodology prior to initial fuel load.

15.1 Increase in Heat Removal from the Primary System (Related to RG 1.206, Section C.III.1, Chapter 15, C.I.15.6, "Event Evaluation")

Analyses focused on the increase in heat removal from the primary system address anticipated operational occurrences (AOOs) and accidents that increase the heat removal by the secondary system, which could result in a decrease in reactor coolant temperature. Increased heat removal can be caused by:

- Feedwater system malfunctions causing a reduction in feedwater temperature
- Feedwater system malfunctions causing an increase in feedwater flow
- Excessive increase in secondary steam flow
- Inadvertent opening of a steam generator relief or safety valve
- Steam system piping failure
- Inadvertent operation of the passive residual heat removal heat exchanger

Section 15.1 of the WLS COL FSAR, Revision 11, incorporates by reference, Section 15.1, “Increase in Heat Removal from the Primary System,” of Revision 19 of the AP1000 DCD. In addition, in the WLS COL FSAR, the applicant provided the following:

Departures

- WLS DEP 6.4-1

The applicant provided additional information in Section 15.1.5 of the WLS COL FSAR about WLS DEP 6.4-1 related to design changes affecting habitability of the main control room and changes to the design basis accident (DBA) radiological consequences analyses, including calculated doses to control room operators and offsite. This information, as well as related WLS DEP 6.4-1 information appearing in other chapters of the FSAR, is reviewed in Section 21.2 of this SER.

The NRC staff reviewed Section 15.1 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this section. The NRC staff’s review confirmed that the applicant addressed the required information to satisfy the evaluation criteria. There is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the NRC staff’s technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

15.2 Decrease in Heat Removal By the Secondary System

Analyses focused on the decrease in heat removal by the secondary system address AOOs and accidents that could result in a reduction of the capacity of the secondary system to remove heat generated in the reactor coolant system (RCS). Decreased heat removal can be caused by:

- Steam pressure regulator malfunction or failure that results in decreasing steam flow
- Loss of external electrical load
- Turbine trip
- Inadvertent closure of main steam isolation valves
- Loss of condenser vacuum and other events resulting in turbine trip
- Loss of alternating current (ac) power to station auxiliaries
- Loss of normal feedwater flow
- Feedwater system pipe break

Section 15.2 of the WLS COL FSAR, Revision 11, incorporates by reference, Section 15.2, "Decrease in Heat Removal by the Secondary System," of Revision 19 of the AP1000 DCD. In addition, in the WLS COL FSAR, the applicant provided the following:

Departures

- WLS DEP 6.3-1

The applicant provided additional information about WLS DEP 6.3-1 in Section 15.2.6 of the FSAR related to quantifying the duration that the passive residual heat removal system heat exchanger can maintain safe shutdown conditions, changing the indefinite duration to greater than 14 days. This information, as well as related WLS DEP 6.3-1 information appearing in other chapters of the FSAR, is reviewed in Section 21.1 of this report.

- WLS DEP 3.2-1

The applicant provided additional information about WLS DEP 3.2-1 in Section 15.2 of the FSAR related to the performance of the condensate return portion of the Passive Core Cooling System. This information, as well as related WLS DEP 3.2-1 information appearing in other chapters of the FSAR, is reviewed in Section 21.1 of this report.

The NRC staff reviewed Section 15.2 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this section. The NRC staff's review confirmed that the applicant addressed the required information to satisfy the evaluation criteria. There is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

15.3 Decrease in Reactor Coolant System Flow Rate

Analyses focused on the decrease in RCS flow rate address AOOs and accidents that could result in a decrease in the RCS flow rate. Decreased flow rate can be caused by:

- Partial loss of forced reactor coolant flow
- Complete loss of forced reactor coolant flow
- Reactor coolant pump (RCP) shaft seizure (locked motor)
- RCP shaft break

Section 15.3 of the WLS COL FSAR, Revision 11, incorporates by reference, Section 15.3, "Decrease in Reactor Coolant System Flow Rate," of Revision 19 of the AP1000 DCD. In addition, in the WLS COL FSAR, the applicant provided the following:

Departures

- WLS DEP 6.4-1

The applicant provided additional information in Section 15.3.3 of the WLS COL FSAR about WLS DEP 6.4-1 related to design changes affecting habitability of the main control room and changes to the DBA radiological consequences analyses, including calculated doses to control room operators and offsite. This information, as well as related WLS DEP 6.4-1 information appearing in other chapters of the FSAR, is reviewed in Section 21.2 of this SER.

The NRC staff reviewed Section 15.3 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this section. The NRC staff's review confirmed that the applicant addressed the required information to satisfy the evaluation criteria. There is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

15.4 <u>Reactivity and Power Distribution Anomalies</u>

15.4.1 Introduction

Analyses focused on reactivity and power distribution anomalies address AOOs and accidents that could result in anomalies in the reactivity or power distribution in the reactor core. Reactivity and power distribution anomalies can be caused by:

- Uncontrolled rod cluster control assembly (RCCA) bank withdrawal from a subcritical or low-power startup condition
- Uncontrolled RCCA bank withdrawal at power
- RCCA misalignment
- Startup of an inactive RCP at an incorrect temperature
- Chemical and volume control system malfunction that results in a decrease in the boron concentration in the reactor coolant
- Inadvertent loading and operation of a fuel assembly in an improper position
- Spectrum of RCCA ejection accidents

15.4.2 Summary of Application

Section 15.4 of the WLS COL FSAR, Revision 11, incorporates by reference Section 15.4 of the AP1000 DCD, Revision 19. In addition, in the WLS COL FSAR, the applicant provided the following:

<u>Departures</u>

- WLS DEP 6.4-1

The applicant provided additional information in Sections 15.4.8 and 15.4.10 of the WLS COL FSAR about WLS DEP 6.4-1 related to design changes affecting habitability of the main control room and changes to the DBA radiological consequences analyses, including calculated doses to control room operators and offsite. This information, as well as related WLS DEP 6.4-1 information appearing in other chapters of the FSAR, is reviewed in Section 21.2 of this SER.

Generic Letter 85-05

In its letter dated November 4, 2010, the applicant endorsed a letter dated January 22, 2010, from the VEGP applicant that proposed to include Generic Letter (GL) 85-05, "Inadvertent Boron Dilution Events," in Table 1.9-204 of the FSAR as part of STD COL 1.9-2 to address Bulletins and GLs.

15.4.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

15.4.4 Technical Evaluation

The NRC staff reviewed Section 15.4 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to reactivity and power distribution anomalies. The results of the NRC staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.

- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the WLS COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) contains evaluation material from the SER for the Bellefonte Nuclear Plant (BLN), Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from Section 15.4.4 of the VEGP SER:

Generic Letter 85-05

GL 85-05, "Inadvertent Boron Dilution Events," informed each PWR licensee of the NRC staff position resulting from the evaluation of Generic Issue 22, "Inadvertent Boron Dilution Events," and urges each licensee to ensure that its plants have adequate protection against boron dilution events. GL 85-05 was evaluated as a part of the AP1000 DCD review, and the evaluation was documented in NUREG-1793, Chapter 20. GL 85-05 was resolved based on the analyses of inadvertent boron dilution events described in AP1000 DCD Section 15.4.6, which show that in all modes of operation the inadvertent boron dilution is prevented or responded to by automatic functions, or sufficient time is available for operator action to terminate the transient. The staff also stated that COL applicants should develop plant-specific emergency operating procedures (EOPs) that address the boron dilution events. The development of EOPs is identified as COL Information Item 13.5-1, Plant Procedures, which is addressed in BLN FSAR Section 13.5. Therefore, based on the above, the applicant needs to reinsert a reference to GL 85-05 in FSAR Table 1.9-204 and provide a cross reference to COL Information Item 13.5-1. This is ***Open Item 15.4-1.***

Resolution of Standard Content Open Item 15.4-1

To address Open Item 15.4-1 in the BLN SER with open items, the VEGP applicant stated in its letter dated January 22, 2010, that VEGP COL FSAR Table 1.9-204, "Generic Communications Assessment," would be revised to list GL 85-05 with a cross-reference to VEGP COL FSAR Section 13.5. Until this change is incorporated in a future version of the VEGP COL FSAR, this item is being tracked as ***Confirmatory Item 15.4-1.***

Resolution of Standard Content Confirmatory Item 15.4-1

Confirmatory Item 15.4-1 is an applicant commitment to revise its FSAR Table 1.9-204 to list GL 85-05 with a cross-reference to VEGP COL FSAR Section 13.5. The staff verified that the VEGP COL FSAR was appropriately revised. As a result, Confirmatory Item 15.4-1 is now closed.

15.4.5 Post Combined License Activities

There are no post-COL activities related to this section.

15.4.6 Conclusion

The NRC staff reviewed the application and checked the referenced DCD. The NRC staff's review confirmed that the applicant addressed the required information relating to reactivity and power distribution anomalies, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the WLS COL FSAR related to GL 85-05 is acceptable. Plant-specific EOPs, which will include responding to abnormal events such as the boron dilution events discussed in GL 85-05, are evaluated by the staff in Section 13.5 of this SER. WLS DEP 6.4-1, related to design changes affecting habitability of the main control room and changes to the calculated doses to control room operators, is reviewed and found acceptable by the staff in Section 21.2 of this SER.

15.5 Increase in Reactor Coolant Inventory

Analyses focused on the increase in reactor coolant inventory address AOOs that could result in an increase in RCS inventory. Increased inventory can be caused by:

- Inadvertent operation of the core makeup tanks during power operation
- Chemical and volume control system malfunctions that increases reactor coolant inventory

Section 15.5 of the WLS COL FSAR, Revision 11, incorporates by reference, with no departures or supplements, Section 15.5, “Increase in Reactor Coolant Inventory,” of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.[1] The NRC staff’s review confirmed that there is no outstanding issue related to this section. The results of the NRC staff’s technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

15.6 Decrease in Reactor Coolant Inventory

Analyses focused on the decrease in reactor coolant inventory address AOOs and accidents that could result in a decrease in RCS inventory. Decreased inventory can be caused by the following:

- Inadvertent opening of a pressurizer safety valve or inadvertent operation of the automatic depressurization system

- Failure of small lines carrying primary coolant outside containment

- Steam generator tube failure

- LOCA resulting from a spectrum of postulated piping breaks within the reactor coolant pressure boundary (RCPB).

Section 15.6 of the WLS COL FSAR, Revision 11, incorporates by reference Section 15.6, “Decrease in Reactor Coolant Inventory,” of Revision 19 of the AP1000 DCD. In addition, in the WLS COL FSAR, the applicant provided the following:

Departures

- WLS DEP 6.4-1

The applicant provided additional information in Sections 15.6.2, 15.6.3, 15.6.5, and 15.6.6 of the WLS COL FSAR about WLS DEP 6.4-1 related to design changes affecting habitability of the main control room and changes to the DBA radiological consequences analyses, including calculated doses to control room operators and offsite. This information, as well as related WLS DEP 6.4-1 information appearing in other chapters of the FSAR, is reviewed in Section 21.2 of this SER.

AP1000 COL Information Item

- WLS COL 2.3-4

The applicant provided additional information in WLS COL 2.3-4 related to site characteristic[2] atmospheric dispersion factor (χ/Q) values. The effect of WLS COL 2.3-4 on the design-basis accident (DBA) radiological consequences analyses is addressed in Section 15A of this SER.

The NRC staff reviewed Section 15.6 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this section. The NRC staff's review confirmed that the applicant addressed the required information to satisfy the evaluation criteria. There is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

15.7 Radioactive Release From a Subsystem or Component

15.7.1 Introduction

Analyses focused on radioactive release from a subsystem or component address AOOs and accidents that could result in a release of radioactive material to the environment. Radioactive releases can be caused by the following:

- Gas waste management system leak or failure
- Liquid waste management system leak or failure (atmospheric release)
- Release of radioactivity to the environment via liquid pathways
- Fuel handling accident
- Spent fuel cask drop accident

[2] In the WLS COL FSAR, the applicant uses the phrases "site-specific χ/Q values" and χ/Q "site characteristics" interchangeably. In this SER, the staff opts to use the term "site characteristics" because it is defined in 10 CFR Part 52. However, no distinction between the two terms is implied.

15.7.2 Summary of Application

Section 15.7 of the WLS COL FSAR, Revision 11, incorporates by reference Section 15.7 of the AP1000 DCD, Revision 19. In addition, in WLS COL FSAR Section 15.7, the applicant provided the following:

Departures

- WLS DEP 6.4-1

The applicant provided additional information in Section 15.7.4 of the WLS COL FSAR about WLS DEP 6.4-1 related to design changes affecting habitability of the main control room and changes to the DBA radiological consequences analyses, including calculated doses to control room operators and offsite. This information, as well as related WLS DEP 6.4-1 information appearing in other chapters of the FSAR, is reviewed in Section 21.2 of this SER.

AP1000 COL Information Item

- WLS COL 15.7-1

The applicant provided additional information in WLS COL 15.7-1 to address COL Information Item 15.7-1, "Consequences of Tank Failures." This COL item is addressed by the applicant in WLS COL FSAR Section 2.4.13.

15.7.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the radioactive release from a subsystem or component are given in Section 11.2 of NUREG-0800, Branch Technical Position (BTP) 11-6, and Section 2.4.13 of NUREG-0800, Acceptance Criterion Number 5.

The regulatory basis for acceptance of the supplementary information on consequences of a tank failure is established in:

- 10 CFR Part 20, "Standards for protection against radiation," Appendix B, "Annual Limits on Intake (ALIs) and Derived Air Concentrations (DACs) of Radionuclides for Occupational Exposure; Effluent Concentrations; Concentrations for Release to Sewerage"

- 10 CFR 20.1301, "Dose limits for individual members of the public"

- 10 CFR 20.1406, "Minimization of contamination"

- 10 CFR Part 50, "Domestic licensing of production and utilization facilities," Appendix A, "General Design Criteria for Nuclear Power Plants," General Design Criteria (GDC) 60, "Control of Releases of Radioactive Materials to the Environment," and GDC 61, "Fuel Storage and Handling and Radioactivity Control"

- 10 CFR 50.34a, "Design objectives for equipment to control releases of radioactive material in effluents—nuclear power reactors"
- 10 CFR 50.36a, "Technical specifications on effluents from nuclear power reactors"
- 10 CFR 52.80(a), "Contents of applications; additional technical information"
- RG 4.21, "Minimization of Contamination and Radioactive Waste Generation: Life-Cycle Planning"
- RG 1.109, "Calculation of Annual Doses to Man from Routine Releases of Reactor Effluents for the Purpose of Evaluating Compliance with 10 CFR Part 50, Appendix I," Revision 1
- RG 1.113, "Estimating Aquatic Dispersion of Effluents from Accidental and Routine Reactor Releases for the Purpose of Implementing Appendix I," Revision 1
- RG 1.143, "Design Guidance for Radioactive Waste Management Systems, Structures, and Components Installed in Light-Water-Cooled Nuclear Power Plants," Revision 2, Regulatory Position C.1.1

15.7.4 Technical Evaluation

The NRC staff reviewed Section 15.7 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the radioactive release from a subsystem or component. The results of the NRC staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

The staff reviewed the information in the WLS COL FSAR:

AP1000 COL Information Item

- WLS COL 15.7-1

COL Information Item 15.7-1 states:

> Combined License applicant referencing the AP1000 certified design will perform an analysis of the consequences of potential release of radioactivity to the environment due to a liquid tank failure as outlined in subsection 15.7.3.

The applicant addresses the consequence of a liquid waste tank failure in WLS COL FSAR Section 2.4.13. The staff's evaluation of liquid waste tank failure is described in Section 11.2, "Liquid Waste Management Systems," of this SER.

15.7.5 Post Combined License Activities

There are no post-COL activities related to this section.

15.7.6 Conclusion

The NRC staff reviewed the application and checked the referenced DCD. The NRC staff's review confirmed that the applicant addressed the required information relating to radioactive release from a subsystem or component, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the WLS COL FSAR is acceptable and meets the regulatory guidance in Sections 2.4.13 and 11.2 of NUREG-0800. The staff based its conclusion on the following:

- WLS DEP 6.4-1, related to design changes affecting habitability of the main control room and changes to the calculated doses to control room operators, is reviewed and found acceptable by the staff in Section 21.2 of this SER.

- WLS COL 15.7-1 is acceptable based on the evaluations in Sections 2.4.13 and 11.2 of this SER.

15.8 <u>Anticipated Transients Without Scram</u>

Analyses focused on anticipated transients without scram (ATWS) address an AOO during which an automatic reactor scram is required but fails to occur due to a common mode fault in the reactor protection system.

Section 15.8 of the WLS COL FSAR, Revision 11, incorporates by reference, with no departures or supplements, Section 15.8, "Anticipated Transients Without Scram," of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.[1] The NRC staff's review confirmed that there is no outstanding issue related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Appendix 15A Evaluation Models and Parameters for Analysis of Radiological Consequences of Accidents

15A.1 Introduction

This appendix includes the parameters and models that form the basis of the radiological consequences analyses for the various postulated accidents.

15A.2 Summary of Application

In the WLS COL FSAR, Revision 11, Chapter 15, "Accident Analyses," the applicant incorporated by reference Appendix 15A to Chapter 15, "Accident Analyses," of the AP1000 DCD, Revision 19.

In addition, the applicant provided the following:

Departures

- WLS DEP 6.4-1

The applicant provided additional information in Appendix 15A of the WLS COL FSAR about WLS DEP 6.4-1 related to design changes affecting habitability of the main control room and changes to the DBA radiological consequences analyses, including calculated doses to control room operators and offsite. WLS DEP 6.4-1 revises the analysis of the radiological consequences described in this section of the SER. This information, as well as related WLS DEP 6.4-1 information appearing in other chapters of the FSAR, is reviewed in Section 21.2 of this SER.

AP1000 COL Information Item

- WLS COL 2.3-4

In WLS COL FSAR Sections 15.6 and 15A, the applicant provided additional information in WLS COL 2.3-4 on site characteristic χ/Q values to partially resolve COL Information Item 2.3-4. The applicant provided additional information in WLS COL FSAR Section 2.3.4 to resolve the remaining portion of COL Information Item 2.3-4, and the staff's review of this portion is in Section 2.3.4 of this SER.

15A.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the accident analyses are given in Section 15.0.3 of NUREG-0800.

Requirements for the technical information in the FSAR are given in 10 CFR 52.79. In particular, 10 CFR 52.79(a)(1)(vi) requires a description and safety assessment of the site on which the facility is to be located, including an evaluation of the offsite radiological consequences of postulated accidents to show that the site characteristics comply with the following offsite radiological consequence evaluation factors:

(A) An individual located at any point on the exclusion area boundary (EAB) for any 2-hour period following the onset of the postulated fission product release, would not receive a radiation dose in excess of 0.25 Sievert (Sv) (25 roentgen equivalent man (rem)) total effective dose equivalent (TEDE), and

(B) An individual located at any point on the outer boundary of the low population zone (LPZ), who is exposed to the radioactive cloud resulting from the postulated fission product release (during the entire period of its passage) would not receive a radiation dose in excess of 0.25 Sv (25 rem) TEDE.

Applications for DCs must include similar evaluations to show compliance with 10 CFR 52.47(a)(2), which includes the same offsite radiological consequence evaluation factors as given in 10 CFR 52.79(a)(1). In other words, both the AP1000 DCD and the COL FSAR must have DBA radiological consequences analyses that estimate a dose at or below 0.25 Sv (25 rem) TEDE at the EAB and LPZ receptors.

Compliance with the control room habitability dose requirements of 10 CFR Part 50, Appendix A, GDC 19, "Control Room," requires that the applicant show that, for a plant located at the WLS site, the control room provides adequate radiation protection to ensure that radiation exposures shall not exceed 0.05 Sv (5 rem) TEDE to permit access and occupancy of the control room under accident conditions for the duration of the accident.

15A.4 Technical Evaluation

The NRC staff reviewed Appendix 15A to Chapter 15 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to radiological consequences of accidents. The results of the NRC staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

The staff reviewed the information in the WLS COL FSAR:

Departures

- WLS DEP 6.4-1

The applicant provided additional information in Appendix 15A of the WLS COL FSAR about WLS DEP 6.4-1 related to design changes affecting habitability of the main control room and changes to the DBA radiological consequences analyses, including calculated doses to control room operators and offsite. This information revises the analysis of the radiological consequences described in this section of the SER and is reviewed in Section 21.2 of this SER.

WLS DEP 6.4-1 is based on revised DBA radiological consequence analyses that make changes to specific parameters and methodologies that were used in the DBA radiological consequence analyses discussed in AP1000 DCD Chapter 15. The remainder of the analysis assumptions, inputs, and methodologies are the same as given in AP1000 DCD that the staff previously evaluated and found acceptable in NUREG-1793, "Final Safety Evaluation Report Related to Certification of the AP1000 Standard Design," Initial Report, Section 15.3.

AP1000 COL Information Item

- WLS COL 2.3-4

In WLS COL FSAR Sections 15.6 and 15A, the applicant stated that it provided additional information in WLS COL 2.3-4 to partially resolve COL Information Item 2.3-4, which states:

> Combined License applicants referencing the AP1000 certified design will address the site-specific χ/Q values specified in [DCD] subsection 2.3.4. For a site selected that exceeds the bounding χ/Q values, the Combined License applicant will address how the radiological consequences associated with the controlling design basis accident continue to meet the dose reference values given in 10 CFR Part 50.34 and control room operator dose limits given in General Design Criteria 19 using site-specific χ/Q values. The Combined License applicant should consider topographical characteristics in the vicinity of the site for restrictions of horizontal and/or vertical plume spread, channeling or other changes in airflow trajectories, and other unusual conditions affecting atmospheric transport and diffusion between the source and receptors. No further action is required for sites within the bounds of the site parameters for atmospheric dispersion.
>
> With regard to assessment of the postulated impact of an accident on the environment, the COL applicant will provide χ/Q values for each cumulative frequency distribution which exceeds the median value (50 percent of the time).

The commitment was also captured as COL Action Items 2.3.4-1, 2.3.4-2, and 2.3.4-3 in Appendix F of NUREG-1793, which states:

> The COL applicant will determine the site specific χ/Q values. If the site-specific values exceed the bounding χ/Q values, the COL applicant will address how the radiological consequences associated with the controlling DBA continue to meet the radiological dose consequence criteria given in Title 10, Section 50.34(a)(1)(ii)(D)*(1) and (2)*, of the *Code of Federal Regulations* (10 CFR 50.34), using site-specific χ/Q values.
>
> The COL applicant will determine the site specific χ/Q values. If the site-specific values exceed the bounding χ/Q values, the COL applicant will address how the radiological consequences associated with the controlling DBA continue to meet the control room operator dose limits given in General Design Criteria 19, using site-specific χ/Q values.
>
> The COL applicant will provide χ/Q values for each cumulative frequency distribution that exceeds the median value (50 percent of the time).

WLS COL 2.3-4 added text to the end of Section 15.6.5.3.7.3 and Section 15A.3.3 of the AP1000 DCD to state that the site-specific atmospheric dispersion (χ/Q) values provided in WLS COL FSAR Section 2.3 are bounded by the values given in AP1000 DCD Table 15A-5, "Offsite Atmospheric Dispersion Factors (χ/Q) For Accident Dose Analysis," (offsite receptors) and Table 15A-6, "Control Room Atmospheric Dispersion Factors (χ/Q) For Accident Dose Analysis" (control room receptors).

The NRC staff reviewed the impact of the site characteristic χ/Q values given in response to WLS COL 2.3-4 on the radiological consequences of DBAs. The applicant did not provide site-specific doses at the EAB, LPZ, or control room for the DBAs referenced in AP1000 DCD, Chapter 15, but instead incorporated by reference the analysis of the radiological consequences in AP1000 DCD, Chapter 15.

AP1000 DCD, Chapter 15, over several sections, describes and provides results of the radiological consequences analyses for the DBAs applicable to the AP1000 design. A list of the DBAs analyzed for radiological consequences and the corresponding sections where the radiological consequences analyses for those DBAs are discussed in the AP1000 DCD is given below.

DCD Section	Design Basis Accident
15.1.5.4	Main Steam Line Break
15.3.3.3	Reactor Coolant Pump Shaft Seizure (Locked Rotor)
15.4.8.3	Control Rod Ejection
15.6.2	Small Line Break
15.6.3.3	Steam Generator Tube Rupture
15.6.5.3	Loss of Coolant Accident (LOCA)
15.7.4.3	Fuel Handling Accident

The DBA radiological consequences analyses in the AP1000 DCD were based, in part, on site parameter atmospheric dispersion values (i.e., χ/Q values). These site parameter χ/Q values are the only postulated environmental feature of an assumed site that are used in DBA radiological consequence analyses. The AP1000 site parameter χ/Q values used in the DBA radiological consequence analyses were selected to bound 70 to 80 percent of U.S. sites. As a result, 70 to 80 percent of U.S. sites would be expected to have site characteristic χ/Q values that are less than the AP1000 site parameter χ/Q values, and would, therefore, have corresponding DBA radiological consequences that are lower than those described in the AP1000 DCD. To resolve WLS COL 2.3-4, the applicant discussed the WLS site characteristic short-term (accident) χ/Q values in WLS COL FSAR Section 2.3.4. The WLS site characteristic EAB and LPZ χ/Q values for DBAs are given in WLS COL FSAR Table 2.0-201, and the control room χ/Q values for DBAs are given in WLS COL FSAR Table 2.0-202. In Section 2.3.4 of this SER, the NRC staff discusses its review of the WLS site characteristic χ/Q values and resolution to WLS COL 2.3-4.

As described in Section 2.3.4 of this SER, the WLS site characteristic χ/Q values for each time averaging period are less than the corresponding AP1000 site parameter χ/Q values. This causes the postulated radiological consequences of DBAs at the WLS site to be lower than those reported in the AP1000 DCD. Therefore, since the offsite radiological consequence requirements of 10 CFR 50.34(a)(1)(ii)(D)(1) and (2)[3] and the DBA control room radiological consequence criteria in GDC 19 are met for the AP1000, then these same requirements are also met by the applicant for the WLS site.

The effect of the site-specific χ/Q values on the Technical Support Center radiological habitability is evaluated by the NRC staff in SER Section 13.3 as part of its evaluation of WLS DEP 18.8-1.

Although WLS DEP 6.4-1 is a site-specific departure from the AP1000 DCD, the revised DBA dose analyses provided by the applicant are generic analyses in that they use the same short-term (accident) atmospheric dispersion factor (χ/Q) values given as site parameters in AP1000 DCD, Section 2.3.4. For WLS DEP 6.4-1, no changes were made to the WLS site characteristic short-term χ/Qs given in FSAR 2.3.4; therefore, in accordance with the discussion of WLS COL 2.3-4 above, the WLS site-specific short-term χ/Q values are less than those used in the revised generic analysis supporting WLS DEP 6.4-1. By the same logic above, the WLS site-specific estimated total dose at the EAB, LPZ, and the MCR for each DBA is, therefore, less than the generic revised estimated total dose at the same receptor location for each DBA, as provided in the additional FSAR information for WLS DEP 6.4-1.

15A.5 Post Combined License Activities

There are no post-COL activities related to this section.

15A.6 Conclusion

The NRC staff reviewed the application and checked the referenced DCD. The NRC staff's review confirmed that the applicant addressed the required information relating to the evaluation models and parameters for analysis of radiological consequences of accidents, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the WLS COL FSAR is acceptable and meets the requirements of 10 CFR 52.79(a)(1) and 10 CFR Part 50, Appendix A, GDC 19. The staff based its conclusion on the following:

- WLS DEP 6.4-1 provides additional information related to design changes affecting habitability of the main control room and changes to the DBA radiological consequences analyses, including calculated doses to control room operators and offsite. This information revises the analysis of the radiological consequences described in this section of the SER and is reviewed and found acceptable by the staff in Section 21.2 of this SER.

- WLS COL 2.3-4 is acceptable because the DBA offsite radiological consequences meet the requirements of 10 CFR 52.79(a)(1) and the DBA control room radiological consequences meet the requirements of GDC 19.

[3] The radiological consequence criteria in 50.34(a)(1)(ii)(D)(1) and (2) are the same criteria for DC applications in 10 CFR 52.47(a)(2)(iv) and for COL applicants in 10 CFR 52.79(a)(1)(vi)

Appendix 15B **<u>Removal of Airborne Activity from the Containment Atmosphere Following a LOCA</u>**

This appendix includes information related to the AP1000 design, which does not depend on active systems to remove airborne particulates or elemental iodine from the containment atmosphere following a postulated LOCA with core melt. The AP1000 applicant stated that naturally occurring passive removal processes provide significant removal capability such that airborne elemental iodine is reduced to very low levels within a few hours and the airborne particulates are reduced to extremely low levels within 12 hours.

Appendix 15B of the WLS COL FSAR, Revision 11, incorporates by reference, Appendix 15B, “Removal of Airborne Activity from the Containment Atmosphere Following a LOCA,” of Revision 19 of the AP1000 DCD. In addition, in the WLS COL FSAR, the applicant provided the following:

<u>Departures</u>

- WLS DEP 6.4-1

The applicant provided additional information in Appendix 15B of the WLS COL FSAR about WLS DEP 6.4-1 related to design changes affecting habitability of the main control room and changes to the calculated doses to control room operators. This information, as well as related WLS DEP 6.4-1 information appearing in other chapters of the FSAR, is reviewed in Section 21.2 of this SER.

The NRC staff reviewed Appendix 15B of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this section. The NRC staff’s review confirmed that the applicant addressed the required information to satisfy the evaluation criteria. There is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the NRC staff’s technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Table 15.0-1. Power Calorimetric Uncertainty Methodology

Design Commitment	Inspections, Tests, Analyses	Acceptance Criteria
4. The plant calorimetric uncertainty and plant instrumentation performance is bounded by the 1 percent calorimetric uncertainty value assumed for the initial reactor power in the safety analysis.	Inspection will be performed of the plant operating instrumentation installed for feedwater flow measurement, its associated power calorimetric uncertainty calculation, and the calculated calorimetric values.	a) the as-built system takes input for feedwater flow measurement from a Caldon [Cameron] LEFM CheckPlus™ System; b) the power calorimetric uncertainty calculation documented for that instrumentation is based on an NRC-accepted Westinghouse methodology and the uncertainty values for that instrumentation are not lower than those for the actual installed instrumentation; and c) the calculated calorimetric power uncertainty measure values are bounded by the 1 percent uncertainty value assumed for the initial reactor power in the safety analysis.

16.0 TECHNICAL SPECIFICATIONS

This chapter discusses the plant-specific technical specifications (PTS), as well as the design reliability assurance program (D-RAP) and the controls for systems, structures, and components (SSCs) required for defense-in-depth in accordance with the program for regulatory treatment of nonsafety systems (RTNSS).

16.1 Technical Specifications

16.1.1 Introduction

Section 16.1, "Technical Specifications," of the William States Lee III Nuclear Station (WLS) combined license (COL) Final Safety Analysis Report (FSAR), and the WLS COL Part 4, "Technical Specifications," provide the PTS for WLS Units 1 and 2, in accordance with Title 10 of the *Code of Federal Regulations* (10 CFR) 50.36, "Technical specifications," and 10 CFR 52.79(a)(30). Technical Specifications (TS) impose limits, operating conditions, and other requirements upon reactor facility operation for the public health and safety. The TS are derived from the analyses and evaluations in the safety analysis report. In general, TS must include: (1) safety limits and limiting safety system settings; (2) limiting conditions for operation (LCO); (3) surveillance requirements (SRs); (4) design features; and (5) administrative controls. The PTS are derived from the analyses and evaluations in the AP1000 Design Control Document (DCD) and the WLS COL FSAR.

As part of the regulatory standardization effort, the U.S. Nuclear Regulatory Commission (NRC) staff has prepared standard technical specifications (STS) for each of the light-water reactor nuclear steam supply systems and associated balance-of-plant equipment systems. In 1992, the NRC issued the STS to clarify the content and format of requirements necessary to ensure safe operation of nuclear power plants. The STS for Westinghouse pressurized water reactors are included in NUREG-1431, "Standard Technical Specifications - Westinghouse Plants." Volume 1 addresses the STS, and Volume 2 addresses the associated STS Bases. The STS include bases for safety limits, limiting safety system settings, LCO, and associated action and surveillance requirements. Major revisions to the STS were published in 1995 (Revision 1), 2001 (Revision 2), and 2004 (Revision 3).

The format and content of the PTS and Bases for a COL referencing a certified design should be based on the generic TS (GTS) and Bases for that design. For a COL application that references a certified design, the proposed PTS and Bases may include appropriate plant-specific departures from the referenced GTS and Bases when warranted. These departures, if included with the COL application, need to be justified to demonstrate that the requirements of 10 CFR 50.36 are met.

16.1.2 Summary of Application

Section 16.1 of the WLS COL FSAR, Revision 11, incorporates by reference Sections 16.1.1 and 16.1.2 of the AP1000 DCD, Revision 19. Part 4 of the WLS COL incorporates by reference the AP1000 GTS and Bases in Section 16.1 of the DCD. In accordance with Section IV(A)(2)(c) of Appendix D, "Design Certification Rule for the AP1000 Design" to 10 CFR Part 52, "Licenses, certifications, and approvals for nuclear power plants," the applicant's PTS consist of the

AP1000 GTS and site-specific information. The applicant took departures from the AP1000 GTS.

The AP1000 GTS includes items that a COL applicant must satisfy in order to complete a particular GTS provision. Detailed design information, equipment selection, instrumentation settings, and other information not available at the time of design certification (DC) are needed to establish the values or information to be included in the PTS. Locations for the addition of this information are signified in the GTS by square brackets [ ] or reviewer's notes to indicate that the COL applicant must provide plant-specific values or alternate text.

In WLS COL application Part 4, the applicant provided the following:

Departures

- WLS DEP 3.2-1

The applicant provided additional information about WLS DEP 3.2-1 in WLS COL Part 4, including changes to TS SR 3.5.4.7 and corresponding Bases, Bases B3.3.3 (LCO Section), and Bases B3.5.4 (Background Section), related to design modifications to the condensate return portion of the Passive Core Cooling System. This information, as well as related WLS DEP 3.2-1 information appearing in other chapters of the FSAR, is reviewed in Section 21.1 of this SER.

- WLS DEP 6.4-1

The applicant provided additional information about WLS DEP 6.4-1 in WLS COL Part 4, including changes to TS LCO 3.7.4, TS SR 3.7.4.1, and Bases 3.4.10, 3.7.4, and 3.7.6 related to design changes affecting habitability of the main control room and changes to the calculated doses to control room operators. This information, as well as related WLS DEP 6.4-1 information appearing in other chapters of the FSAR, is reviewed in Section 21.2 of this SER.

- WLS DEP 6.4-2

The applicant provided additional information about WLS DEP 6.4-2 in WLS COL Part 4, including changes to TS 3.3.2 and corresponding Bases and TS 3.7.6 and corresponding Bases related to design changes affecting how the temperature and humidity in the main control room are maintained within the limits for reliable human performance. This information, as well as related WLS DEP 6.4-2 information appearing in other chapters of the FSAR, is reviewed in Section 21.3 of this SER.

- WLS DEP 7.3-1

The applicant provided additional information about WLS DEP 7.3-1 in WLS COL Part 4, including changes to TS Table 3.3.2-1 and associated Bases, related to required design changes for the PMS source range neutron flux doubling logic to comply with the requirements of IEEE Std. 603-1991, Clause 6.6. This information, as well as related WLS DEP 7.3-1 information appearing in other chapters of the FSAR, is reviewed in Section 21.5 of this SER.

<u>AP1000 COL Information Item</u>

- WLS COL 16.1-1

The applicant provided additional information in WLS COL 16.1-1 to resolve COL Information Item 16.1-1 (COL Action Item 16.2-1). The applicant provided additional information to address each of the remaining brackets [ ] and reviewer's notes in the AP1000 GTS.

The following sections of the WLS PTS and Bases include information that the applicant addressed as part of COL Information Item 16.1-1:

- PTS 3.3.1, 3.3.2, and 3.6.4
- PTS 4.1, 4.1.1, and 4.1.2
- PTS 5.1.1, 5.1.2, 5.2.1.a, 5.2.1.b, 5.2.2, 5.3, 5.3.1, 5.6.1, and 5.6.2

16.1.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793, "Final Safety Evaluation Report [FSER] Related to Certification of the AP1000 Standard Design," and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for TS and Bases reviews are given in Section 16 of NUREG-0800, "Standard Review Plan [SRP] for the Review of Safety Analysis Reports for Nuclear Power Plants: LWR Edition." Areas of review that interface with other sections of the SRP can also be found in Section 16 of NUREG-0800.

The applicable regulatory requirements for the information being reviewed in this section are:

- 10 CFR 50.36, "Technical Specifications."
- 10 CFR 50.36a, "Technical specifications on effluents from nuclear power reactors."
- 10 CFR 52.79(a)(30), "Contents of applications."

16.1.4 Technical Evaluation

The NRC staff reviewed Section 16.1 of the WLS COL FSAR and Part 4 of the WLS COL application, and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic[1]. The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the TS. The results of the NRC staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

---

[1] See Section 1.2.2 for a discussion of the staff's review related to verification of the scope of information to be included in a COL application that references a DC.

Section 1.2.3 of this safety evaluation report (SER) provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (Vogtle Electric Generating Plant [VEGP], Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from requests for additional information (RAIs).

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.

- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the WLS COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the Bellefonte Nuclear Plant (BLN), Units 3 and 4 COL application.

Many VEGP SER section numbers were changed from those used in the BLN SER to more closely follow the PTS numbering. Therefore, the corresponding BLN SER section numbers are frequently identified when quoting standard content material from the SER for the reference COL application (VEGP).

The staff reviewed the information in the WLS COL FSAR and the WLS COL application, Part 4:

<u>*AP1000 COL Information Item*</u>

- WLS COL 16.1-1

The following portion of this technical evaluation section is reproduced from Section 16.1.4 of the VEGP SER:

> *The following portion of this technical evaluation section is reproduced from Section 16.1.4 of the BLN SER:*
>
> *In Section 16.1.1 of the BLN COL FSAR, the applicant provided additional information in BLN COL 16.1-1 to resolve COL Information Item 16.1-1 (COL Action Item 16.2-1) listed under the Section 16.1.1 header, "Combined License Information," of the AP1000 DCD, Revision 17, which states:*
>
> > *This set of technical specifications is intended to be used as a guide in the development of the plant-specific technical*

> *specifications. The preliminary information originally provided in brackets [ ] has been revised with the updated information APP-GW-GLR-064 and APP-GW-GLN-075. Combined License applicants referencing the AP1000 will be required to provide the final information for the remaining brackets [ ] with final plant-specific information.*

In Section 16.1 of the BLN COL FSAR, the applicant noted that the GTS and Bases provided with Chapter 16 of the AP1000 DCD are incorporated by reference into the PTS provided in Part 4 of the BLN COL application.

The staff evaluated the applicant's disposition of each of the remaining bracketed information items in the respective TS sections listed below.

The staff did not review portions of the BLN PTS and Bases that were identical to the AP1000 GTS and Bases. The technical evaluation for those portions that are identical to the AP1000 GTS and Bases can be found in the NRC staff's FSER for the AP1000 DCD.

16.1.4.1 <u>Use and Application</u>

Section 1.0 of the BLN PTS includes definitions of terms used in the context of plant TS, and examples to illustrate the applications of logical connectors, completion times for required actions, and frequencies for surveillance requirements (SRs). Section 1.0 of the BLN PTS is identical to the AP1000 GTS. There is no site-specific information that the applicant needed to provide to complete this section.

16.1.4.2 <u>Safety Limits</u>

Section 2.0 of the BLN PTS and Bases include[s] requirements for safety limits to ensure that the fuel design limits are not exceeded during steady state conditions, normal operational transients, and anticipated operational occurrence. Section 2.0 of the BLN PTS and Bases are [is] identical to the AP1000 GTS and Bases. There is no site-specific information that the applicant needed to provide to complete this section.

16.1.4.3.0 Limiting Condition for Operation and Surveillance Requirement Applicability

The following portion of this technical evaluation section is reproduced from Section 16.1.4.3 of the BLN SER:

Section 3.0 of the BLN PTS and Bases include[s] general provisions regarding determination of equipment operability and performance of SRs in specific TS sections (i.e., TS 3.1 through TS 3.9). Section 3.0 of the BLN PTS and Bases are [is] identical to the AP1000 GTS and Bases. There is no site-specific information that the applicant needed to provide to complete this section.

16.1.4.3.1 Reactivity Control Systems

The following portion of this technical evaluation section is reproduced from Section 16.1.4.4 of the BLN SER:

Section 3.1 of the BLN PTS and Bases include[s] requirements for the reactivity control systems which are designed to reliably control reactivity changes, and under postulated accident conditions, ensure that the capability to cool the core is maintained. Section 3.1 of the BLN PTS and Bases are [is] identical to the AP1000 GTS and Bases. There is no site-specific information that the applicant needed to provide to complete this section.

16.1.4.3.2 Power Distribution Limits

The following portion of this technical evaluation section is reproduced from Section 16.1.4.5 of the BLN SER:

Section 3.2 of the BLN PTS and Bases include[s] requirements for the reactor core power distribution limits which are designed to reliably control core thermal limits and core power distribution consistent with the design safety analysis. Section 3.2 of the BLN PTS and Bases are [is] identical to the AP1000 GTS and Bases. There is no site-specific information that the applicant needed to provide to complete this section.

16.1.4.3.3 Instrumentation

The following portion of this technical evaluation section is reproduced from Section 16.1.4.6 of the BLN SER:

Section 3.3 of the BLN PTS and Bases include[s] requirements for the instrumentation systems that display information required to protect against violating core fuel design limits and Reactor Coolant System (RCS) integrity, and to mitigate accidents.

The BLN instrumentation will be selected after COL issuance, and therefore, in accordance with COL/DC-ISG-8, "Necessary Content of Plant-Specific Technical Specifications When a Combined License is Issued," all trip setpoints and allowable values must be established through a staff-approved administrative control TS that specifies use of an NRC-approved methodology for determining the trip setpoints and allowable values, and a document controlled by 10 CFR 50.59 for recording this information. The trip setpoints and allowable *values, referred to in Tables 3.3.1-1 and 3.3.2-1, will be determined after selection of specific instrumentation.*

Request for additional information (RAI) 16-1 was issued in accordance with COL/DC-ISG-8, and requested that the applicant identify the method of determining the trip setpoints and allowable values, as well as establish an associated document in which to record the site-specific values and other restrictions necessary to satisfy 10 CFR 50.36. The applicant should clarify that after selection of specific instrumentation, the trip setpoints and allowable values, referred to in Tables 3.3.1-1 and 3.3.2-1, will be calculated using the setpoint control program that specifies the approved methodology (i.e., WCAP-16361, APP-PMS-JEP-001, Revision 0, May 2006, "Westinghouse Setpoint Methodology for Protection Systems – AP1000"). In addition, the applicant should propose a setpoint control program to be added in the Administrative Control section of the TS, as stated in COL/DC-ISG-8. ***This is identified as Open Item 16.1-1****.*

<u>Resolution of Standard Content Open Item 16.1-1</u>

Resolution to this issue was brought forward at a public meeting on September 3, 2009, attended by the staff, Westinghouse, and the AP1000 COL applicants. Westinghouse committed to provide an acceptable setpoint control program in the AP1000 DC amendment application, which would then be adoptable by any COL applicants. This program was submitted to the staff in a letter dated February 19, 2010, and revised on May 6, 2010. The review of this program is documented in a supplement to NUREG-1793.

The applicant, in its May 21, 2010, supplemental response to this open item, committed to calculate trip setpoints and allowable values using the approved methodology cited above and to incorporate the AP1000 DCD setpoint control program in the Administrative Controls section of its PTS. The staff finds this response acceptable, since it ensures the applicant will use approved methodologies and a comprehensive administrative program to calculate setpoint values. The incorporation of this program into the VEGP TS in a later revision is ***Confirmatory Item 16.1-1.***

<u>Resolution of Standard Content Confirmatory Item 16.1-1</u>

Confirmatory Item 16.1-1 is an applicant commitment to revise its PTS to incorporate the AP1000 DCD setpoint control program in the Administrative Controls section of its PTS. The staff verified that the PTS was appropriately revised. As a result, Confirmatory Item 16.1-1 is now closed. [The Administrative controls section of the WLS PTS cites Revision 1 of WCAP-16361, consistent with the GTS in the AP1000 certified design.]

16.1.4.3.4 Reactor Coolant System

The following portion of this technical evaluation section is reproduced from Section 16.1.4.7 of the BLN SER:

Section 3.4 of the BLN PTS and Bases include[s] requirements for various RCS parameters (i.e., pressure, temperature, flow, etc.) and subsystems (i.e., RCS loops, pressurizer, low-temperature overpressure protection, etc.) to ensure the fuel integrity and the RCPB [reactor coolant pressure boundary] integrity are preserved during all modes of plant operation. Section 3.4 of the BLN PTS and Bases are [is] identical to the AP1000 GTS and Bases. There is no site-specific information that the applicant needed to provide to complete this section.

16.1.4.3.5 Emergency Core Cooling Systems

The following portion of this technical evaluation section is reproduced from Section 16.1.4.8 of the BLN SER:

Section 3.5 of the BLN PTS and Bases include[s] requirements for the safety-related passive core cooling system, which is designed to perform emergency core decay heat removal, RCS emergency makeup and boration, and safety injection. Section 3.5 of the BLN PTS and Bases are [is] identical to the AP1000 GTS and Bases. There is no site-specific information that the applicant needed to provide to complete this section.

16.1.4.3.6 Containment Systems

The following portion of this technical evaluation section is reproduced from Section 16.1.4.9 of the BLN SER:

Section 3.6 of the BLN PTS and Bases include[s] requirements for the containment systems, which are designed to shield [contain] fission products that may be in the containment atmosphere following accident conditions. Section 3.6 of the BLN PTS and Bases are [is] identical to the AP1000 GTS and Bases, except for the deletion of a reviewer's note. For TS 3.6.4, the reviewer's note is not applicable to the PTS, and the applicant has appropriately removed the information. This is acceptable to the staff. There is no site-specific information that the applicant needed to provide to complete this section.

16.1.4.3.7 Plant Systems

The following portion of this technical evaluation section is reproduced from Section 16.1.4.10 of the BLN SER:

Section 3.7 of the BLN PTS and Bases include[s] requirements for various systems in the secondary side of the steam generators (i.e., the main steam safety valves, the main steam isolation valves, the main feedwater isolation valves, etc.), the spent fuel pool water level and makeup systems, and the main *control room habitability system. Section 3.7 of the BLN PTS and Bases are [is] identical to the AP1000 GTS and Bases. There is no site-specific information that the applicant needed to provide to complete this section.*

16.1.4.3.8 Electrical Power Systems

The following portion of this technical evaluation section is reproduced from Section 16.1.4.11 of the BLN SER:

Section 3.8 of the BLN PTS and Bases include[s] requirements for the plant electrical systems that provide redundant, diverse and dependable power sources for all plant operating conditions. In the event of a total loss of off-site power, batteries and back-up on-site diesel generators are provided to supply electrical power equipment necessary for the safe shutdown of the plant. Section 3.8 of the BLN PTS and Bases are [is] identical to the AP1000 GTS and Bases. There is no site-specific information that the applicant needed to provide to complete this section.

16.1.4.3.9 Refueling Operations

The following portion of this technical evaluation section is reproduced from Section 16.1.4.12 of the BLN SER:

Section 3.9 of the BLN PTS and Bases include[s] requirements for boron concentration, unborated water sources, nuclear instrumentation, containment penetrations, and water inventory in the refueling pool during Mode 6. Section 3.9 of the BLN PTS and Bases are [is] identical to the AP1000 GTS and Bases. There is no site-specific information that the applicant needed to provide to complete this section.

16.1.4.4 *Design Features*

Section 4.0 of the WLS PTS includes other design features not covered elsewhere in the PTS such as the site location, the site maps, and other information related to core design and fuel storage design. Section 4.0 of the WLS PTS is identical to the AP1000 GTS except for site-specific information provided by the applicant. In Section 4.1, the applicant provided the WLS site location information to replace the bracketed information in the GTS. The staff found the added information acceptable since it is consistent with related information found in FSAR Section 2.1.1, and in accordance with guidance provided in the GTS. In Section 4.1.1, the applicant provided Figure 4.1-2, which describes its site boundary and exclusion area boundaries. The staff found the added information acceptable since it is consistent with related information found in WLS COL FSAR Sections 2.1.1.2 and 2.1.1.3, and in accordance with the guidance provided in the GTS. In Section 4.1.2, the applicant also provided the site location in Figure 4.1-1 and a description of the radius, which establishes its low population zone. The staff found the added information acceptable since it is consistent with related information found in WLS COL FSAR Section 2.1.3, and is in accordance with the guidance provided in the GTS.

The following portion of this technical evaluation section is reproduced from Section 16.1.4.5 of the VEGP SER:

16.1.4.5 Administrative Controls

The following portion of this technical evaluation section is reproduced from Section 16.1.4.14 of the BLN SER:

This section of the BLN PTS includes provisions, which address various administrative controls related to plant key personnel responsibilities, plant procedures, special programs and reports, etc., to ensure the plant is safely operated. As discussed in Section 16.1.4.6 above, [WLS SER Section 16.1.4.3.3,] *the BLN instrumentation will be selected after COL issuance, and therefore, in accordance with COL/DC-ISG-8, all trip setpoints and allowable values must be established through a staff-approved administrative control TS that specifies use of an NRC-approved methodology for determining the trip setpoints and allowable values, and a document controlled by 10 CFR 50.59 for recording this information. The trip setpoints and allowable values, referred to in Tables 3.3.1-1 and 3.3.2-1, will be determined after selection of specific instrumentation.*

The staff issued RAI 16-1 and requested that the applicant identify the method of determining the trip setpoints and allowable values, as well as establish an associated document in which to record the site-specific values and other restrictions necessary to satisfy 10 CFR 50.36. The applicant should clarify that after selection of specific instrumentation, the trip setpoints and allowable values, referred to in Tables 3.3.1-1 and 3.3.2-1, will be calculated using the setpoint control program that specifies the approved methodology (i.e., WCAP-16361, APP-PMS-JEP-001, Revision 0, May 2006, "Westinghouse Setpoint Methodology for Protection Systems – AP1000"). In addition, the applicant should propose a setpoint control program to be added in the Administrative Control section of the TS, as stipulated in COL/DC-ISG-8. ***This is identified as Open Item 16.1-1****.*

Resolution of Standard Content Open Item 16.1-1

The resolution of this issue is discussed in the evaluation of Section 16.1.4.3.3, "Instrumentation," above. The applicant committed to adopting the setpoint control program approved in the AP1000 DC, which will be verified in a future revision of the VEGP TS. This is ***Confirmatory Item 16.1-1****.*

Resolution of Confirmatory Item 16.1-1

Confirmatory Item 16.1-1 is an applicant commitment to revise its PTS to incorporate the AP1000 DCD setpoint control program in the Administrative Controls section of its PTS. The staff verified that the PTS was appropriately revised. As a result, Confirmatory Item 16.1-1 is now closed. [The

Administrative controls section of the WLS PTS cites Revision 1 of WCAP-16361, consistent with the GTS in the AP1000 certified design.]

The following portion of this technical evaluation section is reproduced from Section 16.1.4.14 of the BLN SER:

In Section 5.3.1 of the BLN PTS, the applicant replaced the GTS bracketed information, clarifying that each member of the unit staff shall meet or exceed minimum qualifications of RG [Regulatory Guide] *1.8, Revision 3 except for during cold license operator training where portions of RG 1.8, Revision 2 will apply. The staff finds this acceptable because RG 1.8, Revision 3 does not address cold license operator training. In other respects, Sections 5.0, 5.1.1, 5.1.2, 5.2.1a, 5.2.1b, 5.2.2, 5.3, 5.6.1, and 5.6.2 of the BLN PTS are identical to the AP1000 GTS, except for site-specific information provided by the applicant to replace the bracketed information in the GTS. The site-specific information provided was administrative in nature and the staff found it acceptable.*

In Section 5.2.2 of the VEGP PTS, the applicant proposed to remove the brackets around the COL item related to unit staff organization, as well as removing work hour restrictions in TS 5.2.2.d. The applicant refers to 73 Federal Register (FR) 79923 which provides the NRC's model application for adopting Technical Specification Task Force (TSTF)-511, Revision 0, "Eliminate Working Hour Restrictions from TS 5.2.2 to Support Compliance with 10 CFR Part 26 ["Fitness for Duty Programs"]*." The staff finds this deletion acceptable since it conforms to the guidance provided in the TSTF and working hour restrictions in 10 CFR Part 26, and therefore, is no longer required to be in the TS. This appropriately meets the intent of completing this bracketed information.*

16.1.5 Post Combined License Activities

There are no post-COL activities related to this section.

16.1.6 Conclusion

The NRC staff reviewed the application and checked the referenced DCD. The NRC staff's review confirmed that the applicant addressed the required information relating to the WLS PTS and Bases, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements. The staff based its conclusion on the following:

- WLS DEP 3.2-1, related to design modifications to the condensate return portion of the Passive Core Cooling System, is reviewed and found acceptable by the staff in Section 21.1 of this SER.

- WLS DEP 6.4-1, related to design changes affecting habitability of the main control room and changes to the calculated doses to control room operators, is reviewed and found acceptable by the staff in Section 21.2 of this SER.

- WLS DEP 6.4-2, related to design changes affecting how the temperature and humidity in the main control room are maintained within the limits for reliable human performance, is reviewed and found acceptable by the staff in Section 21.3 of this SER.

- WLS DEP 7.3-1, related to required design changes for the PMS source range neutron flux doubling logic to comply with the requirements of IEEE Std. 603-1991, Clause 6.6, is reviewed and found acceptable by the staff in Section 21.5 of this SER.

- WLS COL 16.1-1, related to PTS and their Bases, is acceptable because the site-specific information is either identical to the GTS or will be completed using NRC-approved methodologies.

For the reasons set forth above, the staff finds that Section 16.1 of the WLS COL FSAR and Part 4 of the WLS COL application are acceptable and satisfy the requirements of 10 CFR 50.36; 10 CFR 50.36a, "Technical specifications on effluents from nuclear power reactors"; and 10 CFR 52.79(a)(30).

16.2 Design Reliability Assurance Program (Related to RG 1.206, Section C.III.1, Chapter 17, C.I.17.4, "Reliability Assurance Program Guidance")

The D-RAP comprises the reliability assurance activities that assure that the plant is consistent with the certified design when fuel is loaded for the first time.

Section 16.2 of the WLS COL FSAR, Revision 11, incorporates by reference, with no departures or supplements, Section 16.2, "Design Reliability Assurance Program," of Revision 19 of the AP1000 DCD, which in turn refers to Section 17.4 for a description of the program. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

The NRC staff's review of the applicant's D-RAP is documented in Section 17.4 of this SER.

16.3 Investment Protection

16.3.1 Introduction

The AP1000 design includes active systems that provide defense-in-depth capabilities (identified as "investment protection" by the applicant) for RCS makeup and decay heat removal. These active systems are the first line of defense in reducing challenges to the passive systems in the event of transients or plant upsets. Most active systems in the AP1000 design are designated as nonsafety-related. Because some active systems reduce challenges to safety-related systems to a significant degree, short-term availability controls are necessary to provide reasonable assurance that these SSCs are operable during anticipated events.

A detailed evaluation of the regulatory treatment of non-safety systems for the AP1000 design, and the concept of investment protection, is addressed in Chapter 22 of NUREG-1793.

16.3.2 Summary of Application

Section 16.3 of the WLS COL FSAR, Revision 11, incorporates by reference Section 16.3 of the AP1000 DCD, Revision 19.

In addition, in WLS COL FSAR Section 16.3, the applicant provided the following:

AP1000 COL Information Item

- STD COL 16.3-1

The applicant provided additional information in Standard (STD) COL 16.3-1 to address COL Information Item 16.3-1. This item is related to the development of a procedure to control the operability of investment protection SSCs.

16.3.3 Regulatory Basis

The regulatory basis of the information incorporated by reference, and the additional information presented in this application, is addressed in NUREG-1793 and its supplements.

16.3.4 Technical Evaluation

The NRC staff reviewed Section 16.3 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to SSCs required for defense-in-depth. The results of the NRC staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.

- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the WLS COL application. This standard content material is

identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the BLN Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from Section 16.3.4 of the VEGP SER:

> *AP1000 COL Information Item*
>
> - *STD COL 16.3-1*
>
> *The applicant provided supplemental information by adding the following statement to DCD Section 16.3-1:*
>
> > *Station procedures govern and control the operability of investment protection systems, structures, and components in accordance with Table 16.3-2 of the DCD, and provide the operating staff with instruction for implementing required actions when operability requirements are not met. Procedure development is addressed in FSAR Section 13.5.*
>
> *Section 22.5.9 of the NRC staff's FSER related to the DCD (NUREG-1793) evaluated the short-term availability controls proposed by Westinghouse for important non-safety-related SSCs. The NRC staff concluded that the administrative controls for the SSCs required for defense in depth, listed in Table 16.3-2 of the AP1000 DCD, were acceptable. COL applicants referencing the AP1000 are responsible for developing a procedure to control the operability of these SSCs in accordance with DCD Table 16.3-2 (COL Information Item 16.3.2-1* [16.3-1]*).*
>
> *The applicant's response to STD COL 16.3-1 is acceptable because there were no exceptions taken to the list of SSCs required for defense in depth nor to the administrative procedures included in AP1000 DCD Table 16.3-2. The applicant also committed to place this information in station procedures. The information in DCD Table 16.3-2 also provides the operating staff with instruction for implementing required actions when operability requirements are not met.*

16.3.5 Post Combined License Activities

There are no post-COL activities related to this section.

16.3.6 Conclusion

The NRC staff reviewed the application and checked the referenced DCD. The NRC staff's review confirmed that the applicant addressed the required information related to defense-in-depth using nonsafety-related SSCs, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the

NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the WLS COL FSAR is acceptable based on the regulatory basis addressed in NUREG-1793. The staff based its conclusion on the following:

- STD COL 16.3-1, as related to SSCs required for defense-in-depth, is acceptable because it states that station procedures will govern and control the operability of these SSCs, in accordance with Table 16.3-2 of the AP1000 DCD, without exceptions. The information in DCD Table 16.3-2 also provides the operating staff with guidance for taking required actions when operability requirements are not met.

17.0 QUALITY ASSURANCE (RELATED TO RG 1.206, SECTION C.III.1, CHAPTER 17, C.I.17, "QUALITY ASSURANCE AND RELIABILITY ASSURANCE")

The quality assurance (QA) program for design, fabrication, construction, testing, and operation, the design reliability program, and the maintenance rule program are discussed in this chapter.

17.1 Quality Assurance During the Design and Construction Phases

17.1.1 Introduction

The QA program related to design and construction activities is discussed in this section. It addresses the QA program implemented during combined license (COL) application development, including site characterization activities, design and construction phases.

17.1.2 Summary of Application

Section 17.1, "Quality Assurance During the Design and Construction Phases," of the William States Lee III Nuclear Station, Units 1 and 2 (WLS), COL Final Safety Analysis Report (FSAR), Revision 11, incorporates by reference Section 17.1 of the AP1000 Design Control Document (DCD), Revision 19.

In addition, in WLS COL FSAR Section 17.1, the applicant provided the following:

AP1000 COL Information Item

- WLS COL 17.5-1

The applicant provided additional information in WLS COL 17.5-1 to address COL Information Item 17.5-1. In WLS COL 17.5-1, the applicant addresses the quality assurance program under which the COL application was developed for the design and construction phases, which is applicable until COL issuance. Section 17.5, "Quality Assurance Program Description – New License Applicants," of the WLS COL FSAR addresses the QA program for the remaining portion of the design and construction phases following COL issuance, which is described in the Duke Nuclear Plant Development (NPD) Quality Assurance Program Description (QAPD).

17.1.3 Regulatory Basis

The regulatory basis of the information incorporated by reference into WLS COL FSAR Section 17.1 is addressed in NUREG-1793, "Final Safety Evaluation Report Related to Certification of the AP1000 Standard Design," and its supplements.

In addition, the relevant requirements of the Commission regulations for the resolution of WLS COL 17.5-1 are established in Title 10 of the *Code of Federal Regulations* (10 CFR), Part 50, "Domestic licensing of production and utilization facilities," Appendix B, "Quality assurance criteria for nuclear power plants and fuel reprocessing plants," as required by 10 CFR 52.79(a)(25).

17.1.4 Technical Evaluation

The staff of the Nuclear Regulatory Commission (NRC) reviewed Section 17.1 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to QA during design and construction phases. The results of the NRC staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this safety evaluation report (SER) provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the design certification (DC) and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (Vogtle Electric Generating Plant, Units 3 and 4 [VEGP]) were equally applicable to the WLS Units 1 and 2 COL application, the NRC staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from requests for additional information (RAIs).

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.

- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the WLS COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the Bellefonte Nuclear Plant (BLN), Units 3 and 4 COL application. Any confirmatory items in the standard content material retain the numbers assigned in the VEGP SER.

The staff reviewed the following information in the WLS COL FSAR:

AP1000 COL Information Item

- WLS COL 17.5-1

The NRC staff reviewed the partial resolution of WLS COL 17.5-1 related to QA during the design and construction phases until COL issuance, which is included under Section 17.1 of the WLS COL FSAR. The remaining information for WLS COL 17.5-1 is included in Section 17.5 of the WLS COL FSAR. The staff's review of WLS COL 17.5-1 is a combination of plant-specific evaluation and standard content evaluation.

---

[1] See SER Section 1.2.2 for a discussion of the NRC staff's review related to verification of the scope of information to be included in a COL application that references a design certification (DC).

Duke supplemented the information in AP1000 DCD Section 17.1 with new text to address the QA program requirements for design and construction activities implemented from COL application development through operations. Upon review of the additional text provided by the applicant, the NRC staff identified areas where additional information was needed.

In RAI 17.5-8, dated October 6, 2008, the NRC staff noted that WLS COL FSAR Section 17.1 states that the Duke Energy QA program and the Westinghouse Electric Company Quality Management System establish the QA requirements for design activities until the Duke NPD QAPD becomes effective. The staff requested clarification on the expected Duke Energy and Westinghouse Electric Company scope of work related to the applicant's COL application design activities from the time of docketing until the time the COL might be issued.

In its response letter, dated December 11, 2008, the applicant referenced a letter dated February 6, 2008, which provided a clarification to Section 17.1 of the WLS COL FSAR. Enclosure 1 of that letter revised the WLS COL FSAR to remove the reference to the Westinghouse Electric Company Quality Management System and clarified that the Duke QA program is applicable to design, procurement, and construction activities associated with WLS Units 1 and 2 that may occur before as well as after the COL is issued.

By letter dated December 17, 2010, Duke Energy submitted Revision 3 of the WLS COL FSAR. The staff reviewed Section 17.1 of the WLS COL FSAR and confirmed that the applicant had (1) adequately identified which QA programs applied to the design, procurement, and construction activities described in section 17.1 of the WLS COL FSAR, and (2) adequately described the expected scope of work related to the COL activities. Therefore, RAI 17.5-8 is closed.

In RAI 17.5-9, dated October 6, 2008, the NRC staff requested that the applicant confirm when the Duke NPD QAPD will become effective, as well as clarify the difference between the statements that "the Duke NPD QAPD will become effective at COL issuance," located in the WLS COL FSAR Section 17.1, and that "the QA Program - Operation will be implemented 30 days prior to initial fuel loading," located in WLS COL FSAR Table 13.4-201.

In its response letter, dated December 11, 2008, the applicant stated that the Duke NPD QAPD becomes effective at COL issuance, and establishes the QA program requirements for the remaining portion of the design and construction phases. However, full implementation of operations-related requirements is not expected until 30 days prior to fuel load, as indicated in FSAR Table 13.4-201. Accordingly, as part of its response to RAI 17.5-9, the applicant proposed to revise the last paragraph of Section 17.1 of the WLS COL FSAR to state:

> Implementation of the applicable portions of the "Quality Assurance Program Description" (QAPD) discussed in Section 17.5 begins at COL issuance. The program establishes the QA program requirements for the remaining portion of the design and construction phases and for operations; full implementation of the operations related requirements will be no later than as indicated in Table 13.4-201.

By letter dated December 17, 2010, Duke Energy submitted Revision 3 of the WLS COL FSAR. The staff reviewed Section 17.1 of the WLS COL FSAR and confirmed that the applicant had provided (1) an acceptable implementation schedule for the Duke NPD QAPD, and (2) an adequate description regarding implementation of the Duke NPD QAPD at COL issuance, and establishment of the appropriate QA program requirements for the remaining portion of the design and construction phases. Therefore, RAI 17.5-9 is closed.

The following portion of this section is reproduced from Section 17.1.4 of the VEGP SER:

> *In addition, the applicant proposed revisions to Appendix 1AA in its letter, dated August 19, 2008, in response to the NRC staff's RAI 1-5. In its response, the applicant proposed to change the exception statements to address the version of NQA-1 instead of addressing the QAPD included in Part 11 of the BLN COL application. The NRC staff has verified that the proposed revision was incorporated into Revision 1 of the BLN COL FSAR for those RGs with QA requirements. RAI 1-5 is closed for all RGs that contain exception statement referencing NQA-1 (i.e., RG 1.28, 1.30, 1.38, 1.39, 1.94, and 1.116) except for RG 1.33.*
>
> *In RAI 1-11, dated December 16, 2008, the NRC staff requested that the applicant document the mechanism for incorporation of the requirements of RG 1.33 since these requirements are not covered by NQA-1. In its letter, dated January 27, 2009, the applicant stated that conformance with RG 1.33 will be supplemented in a future amendment to include a reference to Nuclear Energy Institute (NEI) 06-14A. The NRC staff has addressed this issue with NEI since NEI 06-14A does not commit to RG 1.33. This issue will remain open until closure is reached with NEI 06-14A or the applicant. This is identified as* ***Open Item 17.1-1****.*
>
> *<u>Resolution of Standard Content Open Item 17.1-1</u>*
>
> *In its letter, dated December 31, 2009, the applicant proposed to revise VEGP COL FSAR Section 1.9, Table 1.9-201, "Regulatory Guide/FSAR Section Cross-References," to document that RG 1.33, "Quality Assurance Program Requirements (Operation)," Revision 2, is addressed in Section IV of the QAPD. Additionally, the applicant proposed to revise Appendix 1AA of the VEGP COL FSAR to document conformance to RG 1.33. Therefore, Open Item 17.1-1 is resolved for VEGP and the proposed revisions are identified as* ***Confirmatory Item 17.1-1****, pending formal revision of the VEGP COL FSAR.*
>
> *<u>Resolution of Standard Content Confirmatory Item 17.1-1</u>*
>
> *Confirmatory Item 17.1-1 is an applicant commitment to revise its FSAR Table 1.9-201 and Appendix 1AA to document conformance to RG 1.33. The staff verified that the VEGP COL FSAR was appropriately updated. As a result, Confirmatory Item 17.1-1 is now closed.*

<u>WLS Resolution of Standard Content Open and Confirmatory Item 17.1-1</u>

In a letter dated November 4, 2010, the applicant endorsed the standard content material provided by VEGP. By letter dated December 17, 2010, the applicant provided Revision 3 of the WLS COL FSAR and Revision 3 of the Duke NPD QAPD. In Revision 3 of the Duke NPD QAPD, the applicant addressed the information related to Standard Content Open Item 17.1-1. The NRC staff has confirmed through review of Revision 3 of the Duke NPD QAPD that (1) the applicant has incorporated the appropriate changes to Appendix 1AA of the WLS COL FSAR and Part IV, “Regulatory Commitments,” of the Duke NPD QAPD, and (2) the applicant has adequately identified and specified conformance to RG 1.33, “Quality Assurance Program Requirements (Operation),” Revision 2, consistent with the NRC-approved NEI 06-14A, Revision 7, guidance. This adequately addresses the issue outlined by Confirmatory Item 17.1-1; therefore, Standard Content Open Item 17.1-1 is resolved for the WLS COL application.

In January 2011 the NRC staff conducted a limited scope inspection at the Duke Energy facility in Charlotte, North Carolina, as documented in inspection report numbers 05200018/2011-201 and 05200198/2011-201 dated March 16, 2011. The purpose of the NRC inspection was to verify that the QA processes and procedures were effectively implemented with regard to the WLS COL application. During this inspection, the NRC inspectors identified one violation and one non-cited violation of NRC requirements related to the WLS QA program. Duke Energy responded to the Notice of Violation in a letter dated April 15, 2011. Duke Energy identified its actions to correct and prevent recurrence of the violation and noted that full compliance was achieved. Based on this response, the staff does not intend to conduct a follow-up inspection as a part of the ongoing licensing process.

17.1.5 Post Combined License Activities

There are no post COL activities related to this section.

17.1.6 Conclusion

The NRC staff reviewed the application and checked the referenced DCD. The NRC staff’s review confirmed that the applicant addressed the required information relating to QA during the design and construction phase, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the NRC staff’s technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Based on the information provided by the applicant, the staff concludes that WLS COL 17.5-1 meets the applicable Appendix B to 10 CFR Part 50 and 10 CFR 52.79(a)(25) requirements.

17.2 Quality Assurance During the Operations Phase

Section 17.2, “Quality Assurance During the Operations Phase,” of the WLS COL FSAR, Revision 11, incorporates by reference, with no departures or supplements, Section 17.2 of Revision 19 to the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issues relating to this section remained for review.[1] The review confirmed that there are no outstanding issues related to this section. The results of the NRC staff’s technical evaluation of the information incorporated by reference into the WLS COL application are documented in NUREG-1793 and its supplements.

17.3 Quality Assurance During Design, Procurement, Fabrication, Inspection, and/or Testing of Nuclear Power Plant Items (Related to RG 1.206, Section C.III.1, Chapter 17, C.I.17.3, "Quality Assurance Program Description")

Section 17.3, "Quality Assurance During Design, Procurement, Fabrication, Inspection, and/or Testing of Nuclear Power Plant Items," of the WLS COL FSAR, Revision 11, incorporates by reference, with no departures or supplements, Section 17.3 of Revision 19 to the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issues relating to this section remained for review.[1] The review confirmed that there are no outstanding issues related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference into the WLS COL application are documented in NUREG-1793 and its supplements.

17.4 Design Reliability Assurance Program (Related to RG 1.206, Section C.III.1, Chapter 17, C.I.17.4, "Reliability Assurance Program Guidance")

17.4.1 Introduction

This reliability assurance program (RAP) provides reasonable assurance that a plant is designed, constructed, and operated in a manner that is consistent with the assumptions and risk insights related to structures, systems, and components (SSCs) that are identified as being significant contributors to plant safety as determined by using probabilistic, deterministic, or other methods of analysis. The information is obtained from sources such as the plant- and site-specific `probabilistic risk assessment (PRA), industry operating experience, relevant component failure databases, and expert panels.

The RAP is implemented in two stages. The first stage, the design reliability assurance program (D-RAP), comprises the reliability assurance activities necessary to provide confidence that the plant is consistent with the certified design when fuel is loaded for the first time. The second stage comprises the operational phase reliability assurance activities (OPRAAs) that are to be integrated into other programs.

17.4.2 Summary of Application

Section 17.4, "Design Reliability Assurance Program," of the WLS COL FSAR, Revision 11, incorporates by reference Section 17.4 of the AP1000 DCD, Revision 19.

In addition, in WLS COL FSAR Section 17.4, the applicant provided the following:

Supplemental Information

- STD SUP 17.4-1

The applicant provided supplemental (SUP) information in standard (STD) SUP 17.4-1 regarding the QA requirements for nonsafety-related SSCs within the scope of the D-RAP.

17.4.3 Regulatory Basis

The regulatory basis of the information incorporated by reference into WLS COL FSAR Section 17.4 is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the D-RAP are given in Section 17.4 of NUREG-0800, "Standard Review Plan for the Review of Safety Analysis Reports for Nuclear Power Plants." SECY-95-132, "Policy and Technical Issues Associated with the Regulatory Treatment of Non-Safety Systems in Passive Plant Designs," states the following:

> An application for advanced reactor DC or a COL must include: (1) the description of the RAP used during the design that includes, scope, purpose, and objectives; (2) the process used to evaluate and prioritize the SSCs in the design, based on their degree of risk significance; (3) a list of the SSCs designated as risk significant; and (4) for those SSCs designated as risk significant: (i) a process to determine dominant failure modes that considered industry experience, analytical models, and applicable requirements; and (ii) key assumptions and risk insights from probabilistic, deterministic, or other methods that considered operations, maintenance, and monitoring activities.
>
> Each licensee that references the advanced reactor design must implement the design reliability assurance program approved by the NRC.

The Commission approved this position in the associated staff requirements memorandum (SRM) dated June 28, 1995.

Regulatory Guide (RG) 1.206, "Combined License Applications for Nuclear Power Plants (LWR Edition)," describes an acceptable way to satisfy these requirements.

17.4.4 Technical Evaluation

The NRC staff reviewed Section 17.4 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the D-RAP. The results of the staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application, the NRC staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.
- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The NRC staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the WLS COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the BLN Units 3 and 4 COL application. Any confirmatory items in the standard content material retain the numbers assigned in the VEGP SER.

The following portion of this technical evaluation section is reproduced from Section 17.4.4 of the VEGP SER:

> *<u>Supplemental Information</u>*
>
> - *STD SUP 17.4-1*
>
> *The applicant provided supplemental information in STD SUP 17.4-1 to describe the QA requirements for nonsafety-related SSCs within the scope of D-RAP.*
>
> *The following portion of this technical evaluation section is reproduced from Section 17.4.4 of the BLN SER:*
>
> *No site specific structures, systems, and components (SSCs) have been added to the D-RAP. The applicant asserts that the AP1000 DCD and PRA bound all site specific hazards and associated risks. The staff's evaluation of the probabilistic methods used to reach this conclusion is documented in Chapter 19 of this safety evaluation. The staff concludes that the list of SSCs incorporated by reference to the DCD is an acceptable list for the BLN COL.*
>
> *The staff noted that risk metrics may change with modifications to the plant design or other new information and requested additional information on how the applicant would address risk significant SSCs that are identified after the COL is issued (RAI 17.4-1). In its response dated September 17, 2008, the applicant stated that such changes would be captured and included in the appropriate OPRAAs in accordance with procedures developed under the QA program. In addition, the response states that the [Maintenance Rule] MR program is to be consistent with NEI 07-02A, "Generic FSAR Template Guidance for Maintenance Rule Program Description for Plants Licensed under 10 CFR Part 52," which has been endorsed by the staff in a letter to NEI, dated January 24, 2008.*
>
> *The Maintenance Rule program description calls for establishment of an expert panel prior to fuel load. As additional information is developed, such a panel alters the scope of OPRAAs as appropriate. Because this provides assurance that changes will receive appropriate review, the staff finds it acceptable; therefore, RAI 17.4-1 is closed.*
>
> *However, the staff requested that the applicant supplement the BLN COL FSAR to describe the organizational and process aspects of the RAP that will be performed by the COL holder (RAI 17.4-2). In its response dated April 9, 2009, the applicant proposed to revise the BLN COL FSAR Section 17.4 to include a*

standard supplement identifying the quality assurance requirements for nonsafety-related SSCs within the scope of D-RAP. This is consistent with RG 1.206 and is therefore an acceptable method for meeting the Commission's policy for RAP. The staff identifies the need for a revision to the BLN COL FSAR as ***Confirmatory Item 17.4-1****.*

Resolution of Standard Content Confirmatory Item 17.4-1

Confirmatory Item 17.4-1 required the applicant to update its FSAR to include a standard supplement identifying the QA requirements for nonsafety-related SSCs within the scope of D-RAP. The NRC staff verified that the VEGP COL FSAR was appropriately updated with STD SUP 17.4-1. As a result, Confirmatory Item 17.4-1 is resolved.

The NRC staff verified that the WLS COL FSAR was appropriately updated with STD SUP 17.4-1. As a result, Standard Content Confirmatory Item 17.4-1 is resolved.

17.4.5 Post Combined License Activities

There are no post COL activities related to this section.

17.4.6 Conclusion

The NRC staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant addressed the required information relating to the D-RAP, and there is no outstanding information expected to be addressed in the WLS COL FSAR related to this section. The results of the staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

The NRC staff concludes that the relevant information presented in Section 17.4 of the WLS COL FSAR is consistent with the guidance provided in SECY-95-132, as well as the requirements of 10 CFR 52.47(b)(1), and 10 CFR 52.80(a). Therefore, the WLS D-RAP described in Section 17.4 of the WLS COL FSAR is acceptable.

17.5 Quality Assurance Program Description – New License Applicants (Related to RG 1.206, Section C.III.1, Chapter 17, C.I.17.5, "Quality Assurance Program Guidance")

17.5.1 Introduction

The QA program during the design, fabrication, construction, testing, and operation phases of a nuclear power plant is discussed in this section. Implementation of the applicable portions of the QAPD referenced in Section 17.5, "Quality Assurance Program Description – New License Applicants," of the WLS COL FSAR begins at COL issuance with full implementation of the operations-related requirements consistent with the outline provided in WLS COL FSAR Table 13.4-201, "Operational Programs Required by NRC Regulations."

17.5.2 Summary of Application

In Part 11 of the WLS COL application, the applicant provided a QAPD to be in place during the design, construction, and operations phases of WLS Units 1 and 2. This QAPD will be incorporated by reference in Section 17.5 of the WLS COL FSAR upon resolution of WLS Confirmatory Item 17.5-1, as discussed in the technical section below.

In addition, in WLS COL FSAR Section 17.5, the applicant provided the following:

AP1000 COL Information Items

- WLS COL 17.5-1

The applicant provided additional information in WLS COL 17.5-1 to address COL Information Item 17.5-1. In WLS COL 17.5-1, the applicant addresses the quality assurance program under which the COL application was developed for the design and construction phases, which is applicable until COL issuance. Section 17.5 of the WLS COL FSAR addresses the QA program for the remaining portion of the design and construction phases following COL issuance, which is described in the Duke NPD QAPD.

- STD COL 17.5-2

The applicant provided additional information in STD COL 17.5-2 to address COL Information Item 17.5-2. STD COL 17.5-2 addresses QA programs for procurement, fabrication, installation, construction, and testing of SSCs in the plant.

- STD COL 17.5-4

The applicant provided additional information in STD COL 17.5-4 to address COL Information Item 17.5-4. STD COL 17.5-4 addresses the QA program for operations, and uses FSAR Table 13.4-201 to provide milestones for operational quality assurance program implementation.

- STD COL 17.5-8

The applicant provided additional information in STD COL 17.5-8 to address COL Information Item 17.5-8. STD COL 17.5-8 addresses operational RAP integration with the QA program.

17.5.3 Regulatory Basis

The acceptance criteria associated with the relevant requirements of the Commission regulations for the QAPD are given in Section 17.5 of NUREG-0800. The applicable regulatory requirements for the QAPD are as follows:

Appendix B to 10 CFR Part 50 requires that the application include a description of the QA program to be applied to the design, fabrication, construction, and testing of the SSCs of the facility and establishes QA requirements for the design, construction, and operation of those SSCs. The pertinent requirements of Appendix B apply to all activities affecting the safety-related functions of the SSCs, including designing, purchasing, fabricating, handling, shipping, storing, cleaning, erecting, installing, inspecting, testing, operating, maintaining, repairing, refueling, and modifying.

Section 10 CFR 52.79(a)(17) requires that the application include information with respect to compliance with technically relevant positions of the Three Mile Island requirements of 10 CFR 50.34(f).

Section 10 CFR 52.79(a)(25) requires that the description of the QA program include a discussion of how the applicable requirements of Appendix B have been and will be satisfied, and also include a discussion of how the QA program will be implemented.

Further, 10 CFR 52.79(a)(27) requires that the application include information on the managerial and administrative controls to be used for a nuclear power plant and include a discussion of how the applicable requirements of Appendix B will be satisfied.

17.5.4 Technical Evaluation

The NRC staff reviewed Section 17.5 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the QAPD. The results of the staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application, the NRC staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.

- The staff verified that the site-specific differences were not relevant.

The NRC staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the WLS COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the BLN Units 3 and 4 COL application. Any confirmatory items in the standard content material retain the numbers assigned in the VEGP SER.

Although the NRC staff concluded that the evaluation performed for the standard content is directly applicable to the WLS COL application, there were differences between the information provided by the WLS applicant and that provided by the VEGP applicant regarding details in the

WLS COL FSAR and the Duke NPD QAPD. The resolutions of these differences for WLS are evaluated by the staff following the standard content material to which they apply.

The following portion of this technical evaluation section is reproduced from Section 17.5.4 of the VEGP SER:

> *The NRC staff reviewed Section 17.5 of the BLN COL FSAR and the QAPD provided in Part 11 of the BLN COL application. In RAI 17.5-9, dated May 12, 2008, the NRC staff requested that the applicant explain why the QAPD provided in Part 11 of the BLN COL application is not referenced or incorporated by reference in the BLN COL FSAR Section 17.5. In its letters, dated June 26, 2008, and October 16, 2008, the applicant proposed to revise Section 17.5 of the BLN COL FSAR to state that the QAPD is incorporated by reference. In addition, the applicant proposed to revise Section 17.5 of the BLN COL FSAR to provide the title of the QAPD that is incorporated by reference. The NRC staff has reviewed the proposed revisions to Section 17.5 and concluded that the proposed changes are responsive to RAI 17.5-9. The NRC staff has verified that the proposed revision was incorporated into Revision 1 of the BLN COL FSAR. RAI 17.5-9 is closed.*
>
> *The NRC staff has verified that the proposed revision to incorporate the QAPD by reference was incorporated into the VEGP COL FSAR. In its letter dated January 29, 2010, the applicant proposed to revise Section 17.5 of the VEGP COL FSAR to provide the title of the QAPD that is incorporated by reference. This item is identified as* ***Confirmatory Item 17.5-1****, pending formal revision of the VEGP COL FSAR.*
>
> *<u>Resolution of Standard Content Confirmatory Item 17.5-1</u>*
>
> *Confirmatory Item 17.5-1 is an applicant commitment to revise its FSAR Section 17.5 to specify the title of the QAPD. The staff verified that the VEGP COL FSAR was appropriately updated. As a result, Confirmatory Item 17.5-1 is now closed.*

<u>WLS Resolution of Standard Content Confirmatory Item 17.5-1</u>

In RAI 17.5-11, dated October 6, 2008, the NRC staff noted that WLS COL FSAR Section 17.5 does not either include or incorporate the Duke NPD QAPD by reference. In its response letter, dated December 11, 2008, the applicant proposed to revise Section 17.5 of the WLS COL FSAR to identify that the QAPD is included as Part 11 of the Lee COL application and is incorporated by reference.

By letter dated December 17, 2010, Duke Energy submitted Revision 3 of the WLS COL FSAR. The staff reviewed Section 17.5 of the WLS COL FSAR and confirmed that the applicant had (1) adequately identified which QA program is in place during the design, construction, and operations phases, as described by the Duke NPD QAPD, and (2) adequately identified that the QAPD is included as Part 11 of the Lee COL application and is incorporated by reference. Therefore, RAI 17.5-11 is closed.

In addition, by letter dated November 4, 2010, the applicant endorsed the standard content material provided by VEGP in its letters dated January 29, 2010, and April 2, 2010, in reference to the BLN response to RAI 17.5-9 as standard, and proposed to incorporate the standard content in a future revision of the WLS COL FSAR. The applicant provided its commitment to incorporate the standard content material that consists of revising Section 17.5 of the WLS COL FSAR to incorporate the Duke NPD QAPD by reference and to provide the title of the QAPD that is incorporated by reference. By letter dated December 17, 2010, the applicant provided Revision 3 of the WLS COL FSAR. The NRC staff confirmed that Revision 3 included reference to the Duke NPD QAPD by title in Section 17.1 and 17.5 of the WLS COL FSAR; therefore, Standard Content Confirmatory Item 17.5-1 is resolved for the WLS COL application.

In RAI 17.5-1, dated October 6, 2008, the NRC staff noted that the Duke NPD QAPD, Part I, Section 1.1, “Scope / Applicability,” states that the QAPD applies to COL / construction / pre-operation and/or operation activities, which is not consistent with the scope of the QAPD as stated in QAPD Part I, Section 1 or WLS COL FSAR Table 13.4-201, which lists the QA program as a required operational program. Accordingly, the staff requested that the applicant clarify the scope of the Duke NPD QAPD since it applies to all the stated activities.

In its response letter, dated December 11, 2008, the applicant stated that the Duke NPD QAPD will be revised to clarify that the scope of the Duke NPD QAPD applies to all stated activities. By letter dated December 17, 2010, Duke Energy submitted Revision 3 of the WLS COL FSAR as well as Revision 3 of the Duke NPD QAPD. The staff reviewed Part I, Section 1.1 of the QAPD and confirmed that the applicant had provided an acceptable scope for the activities addressed by the Duke NPD QAPD. Therefore, RAI 17.5-1 is closed.

In RAI 17.5-10, dated October 6, 2008, the NRC staff requested that the applicant provide an evaluation of the existing Duke Energy QA program against the applicable acceptance criteria in Section 17.5 of NUREG-0800, pursuant to the requirements of 10 CFR 52.79(a)(41), which requires that COL applicants must provide an evaluation of the facility against the SRP revision in effect six months before the docket date of the application.

In its response letter, dated December 11, 2008, the applicant stated that the Duke Energy Carolinas Topical Report, Quality Assurance Program, was reviewed and evaluated by the NRC and determined to meet the requirements of Appendix B to 10 CFR Part 50, utilizing the applicable acceptance criteria in NUREG-0800, Section 17.5. The applicant also stated that the QAPD described in Section 17.5 of the WLS COL FSAR, which will apply after COL issuance, has been evaluated for conformance to NUREG-0800, Section 17.5 and discussed in Table 1.9-202 of the WLS COL FSAR and found acceptable. The NRC staff has reviewed the response and determined that the applicant’s response is acceptable. Therefore, RAI 17.5-10 is closed.

In RAI 17.5-2, dated October 6, 2008, the NRC staff requested that the applicant provide clarification of how WLS siting activities, as described in Duke NPD QAPD Part I, Section 1.1, would be subject to the provisions of the QAPD, since siting activities for WLS would be complete at the time of COL issuance.

In its response letter, dated December 11, 2008, the applicant stated that siting under the Duke NPD QAPD would not be applicable to WLS. However, the siting activity was included in the listing of activities to which the Duke NPD QAPD applies based on the development of the

QAPD to serve as topical report for all potential future Duke Energy new nuclear plant development activities.

On the basis of the Duke Energy response, which clarified how siting activities discussed in the WLS COL FSAR would be subject to the Duke NPD QAPD described in Section 17.5 of the WLS COL FSAR, the NRC staff determined that the issue has been adequately resolved for the WLS COL application. Therefore, RAI 17.5-2 is closed.

The NRC staff reviewed the resolution of COL information items STD COL 17.5-2, STD COL 17.5-4, STD COL 17.5-8, and WLS COL 17.5-1, which are addressed in the Duke NPD QAPD. The Duke NPD QAPD is based on NEI 06-14A, "Quality Assurance Program Description," Revision 7, which was approved by the NRC staff using Section 17.5 of NUREG-0800. The staff's review of these four COL information items is a combination of plant-specific evaluation and standard content evaluation.

AP1000 COL Information Items

- STD COL 17.5-2, STD COL 17.5-4, STD COL 17.5-8 and WLS COL 17.5-1

The following portion of this section is reproduced from Section 17.5.4 of the VEGP SER:

> *The NEI 06-14A template provided generic information and format for QAPDs with bracketed areas for applicants to provide plant-specific information. The generic information in NEI 06-14A provides the information required for STD COL 17.5-2, 17.5-4, and 17.5-8. In its review of TVA QAPD, the NRC staff used Section 17.5 of NUREG-0800 and RG 1.206 as guidance. The NRC staff developed Section 17.5 of NUREG-0800 using American Society of Mechanical Engineers (ASME) standard ASME NQA-1-1994, "Quality Assurance Requirements for Nuclear Facility Applications," as supplemented by additional regulatory and industry guidance for nuclear operating facilities.*

Further NRC staff evaluation of the COL information items and the associated sections of the Duke NPD QAPD is provided in the following sections.

17.5.4.1 *Organization*

The following portion of this technical evaluation section is reproduced from Section 17.5.4.1 of the VEGP SER:

> *TVA's QAPD follows the guidance of Section 17.5 of NUREG-0800, paragraph II.A. The QAPD describes and defines the responsibility and authority for planning, establishing, and implementing an effective overall QA program. The QAPD provides a description of an organizational structure, functional responsibilities, levels of authority, and interfaces for establishing, executing, and verifying QAPD implementation. The QAPD establishes independence between the organization responsible for checking a function and the organization that performs the function. In addition, the QAPD allows TVA management to size the QA organization commensurate with the duties and responsibilities assigned.*

> *In the QAPD, TVA commits to comply with the quality standards described in NQA-1-1994, Basic Requirement 1, and Supplement 1S-1.*

<u>WLS RAI 17.5-3 and RAI 17.5-4</u>

During its review of the Duke NPD QAPD, the NRC staff identified several issues regarding QAPD Part II, Section 1, "Organization," that required further clarification.

In RAI 17.5-3, dated October 6, 2008, the NRC staff requested that the applicant restructure the Organization section of the Duke NPD QAPD as follows:

> Clearly delineate (1) how the QA program is implemented during the period of construction and testing, and (2) how the QA program is implemented during the operations phase. The transition process during which the operational programs become effective should be described. Position descriptions, including roles, responsibilities, and lines of authority, should be included for applicable corporate and line positions that implement and verify elements of the QA program and the associated administrative controls.

In RAI 17.5-4, dated October 6, 2008, the NRC staff requested that the applicant provide (1) clarification regarding the inclusion of organizational charts in the Duke NPD QAPD, and (2) additional clarifications and expanded level of detail regarding organizational descriptions provided in Part II, Section 1, of the Duke NPD QAPD.

In its response letter, dated December 11, 2008, the applicant stated, in part, that Duke Energy will revise the Duke NPD QAPD to define the appropriate organizational structure, roles and responsibilities, and reporting relationships for the Duke Energy organizations that will implement the requirements of the QAPD for the development, construction, and operation of new nuclear generating plants. The organizational descriptions and organization charts contained within the Duke NPD QAPD, as revised, will define the corporate and Nuclear Generation Group organizations that implement the quality assurance requirements of the Duke NPD QAPD in support of the development, construction, and operation of the units.

Specifically, the response to RAI 17.5-4 provides descriptions of how the QA program is implemented during the construction and testing phases and during the operations phase, as well as the transition process. The response to RAI 17.5-4 also provides additional information on the QA program responsibilities, implementation, and administrative controls. In addition, the applicant noted that the basic implementation of the QA program is the same during construction and testing and operations; only the activities being implemented differ. However, the manager responsible for Quality Assurance and Oversight performs the independent oversight functions throughout all phases of QA program implementation.

<u>Resolution of WLS RAI 17.5-3 and RAI 17.5-4</u>

By letter dated December 17, 2010, Duke Energy submitted Revision 3 of the WLS COL FSAR as well as Revision 3 of the Duke NPD QAPD. The staff confirmed that Revision 3 of the Duke NPD QAPD incorporated a description of the WLS organization, including organizational charts, consistent with the applicant's RAI responses. Therefore, RAI 17.5-3 and RAI 17.5-4 are closed.

17.5.4.2 *Quality Assurance Program*

The following portion of this technical evaluation section is reproduced from Section 17.5.4.2 of the VEGP SER:

> *TVA's QAPD follows the guidance of Section 17.5 of NUREG-0800, paragraph II.B. The QAPD establishes measures to implement a QA program to ensure that the design, construction, and operation of a nuclear power plant are in accordance with governing regulations and license requirements. The QA program comprises those planned and systematic actions necessary to provide confidence that SSCs will perform their intended safety function, including certain nonsafety-related SSCs and activities that are significant contributors to plant safety, as described in the applicant's FSAR. The QA program requires that a list or system identifying SSCs and activities to which the QAPD applies be maintained.*
>
> *The QAPD provides measures to assess the adequacy of the QAPD and to ensure its effective implementation at least once each year or at least once during the life of the activity, whichever is shorter. The program allows the period for assessing the QAPD during the operations phase to be extended to once every 2 years. In addition, consistent with Section 17.5 of NUREG-0800, paragraph II.B.8, the QAPD applies a grace period of 90 days to activities that must be performed on a periodic basis. The next due date for the performance of an activity that invokes the 90-day grace period remains unchanged. The next due date for an activity performed before the scheduled due date is moved backwards so that the interval prescribed for the performance of the activity is not exceeded.*
>
> *The QAPD also follows the guidance of Section 17.5 of NUREG-0800, paragraphs II.S and II.T. The QAPD describes measures to establish and maintain formal indoctrination and training programs for personnel performing, verifying, or maintaining activities within the scope of the QAPD to ensure that they achieve and maintain suitable proficiency. The plant's technical specifications delineate the minimum qualifications for plant and support staff. Personnel are required to complete the training for positions identified in 10 CFR 50.120, "Training and Qualification of Nuclear Power Plant Personnel," according to programs accredited by the National Nuclear Accrediting Board of the National Academy for Nuclear Training. The QAPD also provides the minimum training requirements for managers responsible for QAPD implementation, in addition to the minimum training requirements for the individuals responsible for planning, implementing, and maintaining the QAPD.*
>
> *The QAPD also follows Section 17.5 of NUREG-0800, paragraph II.W. The QAPD provides measures for establishing an independent review program for activities occurring during the operational phase. In the QAPD, TVA commits to comply with the quality standards described in NQA-1-1994, Basic Requirement 2, and Supplements 2S-1, 2S-2, 2S-3, and 2S-4, with the following alternatives:*
>
> - *NQA-1-1994, Supplement 2S-1, includes NQA-1-1994, Appendix 2A-1. The QAPD proposes the following alternatives to the implementation of Supplement 2S-1 and Appendix 2A-1:*

- *NQA-1-1994, Supplement 2S-1, states that the organization designate those activities that require qualified inspectors and test personnel and establish written procedures for the qualification of these personnel. As an alternative to this requirement, the QAPD proposes that a qualified engineer may plan inspections, evaluate the capabilities of an inspector, or evaluate the training program for inspectors. For the purposes of these functions, a qualified engineer is one who has a baccalaureate degree in engineering in a discipline related to the inspection or test activity (i.e., electrical, mechanical, or civil engineering) and has at least 5 years of engineering work experience, with at least 2 years of this experience regarding nuclear facilities. The NRC staff evaluated this proposed alternative and determined that the designation of a qualified engineer to plan inspections, evaluate inspectors, or evaluate the inspector qualification programs is consistent with the training and qualification criteria of 10 CFR Part 50, Appendix B, Criterion II, "Quality Assurance Program," and NQA-1-1994, Supplement 2S-1. Therefore, the NRC staff concluded that this alternative is acceptable.*

- *NQA-1-1994, Appendix 2A-1 provides guidance for qualifying inspection and test personnel as Level I, II, or III. As an alternative to this guidance, the QAPD proposes that personnel performing independent quality verification inspections, examinations, measurements, or tests will be required to possess qualifications equal to or better than those required for performing the task being verified. In addition, the verification performed must be within the skills of these personnel and addressed by procedures. These personnel will not be responsible for planning quality verification inspections or tests (i.e., establishing hold points and acceptance criteria in procedures, and determining responsibility for performing the inspection), evaluating inspection training programs, or certifying inspection personnel. The NRC staff evaluated this proposed alternative and determined that it is consistent with inspection and test personnel initial qualification requirements specified in Section 17.5 of NUREG-0800, paragraph II.T.5. Therefore, the NRC staff concluded that this alternative is acceptable.*

- *NQA-1-1994, Supplement 2S-2, states that nondestructive examination personnel must be qualified. As an alternative to this requirement, the QAPD proposes to follow the applicable standard cited in Sections III and XI of the ASME Boiler and Pressure Vessel Code. 10 CFR 50.55a, "Codes and Standards," also requires the use of the latest Edition and Addenda of Sections III and XI of the ASME Code. The NRC staff evaluated this proposed alternative and determined that it is consistent with the regulation in 10 CFR 50, Appendix B, Criterion II, "Quality Assurance Program." Therefore, the NRC staff concluded that this alternative is acceptable.*

- *NQA-1-1994, Supplement 2S-3, states that the prospective lead auditors must have participated in a minimum of five audits in the previous*

> *3 years. As an alternative to this requirement, the QAPD proposes to follow the guidance provided in Section 17.5 of NUREG-0800, paragraph II.S.4.c, which states that prospective lead auditors shall demonstrate their ability to properly conduct the audit process, as implemented by the company, to effectively lead an audit team, and to effectively organize and report results, including participation in at least one nuclear audit within the year preceding the date of qualification. The NRC staff evaluated this proposed alternative and determined that it is consistent with the regulation in 10 CFR Part 50, Appendix B, Criterion II. Therefore, the NRC staff concluded that this alternative is acceptable.*

In RAI 17.5-5, dated May 12, 2008, the NRC staff requested that the applicant revise the TVA QAPD Part II, Section 2.5 to cite the correct regulation of 10 CFR 52.79(a)(27) versus 10 CFR 50.34(b)(6)(ii). In its response dated June 26, 2008, the applicant proposed to revise the TVA QAPD Part II, Section 2.5 consistent with the proposed wording in NEI Technical Report 06-14A, "Quality Assurance Program Description," Revision 5, dated May 2008. Revision 5 of NEI 06-14A has not been approved by the NRC staff; therefore, this issue will remain open until Revision 5 of NEI 06-14A is approved and TVA has incorporated the approved changes into the TVA QAPD. This is identified as ***Open Item 17.5-1***.

Resolution of Standard Content Open Item 17.5-1

Revision 7 of NEI 06-14A was approved by the NRC staff in a letter dated November 3, 2009, and adequately addressed RAI 17-5-5. In a letter dated December 31, 2009, the VEGP applicant provided a markup of Revision 9 of the SNC QAPD. The NRC staff has reviewed the markup of SNC QAPD, Revision 9, and determined that conforming changes have been proposed to Section 2.5 consistent with NEI 06-14A, Revision 7. On this basis, Open Item 17.5-1 is ***Confirmatory Item 17.5-7*** *for the VEGP COL application.*

Resolution of Standard Content Confirmatory Item 17.5-7

Confirmatory Item 17.5-7 is an applicant commitment to revise its QAPD. The staff verified that the VEGP COL application was appropriately updated. As a result, Confirmatory Item 17.5-7 is now closed.

WLS Resolution of Standard Content Open Item 17.5-1 and Confirmatory Item 17.5-7

In a letter dated November 4, 2010, the applicant endorsed the standard content material provided by VEGP. By letter dated December 17, 2010, the applicant provided Revision 3 of the WLS COL FSAR and Revision 3 of the Duke NPD QAPD. In Revision 3 of the Duke NPD QAPD, the applicant addressed the information related to Standard Content Open Item 17.5-1. The NRC staff has confirmed through review of Revision 3 of the Duke NPD QAPD that the applicant has incorporated the appropriate changes to Part II, Section 2.5, of the Duke NPD QAPD, which is consistent with the guidance contained in NRC-approved NEI 06-14A, Revision 7. This adequately addresses the issue outlined by Confirmatory Item 17.5-7; therefore, Standard Content Open Item 17.5-1 is resolved for the WLS COL application.

The following portion of this technical evaluation section is reproduced from Section 17.5.4.2 of the VEGP SER:

In RAI 17.5-6, the NRC staff requested that the applicant explain how the discussion of the Independent Review Committee responsibilities in Part II, Section 2.7 of the TVA QAPD is consistent with the requirements of American National Standards Institute (ANSI) N18.7. In its response dated June 26, 2008, the applicant proposed to revise the TVA QAPD Part II, Section 2.7 consistent with the proposed wording in NEI 06-14A, Revision 5. This issue will remain open until Revision 5 of NEI 06-14A is approved and TVA has incorporated the approved changes into the TVA QAPD. This is identified as ***Open Item 17.5-2****.*

Resolution of Standard Content Open Item 17.5-2

NEI 06-14A, Revision 7, adequately addressed RAI 17.5-6. In a letter dated December 31, 2009, the applicant provided a markup of Revision 9 of the SNC QAPD. The NRC staff has reviewed the markup of SNC QAPD, Revision 9, and determined that conforming changes have been proposed to Section 2.7 consistent with NEI 06-14A, Revision 7. On this basis, Open Item 17.5-2 is ***Confirmatory Item 17.5-8*** *for the VEGP COL application.*

Resolution of Standard Content Confirmatory Item 17.5-8

Confirmatory Item 17.5-8 is an applicant commitment to revise its QAPD. The staff verified that the VEGP COL application was appropriately updated. As a result, Confirmatory Item 17.5-8 is now closed.

WLS Resolution of Standard Content Open Item 17.5-2 and Confirmatory Item 17.5-8

In a letter dated November 4, 2010, the applicant endorsed the standard content material provided by VEGP. By letter dated December 17, 2010, the applicant provided Revision 3 of the WLS COL FSAR and Revision 3 of the Duke NPD QAPD. In Revision 3 of the Duke NPD QAPD, the applicant addressed the information related to Standard Content Open Item 17.5-2. The NRC staff has confirmed through review of Revision 3 of the Duke NPD QAPD that the applicant has incorporated the appropriate changes to Part II, Section 2.7, of the Duke NPD QAPD, which is consistent with the guidance contained in NRC-approved NEI 06-14A, Revision 7. This adequately addresses the issue outlined by Confirmatory Item 17.5-8; therefore, Standard Content Open Item 17.5-2 is resolved for the WLS COL application.

WLS RAI 17.5-5

During its review of the Duke NPD QAPD, the NRC staff identified several issues regarding QAPD Part II, Section 2, “Quality Assurance Program,” that required further clarification.

In RAI 17.5-5, dated October 6, 2008, the NRC staff requested that the applicant revise the language in Part II, Section 2, of the Duke NPD QAPD, which states that the QAPD applies to those quality-related activities that involve the functions of safety-related activities of structures, systems, and components (SSCs), as described in the WLS COL FSAR. The revised language should include a description of the QA program applied to the design, and to be applied to the fabrication, construction, and testing, of the SSCs of the facility, as well as to the managerial and administrative controls to be used to assure safe operation. The NRC staff also requested that the applicant identify the corresponding WLS COL FSAR section(s) that describe safety-related SSCs or clarify the purpose of this statement in the Duke NPD QAPD.

In its response letter, dated December 11, 2008, the applicant stated that Duke Energy developed and prepared the Duke NPD QAPD consistent with NRC-approved template NEI 06-14A for the format and content of standard and site specific sections. Duke Energy committed to review and implement the appropriate standard and site specific text changes to Part II, Section 2 of the Duke NPD QAPD, in order to describe these programmatic controls within the QAPD, following approval of NEI 06-14, Revision 5, by the NRC. Since that time, the NRC staff has reviewed and approved NEI 06-14A, Revision 7, which has been adopted by the applicant as the foundation for the Duke NPD QAPD.

The applicant also noted that safety-related SSCs are appropriately described in the DCD and associated FSAR content consistent with RG 1.206; however, SSC requirements were included in Duke NPD QAPD Part II, Section 2, in order to allow the QAPD to be used for potential future new plant development activities. The NRC staff has reviewed the applicant's response to this portion of RAI 17.5-5 and determined that the applicant's response is acceptable.

By letter dated December 17, 2010, Duke Energy submitted Revision 3 of the WLS COL FSAR as well as Revision 3 of the Duke NPD QAPD. The staff confirmed that Revision 3 of the Duke NPD QAPD incorporated a description of the quality-related activities that involve the functions of safety-related activities of SSCs, consistent with the NRC-approved NEI 06-14A, Revision 7, description. Therefore, RAI 17.5-5 is closed.

<u>WLS RAI 17.5-6</u>

In RAI 17.5-6, dated October 6, 2008, the NRC staff requested that the applicant provide clarification of how the Duke NPD QAPD applies to Early Site Permit (ESP) applications / activities, which are referenced in QAPD Part II, Section 2, as well as elsewhere in the document, or remove these references from the QAPD.

In its response letter, dated December 11, 2008, the applicant stated that since Duke Energy did not execute an ESP for WLS, ESP requirements in the Duke NPD QAPD do not apply to the WLS site. WLS COL FSAR Section 17.1 clarifies the timing for and applicability of the QAPD to activities for WLS. However, ESP requirements were included in the Duke NPD QAPD in order to allow the QAPD to be used for potential future new plant development activities.

On the basis of the Duke Energy response, which clarified how ESP activities discussed in the WLS COL FSAR would be subject to the Duke NPD QAPD described in Section 17.5 of the WLS COL FSAR, the NRC staff determined that the issue has been adequately resolved for the WLS COL application. Therefore, RAI 17.5-6 is closed.

<u>WLS RAI 17.5-7</u>

In RAI 17.5-7, dated October 6, 2008, the NRC staff requested that the applicant identify the site-specific design basis activities in Part II, Section 2.3, of the Duke NPD QAPD, consistent with the guidance of NEI 06-14A, Section 2.3, which states that the QAPD in the COLA will be annotated to identify these activities; or justify their omission. Section 2.3 of the Duke NPD QAPD states that this information will be maintained in a project planning document.

In its response letter, dated December 11, 2008, the applicant stated that the Duke NPD QAPD Part II, Section 2.3, addresses identification of QA controls for ESP and COL application development. The wording of QAPD Part II, Section 2.3, is intended to address the activities that would apply to any future ESP or COL application development, and is not intended to be a commitment for the applicant to develop or submit annotated outlines for the COL application. Since Duke Energy did not execute an ESP for WLS, and the COL application preparation was not performed under the Duke NPD QAPD, this requirement would not be applicable to WLS. The applicant committed to revise Duke NPD QAPD Part II, Section 2.3 for clarity.

By letter dated December 17, 2010, Duke Energy submitted Revision 3 of the WLS COL FSAR as well as Revision 3 of the Duke NPD QAPD. The staff confirmed that Revision 3 of the Duke NPD QAPD incorporated a description of the site specific safety-related design basis activities, consistent with the applicant's RAI response, as well as the applicable NRC-approved NEI 06-14A, Revision 7, description. Therefore, RAI 17.5-7 is closed.

The following portion of this technical evaluation section is reproduced from Section 17.5.4.3 of the VEGP SER:

> *17.5.4.3 Design Control*
>
> *The following portion of this technical evaluation section is reproduced from Section 17.5.4.3 of the BLN SER:*
>
> *TVA's QAPD follows the guidance of Section 17.5 of NUREG-0800, paragraph II.C. The QAPD establishes the necessary measures to control the design, design changes, and temporary modifications (e.g., temporary bypass lines, electrical jumpers and lifted wires, and temporary setpoints) of items that are subject to the provisions of the QAPD. The QAPD design process includes provisions to control design inputs, outputs, changes, interfaces, records, and organizational interfaces with the applicant and its suppliers. These provisions ensure that the design inputs (i.e., design bases and the performance, regulatory, quality, and quality verification requirements) are correctly translated into design outputs (i.e., analyses, specifications, drawings, procedures, and instructions). In addition, the QAPD provides for individuals knowledgeable in QA principles to review design documents to ensure that they contain the necessary QA requirements.*
>
> *In the QAPD, TVA commits to comply with the quality standards described in NQA-1-1994, Basic Requirement 3 and Supplement 3S-1, to establish the program for design control and verification, Subpart 2.20 for the subsurface investigation requirements, and Subpart 2.7 for the standards for computer software QA controls.*

The following portion of this technical evaluation section is reproduced from Section 17.5.4.4 of the VEGP SER:

17.5.4.4 Procurement Document Control

The following portion of this technical evaluation section is reproduced from Section 17.5.4.4 of the BLN SER:

TVA's QAPD follows the guidance of Section 17.5 of NUREG-0800, paragraph II.D. The QAPD establishes the necessary administrative controls and processes to ensure that procurement documents include or reference applicable regulatory, technical, and QA program requirements. As noted in Section 17.5 of NUREG-0800, paragraph II.D.1, applicable technical, regulatory, administrative, quality, and reporting requirements (such as specifications, codes, standards, tests, inspections, special processes, and the regulation in 10 CFR Part 21, "Reporting of Defects and Noncompliance") are invoked for procurement of items and services.

In the QAPD, TVA commits to comply with the quality standards described in NQA-1-1994, Basic Requirement 4, and Supplement 4S-1, with the following alternatives and commitment:

- *NQA-1-1994, Supplement 4S-1, Section 2.3, states that procurement documents must require suppliers to have a documented QA program that implements NQA-1-1994, Part I.*

  - *As an alternative to this requirement, the QAPD proposes that suppliers have a documented QA program that meets Appendix B to 10 CFR Part 50, as applicable to the circumstances of the procurement. The NRC staff evaluated this proposed alternative and determined that it is consistent with Appendix B, Criterion IV, "Procurement Document Control." Therefore, the NRC staff concluded that this alternative is acceptable.*

  - *As an alternative to this requirement, the QAPD proposes that procurement documents allow suppliers to work under TVA's QAPD, including implementing procedures, if suppliers do not have their own QA program. The NRC staff evaluated this proposed alternative and determined that TVA's QAPD follows the guidance in Section 17.5 of NUREG-0800, paragraph II.G, regarding "Control of Purchased Material, Equipment, and Services." Specifically, the QAPD provides measures to evaluate prospective suppliers so that only qualified suppliers are selected, acceptance actions are performed for procured products and services, and suppliers are periodically audited and evaluated to ensure that qualified suppliers continue to provide acceptable products and services. Therefore, the NRC staff concluded that this alternative is acceptable.*

- *NQA-1-1994, Supplement 4S-1, Section 3, states that procurement documents are to be reviewed before award of the contract. As an* *alternative to this requirement, the QAPD proposes to conduct the QA review of procurement documents through review of the applicable procurement specification, including the technical and quality procurement requirements, before contract award. In addition, procurement document changes (e.g., scope, technical, or quality requirements) will also receive QA review. The NRC staff evaluated this proposed alternative and determined that it provides adequate QA review of procurement documents before awarding the contract and after any change. Therefore, the NRC staff concluded that this alternative is acceptable.*

- *In the QAPD, TVA commits that procurement documents prepared for commercial-grade items, procured as safety-related items, shall contain technical and quality requirements such that the procured item can be appropriately dedicated. The NRC staff evaluated this proposed commitment and determined that it is consistent with NRC staff guidance in Generic Letter (GL) 89-02, "Actions to Improve the Detection of Counterfeit and Fraudulently Marked Products," dated March 21, 1989, and GL 91-05, "Licensee Commercial-Grade Procurement and Dedication Programs," dated April 9, 1991, as delineated in Section 17.5 of NUREG-0800, paragraphs II.U.1.d and II.U.1.e.Therefore, the NRC staff concluded that this commitment is acceptable.*

*In RAI 17.5-7, dated May 12, 2008, the NRC staff requested that the applicant revise TVA QAPD Part II, Section 4 to substitute "TVA's" for "licensee's" to make it clear that a supplier may work under TVA's approved QA program. In its response dated June 26, 2008, the applicant stated that current use of "licensee's" is consistent with the wording in NEI 06-14A, Revision 4, which has been approved by the NRC staff. In a letter, dated September 17, 2008, the NRC staff requested NEI to address this question as part of a future revision to NEI 06-14A. This issue will remain open until Revision 5 of NEI 06-14A is approved and TVA has incorporated the approved changes into the TVA QAPD. This is identified as **Open Item 17.5-3**.*

Resolution of Standard Content Open Item 17.5-3

*NEI 06-14A, Revision 7, adequately addressed RAI 17.5-7. In a letter dated December 31, 2009, the applicant provided a markup of Revision 9 of the SNC QAPD. The NRC staff has reviewed the markup of SNC QAPD, Revision 9, and determined that conforming changes have been proposed to Section 4 consistent with NEI 06-14A, Revision 7. On this basis, Open Item 17.5-3 is **Confirmatory Item 17.5-9** for the VEGP COL application.*

Resolution of Standard Content Confirmatory Item 17.5-9

Confirmatory Item 17.5-9 is an applicant commitment to revise its QAPD. The staff verified that the VEGP COL application was appropriately updated. As a result, Confirmatory Item 17.5-9 is now closed.

WLS Resolution of Standard Content Open Item 17.5-3 and Confirmatory Item 17.5-9

In a letter dated November 4, 2010, the applicant endorsed the standard content material provided by VEGP. By letter dated December 17, 2010, the applicant provided Revision 3 of the WLS COL FSAR and Revision 3 of the Duke NPD QAPD. In Revision 3 of the Duke NPD QAPD, the applicant addressed the information related to Standard Content Open Item 17.5-3. The NRC staff has confirmed through review of Revision 3 of the Duke NPD QAPD that the applicant has incorporated the appropriate changes to Part II, Section 4, of the Duke NPD QAPD, which is consistent with the guidance contained in NRC-approved NEI 06-14A, Revision 7. This adequately addresses the issue outlined by Confirmatory Item 17.5-9; therefore, Standard Content Open Item 17.5-3 is resolved for the WLS COL application.

The following portion of this technical evaluation section is reproduced from Section 17.5.4.5 of the VEGP SER:

17.5.4.5 Instructions, Procedures, and Drawings

The following portion of this technical evaluation section is reproduced from Section 17.5.4.5 of the BLN SER:

TVA's QAPD follows the guidance of Section 17.5 of NUREG-0800, paragraph II.E. The QAPD establishes the necessary measures and governing procedures to ensure that activities affecting quality are prescribed by and performed in accordance with documented instructions, procedures, and drawings.

In the QAPD, TVA commits to comply with the quality standards described in NQA-1-1994, Basic Requirement 5, to establish procedural controls.

The following portion of this technical evaluation section is reproduced from Section 17.5.4.6 of the VEGP SER:

17.5.4.6 Document Control

The following portion of this technical evaluation section is reproduced from Section 17.5.4.6 of the BLN SER:

TVA's QAPD follows the guidance of Section 17.5 of NUREG-0800, paragraph II.F. The QAPD establishes the necessary measures and governing procedures to control the preparation, review, approval, issuance, and changes of documents that specify quality requirements or prescribe measures for controlling activities affecting quality, including organizational interfaces. The QAPD provides measures to ensure that the same organization that performed the original review and approval also review and approve revisions or changes to documents, unless other organizations are specifically designated.

A listing of all controlled documents identifying the current approved revision or date is maintained so personnel can readily determine the appropriate document for use. To ensure effective and accurate procedures during the operational phase, applicable procedures are reviewed and updated as necessary, *consistent with NRC staff guidance provided in Section 17.5 of NUREG-0800, paragraph II.F.8.*

In the QAPD, TVA commits to comply with the quality standards described in NQA-1-1994, Basic Requirement 6 and Supplement 6S-1, to establish provisions for document control.

The following portion of this technical evaluation section is reproduced from Section 17.5.4.7 of the VEGP SER:

17.5.4.7 *<u>Control of Purchased Material, Equipment, and Services</u>*

The following portion of this technical evaluation section is reproduced from Section 17.5.4.7 of the BLN SER:

TVA's QAPD follows the guidance of Section 17.5 of NUREG-0800, paragraph II.G. The QAPD establishes the necessary measures and governing procedures to control the procurement of items and services to ensure conformance with specified requirements. The program provides measures to evaluate prospective suppliers so that only qualified suppliers are selected. In addition, the program requires that suppliers be periodically audited and evaluated to ensure that qualified suppliers continue to provide acceptable products and services.

The program provides for acceptance actions, such as source verification, receipt inspection, pre- and post-installation tests, and review of documentation, such as certificates of conformance, to ensure that procurement, inspection, and test requirements have been satisfied before relying on the item to perform its intended safety function. Purchased items (such as components, spares, and replacement parts necessary for plant operation, refueling, maintenance, and modifications) and services are subject to quality and technical requirements at least equivalent to those specified for original equipment or by properly reviewed and approved revisions to ensure that the items are suitable for the intended service and are of acceptable quality, consistent with their effect on safety.

In the QAPD, TVA commits to comply with the quality standards described in NQA-1-1994, Basic Requirement 7 and Supplement 7S-1, to establish procurement verification control, with the following exceptions and alternatives:

- *NQA-1-1994, Basic Requirement 7 and Supplement 7S-1, state that procurement sources and suppliers' performance are to be evaluated. As an exception to these requirements, the QAPD proposes that other 10 CFR Part 50 licensees (other than TVA), authorized nuclear inspection agencies, the National Institute of Standards and Technology (NIST), and other State and Federal agencies that may provide items or services to TVA are not required to be evaluated or audited.*

  The NRC staff acknowledges that 10 CFR Part 50 licensees, authorized nuclear inspection agencies, the National Voluntary Laboratory Accreditation Program (NVLAP) administered by NIST, and other state *and federal agencies perform work under quality programs acceptable to the NRC, and that no additional audits or evaluations are required. However, TVA remains responsible for ensuring that procured items or services conform to its Appendix B program, applicable ASME Boiler and Pressure Vessel Code requirements, and other regulatory requirements and commitments. TVA also remains responsible for ensuring that the items or services are suitable for the intended application and for documenting the evaluation that supports this conclusion. The proposed exception provides an appropriate level of quality and safety. The NRC staff determined that this exception is acceptable as documented in a previous SE.*

- *Section 17.5 of NUREG-0800, paragraph II.L.8, establishes provisions for the procurement of commercial-grade calibration services for safety-related applications. As an exception to these provisions, the QAPD proposes that procurement source evaluation and selection measures not be required, provided all of the following conditions are met:*

  - *Purchase documents impose additional technical and administrative requirements to satisfy any licensee-specific QAPD and technical requirements.*

  - *Purchase documents require reporting as-found calibration data when calibrated items are found to be out of tolerance.*

  - *A documented review of the supplier's accreditation will be performed and will include a verification of the following:*

    - *The calibration laboratory holds a domestic accreditation by any one of the following accrediting bodies, which are recognized by the International Laboratory Accreditation Cooperation (ILAC) Mutual Recognition Arrangement (MRA):*

      - *National Voluntary Laboratory Accreditation Program (NVLAP), administered by the National Institute of Standards & Technology,*

      - *American Association for Laboratory Accreditation (A2LA).*

    - *The accreditation encompasses ANS/ISO/IEC 17025, "General Requirements for the Competence of Testing and Calibration Laboratories."*

    - *The published scope of accreditation for the calibration laboratory covers the necessary measurement parameters, range, and uncertainties.*

The NRC staff evaluated and found to be acceptable the NVLAP and A2LA accreditation programs. In RAI 17.5-13, dated May 12, 2008, the NRC staff *requested that the applicant justify the wording discrepancy between TVA QAPD Part II, Section 7.2 and Section 17.5 of NUREG-0800, Section II.L.8.c, regarding the NRC approved alternative for commercial grade calibration services. In its response dated June 24, 2008, the applicant stated that wording is consistent with the wording in NEI 06-14A, Revision 4, which has been approved by the NRC staff. In a letter, dated September 17, 2008, the NRC staff requested NEI to address this question as part of Revision 5 to NEI 06-14A. This issue will remain open until Revision 5 of NEI 06-14A is approved and TVA has incorporated the approved changes into the TVA QAPD. This is identified as* ***Open Item 17.5-4****.*

Resolution of Standard Content Open Item 17.5-4

NEI 06-14A, Revision 7, adequately addressed RAI 17.5-13. In a letter dated December 31, 2009, the VEGP applicant provided a markup of Revision 9 of the SNC QAPD. The NRC staff has reviewed the markup of SNC QAPD, Revision 9, and determined that conforming changes have been proposed to Section 7.2 consistent with NEI 06-14A, Revision 7. On this basis, Open Item 17.5-4 is ***Confirmatory Item 17.5-10*** *for the VEGP COL application.*

Resolution of Standard Content Confirmatory Item 17.5-10

Confirmatory Item 17.5-10 is an applicant commitment to revise its QAPD. The staff verified that the VEGP COL application was appropriately updated. As a result, Confirmatory Item 17.5-10 is now closed.

WLS Resolution of Standard Content Open Item 17.5-4 and Confirmatory Item 17.5-10

In a letter dated November 4, 2010, the applicant endorsed the standard content material provided by VEGP. By letter dated December 17, 2010, the applicant provided Revision 3 of the WLS COL FSAR and Revision 3 of the Duke NPD QAPD. In Revision 3 of the Duke NPD QAPD, the applicant addressed the information related to Standard Content Open Item 17.5-4. The NRC staff has confirmed through review of Revision 3 of the Duke NPD QAPD that the applicant has incorporated the appropriate changes to Part II, Section 7.2, of the Duke NPD QAPD, which is consistent with the guidance contained in NRC-approved NEI 06-14A, Revision 7. This adequately addresses the issue outlined by Confirmatory Item 17.5-10; therefore, Standard Content Open Item 17.5-4 is resolved for the WLS COL application.

The following portion of this technical evaluation section is reproduced from Section 17.5.4.7 of the VEGP SER:

The following portion of this technical evaluation section is reproduced from Section 17.5.4.7 of the BLN SER:

- *NQA-1-1994, Supplement 7S-1, Section 8.1, states that documentary evidence that items conform to procurement documents shall be available at the nuclear facility site prior to installation or use. As an alternative to the requirement for procurement documentary evidence to be available at the nuclear facility site during construction. The QAPD proposes that documentary evidence may be stored in physical form or in electronic media,* *under the control of TVA or its supplier(s), at a location(s) other than the nuclear facility site, as long as the documents can be accessed at the nuclear facility site during construction. After completion of construction, TVA will have sufficient documentary evidence to support operations. The NRC staff determined that implementation of this alternative would allow access to and review of the necessary procurement documentary evidence at the nuclear facility site, both before installation and use. Therefore, the NRC staff concluded that this alternative is acceptable.*

- *As an alternative to the requirements for the control of commercial-grade items and services in NQA-1-1994, Supplement 7S-1, Section 10, TVA commits in the QAPD to follow NRC guidance discussed in GL 89-02 and GL 91-05. In addition, TVA commits to establish and describe special quality verification requirements in applicable documents to assure that the commercially procured items will perform satisfactorily in service. In addition, the documents should provide for determining critical characteristics, technical evaluation, receipt requirements, and quality evaluation of the items to ensure that the items are suitable for their intended use. The NRC staff determined that this alternative will improve detection of counterfeit and fraudulently marked products and will improve the commercial-grade dedication programs. This alternative is consistent with the guidance of Section 17.5 of NUREG-0800, paragraphs II.U.1.d and II.U.1.e. Therefore, the NRC staff concluded that this alternative is acceptable.*

- *As an alternative to the requirements for the control of commercial-grade items and services in NQA-1-1994, Supplement 7S-1, Section 10, TVA commits to use other appropriate approved regulatory means and controls to support TVA commercial grade dedication activities. One example of this is NRC Regulatory Issue Summary (RIS) 2002-22, "Use of EPRI/NEI Joint Task Force Report, 'Guideline on Licensing Digital Upgrades: EPRI TR-102348, Revision 1, NEI 01-01: A Revision of EPRI TR-102348 to Reflect Changes to the 10 CFR 50.59 Rule.'" TVA will assume 10 CFR Part 21 reporting responsibility for all items that TVA dedicates as safety-related.*

In RAI 17.5-14, the NRC staff requested that the applicant provide an explanation as to how RIS 2002-22 represents an example of other approved regulatory means for commercial grade dedication activities. In its response dated June 24, 2008, the applicant stated that wording is consistent with the wording in NEI 06-14A, Revision 4, which has been approved by the NRC staff. In a letter, dated September 17, 2008, the NRC staff requested NEI to address this question as part of Revision 5 to NEI 06-14A. This issue will remain open until Revision 5 of NEI 06-14A is approved and TVA has incorporated the approved changes into the TVA QAPD. This is identified as ***Open Item 17.5-5****.*

Resolution of Standard Content Open Item 17.5-5

NEI 06-14A, Revision 7, adequately addressed RAI 17.5-14. In a letter dated December 31, 2009, the VEGP applicant provided a markup of Revision 9 of the SNC QAPD. The NRC staff has reviewed the markup of SNC QAPD, Revision 9, and determined that conforming changes have been proposed to Section 7.2 *consistent with NEI 06-14A, Revision 7. On this basis, Open Item 17.5-5 is* ***Confirmatory Item 17.5-11*** *for the VEGP COL application.*

Resolution of Standard Content Confirmatory Item 17.5-11

Confirmatory Item 17.5-11 is an applicant commitment to revise its QAPD. The staff verified that the VEGP COL application was appropriately updated. As a result, Confirmatory Item 17.5-11 is now closed.

WLS Resolution of Standard Content Open Item 17.5-5 and Confirmatory Item 17.5-11

In a letter dated November 4, 2010, the applicant endorsed the standard content material provided by VEGP. By letter dated December 17, 2010, the applicant provided Revision 3 of the WLS COL FSAR and Revision 3 of the Duke NPD QAPD. In Revision 3 of the Duke NPD QAPD, the applicant addressed the information related to Standard Content Open Item 17.5-5. The NRC staff has confirmed through review of Revision 3 of the Duke NPD QAPD that the applicant has incorporated the appropriate changes to Part II, Section 7.2, of the Duke NPD QAPD, which is consistent with the guidance contained in NRC-approved NEI 06-14A, Revision 7. This adequately addresses the issue outlined by Confirmatory Item 17.5-11; therefore, Standard Content Open Item 17.5-5 is resolved for the WLS COL application.

The following portion of this technical evaluation section is reproduced from Section 17.5.4.8 of the VEGP SER:

17.5.4.8 Identification and Control of Materials, Parts, and Components

The following portion of this technical evaluation section is reproduced from Section 17.5.4.8 of the BLN SER:

TVA's QAPD follows the guidance of Section 17.5 of NUREG-0800, paragraph II.H. The QAPD establishes the necessary measures for the identification and control of items such as materials, including consumables and items with limited shelf life, parts, components, and partially fabricated subassemblies. The identification of items is maintained throughout fabrication, erection, installation, and use so that the item can be traced to its documentation, consistent with the item's effect on safety.

In the QAPD, TVA commits to comply with the quality standards described in NQA-1-1994, Basic Requirement 8 and Supplement 8S-1, to establish provisions for identification and control of items.

The following portion of this technical evaluation section is reproduced from Section 17.5.4.9 of the VEGP SER:

17.5.4.9 Control of Special Processes

The following portion of this technical evaluation section is reproduced from Section 17.5.4.9 of the BLN SER:

TVA's QAPD follows the guidance of Section 17.5 of NUREG-0800, paragraph II.I. The QAPD establishes programs, procedures, and processes to ensure that special processes requiring interim process controls to ensure quality, such as welding, heat treating, chemical cleaning, and nondestructive examinations are implemented and controlled in accordance with applicable codes, specifications, and standards.

In the QAPD, TVA commits to comply with the quality standards described in NQA-1-1994, Basic Requirement 9 and Supplement 9S-1, to establish measures for the control of special processes.

The following portion of this technical evaluation section is reproduced from Section 17.5.4.10 of the VEGP SER:

17.5.4.10 Inspection

The following portion of this technical evaluation section is reproduced from Section 17.5.4.10 of the BLN SER:

TVA's QAPD follows the guidance of Section 17.5 of NUREG-0800, paragraph II.J. The QAPD establishes the necessary measures to implement inspections that ensure items, services, and activities affecting safety meet established requirements and conform to applicable documented specifications, instructions, procedures, and design documents. The inspection program establishes requirements for planning inspections, determining applicable acceptance criteria, setting the frequency of inspection, and identifying special tools needed to perform the inspection. Properly qualified personnel independent of those who performed or directly supervised the work are required to perform the inspections.

In the QAPD, TVA commits to comply with NQA-1-1994, Basic Requirement 10, Supplement 10S-1, and Subparts 2.4, 2.5, and 2.8, to establish inspection requirements, with the following commitment and alternative:

- *NQA-1-1994, Subpart 2.4, requires the use of the Institute of Electrical and Electronic Engineers (IEEE) Standard 336-1985, "IEEE Standard Installation, Inspection, and Testing Requirements for Power, Instrumentation, and Control Equipment at Nuclear Facilities." IEEE Standard 336-1985 refers to IEEE 498-1985, "IEEE Standard Requirements for the Calibration and Control of Measuring and Test Equipment Used in Nuclear Facilities." Each of these standards uses the definition of safety systems equipment from IEEE Standard 603-1980, "IEEE Standard Criteria for Safety Systems for Nuclear Power Generating Stations." IEEE Standard 603-1980 defines "safety system" as:*

  > *Those systems (the reactor trip system, an engineered safety feature, or both, including all their auxiliary supporting features and other auxiliary feature) which provide a safety function. A safety system is comprised of*

more than one safety group of which any one safety group can provide the safety function.

The QAPD must commit to the definition of safety systems equipment from IEEE Standard 603-1980 to appropriately implement NQA-1-1994, Subpart 2.4. In the QAPD, TVA commits to the definition of safety systems equipment from IEEE Standard 603-1980, but does not commit to the balance of IEEE Standard 603-1980. This definition applies only to equipment in the context of Subpart 2.4. The NRC staff determined that the use of the definition of safety systems equipment is acceptable because it is consistent with the requirements of NQA-1-1994, Subpart 2.4.

- *NQA-1-1994, Supplement 10S-1, Section 3.1, states that inspection personnel shall not report to the immediate supervisor who is responsible for performing the work being inspected. As an alternative to this requirement, the QAPD proposes that QA inspectors will report to quality control management while performing such inspections. The NRC staff determined that the use of this alternative is consistent with guidance provided in Section 17.5 of NUREG-0800, paragraph II.J.1. Therefore, the NRC staff concluded that this alternative is acceptable.*

In a letter dated December 31, 2009, the VEGP applicant provided a markup of Revision 9 of the SNC QAPD that includes the alternative to NQA-1-1994, Supplement 10S-1, Section 3.1, discussed above. The NRC staff has reviewed the markup of SNC QAPD, Revision 9, and determined that the proposed changes are consistent with the alternative evaluated in the BLN SER. These items are identified as ***Confirmatory Item 17.5-12****, pending NRC review of the revised QAPD as referenced in Section 17.5 of the VEGP COL FSAR.*

Resolution of Standard Content Confirmatory Item 17.5-12

Confirmatory Item 17.5-12 is an applicant commitment to revise its QAPD. The staff verified that the VEGP COL application was appropriately updated. As a result, Confirmatory Item 17.5-12 is now closed.

WLS Resolution of Standard Content Confirmatory Item 17.5-12

By letter dated July 29, 2011, the applicant provided Revision 4 of the WLS COL FSAR and Revision 4 of the Duke NPD QAPD. In Revision 4 of the Duke NPD QAPD, the applicant addressed the information related to Standard Content Open Item 17.5-12. The NRC staff has confirmed through review of Revision 4 of the Duke NPD QAPD that the applicant has incorporated the appropriate changes to Part II, Section 10.3, of the Duke NPD QAPD, which is consistent with the guidance contained in NRC-approved NEI 06-14A, Revision 7. This adequately addresses the issue outlined by Confirmatory Item 17.5-12; therefore, Standard Content Confirmatory Item 17.5-12 is resolved for the WLS COL application.

The following portion of this technical evaluation section is reproduced from Section 17.5.4.11 of the VEGP SER:

17.5.4.11 Test Control

The following portion of this technical evaluation section is reproduced from Section 17.5.4.11 of the BLN SER:

TVA's QAPD follows the guidance of Section 17.5 of NUREG-0800, paragraph II.K. The QAPD establishes the necessary measures and governing provisions to demonstrate that items subject to the provisions of the QAPD will perform satisfactorily in service, that the plant can be operated safely as designed, and that the operation of the plant, as a whole, is satisfactory.

In the QAPD, TVA commits to comply with the quality standards described in NQA-1-1994, Basic Requirement 11 and Supplement 11S-1, to establish provisions for testing.

In the QAPD, TVA commits to comply with the quality standards described in NQA-1-1994, Supplement 11S-2 and Subpart 2.7, to establish provisions to ensure that computer software used in applications affecting safety be prepared, documented, verified, tested, and used such that the expected outputs are obtained and configuration control maintained.

The following portion of this technical evaluation section is reproduced from Section 17.5.4.12 of the VEGP SER:

17.5.4.12 Control of Measuring and Test Equipment

The following portion of this technical evaluation section is reproduced from Section 17.5.4.12 of the BLN SER:

TVA's QAPD follows the guidance of Section 17.5 of NUREG-0800, paragraph II.L. The QAPD establishes the necessary measures to control the calibration, maintenance, and use of measuring and test equipment that provide information important to safe plant operation.

In the QAPD, TVA commits to comply with the quality standards described in NQA-1-1994, Basic Requirement 12 and Supplement 12S-1, to establish provisions for control of measuring and test equipment, with the following clarification and exception:

- *The QAPD clarifies that the out-of-calibration conditions, described in paragraph 3.2 of Supplement 12S-1 of NQA-1-1994, refer to cases where the measuring and test equipment are found to be out of the required accuracy limits (i.e., out of tolerance) during calibration. The NRC staff determined that the clarification for the out-of-calibration conditions is consistent with Supplement 12S-1. Therefore, the NRC staff concluded that this clarification is acceptable.*

- *As an alternative to the NQA-1-1994, Subpart 2.4, Section 7.2.1, calibration labeling requirements, the QAPD proposes that, when it is impossible or impractical to mark equipment with required calibration information because of equipment size or configuration, the required calibration information will be documented and traceable to the equipment. The NRC staff determined that this alternative is consistent with NRC staff guidance provided in Section 17.5 of NUREG-0800, paragraph II.L.3. Therefore, the NRC staff concluded that this alternative is acceptable.*

The following portion of this technical evaluation section is reproduced from Section 17.5.4.13 of the VEGP SER:

17.5.4.13 <u>Handling, Storage, and Shipping</u>

The following portion of this technical evaluation section is reproduced from Section 17.5.4.13 of the BLN SER:

TVA's QAPD follows the guidance of Section 17.5 of NUREG-0800, paragraph II.M. The QAPD establishes the necessary measures to control the handling, storage, packaging, shipping, cleaning, and preservation of items to prevent inadvertent damage or loss and to minimize deterioration.

In the QAPD, TVA commits to comply with NQA-1-1994, Basic Requirement 13 and Supplement 13S-1, and to establish provisions for handling, storage, and shipping. In the QAPD, TVA also commits to comply with NQA-1-1994, Subparts 2.1 and 2.2 during the construction and pre-operations phase of the plant, as applicable, with the following alternative:

- *NQA-1-1994, Subpart 2.2, Section 6.6, states that the preparation of records must include information on personnel access to QA records. The QAPD establishes the necessary measures to document personnel authorized to access storage areas and recording personnel access. However, the QAPD proposes to not consider these documents as quality records. As an alternative, SNC will retain these documents in accordance with plant administrative controls. The NRC staff determined that these records do not meet the classification of a quality record as defined in NQA-1-1994, Supplement 17S-1, Section 2.7. Therefore, the NRC staff concluded that this alternative is acceptable.*

- *NQA-1-1994, Subpart 2.2, Section 7.1, refers to Subpart 2.15 for requirements related to handling of items. The QAPD clarifies that the scope of Subpart 2.15 includes hoisting, rigging and transporting of items for nuclear power plants during construction. The NRC staff has determined that this clarification is acceptable because it distinguishes between the requirements for construction and operation.*

NQA-1-1994, Subpart 3.2, Appendix 2.1, Section 3, provides cleaning recommendations and precautions. In a letter dated December 31, 2009, the VEGP applicant proposed a revision to the SNC QAPD to clarify that only the *precautions in Section 3 are committed to in accordance with RG 1.37, "Quality Assurance Requirements for Cleaning of Fluid Systems and Associated Components of Water-Cooled Nuclear Power Plants," Revision 1. The NRC staff has determined that this clarification is acceptable because commitment to Subpart 3.2, Appendix 2.1, Section 3 is consistent with Regulatory Position 3 of RG 1.37. These items are identified as* ***Confirmatory Item 17.5-13****, pending NRC review of the revised QAPD as referenced in Section 17.5 of the VEGP COL FSAR.*

Resolution of Standard Content Confirmatory Item 17.5-13

Confirmatory Item 17.5-13 is an applicant commitment to revise its QAPD. The staff verified that the VEGP COL application was appropriately updated. As a result, Confirmatory Item 17.5-13 is now closed.

WLS Resolution of Standard Content Confirmatory Item 17.5-13

By letter dated July 29, 2011, the applicant provided Revision 4 of the WLS COL FSAR and Revision 4 of the Duke NPD QAPD. In Revision 4 of the Duke NPD QAPD, the applicant addressed the information related to Standard Content Open Item 17.5-13. The NRC staff has confirmed through review of Revision 4 of the Duke NPD QAPD that the applicant has incorporated the appropriate changes to Part II, Section 13.2, of the Duke NPD QAPD, which is consistent with the guidance contained in NRC-approved NEI 06-14A, Revision 7. This adequately addresses the issue outlined by Confirmatory Item 17.5-13; therefore, Standard Content Confirmatory Item 17.5-13 is resolved for the WLS COL application.

The following portion of this technical evaluation section is reproduced from Section 17.5.4.14 of the VEGP SER:

17.5.4.14 Inspection, Test, and Operating Status

The following portion of this technical evaluation section is reproduced from Section 17.5.4.14 of the BLN SER:

TVA's QAPD follows the guidance of Section 17.5 of NUREG-0800, paragraph II.N. The QAPD establishes the necessary measures to identify the inspection, test, and operating status of items and components subject to the provisions of the QAPD to maintain personnel and reactor safety and avoid inadvertent operation of equipment.

In the QAPD, TVA commits to comply with the quality standards described in NQA-1-1994, Basic Requirement 14, for identifying inspection, test, and operating status.

The following portion of this technical evaluation section is reproduced from Section 17.5.4.15 of the VEGP SER:

17.5.4.15 Nonconforming Materials, Parts, or Components

The following portion of this technical evaluation section is reproduced from Section 17.5.4.15 of the BLN SER:

TVA's QAPD follows the guidance of Section 17.5 of NUREG-0800, paragraph II.O. The QAPD establishes the necessary measures to control items, including services that do not conform to specified requirements to prevent inadvertent installation or use. Nonconformances are evaluated for their impact on operability of quality SSCs to ensure that the final condition does not adversely affect safety, operation, or maintenance of the item or service. The results of evaluations of conditions adverse to quality are analyzed to identify quality trends, documented, and reported to upper management in accordance with applicable procedures.

In addition, the QAPD provides for establishing the necessary measures to implement the requirements of Subparts A and C of 10 CFR Part 52, 10 CFR 50.55(e), and 10 CFR Part 21, as applicable.

In the QAPD, TVA commits to comply with the quality standards described in NQA-1-1994, Basic Requirement 15 and Supplement 15S-1, to establish measures for nonconforming material.

The following portion of this technical evaluation section is reproduced from Section 17.5.4.16 of the VEGP SER:

17.5.4.16 Corrective Action

The following portion of this technical evaluation section is reproduced from Section 17.5.4.16 of the BLN SER:

TVA's QAPD follows the guidance of Section 17.5 of NUREG-0800, paragraph II.P. The QAPD establishes the necessary measures to promptly identify, control, document, classify, and correct conditions adverse to quality. The QAPD requires personnel to identify known conditions adverse to quality. Reports of conditions adverse to quality are analyzed to identify trends. Significant conditions adverse to quality are documented and reported to responsible management. In the case of suppliers working on safety-related activities or similar situations, TVA may delegate specific responsibility for the corrective action program, but TVA maintains responsibility for the program's effectiveness.

In addition, the QAPD provides for establishing the necessary measures to implement a reporting program in accordance with the requirements of 10 CFR Part 21.

In the QAPD, TVA commits to comply with the quality standards described in NQA-1-1994, Basic Requirement 16, to establish a corrective action program.

The following portion of this technical evaluation section is reproduced from Section 17.5.4.17 of the VEGP SER:

17.5.4.17 Quality Assurance Records

The following portion of this technical evaluation section is reproduced from Section 17.5.4.17 of the BLN SER:

TVA's QAPD follows the guidance of Section 17.5 of NUREG-0800, paragraph II.Q. The QAPD establishes the necessary measures to ensure that sufficient records of items and activities affecting quality are generated, identified, retained, maintained, and retrievable.

Concerning the use of electronic records storage and retrieval systems, the QAPD complies with the NRC guidance given in RIS 2000-18, "Guidance on Managing Quality Assurance Records in Electronic Media," dated October 23, 2000, and associated Nuclear Information and Records Management Association (NIRMA) guidelines TG 11-1998, TG 15-1998, TG 16-1998 and TG 21-1998.

In the QAPD, TVA commits to comply with the quality standards described in NQA-1-1994, Basic Requirement 17 and Supplement 17S-1, to establish provisions for records, with the following alternative:

- *NQA-1-1994, Supplement 17S-1, Section 4.2(b) states that records must be firmly attached in binders or placed in folders or envelopes for storage in steel file cabinets or on shelving in containers. As an alternative to this requirement, the QAPD proposes that hard-copy records be stored in steel cabinets or on shelving in containers, except that methods other than binders, folders, or envelopes may be used to organize records for storage. The NRC staff determined that this alternative is acceptable as documented in an SER dated September 1, 2005 for Nuclear Management Company.*

The following portion of this technical evaluation section is reproduced from Section 17.5.4.18 of the VEGP SER:

17.5.4.18 Quality Assurance Audits

The following portion of this technical evaluation section is reproduced from Section 17.5.4.18 of the BLN SER:

TVA's QAPD follows the guidance of Section 17.5 of NUREG-0800, paragraph II.R. The QAPD establishes the necessary measures to implement audits to verify that activities covered by the QAPD are performed in conformance with documented requirements. The audit program is reviewed for effectiveness as part of the overall audit process.

The QAPD provides for the applicant or holder to conduct periodic internal and external audits. Internal audits are conducted to determine that the program and *procedures being audited comply with the QAPD. Internal audits, conducted after placing the facility in operation, are performed with a frequency commensurate with safety significance and in such a manner as to ensure that an audit of all applicable QA program elements is completed for each functional area within a period of 2 years. External audits determine the adequacy of a supplier's or contractor's QA program.*

TVA ensures that audits are documented and reviews audit results. TVA responds to all audit findings and initiates appropriate corrective actions. In addition, where corrective actions are indicated, TVA documents follow-up of applicable areas through inspections, review, re-audits, or other appropriate means to verify implementation of assigned corrective actions.

In the QAPD, TVA commits to comply with the quality standards described in NQA-1-1994, Basic Requirement 18 and Supplement 18S-1, to establish the independent audit program.

The following portion of this technical evaluation section is reproduced from Section 17.5.4.19 of the VEGP SER:

17.5.4.19 *Nonsafety-Related SSCs Quality Assurance Control*

17.5.4.19.1 Nonsafety-Related SSCs - Significant Contributors to Plant Safety

The following portion of this technical evaluation section is reproduced from Section 17.5.4.19.1 of the BLN SER:

TVA's QAPD follows the guidance of Section 17.5 of NUREG-0800, paragraph II.V.1. The QAPD establishes program controls applied to nonsafety-related SSCs that are significant contributors to plant safety and to which Appendix B does not apply. The QAPD applies specific controls to these items in a selected manner, targeting the characteristics or critical attributes that render the SSC a significant contributor to plant safety consistent with applicable sections of the QAPD.

The Duke NPD QAPD incorporates the guidance of Section 17.5 of NUREG-0800, Paragraph II.V.1 that establishes specific, targeted program controls for nonsafety related SSCs, and is therefore acceptable to the staff.

17.5.4.19.2 Nonsafety-Related SSCs Credited for Regulatory Events

The Duke NPD QAPD follows the guidance of Section 17.5 of NUREG-0800, Paragraph II.V.2, to establish the quality requirements for nonsafety-related SSCs credited for regulatory events. In the QAPD, Duke Energy commits to comply with the following regulatory guidance:

- Duke Energy implements quality requirements for the fire protection system in accordance with Regulatory Position 1.7, "Quality Assurance," in RG 1.189, "Fire Protection for Operating Nuclear Power Plants," issued April 2001.

- Duke Energy implements the quality requirements for anticipated transient without scram (ATWS) equipment in accordance with Part III, Section 1, of the Duke NPD QAPD.

- Duke Energy implements quality requirements for station blackout (SBO) equipment in accordance with Part III, Section 1, of the Duke NPD QAPD. Regulatory Guide 1.155, "Station Blackout," dated August 1988, is not applicable for the AP1000 design in accordance with the certified design as shown in the DCD, Appendix 1A. Regulatory Guide 1.155 relates to the availability of safety related functions supported by AC power. Since AC power is not required to support the availability of safety-related functions, the guidance is not applicable to the WLS COL application.

17.5.4.20 *Regulatory Commitments*

The Duke NPD QAPD follows the guidance of Section 17.5 of NUREG-0800, Paragraph II.U. The QAPD establishes QA program commitments. By letter dated December 17, 2010, Duke Energy submitted Revision 3 of the WLS COL FSAR as well as Revision 3 of the Duke NPD QAPD. In Part IV of the Duke NPD QAPD, Duke Energy commits to comply with the following NRC regulatory guides and other QA standards to supplement and support the QAPD:

- RG 1.8, “Qualification and Training of Personnel for Nuclear Power Plants,” Revision 3.

- RG 1.26, “Quality Group Classification and Standards for Water-, Steam-, and Radioactive-Waste-Containing Components of Nuclear Power Plants,” Revision 4.

- RG 1.28, “Quality Assurance Program Requirements (Design and Construction),” Revision 3.

- RG 1.29, “Seismic Design Classification,” Revision 4.

- RG 1.33, “Quality Assurance Program Requirements (Operations),” Revision 2.

- RG 1.37, “Quality Assurance Requirements for Cleaning of Fluid Systems and Associated Components for Water-Cooled Nuclear Power Plants,” Revision 1.

- ASME NQA-1-1994 Edition, Parts I, II, and III.

- Nuclear Information and Records Management Association, Inc. (NIRMA) technical guides, as described in Part II, Section 17 of the Duke NPD QAPD.

The following portion of this technical evaluation section is reproduced from Section 17.5.4.20 of the VEGP SER:

> *In RAI 17.5-15 dated May 12, 2008, the NRC staff requested that the applicant revise the TVA QAPD Part IV to commit to RG 1.37 Revision 1, “Quality Assurance Requirements for Cleaning of Fluid Systems and Associated Components of Water-Cooled Nuclear Power Plants,” issued March 2007. In its response dated June 24, 2008, the applicant stated that Part IV of the TVA QAPD is consistent with Revision 4 of NEI 06-14A. In a letter, dated September 17, 2008, the NRC staff requested NEI to address this question as*

part of Revision 5 to NEI 06-14A. However, the applicant committed to RG 1.37, Revision 1, in Revision 1 of the BLN QAPD. RAI 17.5-15 is closed.

In a letter dated December 31, 2009, the VEGP applicant provided a markup of Revision 9 of the SNC QAPD. The NRC staff has reviewed the markup of SNC QAPD, Revision 9, and determined that conforming changes have been proposed to Part IV consistent with NEI 06-14A, Revision 7. On this basis, the updating of the SNC QAPD for closure of standard content RAI 17.5-15 is ***Confirmatory Item 17.5-16*** *for the VEGP COL application.*

Resolution of Standard Content Confirmatory Item 17.5-16

Confirmatory Item 17.5-16 is an applicant commitment to revise its QAPD. The staff verified that the VEGP COL application was appropriately updated. As a result, Confirmatory Item 17.5-16 is now closed.

WLS Resolution of Standard Content Confirmatory Item 17.5-16

In a letter dated November 4, 2010, the applicant endorsed the standard content material provided by VEGP. By letter dated December 17, 2010, the applicant provided Revision 3 of the WLS COL FSAR and Revision 3 of the Duke NPD QAPD. In Revision 3 of the Duke NPD QAPD, the applicant addressed the information related to Standard Content Open Item 17.5-16. The NRC staff has confirmed through review of Revision 3 of the Duke NPD QAPD that the applicant has incorporated the appropriate changes to Part IV of the Duke NPD QAPD, which is consistent with the guidance contained in NRC-approved NEI 06-14A, Revision 7. This adequately addresses the issue outlined by Confirmatory Item 17.5-16; therefore, Standard Content Confirmatory Item 17.5-16 is resolved for the WLS COL application.

The following portion of this technical evaluation section is reproduced from Section 17.5.4.20 of the VEGP SER:

The NRC staff also reviewed Appendix 1AA of the BLN COL FSAR, which lists BLN's conformance with NRC RGs and provides any exceptions to conformance with those RGs. In RAI 17.5-17, the NRC staff requested that the applicant explain how the QAPD provides an acceptable exception to the RGs described in Appendix 1AA. In its response (ML081780171), the applicant stated that Part IV of the TVA QAPD is consistent with Revision 4 of NEI 06-14A. Additionally, the applicant provided further information addressing these RGs in response to RAIs 17.5-15 and 17.5-17. The response to RAI 17.5-15 proposed revisions to Appendix 1AA and Parts II and *IV of the QAPD, whereas the response to RAI 17.5-17 provided further justification. The applicant provided a response to RAI 1-5 in a letter dated August 19, 2008, to address the discrepancies between the revisions of the RGs addressed in Appendix 1AA and those addressed in Westinghouse DCD Appendix 1A. The information in this letter appears to have superseded the changes that were proposed and acceptable to the NRC staff in the applicant's June 24, 2008 letter, thereby reopening the issue identified in RAI 17.5-17. This is identified as* ***Open Item 17.5-6****.*

Resolution of Standard Content Open Item 17.5-6

In a letter dated July 29, 2009, the VEGP applicant stated that the revisions to the COL application identified in the referenced TVA August 19, 2008, letter do supersede the changes identified in the referenced TVA June 24, 2008, letter, as shown in Revision 1 of the BLN COL application. In a letter dated December 31, 2009, the VEGP applicant proposed additional changes to FSAR Chapter 1, Appendix 1AA to address conformance to RG 1.33, Revision 2. The NRC staff has reviewed the proposed changes to VEGP COL FSAR Chapter 1, Appendix 1AA, and determined that the changes are responsive to RAI 17.5-17. On this basis, Open Item 17.5-6 is ***Confirmatory Item 17.5-17*** *for the VEGP COL application*.

Resolution of Standard Content Confirmatory Item 17.5-17

Confirmatory Item 17.5-17 is an applicant commitment to revise its FSAR Appendix 1AA. The staff verified that the VEGP COL FSAR was appropriately updated. As a result, Confirmatory Item 17.5-17 is now closed.

WLS Resolution of Standard Content Open Item 17.5-6 and Confirmatory Item 17.5-17

In a letter dated November 4, 2010, the applicant endorsed the standard content material provided by VEGP. By letter dated December 17, 2010, the applicant provided Revision 3 of the WLS COL FSAR and Revision 3 of the Duke NPD QAPD. In Revision 3 of the Duke NPD QAPD, the applicant addressed the information related to Standard Content Open Item 17.5-6, in regard to applicability of the RGs identified in Part IV of the Duke NPD QAPD and Appendix 1AA of the WLS COL FSAR.

The NRC staff has confirmed through review of Revision 3 of the Duke NPD QAPD and Appendix 1AA of the WLS COL FSAR that the applicant has identified and conforms to Regulatory Guides 1.8, 1.26, 1.29, 1.33, and 1.37. With respect to RG 1.28, the applicant identifies conformance with RG 1.28 for the DCD scope of work, and commits to ASME NQA-1-1994, Parts I, II, and III, in lieu of a commitment to RG 1.28 for the remaining scope of work. This is consistent with the guidance contained in NRC-approved NEI 06-14A, Revision 7. The NRC staff determined that the revisions to the Duke NPD QAPD and Appendix 1AA of the WLS COL FSAR adequately address the issue outlined by Confirmatory Item 17.5-17; therefore, Standard Content Open Item 17.5-6 and Confirmatory Item 17.5-17 are resolved for the WLS COL application.

17.5.5 Post Combined License Activities

There are no post COL activities related to this section.

17.5.6 Conclusion

The NRC staff used the requirements of Appendix B to10 CFR Part 50 and the guidance of Section 17.5 of NUREG-0800 as the basis for evaluating the acceptability of the Duke NPD QAPD and concludes that:

- The QAPD provides adequate guidance for Duke Energy to describe the authority and responsibility of management and supervisory personnel, performance / verification personnel, and self-assessment personnel.

- The QAPD provides adequate guidance for Duke Energy to provide for organizations and persons to perform verification and self-assessment functions with the authority and independence to conduct their activities without undue influence from those directly responsible for costs and schedules.

- The QAPD provides adequate guidance for Duke Energy to apply a QAPD to activities and items that are important to safety.

- The QAPD provides adequate guidance for Duke Energy to establish controls that, when properly implemented, comply with the requirements of 10 CFR Part 52; Appendix B to 10 CFR Part 50; 10 CFR Part 21; and 10 CFR 50.55(e), with the acceptance criteria associated with Section 17.5 of NUREG-0800, and with the commitments to applicable regulatory guidance.

The Duke NPD QAPD addresses WLS COL 17.5-1, STD COL 17.5-2, STD COL 17.5-4, and STD COL 17.5-8.

Based on the information provided by the applicant and the evaluation above, the staff concludes that Section 17.5 of the WLS COL FSAR and the Duke NPD QAPD meet the requirements of Appendix B to 10 CFR Part 50; 10 CFR 52.79(a)(17); 10 CFR 52.79(a)(25); and 10 CFR 52.79(a)(27).

17.6 Maintenance Rule Program (Related to RG 1.206, Section C.III.1, Chapter 17, C.I.17.6, "Description of the Applicant's Program for Implementation of 10 CFR 50.65, The Maintenance Rule")

17.6.1 Introduction

This section addresses the program for maintenance rule (MR) implementation. It is based on the requirements of 10 CFR Part 52 and the guidance provided to the industry by the Nuclear Management and Resources Council (NUMARC) and its successor, the NEI. NUMARC 93-01, "Industry Guidance for Monitoring the Effectiveness of Maintenance at Nuclear Power Plants," is endorsed by the NRC in RG 1.160, "Design Response Spectra for Seismic Design of Nuclear Power Plants." Section 11.0 of NUMARC 93-01 was later revised; the revision, as modified by RG 1.182, "Assessing and Managing Risk Before Maintenance Activities at Nuclear Power Plants," is also endorsed by the NRC. NEI 07-02A, "Generic FSAR Template Guidance for Maintenance Rule Program Description for Plants Licensed Under 10 CFR Part 52," provides a template for presenting this information that has also been endorsed by the NRC staff in a letter addressed to NEI dated January 24, 2008.

17.6.2 Summary of Application

In Section 17.6, "Maintenance Rule Program," of the WLS COL FSAR, the applicant provided the following:

AP1000 COL Information Items

- STD COL 3.8-5

The applicant provided additional information in STD COL 3.8-5 to address COL Information Item 3.8-5. STD COL 3.8-5 addresses the inspection program for structures.

Supplemental Information

- STD SUP 17.6-1

The applicant provided additional information in STD SUP 17.6-1 to incorporate by reference NEI 07-02A. The applicant also identified where operational programs are described in the WLS COL FSAR, including a description of and milestones for the maintenance rule program.

- STD SUP 17.6-2

The applicant provided additional information in STD SUP 17.6-2 to incorporate condition monitoring of underground or inaccessible cables into the maintenance rule program.

License Condition

- Part 10, License Condition 6, "Operational Program Readiness"

This license condition states that the COL holder shall provide an operational program schedule to support NRC inspections.

17.6.3 Regulatory Basis

Commission regulations for the maintenance rule program include the requirements of 10 CFR 50.65, "Requirements for monitoring the effectiveness of maintenance at nuclear power plants," and 10 CFR 52.79(a)(15). The acceptance criteria associated with the relevant requirements of the NRC regulations for the MR are given in Section 17.6 of NUREG-0800.

The regulatory basis of the information incorporated by reference into WLS COL FSAR Section 17.6 is addressed in NUREG-1793 and its supplements for topical report NEI 07-02, Revision 3, which was transmitted to NEI in a letter from the NRC staff dated January 24, 2008.

SECY-05-0197, "Review of Operational Programs in a Combined License Application and Generic Emergency Planning Inspections, Tests, Analyses, and Acceptance Criteria," identifies schedule requirements and proposes a license condition to be satisfied by COL holders.

17.6.4 Technical Evaluation

The NRC staff reviewed Section 17.6 of the WLS COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.[1] The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the MR. The results of the staff's evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the WLS Units 1 and 2 COL application, the NRC staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the WLS COL FSAR. In performing this comparison, the staff considered changes made to the WLS COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.

- The staff verified that the site-specific differences were not relevant.

The NRC staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the WLS COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the BLN Units 3 and 4 COL application. Any confirmatory items in the standard content material retain the numbers assigned in the VEGP SER.

AP1000 COL Information Items

- STD COL 3.8-5

The NRC staff reviewed STD COL 3.8-5 in WLS COL FSAR Section 17.6 related to the inspection program for structures. The staff's review of this program is documented in Section 3.8 of this SER.

The following portion of this technical evaluation section is reproduced from Section 17.6.4 of the VEGP SER:

> *The NRC staff reviewed conformance of Section 17.6 of the BLN COL FSAR, including the COL standard information item identified in Subsection 17.6.2, with the guidance in NUREG-0800, Section 17.6. The staff also compared it with RG 1.206, Section C.III.1, Chapter 17, C.I.17.6, "Description of the Applicant's Program for Implementation of 10 CFR 50.65, the Maintenance Rule."*
>
> *In addition, the NRC staff reviewed the COL standard information item identified in Subsection 17.6.2 above. In its review, the staff used NUREG-0800, Section 17.6, "Maintenance Rule," as guidance.*

<u>*Supplemental Information*</u>

- *STD SUP 17.6-1, which incorporated NEI 07-02A and identified where operational programs are described in the BLN COL FSAR, including a description of the MR program*

The applicant added the following text to Section 17.6 of the BLN COL FSAR:

> *This section incorporates by reference NEI 07-02A, "Generic FSAR Template Guidance for Maintenance Rule Program Description for Plants Licensed under 10 CFR Part 52," with the following supplemental information. See Table 1.6-201.*
>
> *Table 13.4-201 provides milestones for maintenance rule [MR] program implementation.*

The applicant indicated where, in the BLN COL FSAR, the programs listed in Subsection 17.X.3 of NEI 07-02A are described:

- *MR program (Section 17.6)*
- *QA program (Section 17.5)*
- *inservice inspection program (Sections 5.2 and 6.6)*
- *inservice testing program (Section 3.9)*
- *technical specifications surveillance test program (Chapter 16)*

The NRC staff endorsed NEI 07-02A, stating that it provides an acceptable method:

- *for complying with the requirement in 10 CFR 52.79(a)(15) that FSARs contain a description of the program and its implementation*

- *for monitoring the effectiveness of maintenance to meet the requirements of Section 50.65*

- *for satisfying the acceptance criteria of NUREG-0800, Section 17.6*

Because STD SUP 17.6-1 incorporates NEI 07-02A by reference and identifies the relevant operational programs and milestones, the staff finds that the applicant has provided sufficient information to fully describe the maintenance rule program. This provides reasonable assurance that the program, when implemented, satisfies the requirements of 10 CFR 50.65.

- *STD SUP 17.6-2*

In response to RAI 8.2-14, the applicant incorporated cable monitoring into its maintenance rule program. The program will monitor the condition of inaccessible or underground cables, including all those that support SSCs within the scope of 10 CFR 50.65. The staff documented its evaluation of the cable monitoring program in SER Section 8.2.4.

License Condition

- *Part 10, License Condition 6*

The applicant proposed a license condition to provide a schedule to support NRC inspection of operational programs including the MR program. The proposed license condition is consistent with the policy established in SECY-05-0197 and is acceptable.

17.6.5 Post Combined License Activities

For the reasons discussed in the technical evaluation section above, the NRC staff finds the following license condition acceptable:

- License Condition (17-1) – No later than 12 months after issuance of the COL, the licensee shall submit to the Director of the Office of New Reactors, a schedule that supports planning for and conduct of NRC inspections of the Maintenance Rule (MR) program. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until the MR has been fully implemented.

17.6.6 Conclusion

The NRC staff reviewed the application and checked the referenced DCD. The NRC staff's review confirmed that the applicant addressed the required information relating to the MR program. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

STD SUP 17.6-1 incorporated NEI 07-02A by reference, identified where operational programs are described in the WLS COL FSAR, including a description of the MR program, and provided a schedule for implementation of the MR program. STD SUP 17.6-2 incorporated condition monitoring of underground or inaccessible cables into the maintenance rule program.

Based on its evaluation, the NRC staff concludes that the relevant information presented in Section 17.6 of the WLS COL FSAR meets the requirements of 10 CFR 50.65 and 10 CFR 52.79(a)(15), and is, therefore, acceptable.

18.0 HUMAN FACTORS ENGINEERING

18.1 Overview (No Corresponding Section in Regulatory Guide (RG) 1.206)

Section 18.1 of the William States Lee III Nuclear Station (WLS) combined license (COL) Final Safety Analysis Report (FSAR), Revision 11, incorporates by reference, with no departures or supplements, Section 18.1 of Revision 19 of the AP1000 Design Control Document (DCD). The Nuclear Regulatory Commission (NRC) staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.[1] The NRC staff's review confirmed that there is no outstanding issue related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793, "Final Safety Evaluation Report [FSER] Related to Certification of the AP1000 Standard Design," and its supplements.

18.2 Human Factors Engineering Program Management (Related to RG 1.206, Section C.I.18.1, "HFE Program Management")

18.2.1 Introduction

The Human Factors Engineering (HFE) Program Management plan describes the HFE program in sufficient detail to ensure that all aspects of the human-system interfaces (HSIs), procedures, staffing, and training are developed, designed, and evaluated on the basis of a structured top-down systems analysis using accepted HFE guidance.

18.2.2 Summary of Application

Section 18.2 of the WLS COL FSAR, Revision 11, incorporates by reference Section 18.2 of the AP1000 DCD, Revision 19.

In addition, in WLS COL FSAR Section 18.2.1.3, the applicant provided the following:

AP1000 COL Information Item

- WLS COL 18.2-2

The applicant provided additional information in WLS COL Information Item 18.2-2, addressing Emergency Operating Facility (EOF) and Technical Support Center (TSC) communications and HFE design.

License Condition

- License Condition 1, regarding the HFE inspections, tests, analyses and acceptance criteria (ITAAC).

[1] See Section 1.2.2 for a discussion of the staff's review related to verification of the scope of information to be included in a COL application that references a design certification (DC).

18.2.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.
