DATE: MAR 7 1974

LICENSEE: Niagara Mohawk Power Corporation

FACILITY: Nine Mile Point Unit 1

SUMMARY OF MEETING WITH NIAGARA MOHAWK REGARDING QA PROGRAM AND RELOAD FUEL

A two-part meeting was held on February 26, 1974, in Bethesda, Maryland, with representatives of Niagara Mohawk Power Corporation. The first part (during the a.m.) was to discuss the extent and character of additional information on the QA Program that is required for our review and the second part (p.m.) was to inform Niagara Mohawk of recent information made available to us by GE regarding flow blockage of a 7 x 7 fuel bundle during spray tests.

A list of attendees is enclosed.

The significant points of each part of the meeting are summarized below:

QA Program

The present description of the NMP-1 QA Program for Operations was submitted by Niagara Mohawk by letter dated November 16, 1973, in response to our request which was in the form of questions and comments. An initial meeting on December 19, 1973, pointed out that this descriptive information was too brief for us to determine the adequacy of the NMP-1 QA Program for Operations. Additional draft information was provided by Niagara Mohawk. This information was the subject of the present meeting discussions.

The deficiency in the information has not been resolved by the additional draft information and it appears that the question and answer approach is not likely to provide the required information. Therefore, the meeting concluded in an agreement that Niagara Mohawk would submit a complete description of their QA Program for Operations at NMP-1. This description is to show conformance with the requirements of Appendix B of 10 CFR Part 50 and use the various appropriate publications and the meeting discussion points for guidance in its preparation.

MEMO *Rg*

MAR 7 1974

The schedule for submittal of the QA Program description was discussed and Niagara Mohawk indicated they would try to meet an April 1, 1974 date. It was agreed that every effort would be made to avoid delaying the full-term license review schedule. Such a delay would result from a later submittal data and Niagara Mohawk indicated they would inform us regarding any delays after appropriate review within their organization.

Reload Fuel

This part of the meeting was to inform the Niagara Mohawk representatives about recent information contained in the draft topical report provided on February 14, 1974, and referenced in the NMP-1 letter of February 19, 1974, and discussed with General Electric representatives on February 21, 1974. This report contains additional information regarding the effects of simulated clad swelling on a 7 x 7 fuel bundle during core spray tests. At the present time the impact of this information on NMP-1 is to be determined. Another meeting with GE is scheduled for early in March 1974 to define the applicability of these data to the current calculations of ECCS performance following a LOCA.

NMP-1 is presently scheduled to shut down about March 15, 1974, for refueling with 8 x 8 fuel bundles. The evaluation of this recent information is not complete and pending completion it is not yet clear what the effect will be on the proposed NMP-1 refueling with 8 x 8 fuel.
