**Re: Quarterly Report for 4th Quarter 2016 for the Lost Creek ISR Project
Permit #788 (BLM WYW-166318)**

Dear Mr. Wood,

This Quarterly Report for the 4th calendar quarter of 2016 for the Lost Creek ISR Project has been submitted pursuant to Wyoming Department of Environmental Quality - Land Quality Division (LQD) Rules and Regulations Chapter 11 Section 15(b) to provide a summary of:

- *Mechanical Integrity Testing (Ch11 Sect 15(b)(ii)).*
- *Wellfield Monitoring and Water Quality (Ch11 Sect 14).*

Mechanical Integrity Testing

A total of 32 Mechanical Integrity Tests (MIT) were performed on a total of 32 wells in accordance with the approved Permit Operations Plan Section 3.4. Results are summarized on **Attachment 1**. The MITs resulted in 30 successful tests with 2 failures. Most of the MITs for the quarter were performed in conjunction with MO-108 excursion (NRC parameters) investigation. The two failed wells, 11181 and 11284, were not abandoned but recompleted by cementing up to the FG horizon to seal off communication from the HJ and to provide monitoring of the FG to aid in MO-108 excursion monitoring.

Wellfield Monitoring

Wellfield injection and production in Mine Unit 1 (MU1) continued throughout the quarter with thirteen (13) header houses in operation as of the end of the quarter. Lixiviant was generated by the addition of carbon dioxide (CO₂), and oxygen (O₂) to the injection stream.

The injection rates and pressures for each header house manifold are provided on **Attachment 2**. Additionally, production flow (PC), injection flow (IC), bleed values, and number of wells injecting are also represented. The bleed rate percentage is calculated by dividing the bleed rate by the production rate and multiplying by 100. Main bleed is diverted in a metered line directly from the injection circuit line. Additional bleed is determined by accounting for the swab water

generated from the wellfield and converting the volume to a flow rate equivalent. Bleed water is either recycled for secondary Plant process use prior to waste water disposal or is sent directly to the waste water stream. Waste water is disposed of by approved means.

Groundwater level data collected from Mine Unit 1 (MU1) and regional monitoring wells is included in **Attachment 3**. Water levels for MU1 were measured semi-monthly in conjunction with routine excursion groundwater sampling for the ring, overlying, and underlying monitor wells. Quarterly water levels were collected from regional wells (“LC” and “MB” wells). The wells experienced typical fluctuation in water levels for “MO” and “MU” wells and no significant changes in levels occurred. A more pronounced drawdown occurred in MO-108 due to corrective actions in response to an excursion (NRC parameters). Fluctuations are typical for the “M” wells but more pronounced since they are more directly affected by water balance in the wellfield.

Data results from routine groundwater quality monitoring analysis and associated quality control (QC) is included as **Attachment 4**. Excursion monitoring parameters include alkalinity, chloride, and specific conductance for which associated Upper Control Limits (UCLs) have been established by well group (i.e. ring, overlying, and underlying wells). As described in the Permit Operations Plan Section 3.6.4, an excursion may be indicated by any one analytical parameter result exceeding the associated UCL by 20% or more or by two or three results exceeding the respective UCL. The MU1 monitor wells were sampled routinely which includes 28 monitor ring wells, 26 mine unit wells (13 overlying and 13 underlying), and 2 regional DE horizon wells (within MU1). Sampling for operational monitoring was conducted in MU1 on a semi-monthly basis with each event at least 10 days apart. The table displays the analytical result, the applicable UCL value, and the percent difference. A negative percent difference indicates the analytical value is less than the UCL. The percent difference (or percent change) is determined by the following formula:

$$\% \text{ Difference} = \frac{\text{Result} - \text{UCL}}{\text{UCL}} \times 100$$

Monitoring for MO-108 was increased to weekly due to the excursion condition under NRC parameters.

The following analytical results exceeded the associated UCL during the quarter:

- Chloride results for MO-108 exceeded the UCL but by less than 20% on the following occasions: 10/25/2016, 11/1/2016, 11/8/2016, 11/15/2016, and 11/22/2016.
- Chloride values for MO-108 exceeded the UCL by more than 20% on 12/5/2016 but was not considered an excursion under the LQD parameters since the subsequent chloride values did not exceed the UCL.

Samples for routine UCL monitoring and weekly MO-108 monitoring in December were sent to Energy Laboratories due to the LC lab equipment being out of service for maintenance.

Samples were not collected from the regional DE horizon wells LC29M and MB-10 due to lack of water in the wells.

If you have any questions regarding this submittal please feel free to contact me at the Casper Office.

Sincerely,

Michael D. Gaither
Manager EHS and Regulatory Affairs
Ur-Energy USA, Inc.

* Manifold pressure is not indicative of actual well pressures. Flows to wells are throttled on an individual basis at each stub to keep injection pressure below the rated fracture pressure for the well.
gpm: gallons per minute
psi: pounds per square inch

* Manifold pressure is not indicative of actual well pressures. Flows to wells are throttled on an individual basis at each stub to keep injection pressure below the rated pressure for the well.
gpm: gallons per minute
psi: pounds per square inch
