UNITED STATES
NUCLEAR REGULATORY COMMISSION
REGION I
475 ALLENDALE ROAD
KING OF PRUSSIA, PENNSYLVANIA 19406

September 27, 1991

MEMORANDUM FOR: Martin J. McCormick, Plant Manager, Nine Mile Point Unit 2
FROM: Wayne L. Schmidt, Senior Resident Inspector, Nine Mile Point
SUBJECT: Review of IIT Interview Transcripts

The IIT has sent the transcripts of interviews conducted with the personnel listed below to the resident inspector's office. If any of the listed individuals wish to review the transcripts they should do so at the resident inspector's office by October 4, 1991. Guidelines for the review of transcripts are provided in the enclosure. If an individual does not review his transcript by that date we will assume that he did not wish to do so and that the statement is correct to the best of his knowledge.

~~Alan DeGarcia, Steve Doty, Dave Barrett, Jerry Helker, Jim Burr, Bob Crandall, Robert Brown, Ann Julka, Perry Bertsch, James Spadafore, Joe Savoca, Mike Colomb, James Kinsley, Marty McCormick, Chris Kolod, Irineo Ferrer, Fred Gerardine, Anthony Petrelli, Jim Reid, Fred White, Rick Slade, Bruce Hennigan, and Tom Tomlinson.~~

Thank you for your help. If there are any questions please contact me.

Interview of :
ROBERT BROWN :
(Closed) :

Conference Room B
Administration Building
Nine Mile Point Nuclear
Power Plant, Unit Two
Lake Road
Scriba, New York 13093
Thursday, August 22, 1991

The interview commenced, pursuant to notice,
at 9:25 a.m.

PRESENT FOR THE IIT:
Michael Jordan, NRC.
Rich Conte, NRC

P R O C E E D I N G S

[9:25 a.m.]

1
2
3 MR. JORDAN: It's August 22nd, 1991 at
4 approximately 9:25 a.m. We are at the Nine Mile Point Unit
5 Two in the P Building. We are conducting interviews
6 concerning a transient that occurred on August 13th, 1991,
7 and my name is Michael Jordan. I am with the NRC. I am out
8 of Region III.

9 MR. CONTE: I am Rich Conte, Region I.

10 MR. BROWN: Bob Brown. I work with general
11 physics for Niagara Mohawk training.

12 MR. JORDAN: Okay, Bob. Why don't you just give
13 us a general background on what your experience is?

14 MR. BROWN: I have been at Niagara Mohawk training
15 since 1983. I've been certified on Unit One and Unit Two
16 plants. I have taught initial operator training at Nine Mile
17 Point One and Two. I became a requal instructor in 1989 and
18 I have been either instructing in or administrating the
19 requal program since 1989 at Nine Mile Unit Two.

20 MR. CONTE: Okay. The event that happened on
21 August 13th, any involvement you had? Did they call you in?
22 Did they ask for any help as far as your involvement with
23 the event?

24 MR. BROWN: The only involvement I had directly
25 was at the time we were looking for training material that

1 may be of interest on the training the operators had, and I
2 was involved in getting training material and training
3 records to make available.

4 MR. CONTE: This was subsequent? After the event?

5 MR. BROWN: This was -- well, it was during the
6 event but it really wasn't related to the event. It was
7 more of a request from Niagara Mohawk people to get
8 information available for whatever sort of investigation or
9 inquiries might be made.

10 MR. CONTE: Is that training available or was it
11 sent to the assessment group and one of the sub-leaders in
12 the assessment group?

13 MR. BROWN: I turned it over to the requal program
14 coordinator and I don't know who he turned it over to, where
15 it went, but it was just a collection of the electrical
16 system lesson plans and objectives that we trained to.

17 MR. CONTE: The electrical system lesson plans and
18 what?

19 MR. BROWN: And objectives, training objectives.

20 MR. CONTE: Let me understand your position here
21 again. You are with general physics?

22 MR. BROWN: Yes.

23 MR. CONTE: You are overseeing the requal -- you
24 are a supervisor for requal?

25 MR. BROWN: No. I was a supervisor for requal

1 until early this year, February of this year, when --
2 because I am a contractor they replaced me with one of their
3 own people, but I am still an instructor in the requal
4 program.

5 MR. CONTE: Who oversees the Unit Two requal for
6 the Niagara Mohawk?

7 MR. BROWN: The guy's name is Jim Reid.

8 MR. CONTE: Jim what?

9 MR. BROWN: Jim Reid.

10 MR. CONTE: Jim Reid?

11 MR. BROWN: Uh-huh:

12 MR. CONTE: And who does he report to?

13 MR. BROWN: Rick Slade.

14 MR. CONTE: Who?

15 MR. BROWN: Rick Slade.

16 MR. CONTE: Rick Slade. Okay. You want me to
17 take the lead and ask question?

18 MR. JORDAN: Yes.

19 MR. CONTE: Some of the notes are cryptic.

20 Have you had any involvement in the non-licensed
21 operator training program?

22 MR. BROWN: Not in three or four years. I used to
23 do lectures in the non-licensed operator training program as
24 we moved around but I haven't been directly involved in
25 instructing them since probably '87.

1 MR. CONTE: So right now your function in the
2 company is mostly with the licensed operators?

3 MR. BROWN: Licensed operators, yes.

4 MR. CONTE: Okay. I guess besides the electrical
5 distribution the two other major topics or part of
6 electrical distribution is the UPS power supply safety and
7 non-safety and also the control room panels and
8 annunciators.

9 Do you have any familiarity with the job task
10 analysis for the licensed operators and would you, if you
11 do, would you know that it addresses the UPS power supplies,
12 control room annunciators?

13 Does it get that detailed from a job task analysis
14 point of view?

15 MR. BROWN: I am not that sure what the tasks are.
16 I know that we developed prior to the job task analysis
17 training on UPS power supplies, developed objectives prior
18 to -- or from the task analysis, so there are training
19 objectives on UPS's and there is training along with
20 industry event training on UPS's. It's done in the equal
21 program.

22 MR. CONTE: Do you know if the UPS training
23 addresses both safety and non-safety power supplies?

24 MR. BROWN: Yes. It goes through all the types
25 that we have and how they function.

1 MR. CONTE: Would you know if there is any
2 difference between the lesson plans for auxiliary operators
3 versus licensed operators dealing with UPS?

4 MR. BROWN: There is -- no. They use the same one
5 for UPS's but the non-licensed people when they get trained
6 generally walk through the plant and go through around to
7 all the UPS's. When the licensed operators did it, it was
8 all classroom training. It is essentially the same
9 information with different objectives.

10 MR. CONTE: So you would characterize the
11 auxiliary operator training on UPS as more hands on and the
12 licensed operators, more classroom?

13 MR. BROWN: Yes.

14 MR. CONTE: Okay. Jump in at any time you think
15 of a question, Mike.

16 MR. JORDAN: Yes, I will.

17 MR. CONTE: Let's see. How would -- talking about
18 the systems, I guess we would be interested in getting a
19 copy of the job task analysis dealing with the UPS and/or
20 electrical distribution.

21 MR. JORDAN: Also the training plan for both the
22 non-licensed and licensed operators.

23 MR. BROWN: Remember, I told you earlier about the
24 lesson plans that we gathered. That was one of the ones that
25 was in that group, so I don't know if we can make another

1 copy of it. I got a guy coming over here at eleven o'clock.
2 I can send it over with him.

3 MR. CONTE: Okay.

4 MR. JORDAN: Okay.

5 MR. CONTE: I'll give you a chance to write there.
6 Does the job task analysis address the control room panels
7 and the annunciators and what is expected in that area? Do
8 you have any familiarity with that?

9 MR. BROWN: When you say the job task analysis,
10 generally what we have is the task will be something that an
11 operator has to do and from that you will break it down into
12 objectives that will be certain knowledges that he'll have
13 to gain, and that is more -- the job task analysis takes you
14 down to a task that says be able to identify a loss of or be
15 able to identify a situation and from that you have to train
16 him, okay, you're going to have to know what annunciators
17 there are, what meters there are, various things like that.

18 The job task analysis won't really get you to that
19 bottom line. It will just get you to the task that says he
20 has to be able to deal with the loss of power, deal with
21 the loss of pump, whatever it happens to be.

22 MR. CONTE: How is that covered? Is that covered
23 from a system job task analysis of control room panels or is
24 that kind of in the area of emergency and abnormal response?

25 MR. BROWN: The answer to that is yes.

1 MR. CONTE: All of the above?

2 MR. BROWN: Yes. The tasks basically are broken
3 down by system and then there is a section that is broken
4 down by emergency tasks: you must be able to respond to an
5 accident or transient and where it's best fit when you do
6 that training.

7 MR. CONTE: Okay. While we are on the control room
8 panels and annunciators, there is a specific question about
9 how do you train AO's and/or licensed operators in reading
10 recorders? There's two scales on the recorder, the scale
11 associated with the instrument and then there is a scale
12 that associated with the chart paper. Is there a policy and
13 is that policy promulgated in training on how to read either
14 recorder or chart paper?

15 MR. BROWN: They read the recorder.

16 MR. CONTE: They are supposed to read the
17 recorder?

18 MR. BROWN: Yes.

19 MR. CONTE: Okay, and do you know if that is the
20 most accurate from a calibration point of view or why not
21 review the strip chart?

22 MR. BROWN: Well, when you say review the strip
23 chart, now the strip chart is a permanent record you can go
24 back and read but if you are doing a look and see what this
25 reads rather than trying to interpret the strip chart, you

1 just read the recorder, so from a standpoint of trying to
2 operate a plant it is like reading a meter versus trying to
3 figure out what a piece of paper or a chart's doing.

4 If you are looking for a trend you would read the
5 chart but if you are looking for a value, you read the
6 recorder.

7 As far as which one is more accurate, I couldn't
8 tell you.

9 MR. CONTE: The next one here I think is covered
10 on the lesson plans we talked about. We can get copies of
11 that.

12 Any job performance measures that the you are
13 aware of right now that are already established that would
14 say be precursors to a loss of annunciator event such as
15 this, or loss of UPS's and getting them back on the line?

16 MR. BROWN: We have a job performance measure on
17 how to transfer UPS.

18 MR. CONTE: Transfer?

19 MR. BROWN: A UPS from normal, I believe it is
20 from normal to alternate. You have got to go transfer it as
21 a normal evolution and it takes them through doing that.

22 MR. CONTE: Normal to alternate meaning the AC
23 source to the DC source?

24 MR. BROWN: No. I'm sorry -- normal to
25 maintenance.

1 MR. CONTE: Normal to the maintenance.

2 MR. JORDAN: There is a task. Is that part of a
3 task analysis on the measure or is it just the measure?

4 MR. BROWN: There is a measure on that. There is
5 a measure on that.

6 I am not familiar with any more on loss of
7 annunciators. I know there are some that are on loss of
8 power panels, loss of switchgear and how to respond.

9 MR. JORDAN: Let me make sure I understand
10 something on the job performance measures. So, if there's a
11 job performance measure that means there's a task associated
12 with someplace along the line. And that task then has in
13 it, what do you call them --

14 MR. BROWN: Well, if you take a task, you say this
15 is a -- a task is something you have to be able to do. Now,
16 to do that you have to have knowledge and you have to have
17 ability. So, there are knowledges that you teach them and
18 there are abilities that you must -- they learn to
19 demonstrate and what you're checking with the job
20 performance measures that they have both, they can do this
21 task.

22 MR. JORDAN: So that the transfer from maintenance
23 to transfer is that for safety as well as non-safety
24 related?

25 MR. BROWN: The one that we have is on a safety

1 related.

2 MR. JORDAN: For safety related? And we don't --
3 you don't know if there is one for non-safety related or do
4 you know?

5 MR. BROWN: I'm pretty sure that there's not one
6 for non-safety related.

7 MR. JORDAN: Not one for non-safety related?

8 MR. BROWN: Right.

9 MR. CONTE: How about simulator scenarios, what
10 has been done recently, I would say in the last two years in
11 the area of loss of UPS's or loss of annunciators?

12 MR. BROWN: I don't know that we could nail those
13 two areas down to say we trained in that area. We noted a
14 weakness in their response to loss of electrical power --
15 loss of different power panels and the ability to recognize
16 probably back in the early part of 1990 and we changed a lot
17 of scenarios to add that in as an area to concentrate on.
18 We didn't really approach it with the idea of a loss of UPS
19 and the loss of annunciators. It was more of a -- problems
20 with recognition and distribution losses and so we worked
21 on that a lot to strengthen that. And there's a number of
22 scenarios now that have losses of power incorporated in
23 them.

24 MR. CONTE: How did you identify that weakness?

25 MR. BROWN: Through evaluations.

1 MR. CONTE: On the requal training?

2 MR. BROWN: Yeah. During requal training
3 evaluations.

4 MR. CONTE: Any NRC involvement in the
5 identification of that weakness?

6 MR. BROWN: None that I recall. There was some
7 problems at the plant, also some knowledge problems, some
8 operators mentioning that they didn't feel they've been --
9 they needed more training in this, they needed more training
10 in that and I believe there was an LER or a release and
11 event on a loss of power due to a recognition problem. And
12 then it was also noted, I went back and looked, and yeah,
13 there were problems in training too where there was
14 recognition, so we went after that area.

15 MR. JORDAN: But, no specific training on
16 annunciators -- loss of annunciators?

17 MR. BROWN: Not that I recall. I don't ever
18 remember that being a -- loss of annunciator as the topic.

19 MR. CONTE: How about drilling them on loss of
20 radiation monitors such as JEMs, loss of JEMs, loss of area
21 radiation monitors things like that? Any training on that?

22 MR. BROWN: You mean loss of them, there is no
23 power there anymore?

24 MR. CONTE: Yes.

25 MR. BROWN: So you have to come up with another

1 method? When you teach the system and then you go through
2 the abnormal or off-normal conditions that could occur and
3 what the backups are, so in that area nothing that we went
4 in and said, okay, this is something we have to concentrate
5 on, just we teach DRMS and ASRM, all those systems get
6 taught and when you teach them you go through the procedures
7 and the procedures for dealing with losses of or off-normals
8 for not having tech spec requirements and samples required
9 if normal systems aren't available and how they're obtained.

10 MR. CONTE: Okay.

11 MR. JORDAN: How about the training on loss of
12 control indication for control rod positions?

13 MR. BROWN: That's done --

14 MR. JORDAN: Is there alternate methods of -- are
15 they trained on alternate methods of acquiring that data?

16 MR. BROWN: Yeah. And there's also procedural
17 guidance in some of the OP's on -- mostly in the areas of
18 failures to scram and identifying how many rods are out and
19 loss of power to various indicators and what the backup
20 indicators would be for determining it.

21 MR. JORDAN: Are you familiar with the indication
22 that they lost the control room as a result of this
23 transient?

24 MR. BROWN: Not as familiar as I would like to be,
25 no.

1 MR. JORDAN: I'm sure you'll get familiar with it.
2 Okay. If they've lost their full core display and they've
3 lost the rod worth minimizer and they've lost their RSCS and
4 they've lost their full rod display, is there a remote
5 indication -- control room indication for rod positions have
6 been lost, are they trained or is there methods by which
7 they can obtain that information remote to the control room?

8 MR. BROWN: The other option is the process
9 computer, of course, and I believe that was gone too.

10 MR. JORDAN: That was gone too.

11 MR. BROWN: You can determine -- not specifically
12 rod position, no. But whether or not the reactor is shut
13 down by power level and other indications as far as rod
14 position. If you take away all of those, it gets real
15 difficult.

16 MR. JORDAN: So you don't know of any training on
17 -- if they've lost all of their control room indication for
18 rod positions, including the process computer, there is no
19 training that you know of on obtaining that information at
20 another location?

21 MR. BROWN: Boy, I can't think of anything right
22 off.

23 MR. JORDAN: Okay.

24 MR. CONTE: You did make a point that -- you said
25 that there's an EOP -- what is it EOP-6 contingency

1 procedure or a satellite procedure that tells you on an ATWS
2 that you can go into -- what, some panels and get voltage
3 readings on rod positions to find out rod positions?

4 MR. BROWN: Yeah, you can do that, I think, in the
5 back panel. You can go back and check it there.

6 MR. CONTE: I guess that dependent on whether you
7 have power or not?

8 MR. BROWN: Yeah. And I'm not familiar what power
9 they had or what they didn't, but the systems, the normal
10 systems for picking that stuff off are pretty much taken
11 away in this case.

12 MR. CONTE: And it is an EOP-6 procedure?

13 MR. JORDAN: There is an EOP-6 procedure not
14 dealing with the loss of indication but dealing with how to
15 verify rods that are in. And it goes through --

16 MR. CONTE: Okay. What's the process of training
17 on those EOP-6 procedures? I understand EOP-6 is the ones
18 that go out in the plant or go to the panels and do things
19 as contingencies.

20 MR. BROWN: Yeah.

21 MR. CONTE: Does every licensed operator have to
22 go through every one of those attachments in that
23 contingency?

24 MR. BROWN: They get trained on how to -- everyone
25 of them gets trained on the classroom; a walk-through step-

1 by-step and the reason for the steps. Then we do, either
2 through job performance measure or simulator scenario -- we
3 do training on them and then there's an evaluation,
4 although, there is nothing that rigidly says each operator
5 will be evaluated on each one of the job performance
6 measures.

7 The requal operators, we never did that. I
8 believe, and I would have to go back to prove this, but I
9 believe the licensed operators have to do every one of
10 those. Initial licensed operators are now in the process
11 of getting through the license class and obtaining a
12 license, it's one of the tasks they have to perform.

13 MR. JORDAN: Each of the attachments of the EOP-6?

14 MR. BROWN: Yeah. Well, it would be more as a --
15 there are tasks that they have to do and each one of those
16 is a task and they have to get someone to evaluate them
17 performing all of the tasks. So that would be in there.

18 MR. CONTE: How is that tracked, by qual card?

19 MR. BROWN: Yeah. Essentially it's a book of --
20 an OJT manual, they call it.

21 MR. CONTE: OJT manual?

22 MR. BROWN: Um hm.

23 MR. CONTE: Who oversees the initial program?

24 MR. BROWN: Fred White.

25 MR. CONTE: Fred White?

1 MR. BROWN: Yeah.

2 MR. CONTE: Okay.

3 MR. BROWN: Now, the guys who were licensed at
4 that time, we did the classroom training when EOP-6 first
5 came out. That came out in the fall of last year with the
6 Rev. 4 to the OP's. And we went back and taught them EOP-6,
7 all the attachments, and then we go through them in
8 simulator scenarios and job performance measures.

9 But, we never went back and said each one of you
10 has to perform each one of these tasks.

11 MR. CONTE: Okay. How about overall command and
12 control in emergencies? How is that trained? Obviously
13 the simulator scenarios get you that -- I assume there's
14 evaluations on command and control?

15 MR. BROWN: Every week we do simulator training
16 for at least -- it was a day of simulator training. It's
17 moved up to about a day and a half and then we do simulator
18 evaluation every week. Each one of the SROs gets his turn
19 at performing as the SSS. We do two scenarios a week. And
20 they rotate so that each one plays the roll of the SSS and
21 the ASSS in alternating scenarios. And that is one of the
22 categories in which they get graded and generally, although
23 not always, there is someone from operations -- management
24 who will be there observing the training, and if there's --

25 MR. CONTE: So each week the scenario training

1 where they've got to --

2 MR. BROWN: They have to perform --

3 MR. CONTE: -- perform command --

4 MR. BROWN: -- from anywhere starting out and some
5 normal condition in dealing with a few off-normal events up
6 to EOP entry and the direction of emergency.

7 MR. CONTE: Excuse me. You say it used to be a
8 day and it's a day and a half now?

9 MR. BROWN: Well, no. There's two different
10 things. There's training and there's evaluation. They have
11 always done two evaluation scenarios, but the amount of
12 training where we -- where you do the coaching as an
13 instructor -- in evaluation they just go from beginning to
14 end and whatever happens, happens.

15 In training, if things aren't going well you stop
16 and anywhere from coach up to discussion of events. So we
17 do that for about a day and a half now and then we go into
18 the evaluation mode. That's every Thursday.

19 MR. CONTE: Okay. The coaching is a day and a
20 half and the actual run and evaluation, don't let the
21 scenario stop, is what, a morning?

22 MR. BROWN: It's -- they do two scenarios of an
23 hour each. And then each one of those is followed by self
24 assessment.

25 MR. CONTE: Sounds like an NRC quality

1 examination.

2 MR. JORDAN: Yes.

3 MR. CONTE: Okay. Good. How about in the --

4 MR. JORDAN: Can I ask a question?

5 MR. CONTE: Yes, go ahead.

6 MR. JORDAN: Before we get too far, I have one
7 question back on EOP-6. The method that they get into EOP-
8 6, do the normal -- I don't want to say normal -- do the
9 other EOPs put you into EOP-6, or do you just have to know
10 that, if you're at this point in the EOPs, the EOP-6 would
11 assist you.

12 MR. BROWN: No. You have entry conditions into
13 the EOPs themselves, and then you're directed if you have to
14 do something. It will be something like, Go manually
15 override this valve, and it will tell you in EOPs, Do that
16 in accordance with EOP-6, attachment -- whatever the number
17 for the system.

18 MR. JORDAN: So they wouldn't get into EOP-6
19 unless they were directed to.

20 MR. BROWN: Unless they were in the EOPs.

21 MR. JORDAN: Does the EOP-6 address them to what
22 attachment to function off of?

23 MR. BROWN: Yes. All the guy has to do is read it
24 right out of the EOP. It'll say, In accordance with EOP-6,
25 attachment -- whatever the number is.

1 MR. JORDAN: So if there's an action or task
2 that's designed and it's in the EOPs, it will be directed to
3 it. Otherwise, you just stay in the normal EOPs.

4 MR. BROWN: Well, you're never leaving them.

5 MR. JORDAN: I understand that.

6 MR. BROWN: But, yes, you would be directed
7 directly to it.

8 MR. JORDAN: Okay. And if you're not, then
9 there's no assistance out of EOP that you can get by doing
10 that task. I'm just curious; what I'm looking for is the
11 rod position indications if --

12 MR. BROWN: Oh, in other words, I wouldn't use
13 that unless I was in EOPs; that's true, but in learning that
14 I'm going to learn what else I can do when I don't have my
15 normal -- Somewhere along there, then, as an operator, I
16 have to learn, Check this, check this, check this, and all
17 the various ways there are to check them.

18 MR. JORDAN: Thanks, Bob.

19 MR. CONTE: Excuse me. How much time do we have?
20 Do we have another interview at 10 in this room, or what?

21 MR. JORDAN: We have another interview at 11.

22 MR. CONTE: Who's coming in this room at 10
23 o'clock? Nobody?

24 MR. JORDAN: Nobody.

25 MR. CONTE: Okay. So we can continue beyond 10 --

1 hopefully not too far beyond 10.

2 Related back to the command-and-control issue, how
3 about training on 10 CFR 50.54(x) -- I should say 50.54(x)
4 for the record.

5 MR. BROWN: I know which one you mean.

6 MR. CONTE: This is emergency actions for
7 operators.

8 MR. BROWN: Yes.

9 MR. CONTE: Could you recount what basically is
10 given to the operators?

11 MR. BROWN: Well, as a matter of fact, we just did
12 that last cycle. We went through 10 CFR 50 and 10 CFR 55,
13 and in there we went through, in the classroom, 50.54(x) and
14 50.54(y), so it was classroom training, and then, in the
15 simulator, we go through mostly EOP training. If the
16 operator is aware that he's in a situation where he has to
17 invoke that, he'll say that.

18 MR. CONTE: Are you saying there's a requal lesson
19 planned on the 50.54(x)?

20 MR. BROWN: Stated in there? Yes.

21 MR. CONTE: And the last cycle, so there would be
22 a record for the midshift crew of having received this
23 training?

24 MR. BROWN: Yes.

25 MR. CONTE: I see.

1 What does the requal record reflect for an
2 individual? What do you keep track of?

3 MR. BROWN: Every lesson that he attends and the
4 time that he attends. They get credit for completing the
5 training. They get graded in the areas of evaluation; they
6 get graded on static exams, job performance measure, and
7 written exams. They do that every cycle, so once out of
8 every six weeks, if I'm an operator, I go through about two
9 days of classroom training, two days of simulator training,
10 simulator evaluation, written exam, static exam, and at
11 least two job-performance measures. All those things that
12 we're evaluating get grades, and everything else, they just
13 credit for completing the training. That's pretty much what
14 they do in a week.

15 MR. CONTE: Who would I see in the organization to
16 at least review the records for the midshift people that
17 were on watch at the time, requal?

18 MR. BROWN: You could see Jim Reid?

19 It's all computerized now, so you just call them
20 up by name, and you can look at all the training they've had
21 in the last two years.

22 MR. CONTE: No, problem? Good.

23 Let's talk about post-trip response of the plant
24 and what you expect of your operators. Could you run
25 through the sequence on what you teach your operators to do

1 on a normal, post-reactor scram, when lights come in
2 indicating a reactor scram?

3 MR. BROWN: Well, you have --

4 MR. CONTE: Annunciator lights come in indicating
5 reactor scram.

6 MR. BROWN: The shift supervisor is the man who
7 has the big-picture responsibility and is in charge of the
8 situation, so he's the step-back, touch-nothing, gather-
9 information, and direct. If there is an EOP entry or an
10 entry into that sort of procedure, then it's his
11 responsibility to enter it. The operators are trained. The
12 CSO has charge of the control room, unless there's an EOP
13 entry, in which case he becomes another operator to be used
14 by the SSS, with no function, as in command of anything. So
15 it's more that the operators in a normal sequence are
16 reporting to the CSO, who's reporting to the SSS. As soon
17 as they enter an emergency condition, the SSS is in charge,
18 and everyone reports to him.

19 The response would be that the person -- the E
20 operator, most likely -- at the 603 panel takes the
21 automatic actions for the scram at the 603 panel. There is
22 generally one other operator in the control room responsible
23 for the other actions: verifying turbine trip, verifying
24 electrical panel transfer, and verifying generally that the
25 response of the other systems is as expected. Each operator

1 reports back to the SSS what he finds or what he does.

2 MR. CONTE: Do you have those immediate actions
3 committed to memory?

4 MR. BROWN: Do I, personally?

5 MR. CONTE: Yes.

6 MR. BROWN: Boy, that would be a good test. I
7 used to.

8 MR. CONTE: Where do I find them?

9 MR. BROWN: You would find them on the panel in
10 the control room, underneath the plexiglass that the E
11 operator is standing up against.

12 MR. CONTE: They're listed there?

13 MR. BROWN: The page out of the procedure is kept
14 under the plexiglass there.

15 MR. CONTE: Which procedure is it?

16 MR. BROWN: It's OP-101(c), off-normal.

17 MR. CONTE: SOP-101 --

18 MR. BROWN: No, it's not an SOP. It's an N2OP-
19 101(c), in the off-normal section H.

20 MR. JORDAN: Is that the name of the procedure,
21 OP-101(c)?

22 MR. BROWN: Yes.

23 MR. JORDAN: Off-normal.

24 MR. BROWN: Got it.

25 MR. CONTE: And that list specifically says,

1 Immediate action in a reactor scram.

2 MR. BROWN: Yes. It has, Reactor scram immediate
3 actions, subsequent actions, the whole bit, and that section
4 is kept out on the panel. You've been in the control room.
5 You're familiar with the desk where they've got the section
6 for reduced flow operation? Under there they also keep the
7 actions for scram.

8 MR. CONTE: You've got to turn away from 603, and
9 you look at the computer console where the CSO stands. It's
10 right on that?

11 MR. BROWN: Well, their training is to take their
12 immediate actions, which they're required to know, and then
13 to follow up their actions, verifying that everything was
14 completed in accordance with the procedure.

15 Now, in a normal situation there are enough people
16 there to help him. If it gets into an emergency of any
17 proportion, he may be on his own to first perform and then
18 verify.

19 MR. CONTE: Okay.

20 Would you happen to know if checking CRD flow is
21 one of those immediate actions?

22 MR. BROWN: I don't believe it is.

23 MR. CONTE: Is it important for the operators to
24 know CRD flow on a post-trip response?

25 MR. BROWN: It's important to know the response of

1 the system, and eventually, when you reset a scram, you can
2 verify reset by the behavior of the CRD system, so they're
3 trained that way, but I guess I don't know what you mean by
4 "important."

5 MR. CONTE: Well, when the scram signal is in, do
6 you normally train or focus in on what the normal flow for
7 CRD flow is when the scram signal is in?

8 MR. BROWN: We train them on the flow path through
9 the CRD system with a scram signal in, and we train them on
10 why you want to reset a scram as soon as possible -- the CRD
11 flow path being one of the concerns. Yes, that's trained
12 on, but there is no immediate response; when you're taking
13 immediate actions, it's things like, Put the mode switch in
14 shutdown; insert your instrumentation; verify that you have
15 level; verify you have pressure control; verify that the
16 turbine trips. If CRD flow is in there, it's a new
17 addition; it wasn't one of the things you instantly look up,
18 to see CRD flow.

19 MR. CONTE: What do you tell them in terms of --
20 Do you remember what you tell them in terms of the
21 importance of resetting the scram with respect to CRD flow?

22 MR. BROWN: Well, the flow path when the scram is
23 through the charging header into the scram dump volume,
24 which is isolated. When you reset, you isolate the scram
25 dump volume from the reactor vessel through the mechanism,

1 so, if you don't reset it, then you have through the scram
2 dump volume to the reactor building equipment drain tank a
3 path for leakage if the drains on the scram dump volume
4 don't hold.

5 MR. CONTE: Did you have a question, Mike?

6 MR. JORDAN: Yes. I was just curious. Do you
7 train on what the expected, normal CRD flow is for a scram?

8 MR. BROWN: We train on the entire sequence, what
9 you would expect --

10 MR. JORDAN: You don't understand what I'm saying.
11 Not just how the system operates, but normal flow is 50
12 gpms; when you have a scram, you can expect -- what's the
13 normal flow after a scram on CRD? Do you know?

14 MR. BROWN: Normal flow on CRD after scram is
15 about 100 to 200 -- about 200 gallons a minute.

16 MR. JORDAN: About 200 gallons a minute. Okay.
17 So you train the people that normal flow is 50? I don't
18 know what it is here?

19 MR. BROWN: It's 63.

20 MR. JORDAN: It's 63 here. If you're 100 percent
21 power, normal flow is 63, and then you have a lesson plan to
22 train?

23 MR. BROWN: Yes.

24 MR. JORDAN: That's how you do it, through a
25 lesson plan?

1 MR. BROWN: We go through the --

2 MR. JORDAN: It says the consequences of a scram:
3 you're going to see CRD flow increased to --

4 MR. BROWN: Yes. You do it mostly when you teach
5 the CRD system, and then you go through it again in the
6 simulator when you go through a scram, but you go through
7 the whole sequence of what the flow path is and why the flow
8 is different, the valve response, why the valve's responding
9 that way, and recognition of improper operation by flows and
10 pressures in the system.

11 MR. JORDAN: So that's taught: this is how this
12 system reacts to a reactor scram.

13 MR. BROWN: Yes.

14 It's also taught in there, if it looked like this,
15 what different things could be wrong, what you can identify
16 from those indications, like what it should be doing, and
17 then you may run something on them where something fails and
18 say, Okay; now figure out what it is doing, based on your
19 indications.

20 MR. CONTE: On the simulator portion, are there
21 specific lesson plans for taking them through that sequence
22 of events, or is it mostly just from a simulator scenario
23 bank?

24 MR. BROWN: There are training scenarios. Mostly
25 you'll see that in the initial training. Then the scenario

1 will be, We'll run a failure on them -- when they get to
2 requal, we'll run a scenario where something fails and then
3 they identify the situation; if not, we go back through
4 them, what they should have seen, what they didn't see.

5 MR. CONTE: So on the bank you believe there's a
6 training scenario that takes you through the CRD evolution?

7 MR. BROWN: It wouldn't be specific to that. It
8 would be a lot of things. That would be in there.

9 MR. CONTE: Okay. All right.

10 The general topic of initiation of flows in
11 systems to avoid the so-called heavy-handed operator, being
12 gentle, like establishing a reactor cool-down, how is that
13 communicated to people?

14 MR. BROWN: You mean not opening valves too
15 quickly?

16 MR. CONTE: Yes, not jamming the thing open,
17 causing excessive cool-down rate. As case in point is the
18 initiation, for example -- Another example, besides a cool-
19 down rate, is the initiation of reactor water cleanup, and
20 the other one would be the shutdown cooling system before it
21 becomes on service.

22 MR. BROWN: Well, there are a lot of different
23 ways. We teach them valve operations. We go through
24 significant events due to valve misoperations in the
25 industry. We go through system operation when we teach

Faint, illegible text scattered across the page, possibly bleed-through from the reverse side. Some characters are barely visible, such as 'A' and 'B'.

1 systems. Then, theoretically, we have topics on fluid flow,
2 causes of pumps' running out, pumps' cavitating, system
3 cavitation, water hammering systems and the things that
4 create that, so it is communicated in all those various
5 ways.

6 MR. CONTE: How is that communicated? Is that
7 concisely put in one lesson plan, or is that across many
8 lesson plans?

9 MR. BROWN: There is a lesson plan on valve
10 misoperation, significant events in the industry from valve
11 misoperations, and there is a lesson plan on fluid flow and
12 statics and dynamics of fluid flow.

13 I believe the lesson plan on valve misoperations
14 has valve operations. If not, there's a separate one that
15 has it.

16 MR. JORDAN: How about specific valves in specific
17 systems that this valve can cause these types of problems?

18 MR. BROWN: You mean this type of valve, or this
19 valve in this system?

20 MR. JORDAN: Right. You say you have a lesson
21 plan on industry lessons learned -- generally you have
22 lessons learned on fluid flow in the systems. Now, when you
23 get to the system training, when you get to reactor water
24 cleanup system, this is the valves, or these are the valves,
25 or whatever, that can cause you these industry problems? Is

1 there specific training on those types of things? Be
2 careful, guys, when you operate this system; these are the
3 valves that cause you this?

4 MR. BROWN: Generally what you'll find is, in the
5 procedure there will be a caution or a note, depending on
6 which is appropriate, or just a step in the procedure:
7 Instead of saying, Open this valve, it will say, Slowly open
8 this valve, or, Throttle this valve open. When we go back
9 through the procedure, you discuss these operations. It's a
10 very general objective, because it will say, Discuss the
11 procedure, so what we'll do is go back through and discuss
12 the different evolutions and the whys and the wherefore of
13 why it says, Slowly open this valve. You wouldn't be able
14 to trace it back to, Yes, this valve was discussed on this
15 day. More you'd find, Discuss the procedure, and in there
16 you'll see questions and notes.

17 MR. CONTE: Okay. I think we're going to be in
18 need of a lesson plan index to mark up and ask for copies,
19 and we can do that through Niagara Mohawk.

20 MR. BROWN: Okay. What you're going to look for
21 is, there are three different sets of lessons plans --
22 there's non-licensed, licensed, and requal -- so you want to
23 make sure you get all three.

24 MR. CONTE: Good. Thank you for that advice.

25 Do you know what is taught from a point of view

1 of actions on SRV, any SRV actuations? How was that
2 covered? Is that emergency response, lesson plans, abnormal
3 response?

4 MR. BROWN: We teach main steam lesson, in which
5 SRVs are discussed, and then we teach procedure for main
6 steam system, which has all the actions for what to do on an
7 SRV lift. Then we have simulator scenarios, where we go
8 through and actually do SRV lifts, and some of them are,
9 when they take their immediate action to close the valve, it
10 closes, and some of them are, they take their immediate
11 action to close the valve, and it doesn't close, so they
12 take the follow-on actions from there.

13 MR. CONTE: There's a lesson plan, one for the
14 system and one for the procedure, or is it a combined lesson
15 plan?

16 MR. BROWN: No. The procedure is taught as a
17 function of the system. You teach the system; then you
18 teach all the instrumentation controls; then you teach the
19 procedure for the system; then you teach the tech spec for
20 the system.

21 MR. CONTE: So you talk about different sections
22 of one lesson plan.

23 MR. BROWN: Different sections of one lesson plan.

24 MR. CONTE: Okay.

25 MR. JORDAN: The actions associated with SRV

1 lifting -- are the consequences of SRV lifting that of
2 heating up the suppression pool, discharging energy into the
3 suppression pool, or suppression chamber, and they take the
4 subsequent actions after that, some type of a vacuum
5 breaker cycling -- does the energy increase in the
6 suppression pool make any different -- the actions
7 associated with SRV and vacuum breaker lifting -- are you
8 trained on taking the same actions if you have RCIC
9 actuations or small leaks into the area? Is there any
10 different on where the energy comes from in the suppression
11 pool? Are the actions different?

12 MR. BROWN: The vacuum breaker actuation is a
13 surveillance requirement that is required specifically for
14 following SRV. As far as entry, temperature of the
15 suppression chamber or suppression pool, there's a limit on
16 what it can be, and you're required to maintain it below
17 that and take whatever action you need to maintain it below
18 that, regardless of the source of heat.

19 Now, there are two different numbers. One is
20 whether you intentionally put heat in there; another one is
21 based on just normal operation. If there were a leak in
22 there, you'd have to stay with the normal operation. If you
23 were testing a system like RCIC then they give you a little
24 more room on your number.

25 MR. JORDAN: But the vacuum breaker cycling is

1 strictly for SRV only?

2 MR. BROWN: Yes.

3 MR. JORDAN: I'm going to ask you, Do you know why
4 they do it just for SRVs and not for other energy sources?

5 MR. BROWN: I don't know the basis of the spec.

6 MR. JORDAN: Okay.

7 MR. BROWN: It's a tech spec surveillance to cycle
8 vacuum breakers.

9 MR. CONTE: You mentioned significant valve
10 misoperations, industry experience being fed back into the
11 training program. Any other topics on operator experience
12 being fed back?

13 MR. BROWN: There's one on UPS's and different
14 failures in the industry on UPS's.

15 MR. CONTE: A lesson plan?

16 MR. BROWN: Well, it's part of the UPS lesson
17 plan, to discuss significant events in the industry on
18 UPS's. Unfortunately, no one had ever had one like this
19 before, but things that can go wrong with UPS's are in
20 there.

21 If you were to take out the training procedure, it
22 lists the significant events, different SOERS that we are
23 required to incorporate into the training program. In there
24 there's valve mispositions, pump misoperations; there's
25 problems with UPS's, and so on and so on. There are a lot

1 of them in there. Also, once a week we do significant event
2 review, which is generally a collection of different
3 industry events related around a theme, and they take them
4 into the classroom and split the operators up into groups,
5 go through the event, have them determine what went wrong,
6 what could have been better, what protections we have here,
7 what protections we may need here, to prevent those sorts of
8 things from occurring.

9 MR. CONTE: That's part of their week in requal?

10 MR. BROWN: That's part of the week in requal,
11 yes.

12 MR. CONTE: Okay.

13 We understand there was a line 5 loss recently for
14 Nine Mile Two, offsite source of power, and as a result
15 there was an increased training on electrical distribution.
16 You mentioned earlier that there was an early-1980
17 identification of a weakness in electrical distribution --

18 MR. JORDAN: 1990.

19 MR. CONTE: Oh, 1990. I'm sorry.

20 Can you give us any more about the line 5 loss and
21 how that was incorporated in the training, or don't you
22 know what we're talking about?

23 MR. BROWN: Yes, I think I do, because -- See,
24 I've been flipping back and forth between initial and
25 requals, so sometime I'm confused about that. We wrote a

1 job performance measure for recovery from a loss of line 5,
2 and then they wrote -- I believe they added it to a
3 simulator scenario also, loss of line 5 and recovery.

4 Typically what we do, in any kind of an event like
5 that -- not just a loss of line 5, but a reactor scram that
6 was operator error, or the system didn't operate the way
7 they expected, any kind of event like that that occurs --
8 we'll send out a post-event survey, we call it, and get the
9 operator's event on how they handled the event, how they
10 felt they handled the event, how they felt training either
11 helped them or hindered them, what kind of training they had
12 that was a benefit, what kind of training they could have
13 used that would have helped them, and then we try and get a
14 collection of their comments and make changes or, in some
15 cases, just develop the scenario as best we can to occur the
16 way it did and run them back through that, so that all the
17 groups get to deal with it.

18 Then those go on file, and then we incorporate
19 training. Somewhere down you try to make it fit. Like if
20 it was, during a startup they inadvertently, then you gather
21 that information, find out what you could have done better,
22 and you incorporate it into the training scenario for
23 startups to cover that specifically the next time.

24 MR. CONTE: Do you know whether there was an
25 operator performance problem on the line 5 loss event?

1 MR. BROWN: No, I don't recall that, no.

2 MR. CONTE: So, as far as you can tell, as a
3 result of the critique of the line 5 loss, some training
4 actions were needed.

5 MR. BROWN: I believe that's true, yes -- either
6 needed or --

7 MR. CONTE: Requested.

8 MR. BROWN: Yes.

9 MR. CONTE: By the operators.

10 I thought I had another question.

11 Yes, the other question was all these -- did the
12 Line 5 loss cause a trip?

13 MR. BROWN: I'm not familiar with the exactly the
14 Line 5 loss you are referring to, when you say recently. I
15 know there was one about a year ago.

16 MR. CONTE: That might be the one. We heard about
17 it.

18 MR. BROWN: If it was, then it did result in a
19 trip.

20 MR. CONTE: It did?

21 MR. BROWN: Yes.

22 MR. CONTE: And I assume that there is a post-trip
23 response on that, right?

24 MR. BROWN: I believe there is on that one, yes.
25 I am pretty sure there is. It is called a post-event

1 survey.

2 MR. CONTE: Post-event survey?

3 MR. BROWN: Yes, and it is something Training
4 initiates.

5 MR. CONTE: We are not used to the lingo around
6 here.

7 MR. BROWN: And the lingo changes to fit what we
8 are doing sometimes.

9 MR. JORDAN: Is there training on the -- as a
10 result of an ATWS on system response to ATWS's?

11 MR. BROWN: Yes.

12 MR. JORDAN: Is it called ATWS training or what is
13 it called?

14 MR. BROWN: It is called EOP training. There is --
15 well, you know, it depends on what direction you look at it
16 from. There are systems designed into the plant specifically
17 to deal with that. We teach those systems.

18 MR. JORDAN: That it separate?

19 MR. BROWN: Yes.

20 MR. JORDAN: But EOP training?

21 MR. BROWN: That's right. Then you go through EOP
22 -- well, in the system training now we teach where that
23 system is utilized in EOPs. Then when you teach EOPs you go
24 back and teach all the EOPs and then you go into the
25 simulator and you run scenarios during the training of the

1 EOPs.

2 When we actually put the EOPs in place we went
3 through and ran a scenario that would take them through
4 every leg of every EOP.

5 MR. JORDAN: I guess what I am looking for, Bob,
6 is that you have some systems that operate automatically off
7 of an ATWS?

8 MR. BROWN: Yes, we do.

9 MR. JORDAN: And if they actuate they may give you
10 indication that you have an ATWS? They may or may not?

11 MR. BROWN: There's an annunciator that says ATWS
12 when one of the systems actuates but the signals that
13 actuate may be indicative of an ATWS. It doesn't
14 necessarily say, yes, you have an ATWS.

15 MR. JORDAN: So recognitions of actuations of
16 those systems normally aren't EOP-directed?

17 MR. BROWN: Normally are not or normally -- yes,
18 they are.

19 MR. JORDAN: They are?

20 MR. BROWN: Yes.

21 MR. JORDAN: And the EOPs will tell you to look
22 for this type --

23 MR. BROWN: No, actually it -- no, it will say did
24 you get this actuation? You have to be able to figure out
25 yes or no you got that. That's what we teach them in system

1 training, okay? When this pressure comes on, this happens,
2 you get this light and this light means.

3 MR. JORDAN: But does the EOP then direct you to
4 go over and look for this light?

5 MR. BROWN: The EOPs is more it will ask you a
6 question like has this happened, yes or no. Then you have
7 to --

8 MR. JORDAN: But that is one of the things it will
9 ask you, have you gotten high enough pressure to actuate the
10 ATWS?

11 MR. BROWN: It will say has ARI actuated.

12 MR. JORDAN: ARI actuated automatically.

13 MR. BROWN: -- and you will then determine yes or
14 no it hasn't.

15 MR. CONTE: Do you know anything about the
16 demonstration today at one o'clock in the simulator?

17 MR. BROWN: I know that the simulator, we have
18 built a scenario to actuate and there has been talk of using
19 it back and forth. I didn't know there was one set up for
20 today, no.

21 MR. CONTE: Okay. I guess it is fair to say that
22 there has not been a scenario developed to do what happened
23 in the recent event with the five loss of --

24 MR. BROWN: Prior to this?

25 MR. CONTE: Yes.

1 MR. BROWN: No. No one would have believed this.
2 See, one of the things is -- that we worked real hard on was
3 going from just running scenarios to see thing happen to
4 trying to make them credible so it looks like this is how
5 this can happen. I am not sure anybody would have this as a
6 credible scenario if we had run it so we never did do a loss
7 of all the UPS's.

8 MR. CONTE: But I understand based on operator
9 interviews that they have seen a loss of annunciators, maybe
10 not the full core display but they have seen a loss of
11 annunciators.

12 MR. BROWN: Yes. That they have seen.

13 MR. CONTE: That is a scenario malfunction or
14 that's standard simulator malfunction that you can put in?

15 MR. BROWN: We can do it as any pick an
16 annunciator and lose it or you can turn off all the
17 annunciators.

18 MR. JORDAN: -- loss of all annunciators?

19 MR. BROWN: Yes, somewhere along the line I know
20 we have. I don't know if I could pinpoint for you where it
21 was done but I know we have trained on it.

22 MR. JORDAN: Is it in requal training also?

23 MR. BROWN: Yes, it's done.

24 MR. JORDAN: It's done?

25 MR. BROWN: But it's done kind of more of a loss

1 of annunciators when you trip the system and you might
2 override the annunciators to see if they'll recognize a
3 recognition kind of thing but I can't ever recall on equal
4 just turning off all the annunciators and seeing if they
5 recognize that.

6 We have never done to my knowledge a loss of all
7 annunciators and most indications all at the same time.

8 MR. CONTE: It's partial systems and partial --

9 MR. BROWN: Yes, partial system.

10 MR. JORDAN: Partial annunciator loss?

11 MR. BROWN: Yes, and we do a lot of floor
12 discussion on what if that didn't work, what else could we
13 tell you, how do you know that's true, what actuates that
14 light -- those kinds of things, rather than just get a light
15 and that's true, what gives you that light so you know what
16 it means in the thing.

17 Going back to the ATWS, there's two annunciators
18 there. One says potential ATWS; the other one says ATWS.
19 What's the difference in what makes those lights go on and
20 what do those lights -- where do they get their input so why
21 do they believe whatever it is they are telling you. Those
22 kinds of things get discussed.

23 MR. CONTE: There is a scheme up there in the
24 control room. The starred meters are safety grade power
25 supplies. The labelled ones with the red background are Reg

The first part of the document discusses the importance of maintaining accurate records of all transactions. It emphasizes that every entry should be supported by a valid receipt or invoice. This ensures transparency and allows for easy verification of the data.

In the second section, the author outlines the various methods used to collect and analyze the data. This includes both manual and automated processes. The goal is to ensure that the information gathered is both reliable and comprehensive.

The third section provides a detailed breakdown of the results. It shows that there has been a significant increase in sales over the period analyzed. This is attributed to several factors, including improved marketing strategies and better customer service.

Finally, the document concludes with a series of recommendations for future actions. It suggests that the company should continue to invest in its marketing efforts and focus on building long-term relationships with its customers.

1 Guide 197, is that correct?

2 MR. BROWN: I believe that is the scheme, yes.

3 MR. CONTE: How is that training communicated, the
4 fact that that exists?

5 MR. BROWN: Only in that -- when we go through and
6 we initially bring them to the simulator you do walk-
7 throughs with them on, okay, this is where things are, this
8 is what things mean. Then, as changes get made like they'll
9 issue a department direction or an instruction that they are
10 going to change something, they are going to add an operator
11 aide or something, they'll send over -- if they consider it
12 necessary to be trained on, they'll send over a change
13 request and we will add it into the program wherever it
14 should be added, but something like, you know, we are going
15 to put a new plate down and we are going to color this
16 different, that may or may not. What happens is Operations
17 requests Training to cover that and then Training will add
18 it in where appropriate.

19 Past the initial training on why these meters have
20 red backgrounds it's not done unless it is requested again
21 that it needs to be done, so everybody will get it initially
22 and then from then it's you either know that it's true or
23 you don't.

24 MR. CONTE: For each individual on the crew that
25 was on shift at the time, would training records reflect the

1 last time they had been exposed to some loss of power supply
2 or loss of annunciators?

3 MR. BROWN: Yes, but it is not real clean. You
4 have to go back and what it exposes you to is a scenario
5 number and you have to go take that number back to the
6 scenario and go through the scenario and see what was done.

7 MR. CONTE: Okay.

8 MR. BROWN: However, the best way is to find
9 somebody who ran it who recalls the last time they did one.
10 They'll all be the same scenario as every cycle so the guy
11 who remembers when the last time they did a loss of power
12 will know what cycle it is and he'll look it up for those
13 guys for that cycle.

14 I believe it was done in the Spring or early
15 Summer.

16 MR. CONTE: That wouldn't be a newly-formed shift,
17 would it? Is there a substantial record of this shift being
18 together?

19 MR. BROWN: I am not sure that this shift -- this
20 shift is not normally together. The normal SSS on this
21 shift was not there that night, so this shift -- Mike Eron
22 is a relief shift SRO, so there is a record of them being
23 trained but as far as together, no.

24 MR. CONTE: You don't keep shift records, you keep
25 individual records?

1 MR. BROWN: Well, we keep individual records but
2 what you are going to find is when you do a simulator
3 evaluation you train the shift and on that evaluation all
4 the people are listed and it's generally we try and train
5 them, the shifts, together and then we have staff groups to
6 just make it convenient to get them.

7 If you only have two guys show up for one week,
8 you can't do simulator training so we arrange the staff so
9 that four, five or six guys show up each week and we can do
10 the simulator training.

11 The shifts pretty much stay in rotation because
12 they rotate into training like they rotate into midshift.
13 It works out that way for simulator training. You can go
14 back and find out they all had the same training on the same
15 day at the same time, but we keep a record of each person
16 individually what he did or she did.

17 MR. JORDAN: Is the simulator training -- if they
18 train on Simulator No. 5 at this time do all crews train on
19 that same simulator, so once they get into the cycle they
20 all train on the same so you find that the loss of power,
21 everybody gets trained on the loss of power via that same
22 simulator scenario?

23 MR. BROWN: Yes, and everybody gets evaluated
24 against it.

25 MR. JORDAN: Not only everybody on that crew but

1 everybody that is in training?

2 MR. BROWN: Everybody in license.

3 MR. JORDAN: Thank you.

4 MR. CONTE: I don't have anything else.

5 MR. JORDAN: I don't have anything else.

6 We can go off the record.

7 [Whereupon, at 10:20 a.m., the taking of the
8 interview was concluded.]

REPORTER'S CERTIFICATE

This is to certify that the attached proceedings before the United States Nuclear Regulatory Commission

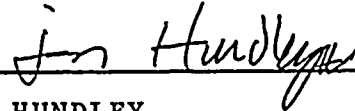

in the matter of:

NAME OF PROCEEDING: Int. of ROBERT BROWN

DOCKET NUMBER:

PLACE OF PROCEEDING: Scriba, N.Y.

were held as herein appears, and that this is the original transcript thereof for the file of the United States Nuclear Regulatory Commission taken by me and thereafter reduced to typewriting by me or under the direction of the court reporting company, and that the transcript is a true and accurate record of the foregoing proceedings.

KING OF PRUSSIA, PENNSYLVANIA 19406

September 27, 1991

MEMORANDUM FOR: Martin J. McCormick, Plant Manager, Nine Mile Point Unit 2
FROM: Wayne L. Schmidt, Senior Resident Inspector, Nine Mile Point
SUBJECT: Review of IIT Interview Transcripts

The IIT has sent the transcripts of interviews conducted with the personnel listed below to the resident inspector's office. If any of the listed individuals wish to review the transcripts they should do so at the resident inspector's office by October 4, 1991. Guidelines for the review of transcripts are provided in the enclosure. If an individual does not review his transcript by that date we will assume that he did not wish to do so and that the statement is correct to the best of his knowledge.

~~Alan DeGarcia, Steve Doty, Dave Barrett, Jerry Helker, Jim Burr, Bob Crandall, Robert Brown, Anil Julka, Perry Bertsch, James Spadafore, Joe Savoca, Mike Colomb, James Kinsley, Marty McCormick, Chris Kolod, Irineo Ferrer, Fred Gerardine, Anthony Petrelli, Jim Reid, Fred White, Rick Slade, Bruce Hennigan, and Tom Tomlinson.~~

Thank you for your help. If there are any questions please contact me.

Interview of :
ROBERT BROWN :
(Closed) :

Conference Room B
Administration Building
Nine Mile Point Nuclear
Power Plant, Unit Two
Lake Road
Scriba, New York 13093
Thursday, August 22, 1991

The interview commenced, pursuant to notice,
at 9:25 a.m.

PRESENT FOR THE IIT:
Michael Jordan, NRC.
Rich Conte, NRC

1

P R O C E E D I N G S

[9:25 a.m.]

1
2
3 MR. JORDAN: It's August 22nd, 1991 at
4 approximately 9:25 a.m. We are at the Nine Mile Point Unit
5 Two in the P Building. We are conducting interviews
6 concerning a transient that occurred on August 13th, 1991,
7 and my name is Michael Jordan. I am with the NRC. I am out
8 of Region III.

9 MR. CONTE: I am Rich Conte, Region I.

10 MR. BROWN: Bob Brown. I work with general
11 physics for Niagara Mohawk training.

12 MR. JORDAN: Okay, Bob. Why don't you just give
13 us a general background on what your experience is?

14 MR. BROWN: I have been at Niagara Mohawk training
15 since 1983. I've been certified on Unit One and Unit Two
16 plants. I have taught initial operator training at Nine Mile
17 Point One and Two. I became a requal instructor in 1989 and
18 I have been either instructing in or administrating the
19 requal program since 1989 at Nine Mile Unit Two.

20 MR. CONTE: Okay. The event that happened on
21 August 13th, any involvement you had? Did they call you in?
22 Did they ask for any help as far as your involvement with
23 the event?

24 MR. BROWN: The only involvement I had directly
25 was at the time we were looking for training material that

1 may be of interest on the training the operators had, and I
2 was involved in getting training material and training
3 records to make available.

4 MR. CONTE: This was subsequent? After the event?

5 MR. BROWN: This was -- well, it was during the
6 event but it really wasn't related to the event. It was
7 more of a request from Niagara Mohawk people to get
8 information available for whatever sort of investigation or
9 inquiries might be made.

10 MR. CONTE: Is that training available or was it
11 sent to the assessment group and one of the sub-leaders in
12 the assessment group?

13 MR. BROWN: I turned it over to the requal program
14 coordinator and I don't know who he turned it over to, where
15 it went, but it was just a collection of the electrical
16 system lesson plans and objectives that we trained to.

17 MR. CONTE: The electrical system lesson plans and
18 what?

19 MR. BROWN: And objectives, training objectives.

20 MR. CONTE: Let me understand your position here
21 again. You are with general physics?

22 MR. BROWN: Yes.

23 MR. CONTE: You are overseeing the requal -- you
24 are a supervisor for requal?

25 MR. BROWN: No. I was a supervisor for requal

1 until early this year, February of this year, when --
2 because I am a contractor they replaced me with one of their
3 own people, but I am still an instructor in the requal
4 program.

5 MR. CONTE: Who oversees the Unit Two requal for
6 the Niagara Mohawk?

7 MR. BROWN: The guy's name is Jim Reid.

8 MR. CONTE: Jim what?

9 MR. BROWN: Jim Reid.

10 MR. CONTE: Jim Reid?

11 MR. BROWN: Uh-huh.

12 MR. CONTE: And who does he report to?

13 MR. BROWN: Rick Slade.

14 MR. CONTE: Who?

15 MR. BROWN: Rick Slade.

16 MR. CONTE: Rick Slade. Okay. You want me to
17 take the lead and ask question?

18 MR. JORDAN: Yes.

19 MR. CONTE: Some of the notes are cryptic.

20 Have you had any involvement in the non-licensed
21 operator training program?

22 MR. BROWN: Not in three or four years. I used to
23 do lectures in the non-licensed operator training program as
24 we moved around but I haven't been directly involved in
25 instructing them since probably '87.

1 MR. CONTE: So right now your function in the
2 company is mostly with the licensed operators?

3 MR. BROWN: Licensed operators, yes.

4 MR. CONTE: Okay. I guess besides the electrical
5 distribution the two other major topics or part of
6 electrical distribution is the UPS power supply safety and
7 non-safety and also the control room panels and
8 annunciators.

9 Do you have any familiarity with the job task
10 analysis for the licensed operators and would you, if you
11 do, would you know that it addresses the UPS power supplies,
12 control room annunciators?

13 Does it get that detailed from a job task analysis
14 point of view?

15 MR. BROWN: I am not that sure what the tasks are.
16 I know that we developed prior to the job task analysis
17 training on UPS power supplies, developed objectives prior
18 to -- or from the task analysis, so there are training
19 objectives on UPS's and there is training along with
20 industry event training on UPS's. It's done in the equal
21 program.

22 MR. CONTE: Do you know if the UPS training
23 addresses both safety and non-safety power supplies?

24 MR. BROWN: Yes. It goes through all the types
25 that we have and how they function.

1 MR. CONTE: Would you know if there is any
2 difference between the lesson plans for auxiliary operators
3 versus licensed operators dealing with UPS?

4 MR. BROWN: There is -- no. They use the same one
5 for UPS's but the non-licensed people when they get trained
6 generally walk through the plant and go through around to
7 all the UPS's. When the licensed operators did it, it was
8 all classroom training. It is essentially the same
9 information with different objectives.

10 MR. CONTE: So you would characterize the
11 auxiliary operator training on UPS as more hands on and the
12 licensed operators, more classroom?

13 MR. BROWN: Yes.

14 MR. CONTE: Okay. Jump in at any time you think
15 of a question, Mike.

16 MR. JORDAN: Yes, I will.

17 MR. CONTE: Let's see. How would -- talking about
18 the systems, I guess we would be interested in getting a
19 copy of the job task analysis dealing with the UPS and/or
20 electrical distribution.

21 MR. JORDAN: Also the training plan for both the
22 non-licensed and licensed operators.

23 MR. BROWN: Remember, I told you earlier about the
24 lesson plans that we gathered. That was one of the ones that
25 was in that group, so I don't know if we can make another

1 copy of it. I got a guy coming over here at eleven o'clock.
2 I can send it over with him.

3 MR. CONTE: Okay.

4 MR. JORDAN: Okay.

5 MR. CONTE: I'll give you a chance to write there.
6 Does the job task analysis address the control room panels
7 and the annunciators and what is expected in that area? Do
8 you have any familiarity with that?

9 MR. BROWN: When you say the job task analysis,
10 generally what we have is the task will be something that an
11 operator has to do and from that you will break it down into
12 objectives that will be certain knowledges that he'll have
13 to gain, and that is more -- the job task analysis takes you
14 down to a task that says be able to identify a loss of or be
15 able to identify a situation and from that you have to train
16 him, okay, you're going to have to know what annunciators
17 there are, what meters there are, various things like that.

18 The job task analysis won't really get you to that
19 bottom line. It will just get you to the task that says he
20 has to be able to deal with the loss of power, deal with
21 the loss of pump, whatever it happens to be.

22 MR. CONTE: How is that covered? Is that covered
23 from a system job task analysis of control room panels or is
24 that kind of in the area of emergency and abnormal response?

25 MR. BROWN: The answer to that is yes.

1 MR. CONTE: All of the above?

2 MR. BROWN: Yes. The tasks basically are broken
3 down by system and then there is a section that is broken
4 down by emergency tasks: you must be able to respond to an
5 accident or transient and where it's best fit when you do
6 that training.

7 MR. CONTE: Okay. While we are on the control room
8 panels and annunciators, there is a specific question about
9 how do you train AO's and/or licensed operators in reading
10 recorders? There's two scales on the recorder, the scale
11 associated with the instrument and then there is a scale
12 that associated with the chart paper. Is there a policy and
13 is that policy promulgated in training on how to read either
14 recorder or chart paper?

15 MR. BROWN: They read the recorder.

16 MR. CONTE: They are supposed to read the
17 recorder?

18 MR. BROWN: Yes.

19 MR. CONTE: Okay, and do you know if that is the
20 most accurate from a calibration point of view or why not
21 review the strip chart?

22 MR. BROWN: Well, when you say review the strip
23 chart, now the strip chart is a permanent record you can go
24 back and read but if you are doing a look and see what this
25 reads rather than trying to interpret the strip chart, you

1 just read the recorder, so from a standpoint of trying to
2 operate a plant it is like reading a meter versus trying to
3 figure out what a piece of paper or a chart's doing.

4 If you are looking for a trend you would read the
5 chart but if you are looking for a value, you read the
6 recorder.

7 As far as which one is more accurate, I couldn't
8 tell you.

9 MR. CONTE: The next one here I think is covered
10 on the lesson plans we talked about. We can get copies of
11 that.

12 Any job performance measures that the you are
13 aware of right now that are already established that would
14 say be precursors to a loss of annunciator event such as
15 this, or loss of UPS's and getting them back on the line?

16 MR. BROWN: We have a job performance measure on
17 how to transfer UPS.

18 MR. CONTE: Transfer?

19 MR. BROWN: A UPS from normal, I believe it is
20 from normal to alternate. You have got to go transfer it as
21 a normal evolution and it takes them through doing that.

22 MR. CONTE: Normal to alternate meaning the AC
23 source to the DC source?

24 MR. BROWN: No. I'm sorry -- normal to
25 maintenance.

1 MR. CONTE: Normal to the maintenance.

2 MR. JORDAN: There is a task. Is that part of a
3 task analysis on the measure or is it just the measure?

4 MR. BROWN: There is a measure on that. There is
5 a measure on that.

6 I am not familiar with any more on loss of
7 annunciators. I know there are some that are on loss of
8 power panels, loss of switchgear and how to respond.

9 MR. JORDAN: Let me make sure I understand
10 something on the job performance measures. So, if there's a
11 job performance measure that means there's a task associated
12 with someplace along the line. And that task then has in
13 it, what do you call them --

14 MR. BROWN: Well, if you take a task, you say this
15 is a -- a task is something you have to be able to do. Now,
16 to do that you have to have knowledge and you have to have
17 ability. So, there are knowledges that you teach them and
18 there are abilities that you must -- they learn to
19 demonstrate and what you're checking with the job
20 performance measures that they have both, they can do this
21 task.

22 MR. JORDAN: So that the transfer from maintenance
23 to transfer is that for safety as well as non-safety
24 related?

25 MR. BROWN: The one that we have is on a safety

1 related.

2 MR. JORDAN: For safety related? And we don't --
3 you don't know if there is one for non-safety related or do
4 you know?

5 MR. BROWN: I'm pretty sure that there's not one
6 for non-safety related.

7 MR. JORDAN: Not one for non-safety related?

8 MR. BROWN: Right.

9 MR. CONTE: How about simulator scenarios, what
10 has been done recently, I would say in the last two years in
11 the area of loss of UPS's or loss of annunciators?

12 MR. BROWN: I don't know that we could nail those
13 two areas down to say we trained in that area. We noted a
14 weakness in their response to loss of electrical power --
15 loss of different power panels and the ability to recognize
16 probably back in the early part of 1990 and we changed a lot
17 of scenarios to add that in as an area to concentrate on.
18 We didn't really approach it with the idea of a loss of UPS
19 and the loss of annunciators. It was more of a -- problems
20 with recognition and distribution losses and so we worked
21 on that a lot to strengthen that. And there's a number of
22 scenarios now that have losses of power incorporated in
23 them.

24 MR. CONTE: How did you identify that weakness?

25 MR. BROWN: Through evaluations.

11

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

1 MR. CONTE: On the requal training?

2 MR. BROWN: Yeah. During requal training
3 evaluations.

4 MR. CONTE: Any NRC involvement in the
5 identification of that weakness?

6 MR. BROWN: None that I recall. There was some
7 problems at the plant, also some knowledge problems, some
8 operators mentioning that they didn't feel they've been --
9 they needed more training in this, they needed more training
10 in that and I believe there was an LER or a release and
11 event on a loss of power due to a recognition problem. And
12 then it was also noted, I went back and looked, and yeah,
13 there were problems in training too where there was
14 recognition, so we went after that area.

15 MR. JORDAN: But, no specific training on
16 annunciators -- loss of annunciators?

17 MR. BROWN: Not that I recall. I don't ever
18 remember that being a -- loss of annunciator as the topic.

19 MR. CONTE: How about drilling them on loss of
20 radiation monitors such as JEMs, loss of JEMs, loss of area
21 radiation monitors things like that? Any training on that?

22 MR. BROWN: You mean loss of them, there is no
23 power there anymore?

24 MR. CONTE: Yes.

25 MR. BROWN: So you have to come up with another

1 method? When you teach the system and then you go through
2 the abnormal or off-normal conditions that could occur and
3 what the backups are, so in that area nothing that we went
4 in and said, okay, this is something we have to concentrate
5 on, just we teach DRMS and ASRM, all those systems get
6 taught and when you teach them you go through the procedures
7 and the procedures for dealing with losses of or off-normals
8 for not having tech spec requirements and samples required
9 if normal systems aren't available and how they're obtained.

10 MR. CONTE: Okay.

11 MR. JORDAN: How about the training on loss of
12 control indication for control rod positions?

13 MR. BROWN: That's done --

14 MR. JORDAN: Is there alternate methods of -- are
15 they trained on alternate methods of acquiring that data?

16 MR. BROWN: Yeah. And there's also procedural
17 guidance in some of the OP's on -- mostly in the areas of
18 failures to scram and identifying how many rods are out and
19 loss of power to various indicators and what the backup
20 indicators would be for determining it.

21 MR. JORDAN: Are you familiar with the indication
22 that they lost the control room as a result of this
23 transient?

24 MR. BROWN: Not as familiar as I would like to be,
25 no.

1 MR. JORDAN: I'm sure you'll get familiar with it.
2 Okay. If they've lost their full core display and they've
3 lost the rod worth minimizer and they've lost their RSCS and
4 they've lost their full rod display, is there a remote
5 indication -- control room indication for rod positions have
6 been lost, are they trained or is there methods by which
7 they can obtain that information remote to the control room?

8 MR. BROWN: The other option is the process
9 computer, of course, and I believe that was gone too.

10 MR. JORDAN: That was gone too.

11 MR. BROWN: You can determine -- not specifically
12 rod position, no. But whether or not the reactor is shut
13 down by power level and other indications as far as rod
14 position. If you take away all of those, it gets real
15 difficult.

16 MR. JORDAN: So you don't know of any training on
17 -- if they've lost all of their control room indication for
18 rod positions, including the process computer, there is no
19 training that you know of on obtaining that information at
20 another location?

21 MR. BROWN: Boy, I can't think of anything right
22 off.

23 MR. JORDAN: Okay.

24 MR. CONTE: You did make a point that -- you said
25 that there's an EOP -- what is it EOP-6 contingency

1 procedure or a satellite procedure that tells you on an ATWS
2 that you can go into -- what, some panels and get voltage
3 readings on rod positions to find out rod positions?

4 MR. BROWN: Yeah, you can do that, I think, in the
5 back panel. You can go back and check it there.

6 MR. CONTE: I guess that dependent on whether you
7 have power or not?

8 MR. BROWN: Yeah. And I'm not familiar what power
9 they had or what they didn't, but the systems, the normal
10 systems for picking that stuff off are pretty much taken
11 away in this case.

12 MR. CONTE: And it is an EOP-6 procedure?

13 MR. JORDAN: There is an EOP-6 procedure not
14 dealing with the loss of indication but dealing with how to
15 verify rods that are in. And it goes through --

16 MR. CONTE: Okay. What's the process of training
17 on those EOP-6 procedures? I understand EOP-6 is the ones
18 that go out in the plant or go to the panels and do things
19 as contingencies.

20 MR. BROWN: Yeah.

21 MR. CONTE: Does every licensed operator have to
22 go through every one of those attachments in that
23 contingency?

24 MR. BROWN: They get trained on how to -- everyone
25 of them gets trained on the classroom; a walk-through step-

1 by-step and the reason for the steps. Then we do, either
2 through job performance measure or simulator scenario -- we
3 do training on them and then there's an evaluation,
4 although, there is nothing that rigidly says each operator
5 will be evaluated on each one of the job performance
6 measures.

7 The requal operators, we never did that. I
8 believe, and I would have to go back to prove this, but I
9 believe the licensed operators have to do every one of
10 those. Initial licensed operators are now in the process
11 of getting through the license class and obtaining a
12 license, it's one of the tasks they have to perform.

13 MR. JORDAN: Each of the attachments of the EOP-6?

14 MR. BROWN: Yeah. Well, it would be more as a --
15 there are tasks that they have to do and each one of those
16 is a task and they have to get someone to evaluate them
17 performing all of the tasks. So that would be in there.

18 MR. CONTE: How is that tracked, by qual card?

19 MR. BROWN: Yeah. Essentially it's a book of --
20 an OJT manual, they call it.

21 MR. CONTE: OJT manual?

22 MR. BROWN: Um hm.

23 MR. CONTE: Who oversees the initial program?

24 MR. BROWN: Fred White.

25 MR. CONTE: Fred White?

1 MR. BROWN: Yeah.

2 MR. CONTE: Okay.

3 MR. BROWN: Now, the guys who were licensed at
4 that time, we did the classroom training when EOP-6 first
5 came out. That came out in the fall of last year with the
6 Rev. 4 to the OP's. And we went back and taught them EOP-6,
7 all the attachments, and then we go through them in
8 simulator scenarios and job performance measures.

9 But, we never went back and said each one of you
10 has to perform each one of these tasks.

11 MR. CONTE: Okay. How about overall command and
12 control in emergencies? How is that trained? Obviously
13 the simulator scenarios get you that -- I assume there's
14 evaluations on command and control?

15 MR. BROWN: Every week we do simulator training
16 for at least -- it was a day of simulator training. It's
17 moved up to about a day and a half and then we do simulator
18 evaluation every week. Each one of the SROs gets his turn
19 at performing as the SSS. We do two scenarios a week. And
20 they rotate so that each one plays the roll of the SSS and
21 the ASSS in alternating scenarios. And that is one of the
22 categories in which they get graded and generally, although
23 not always, there is someone from operations -- management
24 who will be there observing the training, and if there's --

25 MR. CONTE: So each week the scenario training

1 where they've got to --

2 MR. BROWN: They have to perform --

3 MR. CONTE: -- perform command --

4 MR. BROWN: -- from anywhere starting out and some
5 normal condition in dealing with a few off-normal events up
6 to EOP entry and the direction of emergency.

7 MR. CONTE: Excuse me. You say it used to be a
8 day and it's a day and a half now?

9 MR. BROWN: Well, no. There's two different
10 things. There's training and there's evaluation. They have
11 always done two evaluation scenarios, but the amount of
12 training where we -- where you do the coaching as an
13 instructor -- in evaluation they just go from beginning to
14 end and whatever happens, happens.

15 In training, if things aren't going well you stop
16 and anywhere from coach up to discussion of events. So we
17 do that for about a day and a half now and then we go into
18 the evaluation mode. That's every Thursday.

19 MR. CONTE: Okay. The coaching is a day and a
20 half and the actual run and evaluation, don't let the
21 scenario stop, is what, a morning?

22 MR. BROWN: It's -- they do two scenarios of an
23 hour each. And then each one of those is followed by self
24 assessment.

25 MR. CONTE: Sounds like an NRC quality

10

100

1 examination.

2 MR. JORDAN: Yes.

3 MR. CONTE: Okay. Good. How about in the --

4 MR. JORDAN: Can I ask a question?

5 MR. CONTE: Yes, go ahead.

6 MR. JORDAN: Before we get too far, I have one
7 question back on EOP-6. The method that they get into EOP-
8 6, do the normal -- I don't want to say normal -- do the
9 other EOPs put you into EOP-6, or do you just have to know
10 that, if you're at this point in the EOPs, the EOP-6 would
11 assist you.

12 MR. BROWN: No. You have entry conditions into
13 the EOPs themselves, and then you're directed if you have to
14 do something. It will be something like, Go manually
15 override this valve, and it will tell you in EOPs, Do that
16 in accordance with EOP-6, attachment -- whatever the number
17 for the system.

18 MR. JORDAN: So they wouldn't get into EOP-6
19 unless they were directed to.

20 MR. BROWN: Unless they were in the EOPs.

21 MR. JORDAN: Does the EOP-6 address them to what
22 attachment to function off of?

23 MR. BROWN: Yes. All the guy has to do is read it
24 right out of the EOP. It'll say, In accordance with EOP-6,
25 attachment -- whatever the number is.

1 MR. JORDAN: So if there's an action or task
2 that's designed and it's in the EOPs, it will be directed to
3 it. Otherwise, you just stay in the normal EOPs.

4 MR. BROWN: Well, you're never leaving them.

5 MR. JORDAN: I understand that.

6 MR. BROWN: But, yes, you would be directed
7 directly to it.

8 MR. JORDAN: Okay. And if you're not, then
9 there's no assistance out of EOP that you can get by doing
10 that task. I'm just curious; what I'm looking for is the
11 rod position indications if --

12 MR. BROWN: Oh, in other words, I wouldn't use
13 that unless I was in EOPs; that's true, but in learning that
14 I'm going to learn what else I can do when I don't have my
15 normal -- Somewhere along there, then, as an operator, I
16 have to learn, check this, check this, check this, and all
17 the various ways there are to check them.

18 MR. JORDAN: Thanks, Bob.

19 MR. CONTE: Excuse me. How much time do we have?
20 Do we have another interview at 10 in this room, or what?

21 MR. JORDAN: We have another interview at 11.

22 MR. CONTE: Who's coming in this room at 10
23 o'clock? Nobody?

24 MR. JORDAN: Nobody.

25 MR. CONTE: Okay. So we can continue beyond 10 --

1 hopefully not too far beyond 10.

2 Related back to the command-and-control issue, how
3 about training on 10 CFR 50.54(x) -- I should say 50.54(x)
4 for the record.

5 MR. BROWN: I know which one you mean.

6 MR. CONTE: This is emergency actions for
7 operators.

8 MR. BROWN: Yes.

9 MR. CONTE: Could you recount what basically is
10 given to the operators?

11 MR. BROWN: Well, as a matter of fact, we just did
12 that last cycle. We went through 10 CFR 50 and 10 CFR 55,
13 and in there we went through, in the classroom, 50.54(x) and
14 50.54(y), so it was classroom training, and then, in the
15 simulator, we go through mostly EOP training. If the
16 operator is aware that he's in a situation where he has to
17 invoke that, he'll say that.

18 MR. CONTE: Are you saying there's a requal lesson
19 planned on the 50.54(x)?

20 MR. BROWN: Stated in there? Yes.

21 MR. CONTE: And the last cycle, so there would be
22 a record for the midshift crew of having received this
23 training?

24 MR. BROWN: Yes.

25 MR. CONTE: I see.

1 What does the requal record reflect for an
2 individual? What do you keep track of?

3 MR. BROWN: Every lesson that he attends and the
4 time that he attends. They get credit for completing the
5 training. They get graded in the areas of evaluation; they
6 get graded on static exams, job performance measure, and
7 written exams. They do that every cycle, so once out of
8 every six weeks, if I'm an operator, I go through about two
9 days of classroom training, two days of simulator training,
10 simulator evaluation, written exam, static exam, and at
11 least two job-performance measures. All those things that
12 we're evaluating get grades, and everything else, they just
13 credit for completing the training. That's pretty much what
14 they do in a week.

15 MR. CONTE: Who would I see in the organization to
16 at least review the records for the midshift people that
17 were on watch at the time, requal?

18 MR. BROWN: You could see Jim Reid?

19 It's all computerized now, so you just call them
20 up by name, and you can look at all the training they've had
21 in the last two years.

22 MR. CONTE: No, problem? Good.

23 Let's talk about post-trip response of the plant
24 and what you expect of your operators. Could you run
25 through the sequence on what you teach your operators to do

1 on a normal, post-reactor scram, when lights come in
2 indicating a reactor scram?

3 MR. BROWN: Well, you have --

4 MR. CONTE: Annunciator lights come in indicating
5 reactor scram.

6 MR. BROWN: The shift supervisor is the man who
7 has the big-picture responsibility and is in charge of the
8 situation, so he's the step-back, touch-nothing, gather-
9 information, and direct. If there is an EOP entry or an
10 entry into that sort of procedure, then it's his
11 responsibility to enter it. The operators are trained. The
12 CSO has charge of the control room, unless there's an EOP
13 entry, in which case he becomes another operator to be used
14 by the SSS, with no function, as in command of anything. So
15 it's more that the operators in a normal sequence are
16 reporting to the CSO, who's reporting to the SSS. As soon
17 as they enter an emergency condition, the SSS is in charge,
18 and everyone reports to him.

19 The response would be that the person -- the E
20 operator, most likely -- at the 603 panel takes the
21 automatic actions for the scram at the 603 panel. There is
22 generally one other operator in the control room responsible
23 for the other actions: verifying turbine trip, verifying
24 electrical panel transfer, and verifying generally that the
25 response of the other systems is as expected. Each operator

1 reports back to the SSS what he finds or what he does.

2 MR. CONTE: Do you have those immediate actions
3 committed to memory?

4 MR. BROWN: Do I, personally?

5 MR. CONTE: Yes.

6 MR. BROWN: Boy, that would be a good test. I
7 used to.

8 MR. CONTE: Where do I find them?

9 MR. BROWN: You would find them on the panel in
10 the control room, underneath the plexiglass that the E
11 operator is standing up against.

12 MR. CONTE: They're listed there?

13 MR. BROWN: The page out of the procedure is kept
14 under the plexiglass there.

15 MR. CONTE: Which procedure is it?

16 MR. BROWN: It's OP-101(c), off-normal.

17 MR. CONTE: SOP-101 --

18 MR. BROWN: No, it's not an SOP. It's an N2OP-
19 101(c), in the off-normal section H.

20 MR. JORDAN: Is that the name of the procedure,
21 OP-101(c)?

22 MR. BROWN: Yes.

23 MR. JORDAN: Off-normal.

24 MR. BROWN: Got it.

25 MR. CONTE: And that list specifically says,

1 Immediate action in a reactor scram.

2 MR. BROWN: Yes. It has, Reactor scram immediate
3 actions, subsequent actions, the whole bit, and that section
4 is kept out on the panel. You've been in the control room.
5 You're familiar with the desk where they've got the section
6 for reduced flow operation? Under there they also keep the
7 actions for scram.

8 MR. CONTE: You've got to turn away from 603, and
9 you look at the computer console where the CSO stands. It's
10 right on that?

11 MR. BROWN: Well, their training is to take their
12 immediate actions, which they're required to know, and then
13 to follow up their actions, verifying that everything was
14 completed in accordance with the procedure.

15 Now, in a normal situation there are enough people
16 there to help him. If it gets into an emergency of any
17 proportion, he may be on his own to first perform and then
18 verify.

19 MR. CONTE: Okay.

20 Would you happen to know if checking CRD flow is
21 one of those immediate actions?

22 MR. BROWN: I don't believe it is.

23 MR. CONTE: Is it important for the operators to
24 know CRD flow on a post-trip response?

25 MR. BROWN: It's important to know the response of

1 the system, and eventually, when you reset a scram, you can
2 verify reset by the behavior of the CRD system, so they're
3 trained that way, but I guess I don't know what you mean by
4 "important."

5 MR. CONTE: Well, when the scram signal is in, do
6 you normally train or focus in on what the normal flow for
7 CRD flow is when the scram signal is in?

8 MR. BROWN: We train them on the flow path through
9 the CRD system with a scram signal in, and we train them on
10 why you want to reset a scram as soon as possible -- the CRD
11 flow path being one of the concerns. Yes, that's trained
12 on, but there is no immediate response; when you're taking
13 immediate actions, it's things like, Put the mode switch in
14 shutdown; insert your instrumentation; verify that you have
15 level; verify you have pressure control; verify that the
16 turbine trips. If CRD flow is in there, it's a new
17 addition; it wasn't one of the things you instantly look up,
18 to see CRD flow.

19 MR. CONTE: What do you tell them in terms of --
20 Do you remember what you tell them in terms of the
21 importance of resetting the scram with respect to CRD flow?

22 MR. BROWN: Well, the flow path when the scram is
23 through the charging header into the scram dump volume,
24 which is isolated. When you reset, you isolate the scram
25 dump volume from the reactor vessel through the mechanism,

1 so, if you don't reset it, then you have through the scram
2 dump volume to the reactor building equipment drain tank a
3 path for leakage if the drains on the scram dump volume
4 don't hold.

5 MR. CONTE: Did you have a question, Mike?

6 MR. JORDAN: Yes. I was just curious. Do you
7 train on what the expected, normal CRD flow is for a scram?

8 MR. BROWN: We train on the entire sequence, what
9 you would expect --

10 MR. JORDAN: You don't understand what I'm saying.
11 Not just how the system operates, but normal flow is 50
12 gpms; when you have a scram, you can expect -- what's the
13 normal flow after a scram on CRD? Do you know?

14 MR. BROWN: Normal flow on CRD after scram is
15 about 100 to 200 -- about 200 gallons a minute.

16 MR. JORDAN: About 200 gallons a minute. Okay.
17 So you train the people that normal flow is 50? I don't
18 know what it is here?

19 MR. BROWN: It's 63.

20 MR. JORDAN: It's 63 here. If you're 100 percent
21 power, normal flow is 63, and then you have a lesson plan to
22 train?

23 MR. BROWN: Yes.

24 MR. JORDAN: That's how you do it, through a
25 lesson plan?

1 MR. BROWN: We go through the --

2 MR. JORDAN: It says the consequences of a scram:
3 you're going to see CRD flow increased to --

4 MR. BROWN: Yes. You do it mostly when you teach
5 the CRD system, and then you go through it again in the
6 simulator when you go through a scram, but you go through
7 the whole sequence of what the flow path is and why the flow
8 is different, the valve response, why the valve's responding
9 that way, and recognition of improper operation by flows and
10 pressures in the system.

11 MR. JORDAN: So that's taught: this is how this
12 system reacts to a reactor scram.

13 MR. BROWN: Yes.

14 It's also taught in there, if it looked like this,
15 what different things could be wrong, what you can identify
16 from those indications, like what it should be doing, and
17 then you may run something on them where something fails and
18 say, Okay; now figure out what it is doing, based on your
19 indications.

20 MR. CONTE: On the simulator portion, are there
21 specific lesson plans for taking them through that sequence
22 of events, or is it mostly just from a simulator scenario
23 bank?

24 MR. BROWN: There are training scenarios. Mostly
25 you'll see that in the initial training. Then the scenario

1 will be, We'll run a failure on them -- when they get to
2 requal, we'll run a scenario where something fails and then
3 they identify the situation; if not, we go back through
4 them, what they should have seen, what they didn't see.

5 MR. CONTE: So on the bank you believe there's a
6 training scenario that takes you through the CRD evolution?

7 MR. BROWN: It wouldn't be specific to that. It
8 would be a lot of things. That would be in there.

9 MR. CONTE: Okay. All right.

10 The general topic of initiation of flows in
11 systems to avoid the so-called heavy-handed operator, being
12 gentle, like establishing a reactor cool-down, how is that
13 communicated to people?

14 MR. BROWN: You mean not opening valves too
15 quickly?

16 MR. CONTE: Yes, not jamming the thing open,
17 causing excessive cool-down rate. As case in point is the
18 initiation, for example -- Another example, besides a cool-
19 down rate, is the initiation of reactor water cleanup, and
20 the other one would be the shutdown cooling system before it
21 becomes on service.

22 MR. BROWN: Well, there are a lot of different
23 ways. We teach them valve operations. We go through
24 significant events due to valve misoperations in the
25 industry. We go through system operation when we teach

1 systems. Then, theoretically, we have topics on fluid flow,
2 causes of pumps' running out, pumps' cavitating, system
3 cavitation, water hammering systems and the things that
4 create that, so it is communicated in all those various
5 ways.

6 MR. CONTE: How is that communicated? Is that
7 concisely put in one lesson plan, or is that across many
8 lesson plans?

9 MR. BROWN: There is a lesson plan on valve
10 misoperation, significant events in the industry from valve
11 misoperations, and there is a lesson plan on fluid flow and
12 statics and dynamics of fluid flow.

13 I believe the lesson plan on valve misoperations
14 has valve operations. If not, there's a separate one that
15 has it.

16 MR. JORDAN: How about specific valves in specific
17 systems that this valve can cause these types of problems?

18 MR. BROWN: You mean this type of valve, or this
19 valve in this system?

20 MR. JORDAN: Right. You say you have a lesson
21 plan on industry lessons learned -- generally you have
22 lessons learned on fluid flow in the systems. Now, when you
23 get to the system training, when you get to reactor water
24 cleanup system, this is the valves, or these are the valves,
25 or whatever, that can cause you these industry problems? Is

1 there specific training on those types of things? Be
2 careful, guys, when you operate this system; these are the
3 valves that cause you this?

4 MR. BROWN: Generally what you'll find is, in the
5 procedure there will be a caution or a note, depending on
6 which is appropriate, or just a step in the procedure:
7 Instead of saying, Open this valve, it will say, Slowly open
8 this valve, or, Throttle this valve open. When we go back
9 through the procedure, you discuss these operations. It's a
10 very general objective, because it will say, Discuss the
11 procedure, so what we'll do is go back through and discuss
12 the different evolutions and the whys and the wherefore of
13 why it says, Slowly open this valve. You wouldn't be able
14 to trace it back to, Yes, this valve was discussed on this
15 day. More you'd find, Discuss the procedure, and in there
16 you'll see questions and notes.

17 MR. CONTE: Okay. I think we're going to be in
18 need of a lesson plan index to mark up and ask for copies,
19 and we can do that through Niagara Mohawk.

20 MR. BROWN: Okay. What you're going to look for
21 is, there are three different sets of lessons plans --
22 there's non-licensed, licensed, and requal -- so you want to
23 make sure you get all three.

24 MR. CONTE: Good. Thank you for that advice.

25 Do you know what is taught from a point of view

[Faint, illegible text, possibly bleed-through from the reverse side of the page]

1 of actions on SRV, any SRV actuations? How was that
2 covered? Is that emergency response, lesson plans, abnormal
3 response?

4 MR. BROWN: We teach main steam lesson, in which
5 SRVs are discussed, and then we teach procedure for main
6 steam system, which has all the actions for what to do on an
7 SRV lift. Then we have simulator scenarios, where we go
8 through and actually do SRV lifts, and some of them are,
9 when they take their immediate action to close the valve, it
10 closes, and some of them are, they take their immediate
11 action to close the valve, and it doesn't close, so they
12 take the follow-on actions from there.

13 MR. CONTE: There's a lesson plan, one for the
14 system and one for the procedure, or is it a combined lesson
15 plan?

16 MR. BROWN: No. The procedure is taught as a
17 function of the system. You teach the system; then you
18 teach all the instrumentation controls; then you teach the
19 procedure for the system; then you teach the tech spec for
20 the system.

21 MR. CONTE: So you talk about different sections
22 of one lesson plan.

23 MR. BROWN: Different sections of one lesson plan.

24 MR. CONTE: Okay.

25 MR. JORDAN: The actions associated with SRV

1 lifting -- are the consequences of SRV lifting that of
2 heating up the suppression pool, discharging energy into the
3 suppression pool, or suppression chamber, and they take the
4 subsequent actions after that, some type of a vacuum
5 breaker cycling -- does the energy increase in the
6 suppression pool make any different -- the actions
7 associated with SRV and vacuum breaker lifting -- are you
8 trained on taking the same actions if you have RCIC
9 actuations or small leaks into the area? Is there any
10 different on where the energy comes from in the suppression
11 pool? Are the actions different?

12 MR. BROWN: The vacuum breaker actuation is a
13 surveillance requirement that is required specifically for
14 following SRV. As far as entry, temperature of the
15 suppression chamber or suppression pool, there's a limit on
16 what it can be, and you're required to maintain it below
17 that and take whatever action you need to maintain it below
18 that, regardless of the source of heat.

19 Now, there are two different numbers. One is
20 whether you intentionally put heat in there; another one is
21 based on just normal operation. If there were a leak in
22 there, you'd have to stay with the normal operation. If you
23 were testing a system like RCIC then they give you a little
24 more room on your number.

25 MR. JORDAN: But the vacuum breaker cycling is

1 strictly for SRV only?

2 MR. BROWN: Yes.

3 MR. JORDAN: I'm going to ask you, Do you know why
4 they do it just for SRVs and not for other energy sources?

5 MR. BROWN: I don't know the basis of the spec.

6 MR. JORDAN: Okay.

7 MR. BROWN: It's a tech spec surveillance to cycle
8 vacuum breakers.

9 MR. CONTE: You mentioned significant valve
10 misoperations, industry experience being fed back into the
11 training program. Any other topics on operator experience
12 being fed back?

13 MR. BROWN: There's one on UPS's and different
14 failures in the industry on UPS's.

15 MR. CONTE: A lesson plan?

16 MR. BROWN: Well, it's part of the UPS lesson
17 plan, to discuss significant events in the industry on
18 UPS's. Unfortunately, no one had ever had one like this
19 before, but things that can go wrong with UPS's are in
20 there.

21 If you were to take out the training procedure, it
22 lists the significant events, different SOERS that we are
23 required to incorporate into the training program. In there
24 there's valve mispositions, pump misoperations; there's
25 problems with UPS's, and so on and so on. There are a lot

1 of them in there. Also, once a week we do significant event
2 review, which is generally a collection of different
3 industry events related around a theme, and they take them
4 into the classroom and split the operators up into groups,
5 go through the event, have them determine what went wrong,
6 what could have been better, what protections we have here,
7 what protections we may need here, to prevent those sorts of
8 things from occurring.

9 MR. CONTE: That's part of their week in requal?

10 MR. BROWN: That's part of the week in requal,
11 yes.

12 MR. CONTE: Okay.

13 We understand there was a line 5 loss recently for
14 Nine Mile Two, offsite source of power, and as a result
15 there was an increased training on electrical distribution.
16 You mentioned earlier that there was an early-1980
17 identification of a weakness in electrical distribution --

18 MR. JORDAN: 1990.

19 MR. CONTE: Oh, 1990. I'm sorry.

20 Can you give us any more about the line 5 loss and
21 how that was incorporated in the training, or don't you
22 know what we're talking about?

23 MR. BROWN: Yes, I think I do, because -- See,
24 I've been flipping back and forth between initial and
25 requals, so sometime I'm confused about that. We wrote a

12

21

1. The first part of the document is a list of names and addresses.

2. The second part of the document is a list of names and addresses.

3. The third part of the document is a list of names and addresses.

4

4. The fourth part of the document is a list of names and addresses.

5

2

6

5. The fifth part of the document is a list of names and addresses.

6. The sixth part of the document is a list of names and addresses.

1 job performance measure for recovery from a loss of line 5,
2 and then they wrote -- I believe they added it to a
3 simulator scenario also, loss of line 5 and recovery.

4 Typically what we do, in any kind of an event like
5 that -- not just a loss of line 5, but a reactor scram that
6 was operator error, or the system didn't operate the way
7 they expected, any kind of event like that that occurs --
8 we'll send out a post-event survey, we call it, and get the
9 operator's event on how they handled the event, how they
10 felt they handled the event, how they felt training either
11 helped them or hindered them, what kind of training they had
12 that was a benefit, what kind of training they could have
13 used that would have helped them, and then we try and get a
14 collection of their comments and make changes or, in some
15 cases, just develop the scenario as best we can to occur the
16 way it did and run them back through that, so that all the
17 groups get to deal with it.

18 Then those go on file, and then we incorporate
19 training. Somewhere down you try to make it fit. Like if
20 it was, during a startup they inadvertently, then you gather
21 that information, find out what you could have done better,
22 and you incorporate it into the training scenario for
23 startups to cover that specifically the next time.

24 MR. CONTE: Do you know whether there was an
25 operator performance problem on the line 5 loss event?

1 MR. BROWN: No, I don't recall that, no.

2 MR. CONTE: So, as far as you can tell, as a
3 result of the critique of the line 5 loss, some training
4 actions were needed.

5 MR. BROWN: I believe that's true, yes -- either
6 needed or --

7 MR. CONTE: Requested.

8 MR. BROWN: Yes.

9 MR. CONTE: By the operators.

10 I thought I had another question.

11 Yes, the other question was all these -- did the
12 Line 5 loss cause a trip?

13 MR. BROWN: I'm not familiar with the exactly the
14 Line 5 loss you are referring to, when you say recently. I
15 know there was one about a year ago.

16 MR. CONTE: That might be the one. We heard about
17 it.

18 MR. BROWN: If it was, then it did result in a
19 trip.

20 MR. CONTE: It did?

21 MR. BROWN: Yes.

22 MR. CONTE: And I assume that there is a post-trip
23 response on that, right?

24 MR. BROWN: I believe there is on that one, yes.
25 I am pretty sure there is. It is called a post-event

1 survey.

2 MR. CONTE: Post-event survey?

3 MR. BROWN: Yes, and it is something Training
4 initiates.

5 MR. CONTE: We are not used to the lingo around
6 here.

7 MR. BROWN: And the lingo changes to fit what we
8 are doing sometimes.

9 MR. JORDAN: Is there training on the -- as a
10 result of an ATWS on system response to ATWS's?

11 MR. BROWN: Yes.

12 MR. JORDAN: Is it called ATWS training or what is
13 it called?

14 MR. BROWN: It is called EOP training. There is --
15 well, you know, it depends on what direction you look at it
16 from. There are systems designed into the plant specifically
17 to deal with that. We teach those systems.

18 MR. JORDAN: That it separate?

19 MR. BROWN: Yes.

20 MR. JORDAN: But EOP training?

21 MR. BROWN: That's right. Then you go through EOP
22 -- well, in the system training now we teach where that
23 system is utilized in EOPs. Then when you teach EOPs you go
24 back and teach all the EOPs and then you go into the
25 simulator and you run scenarios during the training of the

1 EOPs.

2 When we actually put the EOPs in place we went
3 through and ran a scenario that would take them through
4 every leg of every EOP.

5 MR. JORDAN: I guess what I am looking for, Bob,
6 is that you have some systems that operate automatically off
7 of an ATWS?

8 MR. BROWN: Yes, we do.

9 MR. JORDAN: And if they actuate they may give you
10 indication that you have an ATWS? They may or may not?

11 MR. BROWN: There's an annunciator that says ATWS
12 when one of the systems actuates but the signals that
13 actuate may be indicative of an ATWS. It doesn't
14 necessarily say, yes, you have an ATWS.

15 MR. JORDAN: So recognitions of actuations of
16 those systems normally aren't EOP-directed?

17 MR. BROWN: Normally are not or normally -- yes,
18 they are.

19 MR. JORDAN: They are?

20 MR. BROWN: Yes.

21 MR. JORDAN: And the EOPs will tell you to look
22 for this type --

23 MR. BROWN: No, actually it -- no, it will say did
24 you get this actuation? You have to be able to figure out
25 yes or no you got that. That's what we teach them in system

1 training, okay? When this pressure comes on, this happens,
2 you get this light and this light means.

3 MR. JORDAN: But does the EOP then direct you to
4 go over and look for this light?

5 MR. BROWN: The EOPs is more it will ask you a
6 question like has this happened, yes or no. Then you have
7 to --

8 MR. JORDAN: But that is one of the things it will
9 ask you, have you gotten high enough pressure to actuate the
10 ATWS?

11 MR. BROWN: It will say has ARI actuated.

12 MR. JORDAN: ARI actuated automatically.

13 MR. BROWN: -- and you will then determine yes or
14 no it hasn't.

15 MR. CONTE: Do you know anything about the
16 demonstration today at one o'clock in the simulator?

17 MR. BROWN: I know that the simulator, we have
18 built a scenario to actuate and there has been talk of using
19 it back and forth. I didn't know there was one set up for
20 today, no.

21 MR. CONTE: Okay. I guess it is fair to say that
22 there has not been a scenario developed to do what happened
23 in the recent event with the five loss of --

24 MR. BROWN: Prior to this?

25 MR. CONTE: Yes.

1 MR. BROWN: No. No one would have believed this.
2 See, one of the things is -- that we worked real hard on was
3 going from just running scenarios to see thing happen to
4 trying to make them credible so it looks like this is how
5 this can happen. I am not sure anybody would have this as a
6 credible scenario if we had run it so we never did do a loss
7 of all the UPS's.

8 MR. CONTE: But I understand based on operator
9 interviews that they have seen a loss of annunciators, maybe
10 not the full core display but they have seen a loss of
11 annunciators.

12 MR. BROWN: Yes. That they have seen.

13 MR. CONTE: That is a scenario malfunction or
14 that's standard simulator malfunction that you can put in?

15 MR. BROWN: We can do it as any pick an
16 annunciator and lose it or you can turn off all the
17 annunciators.

18 MR. JORDAN: -- loss of all annunciators?

19 MR. BROWN: Yes, somewhere along the line I know
20 we have. I don't know if I could pinpoint for you where it
21 was done but I know we have trained on it.

22 MR. JORDAN: Is it in requal training also?

23 MR. BROWN: Yes, it's done.

24 MR. JORDAN: It's done?

25 MR. BROWN: But it's done kind of more of a loss

1 of annunciators when you trip the system and you might
2 override the annunciators to see if they'll recognize a
3 recognition kind of thing but I can't ever recall on equal
4 just turning off all the annunciators and seeing if they
5 recognize that.

6 We have never done to my knowledge a loss of all
7 annunciators and most indications all at the same time.

8 MR. CONTE: It's partial systems and partial --

9 MR. BROWN: Yes, partial system.

10 MR. JORDAN: Partial annunciator loss?

11 MR. BROWN: Yes, and we do a lot of floor
12 discussion on what if that didn't work, what else could we
13 tell you, how do you know that's true, what actuates that
14 light -- those kinds of things, rather than just get a light
15 and that's true, what gives you that light so you know what
16 it means in the thing.

17 Going back to the ATWS, there's two annunciators
18 there. One says potential ATWS; the other one says ATWS.
19 What's the difference in what makes those lights go on and
20 what do those lights -- where do they get their input so why
21 do they believe whatever it is they are telling you. Those
22 kinds of things get discussed.

23 MR. CONTE: There is a scheme up there in the
24 control room. The starred meters are safety grade power
25 supplies. The labelled ones with the red background are Reg

1 Guide 197, is that correct?

2 MR. BROWN: I believe that is the scheme, yes.

3 MR. CONTE: How is that training communicated, the
4 fact that that exists?

5 MR. BROWN: Only in that -- when we go through and
6 we initially bring them to the simulator you do walk-
7 throughs with them on, okay, this is where things are, this
8 is what things mean. Then, as changes get made like they'll
9 issue a department direction or an instruction that they are
10 going to change something, they are going to add an operator
11 aide or something, they'll send over -- if they consider it
12 necessary to be trained on, they'll send over a change
13 request and we will add it into the program wherever it
14 should be added, but something like, you know, we are going
15 to put a new plate down and we are going to color this
16 different, that may or may not. What happens is Operations
17 requests Training to cover that and then Training will add
18 it in where appropriate.

19 Past the initial training on why these meters have
20 red backgrounds it's not done unless it is requested again
21 that it needs to be done, so everybody will get it initially
22 and then from then it's you either know that it's true or
23 you don't.

24 MR. CONTE: For each individual on the crew that
25 was on shift at the time, would training records reflect the

1 last time they had been exposed to some loss of power supply
2 or loss of annunciators?

3 MR. BROWN: Yes, but it is not real clean. You
4 have to go back and what it exposes you to is a scenario
5 number and you have to go take that number back to the
6 scenario and go through the scenario and see what was done.

7 MR. CONTE: Okay.

8 MR. BROWN: However, the best way is to find
9 somebody who ran it who recalls the last time they did one.
10 They'll all be the same scenario as every cycle so the guy
11 who remembers when the last time they did a loss of power
12 will know what cycle it is and he'll look it up for those
13 guys for that cycle.

14 I believe it was done in the Spring or early
15 Summer.

16 MR. CONTE: That wouldn't be a newly-formed shift,
17 would it? Is there a substantial record of this shift being
18 together?

19 MR. BROWN: I am not sure that this shift -- this
20 shift is not normally together. The normal SSS on this
21 shift was not there that night, so this shift -- Mike Eron
22 is a relief shift SRO, so there is a record of them being
23 trained but as far as together, no.

24 MR. CONTE: You don't keep shift records, you keep
25 individual records?

1 MR. BROWN: Well, we keep individual records but
2 what you are going to find is when you do a simulator
3 evaluation you train the shift and on that evaluation all
4 the people are listed and it's generally we try and train
5 them, the shifts, together and then we have staff groups to
6 just make it convenient to get them.

7 If you only have two guys show up for one week,
8 you can't do simulator training so we arrange the staff so
9 that four, five or six guys show up each week and we can do
10 the simulator training.

11 The shifts pretty much stay in rotation because
12 they rotate into training like they rotate into midshift.
13 It works out that way for simulator training. You can go
14 back and find out they all had the same training on the same
15 day at the same time, but we keep a record of each person
16 individually what he did or she did.

17 MR. JORDAN: Is the simulator training -- if they
18 train on Simulator No. 5 at this time do all crews train on
19 that same simulator, so once they get into the cycle they
20 all train on the same so you find that the loss of power,
21 everybody gets trained on the loss of power via that same
22 simulator scenario?

23 MR. BROWN: Yes, and everybody gets evaluated
24 against it.

25 MR. JORDAN: Not only everybody on that crew but

1 everybody that is in training?

2 MR. BROWN: Everybody in license.

3 MR. JORDAN: Thank you.

4 MR. CONTE: I don't have anything else.

5 MR. JORDAN: I don't have anything else.

6 We can go off the record.

7 [Whereupon, at 10:20 a.m., the taking of the
8 interview was concluded.]

REPORTER'S CERTIFICATE

This is to certify that the attached proceedings before the United States Nuclear Regulatory Commission

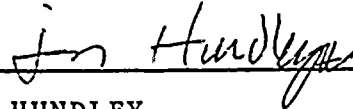

in the matter of:

NAME OF PROCEEDING: Int. of ROBERT BROWN

DOCKET NUMBER:

PLACE OF PROCEEDING: Scriba, N.Y.

were held as herein appears, and that this is the original transcript thereof for the file of the United States Nuclear Regulatory Commission taken by me and thereafter reduced to typewriting by me or under the direction of the court reporting company, and that the transcript is a true and accurate record of the foregoing proceedings.
