Sediment Grain Size Analysis Results For 1994	

OVERVIEW

- A. During the third quarter of 1994, discharges occurred from Discharge Paths 001 (once through cooling water), 001B, 001D, 001E, 001F, 001G, 001H, 001J, 001L, 001M, 001N, 001P, and 002 through 016. No discharges occurred from Discharge Paths 001I, 001K, and 017. A list of all of the permit discharge pathways, including name and number, is provided in Appendix 1.
- B. On July 28, 1994, approximately 20,000 gallons of wastewater containing acetone at a concentration of 20 ppb was drained to Discharge 001M through the waste water holding and treatment tank. The contaminated wastewater discharge was due to maintenance involving the cold machine shop underground storage tank.

Sorrel Marks of the California Regional Water Quality Control Board (CRWQCB) was previously notified on July 26, 1994, that PG&E planned to discharge wastewater containing low levels of acetone to Discharge 001M. A description of the discharge is included in this report at Sorrel Mark's request.

- C. On August 19, 1994, a manual chlorination cycle for the Unit 1 circulating water conduit was not monitored. The on-line chlorine analyzer was inoperable due to maintenance activities. The operations department was instructed not to perform manual chlorinations until the analyzer was fixed. However, at 1000 PDT, a manual chlorination into the Unit 1 circulating water conduit occurred. Based upon the fact that the circulating water pump (CWP) flowrates did not change during the unmonitored time period and the Unit 1 CWP conduit treatment cycle was within specification before, during, and after the unmonitored cycle, the Unit 1 cycle is believed to be within the 120-minute daily chlorination time limit and chlorine discharge concentration. This engineering evaluation was done in accordance with PG&E Letter DCL-94-002, as authorized by the CRWQCB.
- D. On August 20, 1994, during a manual chlorination of the Unit 1 circulating water conduit the chlorination injection time limit was exceeded by less than five minutes. The time limit was exceeded due an inaccurate start time of the concurrent manual dechlorination cycle. The concentration limits for chlorine were not exceeded. NPDES permit 90-09 states that total residual chlorine may not be discharged from any single generating unit for more than two hours per day.

On August 25, 1994, Sorrel Marks of the CRWQCB Staff was notified of this event. Sorrel Marks requested that PG&E include a description of this event in this report.

- E. During the week of September 5th, 1994, auxiliary saltwater system (ASW) flowrate testing occurred. The flowrate testing involved injecting rhodamine dye into the ASW pump suction. Flowrate of the ASW system is 11,000 gpm with a target dye concentration of 10 ppb. This volume was diluted by the four main CWPs flow prior to discharge through Discharge pathway 001. The rhodamine dye concentration would be nondetectable with this dilution factor. Notification was made via PG&E Letter DCL-94-189 submitted to your office on August 26, 1994.

- F. On September 13, 1994, 50 gallons of service cooling water (SCW) containing glutaraldehyde at a concentration of 109 ppm was drained to Discharge 001F. The discharge was due to routine maintenance.
- G. During the Unit 2 sixth refueling outage beginning September 24, 1994, two loops of intake cooling water containing glutaraldehyde, were drained to Discharge 002 as part of a routine maintenance program. Also, one loop of the component cooling water, and one loop of the SCW, containing glutaraldehyde, were drained to Discharge 001F as part of a routine maintenance program. PG&E has committed to report to the CRWQCB "significant" discharges of closed cooling water systems containing glutaraldehyde. Listed below are the volume of water and the glutaraldehyde concentration discharged:

<u>ICW Loop</u>	<u>Volume Drained</u>	<u>Glutaraldehyde Concentration</u>
1	1100 gallons	43 ppm
2	1100 gallons	43 ppm
<u>CCW Loop</u>	<u>Volume Drained</u>	<u>Glutaraldehyde Concentration</u>
2	20 gallons	82 ppm
<u>SCW Loop</u>	<u>Volume Drained</u>	<u>Glutaraldehyde Concentration</u>
2	60 gallons	109 ppm

- H. In all cases, chemical, radiochemical, and toxicity analyses were performed in accordance with chemical analysis procedures contained in the Diablo Canyon Power Plant (DCPP), Units 1 and 2 Plant Manual, Volume 8, by State approved laboratories, or laboratories meeting the requirements specified in the CRWQCB: "Standard Provisions and Reporting Requirements," dated January 25, 1985. Receiving water monitoring was performed in accordance with approved biological and oceanographic procedures.
- I. Each substance listed in Table B of the 1990 Ocean Plan were analyzed in July 1994. Results of the study will be reported in the NPDES permit renewal application for DCPP.

SUMMARY OF MONITORING PROGRAM

A. Monitoring of Plant Influent and Effluent

1. The results of the July, August, and September 1994 plant influent and effluent monitoring are reported on Q2 forms in Appendices 2, 3, and 4, respectively. Additional laboratory results are also placed in Appendices 2 through 4 behind the Q2 forms. This information is provided to ensure that all analytical data are reported "uncensored." The additional data are used to develop the "average" values reported on the Q2 forms when analyses are

performed several times in one day (i.e., for TRC, an average value is reported on the Q2 form).

2. Results from an acute bioassay on water sampled from Discharge 001, performed July 11-15, 1994, are included in **Appendix 5**. The acute toxicity test results show that the toxicity is zero (no mortality occurred during the test).
3. Results from chronic bioassay performed July 13-15, 1994, on water sampled from Discharge 001 are included in **Appendix 6**. The chronic toxicity results show that the toxicity is 1.79. The calculated effluent concentration limit from Chapter IV, Section A of the 1990 California Ocean Plan is 5.11.
4. Listed below are the detection limits used for plant effluent analyses performed during the quarter:

<u>Parameter</u>	<u>Detection Limit</u>
Oil and Grease	3 mg/l
Total Residual Chlorine	0.020 mg/l*
Suspended Solids	1 mg/l
Settleable Solids	0.1 ml/l
Ammonia (N)	0.057 mg/l
Metals (chelation extraction)	
Chromium	0.005 mg/l
Copper	0.003 mg/l
Nickel	0.003 mg/l
Zinc	0.001 mg/l

* Reference PG&E Letter DCL-94-192 submitted to Regional Water Quality Control Board, Central Coast Region, August 31, 1994.

B. Monitoring of Receiving Waters

1. Ecological Studies at Diablo Canyon

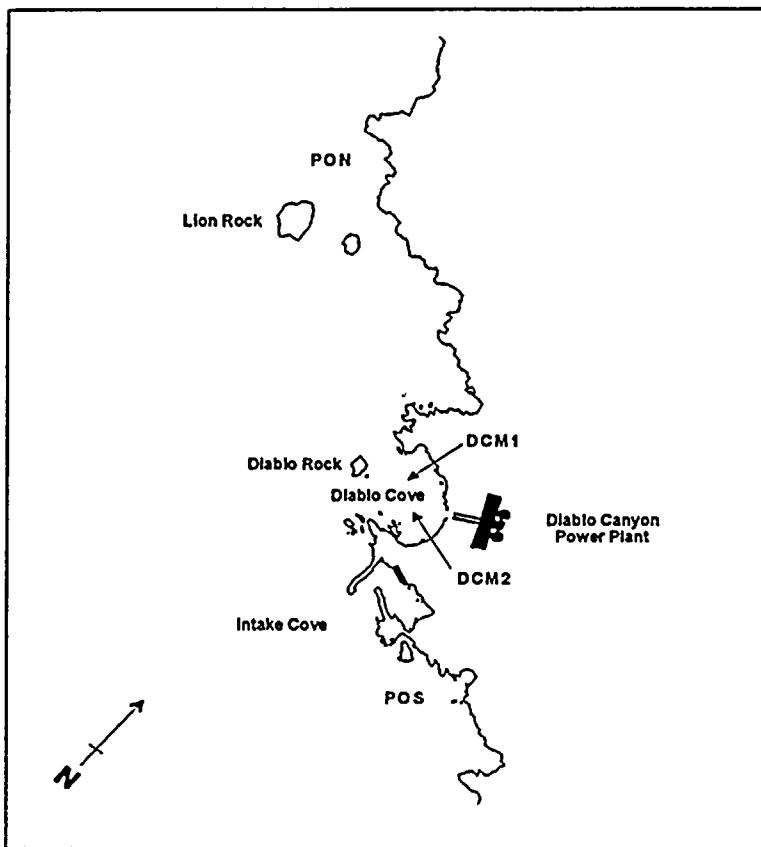

Ecological studies in the vicinity of Diablo Cove conducted during the first quarter, referred to as the Diablo Canyon Thermal Effects Monitoring Program (TEMP), are summarized in the following table.

<u>Subtask</u>	<u>Month Completed</u>
Intertidal Algal Scrapes	August
Intertidal Horizontal Bands	August
Intertidal Vertical Bands	July
Intertidal Black Abalone	July
Subtidal Benthic Stations	August

Subtidal Fish Observations	September
Subtidal Red Abalone Surveys	August
Temperature Monitoring	September

2. Annual Sediment Analysis

Sediment samples were collected on September 7, 1994, at four stations in the vicinity of Diablo Canyon Power Plant (Figure-1).

Locations of NPDES Sediment Sampling Locations
Figure 1

Sediment was collected from the top 5 centimeters of substrate. Samples were stored at 2-4 degrees Celsius and delivered to the analytical laboratory within 24 hours. Metal concentrations were determined using a weak acid leach on the fine-sieved fraction of the sample, as outlined in Monitoring and Reporting Program Order # 90-09. Sediment metals analysis results for 1994 are included in Appendix 7. Metal concentrations in Diablo Cove stations were similar to the concentrations found at control stations north and south of the plant.

Sediment grain size analysis results for 1994 are included in Appendix 8. The particle grain size analyses show that the percentage of fines (<0.1mm

particle size) was less than 10 percent in all samples. The percentage results ranged from a low of 2 percent to a high of 9 percent.

3. Stratified Water Temperature

Stratified water temperature measurements are conducted in February, June, and October. Results are reported in the first, second, and fourth quarter reports.

4. Dissolved Oxygen and pH of Receiving Waters

Dissolved oxygen and pH measurements are conducted in February, June, and October. Results are reported in the first, second, and fourth quarter reports.

5. In Situ Bioassay

Results of the Mussel Watch Program will be reported to the CRWQCB directly from the California Department of Fish and Game in their periodic report for this program.

C. Acti-Brom Treatment Program

DCPP is continuing the use of the proprietary chemical Acti-Brom to control the growth of macrofouling organisms in the main circulating water conduits. DCPP Unit 2 concluded its sixth fuel cycle on September 24, 1994. Unit 2 has been operating since the beginning of May 1993, approximately 500 days. From May 1993 until December 1993, seawater conduit 2-1 was treated with Acti-Brom. During this time conduit 2-2 was not treated. In December 1993, the untreated 2-2 conduit had fouled to the point where manual cleaning of the conduit was necessary. Following the cleaning, Acti-Brom treatment was, as scheduled, switched from the 2-1 conduit to the recently cleaned 2-2 conduit. The now untreated 2-1 conduit remained in operation until it too required cleaning in March 1994. After being cleaned, the 2-1 conduit was returned to service and remained in operation without treatment through the remainder of the fuel cycle. Both conduits were cleaned at the end of September 1994 as part of the normally scheduled refueling outage maintenance activities.

Alternating Acti-Brom treatments between the 2-1 and 2-2 conduits during the latest fuel cycle resulted in a reduction in the number of required mid-cycle cleanings from two per conduit to one. The total amount of macrofouling debris removed from both conduits during the sixth fuel cycle (including the Unit 2 sixth refueling outage cleanings) was approximately 90 tons. In comparison, during the Unit 2 fifth fuel cycle (no Acti-Brom treatment), a combined total of 254 tons of macrofouling debris was cleaned from the Unit 2 conduits. A similar alternating treatment schedule is currently being used on the two Unit 1 conduits.

APPENDIX 1
DIABLO CANYON POWER PLANT

NPDES DISCHARGE POINTS	
DISCHARGE NUMBER	DESCRIPTION
001	Once-Though Cooling Water
001 A	Firewater Systems
001 B	Auxiliary Salt Water Cooling System
001 C	Discharge Deleted
001 D	Liquid Radioactive Waste Treatment System
001 E	Service Cooling Water System
001 F	Turbine Building Sump
001 G	Make-Up Water System Waste Effluent
001 H	Condensate Demineralizer Regenerant
001 I	Seawater Evaporator Blowdown
001 J	Condensate Pumps Discharge Header Overboard
001 K	Condenser Tube Sheet Leak Detection Dump Tank Overboard
001 L	Steam Generator Blowdown
001 M	Wastewater Holding and Treatment System
001 N	Sanitary Wastewater Treatment System
001 P	Seawater Reverse Osmosis System Blowdown
002	Intake Structure Building Floor Drains
003	Intake Screen Wash
004	Biolab and Storm Water Runoff
005, 008, 009, 013, 014, 015	Yard Storm Drains
006, 007, 010, 011, 012	Storm Water Runoff
016	Biolab Seawater Supply Pump Valve Drain
017	Seawater Reverse Osmosis System Blowdown Drain

NOTE: Individual sample results for TRC are adjusted by one of the following formulas to account for dilution by the unchlorinated Circulating Water Pumps. It is assumed that no chlorine demand exists in the sea water:

1. Samples drawn at Discharge Structure =

$$(\text{ppb TRC}) \times ((\# \text{ of operating CWP}s \text{ on chlorinated Unit}) / (\# \text{ of operating CWP}s \text{ for both Units}))$$

2. Samples drawn at Condenser Waterbox Inlet =

$$((\text{ppb TRC}) / (\# \text{ of operating CWP}s \text{ for both Units}))$$

The daily average TRC value reported on the Q2 form is the average of the adjusted TRC results for the day. Some values reported are lower than the 20 ppb instrument MDL as they are adjusted to account for the flowrates of the operating CWPs.

CWPs 1-2 and 2-2 are treated using 20 minute injections. The limit for a 20 minute injection is 89 ppb TRC.

CWP 1-2 and 2-1 are treated using 30 minute injections. The limit for a 30 minute injection is 75 ppb TRC.

5. "	"	"	"	"	-----	-----

NOTES:

- Analysis results above the monthly average shall be reported verbally within 8 hours to a PG&E contact listed above.
- Oil & Grease and Suspended Solids samples are composites during 1 discharge cycle.
- If ECO diagnostic analysis results indicate that the system effluent exceeds the listed limits, increase the frequency at which samples are collected and submitted to contract laboratory.

COMMENTS: July 7th, 1994 #1 O+G sample broke in Camarillo. Notify

John Knemeyer. July 21st #2 O+G sample contaminated in Camarillo. Left message with John Knemeyer 8-3-94

Page: 1

NOTE: Individual sample results for TRC are adjusted by one of the following formulas to account for dilution by the unchlorinated Circulating Water Pumps. It is assumed that no chlorine demand exists in the sea water:

1. Samples drawn at Discharge Structure =

(ppb TRC) x ((# of operating CWP's on chlorinated Unit)/(# of operating CWP's for both Units))

2. Samples drawn at Condenser Waterbox Inlet =

((ppb TRC)/(# of operating CWP's for both Units))

The daily average TRC value reported on the Q2 form is the average of the adjusted TRC results for the day. Some values reported are lower than the 20 ppb instrument MDL as they are adjusted to account for the flowrates of the operating CWP's.

CWP's 1-2 and 2-2 are treated using 20 minute injections. The limit for a 20 minute injection is 89 ppb TRC.

CWP's 1-2 and 2-1 are treated using 30 minute injections. The limit for a 30 minute injection is 75 ppb TRC.

NOTE: Individual sample results for TRC are adjusted by one of the following formulas to account for dilution by the unchlorinated Circulating Water Pumps. It is assumed that no chlorine demand exists in the sea water:

1. Samples drawn at Discharge Structure =

$$(\text{ppb TRC}) \times ((\# \text{ of operating CWP}s \text{ on chlorinated Unit}) / (\# \text{ of operating CWP}s \text{ for both Units}))$$

2. Samples drawn at Condenser Waterbox Inlet =

$$((\text{ppb TRC}) / (\# \text{ of operating CWP}s \text{ for both Units}))$$

The daily average TRC value reported on the Q2 form is the average of the adjusted TRC results for the day. Some values reported are lower than the 20 ppb instrument MDL as they are adjusted to account for the flowrates of the operating CWPs.

CWPs 1-2 and 2-2 are treated using 20 minute injections. The limit for a 20 minute injection is 89 ppb TRC.

CWP 1-2 and 2-1 are treated using 30 minute injections. The limit for a 30 minute injection is 75 ppb TRC.

LABORATORY TEST REPORT

SUBJECT: ACUTE TOXICITY ASSESSMENT OF DISCHARGE WATER FROM
DIABLO CANYON POWER PLANT, THIRD QUARTER OF 1994

Introduction:

One acute toxicity bioassay was conducted at the Nuclear Regulatory Services Diablo Canyon Biological Laboratory on water sampled on July 11, 1994, from Diablo Canyon Power Plant's discharge 001. This bioassay satisfies this quarter's requirement for acute toxicity testing in Diablo Canyon Power Plant's NPDES Permit.

Methods:

The bioassay was a standard 96-hour static acute toxicity test conducted using the guidelines in Kopperdahl (1976) and EPA (1985). The dilutions tested were 100 percent effluent and a dilution water control. Juvenile red abalone (*Haliotis rufescens*) were used as the test species.

Results:

The bioassay (DCPP-211) was begun within twenty-four hours of sample collection. All measured chemical and physical parameters fell within accepted limits. The data sheet is attached. Toxicity was 0 (no mortality occurred during the test).

SUMMARY OF RESULTS

Assav No.	Date Sampled	Location	Toxicity (TUC)
DCPP-211	July 11, 1994	Discharge 001	0 (no mortality)

Avila Beach, California 93424

LABORATORY TEST REPORT

SUBJECT: CHRONIC TOXICITY ASSESSMENT OF DISCHARGE WATER FROM
DIABLO CANYON POWER PLANT, THIRD QUARTER OF 1994

Introduction:

One chronic toxicity bioassay was conducted at the Nuclear Regulatory Services Diablo Canyon Biological Laboratory on water sampled July 12-13, 1994, from Diablo Canyon Power Plant's discharge 001. This bioassay satisfies this quarter's requirement for chronic toxicity testing in the 1990 California Ocean Plan.

Methods:

The bioassay was a 48 hour chronic toxicity test conducted using a state approved protocol developed by the Water Resources Control Board. Larval red abalone (*Haliotis rufescens*) were used as the test organism. The bioassay (DCPP-212) was begun within thirty-six hours of sample collection.

Results:

The highest concentration that was not significantly different from the Control was the 56% concentration (No Observed Effect Level (NOEL) = 56%). Toxicity (TUC) = 100/NOEL = 1.79. The calculated effluent concentration limit from Chapter IV, Section A of the 1990 Ocean Plan is 5.11. Since the measured toxicity (1.79) is below this limit, DCPP is in compliance with the 1990 California Ocean Plan. The data were analyzed using ANOVA with Dunnet's Test. The effluent test and the reference toxicant test met all acceptance criteria. Data sheets and statistical results are attached.

SUMMARY OF RESULTS

<u>Test Solution</u>	<u>Assay No.</u>	<u>Date Sampled</u>	<u>Toxicity (TUC)</u>
Discharge 001	DCPP-212	July 12-13, 1994	1.79 (NOEL = 56%)
Reference Toxicant	NA	July 13, 1994	5.56 (NOEL = 18ug/l)

ABALONE SPAWN AND FERTILIZATION WORKSHEET

Red Abalone Chronic Bioassay
Diablo Canyon Biological Laboratory

Test Start Date/Time : July 13, 1994 @ 13:09 Bioassay Number(s) : DCPP - 212

Test Finish Date/Time : July 15, 1994 @ 13:09 Effluent Source (s) : Diablo Canyon PP Discharge

Test Organism : Haliotis rufescens Collection Date/Time : July 12 - 13 . 1994 @ 08:10

	<u>Males Used</u>	<u>Gonad Index</u>	<u>Date Last Used</u>		<u>Females Used</u>	<u>Gonad Index</u>	<u>Date Last Used</u>

Method of spawning : (X) Peroxide () UV irradiated seawater () Other

Beginning of spawning treatment : 07:52 Peroxide Solution Flushed From Spawning Tanks :

First male spawns : 09:55 Males: 09:55 Females: 10:22

First female spawns : 10:50 Comments:

Multiple spawners : Male : 10:05 Female : 10:55

Condition of spawn : Males : () light (X) moderate () heavy : Females : (X) light () moderate () heavy

Sperm added to egg container : 11:54 Time fertilization complete : 12:12

Condense the fertilized eggs into a beaker and determine the density. Counts of 1 ml samples :

1: 232 2: 238 3: 222 4: 208 5: 221

Mean : 224 STD : _____

Add 1000 embryos to each test container :

Pipette the volume calculated below from the well-mixed beaker sampled above.

(1000 embryos/test container) / (224 #embryos/ml) = 4.46 ml/test container

Temperature of embryos : 15.2 Celsius Temperature of test containers : 15.5 Celsius

Time all containers in incubator : 13:09

Comments : To insure adequate spawn success, 6 additional Male, and 6 additional Female abalone.

Gonad Index 3 - 4, will be used in the Hydrogen Peroxide spawn induction procedure. Injected 4.0mls embryos into test containers (maximum amt. according to procedure)
