RE: Docket No. 50-220
LER 80-12

Dear Mr. Grier:

Attached is Licensee Event Report 80-12, submitted in accordance with Technical Specification Paragraph 6.9.2, Part b(1). The incident reported constituted exceeding the limiting Safety System Setting given in Station Technical Specification 2.1.2.j, Specification for generator load rejection-scrum and is described in detail in the attached report.

This variation upon its original occurrence on dates 12/1/79 and 4/19/80 as written in NMPC Occurrence Reports 79-52 and 80-23 was not interpreted as being a reportable item because of its conservative setting in comparison to Technical Specification Requirements. Upon further analysis, it was discovered that this set point variance should be reported because it was in fact at a Technical Specification limit.

This has been investigated by the Site Operations Review Committee and corrective action was initiated as stated. Any additional information is available at your request. This report was completed in the format designated in NUREG-0161, dated July 1977.

Very truly yours,

Original signed by T. E. Lempges

Thomas E. Lempges
