In FSAR Section 9.1.5.8, a list of items to be addressed by the heavy loads handling procedures is provided. Among those are procedures to address equipment identification, required equipment inspections and acceptance criteria prior to performing lift and movement operations, safety precautions and limitations, rigging arrangement for loads and special tools, rigging hardware, and equipment required for the heavy load lifts.

Inspection and test plans for heavy load handling equipment is addressed in the North Anna 3 FSAR, Revision 8, by the addition of two paragraphs in Section 9.1.5.6 titled “Special Lifting Devices” and “Other Lifting Devices,” and a paragraph in Section 9.1.5.8 titled “Inspection and Testing.” The “Special Lifting Devices” paragraph describes the inspection and test plans for special lifting devices. Special lifting devices are specifically designed lifting equipment for loads of greater than 4,500 kg (10,000 lbs) and are designed and constructed in accordance with American National Standards Institute (ANSI) N14.6, “Special Lifting Devices for Shipping Containers Weighing 10,000 Pounds (4500 kg) or more.” The “Other Lifting Devices” paragraph states that “slings used for heavy load lifts meet the requirements specified for slings in ASME/ANSI B30.9 and the guidance specified in NUREG–0612, Section 5.1.1(5).”

Additionally, to address COL Item STD COL Item 9.1-5-A, the applicant replaced the information in ESBWR DCD, Section 9.1.5.8 with a revised FSAR Section 9.1.5.8, “Operational Responsibilities,” that includes a new “Inspection and Testing” paragraph. In this paragraph, the applicant references ASME/ANSI B30.2, “Overhead and Gantry Cranes (Top Running Bridge, Single or Multiple Girder, Top Running Trolley Hoist),” B30.11, “Monorails and Underhung Cranes,” and B30.16, “Overhead Hoists (Underhung),” as the applicable standards for crane testing and inspection.

In North Anna 3 FSAR, Revision 1, the applicant took exception to the acceptance criteria in the standard and proposed visual criteria of no cracks in place of the nondestructive examination (NDE) requirements specified. Additionally, for the Dryer/Separator Strongback, the applicant took exception to the NDE of load bearing welds every five refueling outages. Instead the applicant proposed visual and dimensional examinations prior to the initial lift each outage. In the “Other Lifting Devices” paragraph, the applicant identifies ASME/ANSI B30.9, “Slings,” as the industry standard for testing and inspection requirements for slings used for heavy loads. In addition, the applicant also identified a change to the load rating criteria for slings used for heavy lifts, which are addressed by ASME/ANSI B30.9, and NUREG–0612, “Control of Heavy Loads at Nuclear Power Plants.” Section 5.1.1(5) of NUREG–0612 discusses the use of both the static and maximum dynamic load to determine the proper size and rating of slings. The applicant proposes to exclude dynamic loads for sizing of slings.

The applicant did not provide adequate justification for these exceptions. Therefore, in RAI 09.01.05-1 dated June 24, 2008 (ADAMS Accession No. ML081760334), the staff asked the applicant to provide their justification for these exceptions. In their response to RAI 09.01.05-1 dated August 4, 2008 (ADAMS Accession No. ML082200545), the applicant changed “STD COL 9.1-6-5” to “STD COL 9.1-5-A.” In STD 9.1-5-A, the applicant removed all exceptions to the guidelines specified in ANSI N14.6 for special lifting devices and revised their FSAR to state that “testing and inspection of special lifting devices follow the guidelines of ANSI N14.6.” The applicant also removed their proposal to exclude dynamic loads for sizing of slings and revised their FSAR to state that “slings used for heavy load lifts meet the requirements specified for slings in ASME/ANSI B30.9 and the guidance specified in NUREG–0612, Section 5.1.1(5).” The staff finds these changes consistent with the guidelines of SRP Section 9.1.5; thus these changes are acceptable and RAI 09.01.05-1 is resolved and closed.

Based on the information that the applicant has added to FSAR Sections 9.1.5.6 and 9.1.5.8, the staff finds that the applicant has satisfied these elements of the COL information item requirements.

The fifth item listed in STD COL 9.1-5-A pertains to the requirement for heavy load personnel qualifications, training, and control programs. The applicant stated in Section 9.1.5.8 that the operators will be trained and qualified to meet the requirements of ASME/ANSI B30.2. Based on this information, the staff finds that the applicant has satisfied these elements of the COL information item requirement.

The sixth item listed in COL Item STD COL 9.1-5-A pertains to QA program requirements to monitor, implement, and ensure compliance with the heavy load handling program. In Section 9.1.5.8 of the FSAR, the applicant states that the QA program described in Section 17.5, "Quality Assurances Program Description-Design Certification, Early Site Permits, and New License Applicants," is applicable to the heavy loads handling program. Based on this information, the staff finds that the applicant has satisfied these elements of the COL information item requirement.

The seventh, and last issue, listed in COL Item STD COL 9.1-5-A pertains to issues described in RIS 2005-25, Supplement 1. In FSAR Sections 9.1.5.8, the applicant addresses how the procedures address issues described in RIS 2005-25, related to the use of non-metallic slings with single failure proof cranes. This section states that heavy load handling procedures will address "the use of slings constructed from metallic material where single-failure-proof features of the handling system are credited in achieving a very low probability of a load drop as described in RIS 2005-25, Supplement 1, and Clarification of NRC Guidelines for Control of Heavy Loads." Based on this information, the staff finds that the applicant has satisfied these elements of the COL information item requirement.

The staff evaluated COL Item STD COL 9.1-5-A using the relevant NRC regulations and acceptance criteria in SRP Section 9.1.5. Based on the above evaluation, the staff finds that the applicant has satisfactorily addressed DCD COL Item 9.1-5-A. The staff also finds that since there will be a QA program with requirements to monitor, implement, and ensure compliance with the heavy load handling program including the program requirements for inspection and testing of equipment, and the program requirements regarding the qualification, and training of personnel, that GDC 1 requirements related to design, fabrication, and testing of SSCs important to maintain quality standards are satisfied. Furthermore, the staff finds that since the heavy load handling program will implement procedures that will provide for the protection of fuel and safety-related equipment from the effects of internally generated missiles that could be generated in the event of a heavy load drop, the requirements of GDC 4 are also satisfied.

9.1.5.5 Post Combined License Activities

There are no post COL activities related to this section.

9.1.5.6 Conclusions

The staff's finding related to information incorporated by reference is in NUREG–1966. The staff reviewed the application and checked the referenced DCD. The staff's review confirms that the applicant has addressed the required information relating to the "Overhead Heavy Load Handling System" and no outstanding information is expected to be addressed in the COL FSAR related to this Section. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to the overhead heavy load handling system, that were incorporated by reference are resolved.

In addition, the staff compared the additional COL information in the application to the relevant NRC regulations, the guidance in SRP Section 9.1.5, and other NRC regulatory guides. The staff's review concludes that the information in this FSAR is acceptable because it meets the requirements of GDC 1 and GDC 4 and satisfactorily addresses DCD COL Item 9.1-5-A.

9.2 Water Systems

9.2.1 Plant Service Water System

9.2.1.1 Introduction

This section of the North Anna 3 COL FSAR describes the plant service water system (PSWS). The system is designed primarily to transfer heat from nonsafety-related heat load components in the Reactor and Turbine Buildings to the environment. The PSWS consists of two independent and fully redundant systems that continuously recirculate raw water through the reactor component cooling water system (RCCWS) and turbine component cooling water system heat exchangers. The source of cooling water for the PSWS is the Auxiliary Heat Sink (AHS), and the heat removed is rejected back to the AHS. The AHS for North Anna 3 consists of mechanical draft plume abated cooling towers. The PSWS is a nonsafety-related system that provides defense-in-depth decay heat removal during normal plant operating and transient conditions. Also, as discussed in the ESBWR DCD Section 19A, "Regulatory Treatment of Non-Safety Systems," the PSWS is subject to regulatory treatment of non-safety systems (RTNSS) based on RTNSS Criterion C considerations.

9.2.1.2 Summary of Application

Section 9.2.1, "Plant Service Water System," of the North Anna 3 COL FSAR, Revision 8 incorporates by reference Section 9.2.1, "Plant Service Water System," of the certified ESBWR DCD, Revision 10.

In addition, in North Anna 3 FSAR, Section 9.2.1 the applicant provided the following:

COL Item

- NAPS COL 9.2.1-1-A Material Selection

In FSAR Section 9.2.1.2, the applicant provided additional information in NAPS COL 9.2.1-1-A to address DCD COL Item 9.2.1-1-A. The applicant selected fiberglass reinforced polyester pipe (FRPP) for the buried portion of the PSWS to preclude long term corrosion. The applicant also stated that appropriate chemical treatment is added to the PSWS basin to mitigate the long-term effects of fouling and corrosion within the PSWS.

Supplemental Information

- NAPS SUP 9.2.1-1 Basin Reserve Storage Capacity

In FSAR Table 9.2-2R, the applicant provided the following supplemental information. The PSWS cooling tower basin reserve water storage capacity is 2.6 million gallons, which is needed to provide heat removal capability for 7 days without active makeup.

- NAPS SUP 9.2.1-2 FRP Piping Testing and Inspections

In FSAR Section 9.2.1.4, the applicant provided additional information to address the PSWS FRPP material initial testing and periodic inspection.

Site Specific Information Replacing Conceptual Design Information

- NAPS CDI System Description

The applicant provided additional information to replace conceptual design information (CDI) contained in the ESBWR DCD. The portions of PSWS that are not a part of the ESBWR Standard Plant consist of the heat rejection facilities (Normal Plant Heat Sink and AHS), which are dependent on actual site conditions. The North Anna PSWS rejects heat only through the AHS mechanical draft cooling towers. The applicant provided Figure 9.2-1R, "Plant Service Water System Simplified Diagram," depicting the PSWS.

- NAPS CDI Table 9.2-2R, "PSWS Component Design Characteristics"

The applicant provided additional information in Table 9.2-2R to replace CDI in the ESBWR DCD. The applicant provided site-specific temperature parameters and the heat load for the cooling tower design.

- Interface Requirement

Section 4.1, "Plant Service Water System," of the ESBWR DCD Tier 1 information specifies as an interface requirement that the PSWS plant-specific heat rejection facilities must be capable of supporting the post-72-hour cooling function of the PSWS and must ensure that PSWS pumps have sufficient available net positive suction head (NPSH) at the pump suction. Part 10 of the COLA, Section 2.4.3, Table 2.4.3-1, "ITAAC for Plant Service Water Reserve Storage Capacity," provides the required plant-specific Inspections, Tests, Analyses, and Acceptance Criteria (ITAAC) for this interface requirement.

.

9.2.1.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is in NUREG–1966, the FSER related to the ESBWR DCD. In addition, the relevant requirements of the Commission regulations for the PSWS and the associated acceptance criteria are in SRP Section 9.2.1.

The applicable regulatory requirements for the PSWS are as follows:

- GDC 2, "Design Bases for Protection Against Natural Phenomena"
- GDC 4
- GDC 44, "Cooling Water"
- GDC 45, "Inspection of Cooling Water System"
- GDC 46, "Testing of Cooling Water System"

- Item (a) of 10 CFR 52.80, “Contents of applications; additional technical information,” which requires the applicant to address ITAAC

9.2.1.4 Technical Evaluation

As documented in NUREG–1966, the staff reviewed and approved Section 9.2.1 of the certified ESBWR DCD, Revision 10. The staff reviewed Section 9.2.1 of the North Anna 3 COL FSAR, Revision 8, and checked the referenced DCD to ensure that the combination of the DCD and the information in the COLA represent the complete scope of information relating to this review topic.[1]

The staff’s review confirmed that the information contained in the application and incorporated by reference addresses the relevant information related to the PSWS.

The PSWS is a nonsafety-related system that provides defense-in-depth decay heat removal capability and is subject to RTNSS based upon risk considerations (i.e., RTNSS Criterion C). RTNSS Criterion C is described in SECY-94-084, “Policy, Technical, and Licensing Issues Pertaining to Evolutional and Advanced Light-Water Reactor Designs,” dated March 28, 1994 (ADAMS Accession No. ML003708068) and in SECY-95-132, “Policy and Technical Issues Associated with the Regulatory Treatment of Non-Safety Systems in Passive Plant Designs (SECY-94-084),” dated May 22, 1995 (ADAMS Accession No. ML003708005). The staff’s evaluation of plant-specific PSWS considerations for the ESBWR design focuses primarily on confirming the capability of the PSWS to perform its defense-in-depth and RTNSS functions; confirming that the PSWS will not adversely impact safety-related SSCs; and confirming that ITAAC, test program specifications, and RTNSS availability controls for PSWS are appropriate.

The staff reviewed the relevant information in the COL FSAR as follows:

<u>*COL Item*</u>

- NAPS COL 9.2.1-1-A Material Selection

The staff reviewed NAPS COL 9.2.1-1-A related to the underground piping material selection under Section 9.2.1 of the North Anna 3 COL FSAR. In accordance with DCD Tier 2, Section 9.2.1.6, “COL Information,” the COL applicant needs to determine PSWS material selections and provide provisions to preclude long-term corrosion and fouling based on site water quality analysis based on the ESBWR DCD Tier 2, Section 9.2.1.2, “System Description.” The applicant addressed this COL information item by including the following plant-specific information in Section 9.2.1.2 of the North Anna 3 FSAR, Revision 8:

> Fiberglass pressure pipe that meets the requirements of [American Society of Mechanical Engineers] ASME B31.1, Power Piping Code, Nonmandatory Appendix III, Rules for Nonmetallic Piping and Piping Lined with Nonmetals, including applicable ASTM and AWWA standards, is used for below-grade piping. Fiberglass pressure pipe is not susceptible to internal corrosion from the chemically treated water or to external corrosion from ground contact.

The PSWS provides defense-in-depth decay heat removal capability and is subject to RTNSS criterion which does not require the same level of treatment as safety-related SSCs. However, specifications and limitations for using FRPP should be properly described in the FSAR to assure that FRPP is capable of performing in accordance with the Commission’s policy on

RTNSS for the PSWS. The impact of using FRPP on reliability and availability assumptions needs to be addressed especially with respect to common cause failure considerations. Finally, the effects of using FRPP on the consequences of pipe failure during seismic events (such as flood effects) need to be addressed in accordance with GDC 2 requirements. The staff, therefore, requested the applicant in RAI 09.02.01-2 dated July 15, 2008 (ADAMS Accession No. ML081970390), to provide additional information to address these considerations and to update the FSAR accordingly. The staff reviewed the applicant's response to RAI 09.02.01-2 dated August 28, 2008 (ADAMS Accession No. ML082460847), and determined the following:

- With respect to criteria and limitations for using FRPP, the applicant indicated that this is addressed by incorporating DCD Chapter 3, Sections 9.2.1.1 and 19A.8.3, and Table 19A-4, "Capability of RTNSS Related Structures." The staff found that aside from general design considerations that apply to the PSWS and RTNSS Criterion C systems and components, the referenced information indicates that the ASME Power Piping Code B31.1, "Power Piping," applies for piping and valves, International Building Code-2003 applies for seismic capability, and Institute of Electrical and Electronics Engineers, Inc., (IEEE) 344, "Recommended Practice for Seismic Qualification of Class 1E Equipment for Nuclear Power Generating Stations," (1987) applies for demonstrating structural integrity. However, the referenced information does not describe FRPP specifications that apply and limitations on use that are necessary to accommodate PSWS operating and transient conditions (such as temperature extremes and water hammer) commensurate with defense-in-depth and RTNSS considerations. Variations in manufacturing techniques and product formulations can lead to inferior components and if FRPP support requirements are not properly specified, water intrusion problems could lead to common cause and common mode PSWS failures.

- With respect to reliability and availability assumptions, the applicant indicated that the PSWS design information that is incorporated by reference (discussed in the above bullet) assures that the use of FRPP will not adversely affect reliability and availability assumptions for the PSWS. However, it is not clear that PSWS availability and reliability assumptions will be satisfied without establishing design specifications and limitations for using FRPP. Variations in manufacturing techniques and product formulations can lead to inferior components and if FRPP support requirements are not properly specified, water intrusion problems could lead to common cause and common mode PSWS failures. Furthermore, without establishing FRPP design specifications, it is not clear how the Commission's design reliability assurance program (D-RAP) as described in SRP Section 17.4, "Reliability Assurance Program," can be properly implemented.

As a follow-up to the fiberglass issues, the staff issued RAI 09.02.01-13 dated May 6, 2009 (ADAMS Accession No. ML091260337), requesting the following information:

Describe the special treatment QA provisions applicable to supplemental quality class S/N (Special Quality Assurance/Non-Safety Related) for the FRPP used in PSWS for RTNSS systems. This special treatment should include the following considerations:

    - Describe how operating experiences (OE), whereas buried fiberglass materials have been utilized in a similar application such as water service with similar piping size, pressure and temperatures, will be addressed in the selection of the buried fiberglass materials.

- Describe if the ASME B31.1, “Nonmandatory Appendix III, Rules for Nonmetallic Piping and Piping Lines with Nonmetals,” will be utilized for the fiberglass design and installation. In addition, describe any material classification, for example American Society for Testing and Materials or American Water Works Association that better defines the piping and fittings standards to be utilized.

- Provide details of the buried fiberglass application related to the special QA requirement associated with RTNSS.

In its response to RAI 09.02.01-13 dated September 2, 2014 (ADAMS Accession No. ML14247A264), the applicant provided additional information related to acceptable application of FRPP for North Anna 3 and that the North Anna 3 PSWS FRPP will meet the requirements of ASME B31.1, “Nonmandatory Appendix III, Rules for Nonmetallic Piping and Piping Lines with Nonmetals,” including the applicable American Society for Testing and Materials (ASTM) and American Water Works Association (AWWA) standards for FRPP that have been incorporated into the Code. North Anna 3 FSAR, Section 9.2.1 includes the requirement to meet these industry standards. Therefore, the staff determined this issue and the RAI are closed.

With respect to the consequences of PSWS pipe failures during seismic events, the applicant referred to Tier 2 of the DCD, Section 9.2.1.3, “Safety Evaluation,” which stipulates that a failure of all or any portion of the PSWS will not impact any plant safety function. Because the plant design-bases include flooding effects due to failure of all of the PSWS, failures that may occur due to the use of FRPP are encompassed by the plant design bases. Therefore, the staff finds that the use of FRPP relative to flooding considerations is acceptable.

In addressing COL 9.2.1-1-A , the staff noted that the applicant only addressed buried PSWS piping but did not address material selections for any other parts of the PSWS, including cooling towers and related components. Consequently, the staff asked the applicant in RAI 09.02.01-3 dated July 15, 2008 (ADAMS Accession No. ML081970390), to provide additional information to specify and explain the material selections that pertain to the rest of the PSWS. The applicant’s response to RAI 09.02.01-3 dated August 28, 2008 (ADAMS Accession No. ML082460847), indicated that material selections for the PSWS (which include the AHS) will take into consideration PSWS water quality, water treatment options that are compatible with Lake Anna discharge limits, economic considerations, and DCD-related RTNSS criteria. However, no mention was made of using only materials (including materials in the AHS) that are both suitable and compatible for their assigned applications and for the conditions that exist. As a follow-up, the staff asked the applicant in supplemental RAI 09.02.01-9 dated May 6, 2009 (ADAMS Accession No. ML091260337), to address the specific composition or properties of those materials to be used in the PSWS. The applicant responded to RAI 09.02.01-9 dated July 8, 2009 (ADAMS Accession No. ML091910257), stating that Carbon steel that meets ASTM standards is used as the pipe material for above grade portions of the PSWS and the water treatment regime mitigates the long-term effects of fouling and corrosion within the PSWS. The applicant revised the COL Item 9.2.1-1-A in FSAR Section 9.2.1 and therefore this RAI and issue is resolved and closed.

SRP Section 9.2.1 and Generic Letter (GL) 89-13, “Service Water System Problems Affecting Safety-Related Equipment” (as referred to by SRP Section 9.2.1), provide guidance for evaluating long-term corrosion and fouling considerations associated with service water systems. In particular, these considerations include:

a. Establishing a program of surveillance and control techniques to prevent flow blockage problems due to biofouling;

b. Establishing a routine inspection and maintenance program to assure that corrosion, erosion, protective coating failure, silting, biofouling and others that are applicable cannot degrade the PSWS defense-in-depth and RTNSS cooling functions; and

c. Establishing a test program to verify (initially and periodically) the heat transfer capability of heat exchangers that are important to safety.

In order to prevent long-term corrosion and fouling of the PSWS, the applicant proposes to chemically treat the water in the PSWS cooling tower basin based on site water quality analysis. The FSAR does not explain what specific vulnerabilities are considered to be pertinent based upon siting considerations and industry OE that applies, and why chemical treatment alone is sufficient for addressing these vulnerabilities. While chemical treatment is a common practice and suitable for minimizing PSWS corrosion and fouling problems to some extent, it does not adequately address all of the potential PSWS vulnerabilities that have been identified over time as a result of industry OE as reflected in GL 89-13. The staff asked the applicant in RAI 09.02.01-4 dated July 15, 2008 (ADAMS Accession No. ML081970390), to address the considerations referred to above and to fully address this COL information item.

The applicant responded to RAI 09.02.01-4 dated August 28, 2008 (ADAMS Accession No. ML082460847), indicating that PSWS is a closed system with makeup water treated to preclude long-term corrosion and fouling based on the site water quality analysis. However, the applicant did not address the question that was asked in that anticipated site and system-specific vulnerabilities and degradation mechanisms, and programmatic controls to address these considerations, were not described. Because the PSWS for North Anna 3 is relied upon for defense-in-depth and RTNSS considerations, reliability is an important factor. Consequently, programmatic controls are necessary to periodically monitor the condition and performance of the PSWS components over time to maintain the availability and reliability of the system. As a follow-up, the staff asked the applicant in supplemental RAI 09.02.01-10 dated May 6, 2009 (ADAMS Accession No. ML091260337), to address how the PSWS will be treated in accordance with 10 CFR 50.65, "Requirements for monitoring the effectiveness of maintenance at nuclear power plants," RG 1.160, "Monitoring the Effectiveness of Maintenance at Nuclear Plant Plants," and Nuclear Management and Resources Council (NUMARC) (now NEI) 93-01, "Industry Guideline for Monitoring the Effectiveness of Maintenance at Nuclear Power Plant." In addition, the staff asked the applicant to describe or provide drawings which indicate the design of the chemical control system, chemical addition system, or water treatment system for the PSWS.

In response to RAI 09.02.01-10 dated August 3, 2009 (ADAMS Accession No. ML092180975), the applicant responded by stating that the North Anna 3 PSWS is subject to reliability and availability controls in accordance with the Maintenance Rule Program requirements and as stated in DCD Section 19A.8.2, all RTNSS systems are in scope of D-RAP, as described in FSAR Section 17.4. Since SSCs that are in the scope of the D-RAP are initially classified as high safety-significant (HSS) for the Maintenance Rule Program, the PSWS is initially classified as HSS. The staff finds that including the PSWS system in the scope of the Maintenance Rule

D-RAP and revising its system drawing Figure 9.2-1R showing the chemical treatment connection is acceptable, and therefore this RAI and issue is resolved and closed.

The staff evaluated COL Item NAPS COL 9.2.1-1-A using the relevant NRC regulations and acceptance criteria in SRP Section 9.2.1, along with GDC 2, 4, 44, 45, and 46. The staff finds that the applicant has satisfactorily addressed this COL Item.

Supplemental Information and Conceptual Design Information

- NAPS SUP 9.2.1-1 — Basin Reserve Storage Capacity
- NAPS SUP 9.2.1-2 — FRP Piping Testing and Inspections
- NAPS CDI — System Description
- NAPS CDI — PSWS Component Design Characteristics

Tier 2 of the DCD, Section 9.2.1.2, states that the heat rejection facilities are dependent upon actual site conditions and are not part of the ESBWR standard plant. The conceptual design, for the standard plant, uses a normal power heat sink (NPHS) and an AHS as the heat rejection facilities. The NPHS is a dry cooling array and hybrid cooling tower and the AHS consists of mechanical draft cooling towers. A cross-tie for the standard plant permits aligning PSWS to either of these heat sinks.

The applicant provided supplemental (NAPS CDI) information in Section 9.2.1.2 of the North Anna 3 COL FSAR to address this item. The NAPS CDI indicates that the AHS is the heat rejection facility for North Anna 3, which consists of mechanical draft plume abated cooling towers. The FSAR provides Table 9.2-2R, “PSWS Component Design Characteristics,” and a revised Figure 9.2-1R, “Plant Service Water System Simplified Diagram,” that incorporate the AHS. Table 9.2-2R provides supplemental plant-specific information (NAPS SUP 9.2.1-1) that specifies the basin reserve storage capacity as 1.18×10^4 m^3 (2.6 million gal). In addition to this, the staff noted that the FSAR also repeats the information that was included in Tier 2 of the DCD and there is no distinction between the plant-specific (NAPS CDI) and the standard plant design information. In order to avoid confusion in the future the staff asked the applicant in RAI 09.02.01-5 dated July 15, 2008 (ADAMS Accession No. ML081970390), to provide appropriate clarification. The applicant’s response to RAI 09.02.01-5 dated August 28, 2008 (ADAMS Accession No. ML082460847), indicated that the information in its entirety is supplemental to address the CDI provided in the DCD. However, only the heat rejection facility that is used for the PSWS is identified as CDI in the DCD. Consequently, most of the information that the applicant provided as supplemental is in fact part of the certified design and cannot be characterized as NAPS CDI. As a follow-up, the staff asked the applicant in supplemental RAI 09.02.01-11 dated May 6, 2009 (ADAMS Accession No. ML091260337), to clearly identify the plant-specific information in the FSAR that addressed the CDI identified in the ESBWR DCD. The applicant responded to RAI 09.02.01-11 dated July 8, 2009 (ADAMS Accession No. ML091910257), and stated that North Anna 3 FSAR, Section 9.2.1.2, Table 9.2-2R, and Figure 9.2-1R will be revised to clearly identify the plant-specific information that addresses CDI identified in the ESBWR DCD. The staff confirmed the information was revised in North Anna 3 FSAR, Revision 8 and therefore this RAI and issue is resolved and closed.

SRP Section 9.2.5, RG 1.27, and GL 89-13 provide guidance that is pertinent for evaluating heat rejection facilities. Important considerations include those discussed above under interface requirements, other plant-specific vulnerabilities and degradation mechanisms that are anticipated based on OE, and the potential impacts of postulated failures or other interactions on safety-related SSCs. The FSAR does not address these considerations. In addition, the FSAR does not address bounding conditions and limiting assumptions that pertain to the functional capability of the cooling towers and programmatic controls that assure functional capability of the cooling towers will be maintained over the life of the plant. Consequently, the staff asked the applicant in RAI 09.02.01-6 dated July 15, 2008 (ADAMS Accession No. ML081970390), to revise the NAPS CDI accordingly to include this information. The applicant's response to RAI 09.02.01-6 dated August 28, 2008 (ADAMS Accession No. ML082460847), indicated that the information requested by the staff is the type of information that is normally provided for a safety-related system. Because the PSWS is nonsafety-related system, the applicant felt that the information in the FSAR was adequate. Although the PSWS is a nonsafety-related system, it is relied upon for providing defense-in-depth cooling for the reactor and SFP, and it is subject to RTNSS considerations. As such, PSWS reliability and availability are important factors. As a follow-up, the staff asked the applicant in supplemental RAI 09.02.01-10 dated May 6, 2009 (ADAMS Accession No. ML091260337), to address how the PSWS (including AHS cooling towers) will be treated in accordance with 10 CFR 50.65, RG 1.160, and NUMARC 93-01. In its response to RAI 09.02.01-10 dated August 3, 2009 (ADAMS Accession No. ML092180975), the applicant stated that the PSWS is subject to reliability and availability controls in accordance with the Maintenance Rule Program requirements. In addition, as stated in DCD Section 19A.8.2, all RTNSS systems are in the scope of the D-RAP, as described in FSAR Section 17.4. Further, as described in FSAR Section 17.4.1, SSCs that are in the scope of the D-RAP are initially classified as HSS for the Maintenance Rule-Program, with any exceptions requiring expert panel review. The PSWS is initially classified as HSS. Since this system will be classified appropriately as described and the staff confirmed the information was revised in North Anna 3 FSAR, Revision 8 this RAI and issue is resolved and closed.

In a follow-up question to RAI 09.02.01-13, the staff issued RAI 09.02.01-15 dated April 29, 2014 (ADAMS Accession No. ML14119A462), and requested additional information on the piping materials initial testing and periodic inspections related to the quality standards that ensure the RTNSS performance requirements described in Chapter 19A for the PSWS system are met. Specifically the staff requested that the quality standards for the FRPP be represented for the PSWS fiberglass material in the North Anna 3 FSAR including additional ITAAC that should be applied to address pressure testing, cyclic testing, or installation of sleeves. The applicant provided its amended response in a letter dated September 2, 2014 (ADAMS Accession No. ML14247A264), and stated that the FSAR will be revised to incorporate the appropriate quality requirements for FRPP material including design loads, applicable codes and standards, and pre-service testing and in-service inspection requirements. In addition the applicant stated that the PSWS design is part of the standard plant and the PSWS piping is within the scope of the standard plant, as is shown in DCD Figure 9.2-1, therefore the standard plant ITAAC applies and there is no site-specific PSWS system ITAAC required. The applicant revised FSAR Section 9.2.1.4 with an additional North Anna 3 supplement item NAPS SUP 9.2.1-2 describing the inspections and tests that would be site-specific for the North Anna 3 PSWS FRPP material as well as including the PSWS system piping in the NEI sponsored, "Underground Piping and Tank Integrity Program," which is developed in accordance with NEI 09-14, "Guideline for the Management of Underground Piping and Tank Integrity." With these COLA changes including the addition of NAPS SUP 9.2.1-2 the staff finds that the RAI 09.02.01-15 and issue is resolved and closed. The staff verified that the North Anna 3 FSAR, Revision 9 incorporated the appropriate changes described in the applicant's response to RAI 09.02.01-15. Therefore, Confirmatory Item 09.02-1 from the staff advanced SER for North Anna 3 is resolved and closed.

The staff evaluated the four items listed above using the relevant NRC regulations and acceptance criteria in SRP Section 9.2.1, along with GDC 2, 4, 44, 45, and 46. The staff finds that the applicant has satisfactorily addressed this COL Item.

Interface Requirement

Tier 1 of the ESBWR DCD, Section 4.1, specifies as an interface requirement that the PSWS plant-specific heat rejection facilities must be capable of supporting the post-72-hour RTNSS cooling function of the PSWS. In particular, the PSWS must be capable of removing at least 2.02×10^7 mega-joule (MJ) or (1.92×10^{10} British thermal unit (BTU)) over a period of 7 days without active makeup. The COL applicant is required to develop plant-specific ITAAC that demonstrate that each train of the plant-specific cooling tower and basin satisfies this interface requirement.

The applicant provided plant-specific ITAAC item, “ITAAC for Plant Service Water Reserve Storage Capacity,” for the PSWS in Section 2.4.3, “ITAAC for Plant Service Water System (Portion Outside the Scope of the Certified Design),” Table 2.4.3-1, “ITAAC for Plant Service Water Reserve Storage Capacity,” of Part 10 of the COLA. The proposed design is for the PSWS to contain an inventory of cooling water sufficient for removing heat from the RCCWS from time 0 (at shutdown) through day 7 without active makeup. The acceptance criteria proposed by the applicant was that the minimum usable water volume in the cooling tower basins (Trains A and B) and associated pump forebay would be 1.18×10^4 m^3 (2.6 million gal), a volume sufficient to remove at least $2.02x10^7$ MJ ($1.92x10^{10}$ BTU) over a period of 7 days without active makeup.

SRP Section 9.2.5 and RG 1.27, “Ultimate Heat Sink for Nuclear Power Plants” (as referred to by SRP Section 9.2.5), provides guidance for evaluating the adequacy of cooling towers. Important factors that need to be considered when demonstrating that cooling towers are capable of dissipating the required heat load include (among other things) the capability to satisfy the PSWS pump minimum NPSH requirements for the most limiting cooling tower basin water level, temperature, and flow conditions; the maximum allowed PSWS water supply temperature; and the most limiting meteorological assumptions that pertain to the site for determining: (a) heat dissipation capability, and (b) water inventory requirements. Transient analyses that take these factors into consideration (including margin for expected degradation and operating flexibility) and confirmatory testing are usually necessary in order to demonstrate that cooling tower performance satisfies the specified heat removal capability.

The ITAAC proposed by the applicant, which specifies a cooling tower basin water inventory requirement, is as a way of demonstrating that the heat removal capability specified by the DCD is capable of performing its defense-in-depth and RTNSS functions. However, the proposed ITAAC did not adequately demonstrate that the cooling towers are capable of dissipating the heat load as specified in the DCD. The staff asked the applicant in RAI 09.02.01-1 dated July 15, 2008 (ADAMS Accession No. ML081970390), to address the considerations referred to above and revise the ITAAC accordingly. The staff reviewed the applicant’s response to RAI 09.02.01-1 dated August 28, 2008 (ADAMS Accession No. ML082460847), and found it only addressed the required volume of water in the cooling tower basin to support up to 7 days. As a follow-up, the staff asked the applicant in supplemental RAI 09.02.01-8 dated May 6, 2009 (ADAMS Accession No. ML091260337), to address additional acceptance criteria that confirms the PSWS can remove the required heat capacity over a period of 7 days without active makeup. In its response to RAI 09.02.01-8 dated July 8, 2009 (ADAMS Accession No. ML091910257), the applicant revised the ITAAC to clarify the required water volume in the

PSWS basin is sufficient to ensure the DCD required heat removal capability over the 7 day period including confirmation that there is sufficient available NPSH at the PSWS pump suction location for the lowest probable water level of the heat sink.

The staff evaluated the interface requirement using the relevant NRC regulations and acceptance criteria in SRP Section 9.2.1, along with GDC 2, 4, 44, 45, and 46. The staff finds that the applicant has satisfactorily addressed this COL Item.

ITAAC Considerations

As specified in the COLA, Part 10, Section 1, "Tier 1/ITAAC," the ITAAC from Tier 1 of the DCD is incorporated by reference. However, Part 10, Section 2.4.3, "ITAAC for Plant Service Water System (Portion Outside the Scope of the Certified Design)," proposes ITAAC for the interface requirement that is specified in Section 4.1 of the DCD Tier 1. The adequacy of the plant-specific ITAAC that are proposed is evaluated above under "Interface Requirements." The applicant's responses to RAI Questions 09.02.01-1 and 09.02.01-8 were reviewed and determined to be acceptable in the above staff's evaluation.

Initial Plant Test Program

As indicated in the FSAR, Chapter 14.2, "Initial Plant Test Program for Final Safety Analysis Reports," the initial plant test program specified by Tier 2 of the DCD for the PSWS is incorporated by reference. The PSWS initial test program is discussed in the DCD Tier 2, Sections 14.2.8.1.51, "Plant Service Water System Preoperational Test," and 14.2.8.2.18, "Plant Service Water System Performance Test." However, these tests do not verify that performance of the CDI portions of the PSWS (including AHS) satisfies design specifications for the various modes of operation. The staff asked the applicant in RAI 09.02.01-7 dated July 15, 2008 (ADAMS Accession No. ML081970390), to establish and describe initial plant test program requirements for the PSWS accordingly. The applicant's response to RAI 09.02.01-7 dated August 28, 2008 (ADAMS Accession No. ML082460847), indicated that the preoperational and startup test programs that are incorporated by reference include testing for the CDI portions of the PSWS. The staff noted that the referenced test programs do not fully address CDI in that cooling tower performance, including fan functions and heat dissipation capability, are not evaluated. Also, the capability of the PSWS to properly function without initiating a water hammer following a loss of power is not addressed by the test program. As a follow-up, the staff asked the applicant in supplemental RAI 09.02.01-12 dated May 6, 2009 (ADAMS Accession No. ML091260337), to address how the design capability of the AHS will be verified by the initial plant test program and how design features which minimize an AHS/PSWS water hammer event are tested or verified that a water hammer event does not occur. The applicant's response to RAI 09.02.01-12 dated August 3, 2009 (ADAMS Accession No. ML092180975), provided revisions to FSAR Section 14.2.8.1.51 and Section 14.2.8.2.18 by adding supplemental information NAPS SUP 14.2-4 and NAPS SUP 14.2-5 in order to clarify the purpose and criteria of the PSWS preoperational test, along with the purpose and description of the PSWS performance test. Based on the staff's review of this RAI response, the staff finds the applicant has addressed the initial test program related to the AHS in the CDI. In addition, the staff finds that the water hammer design features had been added and had been adequately addressed to ensure the CDI had been properly tested. Therefore, this RAI 09.02.01-12 is resolved and closed. Furthermore, the staff has confirmed that the above was incorporated in North Anna 3 FSAR, Revision 8.

The staff evaluated the initial plant test program for the PSWS using the relevant NRC regulations and acceptance criteria in SRP Section 9.2., along with GDC 2, 4, 44, 45, and 46. The staff finds that the applicant has satisfactorily addressed this COL item.

9.2.1.5 Post Combined License Activities

There are no post COL activities related to this section.

9.2.1.6 Conclusions

The staff's finding related to information incorporated by reference is in NUREG–1966. The staff reviewed the application and checked the referenced DCD. The staff's review confirms that the applicant has addressed the required information relating to the PSWS, and no outstanding information is expected to be addressed in the COL FSAR related to this section. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to the PSWS that were incorporated by reference are resolved.

In addition, the staff compared the additional COL information in the application to the relevant NRC regulations, the guidance in SRP Section 9.2.1, and other NRC regulatory guides. The staff's review concludes that the applicant's information is acceptable and meets the requirements of GDC 2, 4, 44, 45, 46, and 10 CFR 52.80(a). The staff has evaluated COL Items NAPS COL 9.2.1-A, NAPS SUP 9.2.1-1, NAPS SUP 9.2.1-2, NAPS CDI, along with the DCD ITAAC and Interface Requirement for this Section to the relevant NRC regulations and acceptance criteria in SRP Section 9.2.1 and SRP Section 9.2.5. The staff's evaluation finds that the applicant has satisfactorily addressed these items and therefore the North Anna 3 PSWS as described is acceptable.

9.2.2 Reactor Component Cooling Water System

Section 9.2.2, "Reactor Component Cooling Water System," of the North Anna 3 COL FSAR, Revision 8, incorporates by reference, with no departures or supplements, Section 9.2.2, "Reactor Component Cooling Water System," of the certified ESBWR DCD, Revision 10 referenced in 10 CFR Part 52, Appendix E. As documented in NUREG–1966, the staff reviewed and approved Section 9.2.2 of the certified ESBWR DCD. The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remains for review.[1]

The staff's review confirmed that the applicant has addressed the required information, and there is no outstanding information related to this section that remains to be addressed in the COL FSAR. Pursuant to 10 CFR 52.63(a)(5) and Section VI.B.1 of Appendix E to 10 CFR Part 52, all nuclear safety issues relating to the RCCWS that were incorporated by reference have been resolved.

9.2.3 Makeup Water System

9.2.3.1 Introduction

The makeup water system (MWS) provides high purity demineralized water to various plant systems. The MWS consists of two subsystems: a demineralization subsystem and a storage and transfer subsystem. The demineralization subsystem takes station water and treats it to the required water quality standards by removing dissolved solids, organics and other impurities. Treated water is stored in a demineralized water storage tank and distributed throughout the plant using transfer pumps. Except for the piping penetrating containment and the associated containment isolation valves, the MWS is not safety related. However, if available, the MWS can provide makeup to the isolation condenser/passive containment cooling (IC/PCCS) pools following an anticipated operational occurrence (AOO) or any abnormal event.

9.2.3.2 Summary of Application

Section 9.2.3, "Makeup Water System," of the North Anna 3 COL FSAR, Revision 8, incorporates by reference Section 9.2.3, "Makeup Water System," of the ESBWR DCD, Revision 10.

In addition, in FSAR Section 9.2.3, the applicant provided the following:

Site-Specific Information Replacing Conceptual Design Information

- NAPS CDI System Description

The applicant provided site-specific information to replace the CDI contained in the ESBWR DCD. The applicant added activated carbon filters upstream of the reverse osmosis unit based on site-specific considerations. The demineralized makeup water is stored in an outdoor demineralized water storage tank and distributed throughout the plant using transfer pumps. Freeze protection is provided for the demineralized water storage tank and piping exposed to freezing conditions. Table 9.2-9R, "Major Makeup Water System Components," in the North Anna 3 COLA lists the major MWS components.

9.2.3.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is in NUREG–1966, the FSER for the ESBWR DCD. In addition, the relevant requirements of the Commission regulations for the MWS are in SRP Section 9.2.3.

In addition, the relevant requirements of the Commission regulations for the MWS and the associated acceptance criteria:

- GDC 2, in that failure of the nonsafety-related system or component due to natural phenomena such as earthquakes, tornadoes, hurricanes, and floods should not adversely affect SSCs important to safety

- RG 1.29, Revision 4 "Seismic Design Classification," March 2007

9.2.3.4 Technical Evaluation

As documented in NUREG–1966, the staff reviewed and approved Section 9.2.3 of the certified ESBWR DCD, Revision 10. The staff reviewed Section 9.2.3 of the North Anna 3 COL FSAR, Revision 8 and checked the referenced ESBWR DCD, to ensure that the combination of the information in the COL FSAR and the information in the ESBWR DCD represents the complete scope of information relating to this review topic.[1]

The staff's review confirms that the information in the application and the information incorporated by reference address the required information related to the MWS.

The staff's review of FSAR Section 9.2.3 is limited to the following North Anna 3 COL FSAR site-specific design replacing the CDI in the ESBWR DCD, Revision 10.

Site-Specific Information Replacing Conceptual Design Information

- NAPS CDI System Description

In FSAR Section 9.2.3.2, the applicant replaced the introductory text and demineralization subsystem portions of the ESBWR DCD, Section 9.2.3.2. In FSAR Section 9.2.3.2, the applicant provided site-specific system descriptions of the MWS.

The MWS consists of two subsystems: (1) the demineralization subsystem, and (2) the storage and transfer subsystem. The makeup water transfer pumps and the demineralization subsystem are sized to meet the demineralized water needs of all operational conditions except for shutdown/refueling/startup. During the shutdown/refueling/startup mode, the increases in plant water consumption require use of a temporary demineralization subsystem and temporary makeup water transfer pumps to be used as a supplemental water source.

The MWS major components are housed entirely in the water treatment building except for the demineralized water storage tank (which is outdoors and adjacent to this building) and the distribution piping to the interface systems. The site-specific design includes freeze protection for the demineralized water storage tank and piping exposed to freezing conditions.

The staff reviewed the site-specific MWS and its components and finds that the applicant's proposed system design is similar to the MWS described in Section 9.2.3.2 of the ESBWR DCD, Revision 10. The NAPS MWS components and associated piping in contact with demineralized water are fabricated from corrosion resistant materials such as stainless steel to prevent contamination of the makeup water.

Water for the demineralization subsystem is provided by the station water system (SWS). Production of demineralized water by the demineralization subsystem can be initiated and shut down either automatically (based on the demineralized water storage tank level) or manually. The applicant described the process and sequence of chemical treatment of the station water to produce demineralized water. The applicant's water treatment process is similar to that described in the DCD Section 9.2.3.2. After the chemical treatment process, the treated water is then transferred to the MWS demineralized storage tank.

The staff reviewed the design information provided in the FSAR Section 9.2.3 for NAPS MWS and finds that the applicant did not identify any further supplements and/or departures, except the above discussed site-specific information. The site-specific portion of the MWS is nonsafety-related and its failure does not compromise any safety-related system or component nor does it prevent a safe-shutdown. Also, the site-specific design will not change the conclusion of ESBWR DCD for MWS, as it relates to GDC 2. Accordingly, the staff finds the site-specific design information meets the requirements of GDC 2 and therefore is acceptable.

Also, the site-specific portion of the MWS does not interface with any potentially radioactive system. Therefore, no interface requirements needed to be satisfied.

9.2.3.5 Post Combined License Activities

There are no post COL activities related to this section.

9.2.3.6 Conclusion

The staff's finding related to information incorporated by reference is in NUREG–1966. The staff reviewed the application and checked the referenced DCD. The staff's review confirms that the applicant has addressed the required information relating to the MWS, and no outstanding information is expected to be addressed in the COL FSAR related to this section. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to the MWS that were incorporated by reference are resolved.

In addition, the staff compared the additional North Anna 3 CDI information in the application to the relevant NRC regulations and regulatory guides. The staff's review concludes that the applicant has provided sufficient information on the site-specific CDI for the MWS. The staff also finds that the CDI for the MWS meets the guidance of Regulatory Position C.2 of RG 1.29 regarding nonsafety-related systems because the failure of the nonsafety-related portions of the systems does not impact any safety-related SSCs. With respect to MWS failures and GDC 2, SSCs important to safety are able to withstand the effects of failure of the MWS as well as natural phenomena without loss of capability to perform their safety function. The staff finds that these requirements have been met. Accordingly, the staff finds the site-specific design information meets the regulatory requirements, as discussed in each section above, and therefore is acceptable.

9.2.4 Potable and Sanitary Water Systems

9.2.4.1 Introduction

The potable water system (PWS) supplies clean water for domestic use and human consumption. The sanitary waste discharge system (SWDS) collects and treats sanitary wastes from plant restrooms and locker room facilities. The system design ensures that there is no possibility for radioactive contamination of the potable water or the sanitary waste drainage system. Neither the PWS nor the SWDS has a safety design basis.

9.2.4.2 Summary of Application

Section 9.2.4, "Potable and Sanitary Water Systems," of the North Anna 3 COL FSAR, Revision 8, incorporates by reference Section 9.2.4, "Potable and Sanitary Water Systems," of the ESBWR DCD, Revision 10. In addition, in FSAR Section 9.2.4, the applicant provided the following:

Site Specific Information Replacing Conceptual Design Information

- NAPS CDI Potable and Sanitary Water Systems

The applicant provided additional information to replace CDI contained in the ESBWR DCD. The applicant described the site-specific potable and sanitary water system. The PWS consists of ground wells at various locations on site. For each well house there is a submersible well pump, compressor, hydro-pneumatic tank and interconnecting piping and valves. The North Anna 3 potable water header is connected to the North Anna 1 and 2 domestic water system with a normally closed valve. The sanitary wastes are collected in underground tanks located throughout the yard and pumped to an on-site sewage treatment plant. Neither the PWS nor the SWDS interconnects with any system that contains radioactive fluids. The SWDS is monitored for radioactivity. The applicant provided Figure 9.2-202, "Potable Water System Simplified Diagram," depicting the PWS and Figure 9.2-203, "Sanitary Waste Discharge System Simplified Diagram," depicting the SWDS.

9.2.4.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is in NUREG–1966. In addition, the relevant requirements of the Commission regulations for the PWS and the SWDS and the associated acceptance criteria are in SRP Section 9.2.4.

The applicable regulatory requirements for the potable and sanitary water system are as follows:

- GDC 60, "Control of Releases of Radioactive Materials to the Environment," of 10 CFR Part 50, Appendix A which relates to design provisions provided to control the release of liquid effluents containing radioactive material from contaminating the PSWS.

Since the PWS/SWDS may affect SSCs due to nonsafety-related equipment failures, additional regulatory requirements are as follows:

- GDC 2 as it relates to structures housing the system and the system itself having the capability of withstanding the effects of natural phenomena such as earthquakes, tornadoes, hurricanes and floods without loss of safety-related functions.

- GDC 4 as it relates to effects of missiles inside and outside of the containment, pipe whip, jets, and environmental conditions from high and moderate energy line breaks and dynamic effects of flow instabilities and loads (e.g., water hammer) during normal plant operation, as well as during accident conditions.

9.2.4.4 Technical Evaluation

As documented in NUREG–1966, the staff reviewed and approved Section 9.2.4 of the certified ESBWR DCD, Revision 10. The staff reviewed Section 9.2.4 of the North Anna 3 COL FSAR, Revision 8, and checked the referenced ESBWR DCD, to ensure that the combination of the information in the COL FSAR and the information in the ESBWR DCD represents the complete scope of information relating to this review topic.[1]

The staff's review confirms that information in the application and the information incorporated by reference address the required information related to the PWS/SWDS.

The staff reviewed the relevant information in the COL FSAR:

Site-Specific Information Replacing Conceptual Design Information

- NAPS CDI Potable and Sanitary Water Systems

The staff reviewed NAPS CDI related to the site-specific design of the potable and sanitary water system included under Section 9.2.4 of the North Anna 3 COL FSAR, Revision 8. Meeting the requirements of GDC 60 for this system ensures that design provisions are in place to prevent liquid effluents containing radioactive materials from contaminating the PWS and SWDS and potentially being released to the environment.

The PWS and SWDS do not perform any safety-related function and are not connected to any safety-related systems. Failure of these systems does not affect any safety-related components or prevent a safe shutdown of the plant.

The proposed source of potable water for the PWS is water from ground wells, at a supply capacity of 12.6 liters per second (200 gallons per minute). It is stated in the application that the water quality will meet the standards of the authorities having jurisdiction. The PWS does not handle radioactive fluids, and it is not connected to and does not interface with any system potentially containing radioactive fluids. However, potable water is supplied to areas where potential backflow could cause radiological contamination. In the unlikely event of radiological intrusion into the PWS in these areas, the applicant has proposed use of backflow preventers to prevent the spread of contamination into the PWS. The staff concludes that because the PWS is not connected to or does not interface with systems that contain radioactivity, and backflow preventers are installed in areas of potential contamination, acceptable design provisions have been made to prevent the inadvertent contamination of the PWS with radioactive material.

The proposed SWDS consists of an onsite sewage treatment plant with a normal capacity of 94,500 liters per day (25,000 gallons per day) or a maximum capacity of 189,000 liters per day (50,000 gallons per day) of sanitary sewage. The effluent is discharged to the waste heat treatment facility. The effluent meets standards established by Federal, state, and local regulations and permits. The SWDS does not handle radioactive fluids. It is not connected to and does not interface with any system potentially containing radioactive fluids.

The staff requested information related to process and effluent monitoring and sampling provisions for the SWDS in RAI 11.05-2 dated May 19, 2008 (ADAMS Accession No. ML081410065). In their response to RAI 11.05-2 dated June 30, 2008 (ADAMS Accession No. ML081900515), the applicant removed composite samplers from the SWDS design and proposed a per batch sewage treatment plant sludge tank grab sampling program. The North Anna 3 FSAR was updated to reflect these changes. The staff concludes that the grab sampling program is adequate in detecting potential radiological contamination and preventing uncontrolled radioactive releases to the environment from this system for the following reasons: the SWDS is not connected to or does not interface with systems that contain radioactivity; sewage treatment plant sludge tank sampling will be performed; and acceptable design provisions have been made to prevent the inadvertent contamination of the SWDS with radioactive material and inadvertent radioactive releases to the environment.

Based on the staff's review of the applicant's design criteria and design bases for the potable and sanitary water systems, the staff finds that acceptable design provisions have been made to prevent the inadvertent contamination of the systems with radioactive material, and therefore find the proposed design of the potable and sanitary water system meets the requirements of GDC 60 and is acceptable.

The staff finds that the site-specific CDI presented within this section of the North Anna 3 COL FSAR is acceptable and meets the requirements of GDC 2, 4, and 60. The staff bases its conclusion on the fact that the potable and sanitary water systems have no safety-related functions and failure of the system would not compromise any safety-related system or component, nor would it prevent a safe shutdown of the plant. The North Anna 3 CDI for the PWS and SWDS have no interface with any safety-related equipment, and no interconnections exist between the PWS and SWDS and any potentially radioactive system. In addition, flooding consequences from the PWS storage tank was evaluated and determined to be acceptable since safety-related or RTNSS SSCs would not be negatively affected from performing their intended functions.

9.2.4.5 Post Combined License Activities

There are no post COL activities related to this section.

9.2.4.6 Conclusion

The staff's finding related to information incorporated by reference is in NUREG–1966. The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the required information relating to the potable and sanitary water systems, and no outstanding information is expected to be addressed in the COL FSAR related to this section. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to the potable and sanitary water systems that were incorporated by reference are resolved.

In addition, the staff compared the additional supplemental information in the application to the relevant NRC regulations, the guidance in SRP Section 9.2.4, and NRC regulatory guides. The staff concludes that the applicant's information on CDI in this section of the North Anna 3 COL FSAR is acceptable and meets the requirements of GDC 2, 4, and 60.

The staff bases its conclusion on the fact that the potable and sanitary water systems have no safety-related function and failure of the system would not compromise any safety-related system or component, nor would it prevent a safe shutdown of the plant. The North Anna 3 CDI for the PWS/SWDS have no interface with any safety-related equipment, and no interconnections exist between the PWS/SWDS and any potentially radioactive system. In addition, flooding consequences from the PWS storage tank was evaluated and determined to be acceptable since safety-related or RTNSS SSCs would not be negatively affected from performing their intended functions.

9.2.5 Ultimate Heat Sink

9.2.5.1 Introduction

The Ultimate Heat Sink (UHS) consists of the IC/PCCS pools, which provide the heat transfer mechanism for the reactor and containment to the atmosphere. The Fire Protection System

(FPS) provides makeup water for the IC/PCCS pools, and SFP from the primary (seismic Category I) firewater storage tanks via the safety-related Fuel and Auxiliary Pools Cooling System (FAPCS) piping, and other water sources that are credited for providing makeup water for the IC/PCCS pools, and SFP after water from the firewater storage tanks has been depleted. The Dryer/Separator pool and Reactor Well provide sufficient makeup water for the IC/PCCS expansion pools to support operation of the IC System and PCCS System during the initial 72 hours following an accident. A source of makeup water for the SFP is not credited during this period. After the initial 72 hours, the FPS is relied upon for supplying the necessary makeup water for the IC/PCCS pools or the SFP for up to 7 days. The parts of the UHS that are relied upon for the first 72 hours following an accident are safety-related and are evaluated in Section 5.4.6, "Isolation Condenser System (ICS)," and Section 6.2.2, "Passive Containment Cooling System." The parts of the UHS that are relied upon for providing makeup water during the period from 72 hours through 7 days post-accident are not required to be safety-related, but must be readily available on-site and are subject to RTNSS as discussed in Chapter 19A of the ESBWR DCD, Revision 10. This section evaluates the adequacy of the capability that is credited for providing makeup water to the IC/PCCS pools, or SFP after the initial 7 days have elapsed following an accident.

9.2.5.2 Summary of Application

Section 9.2.5, "Ultimate Heat Sink," of the North Anna 3 COL FSAR, Revision 8, incorporates by reference Section 9.2.5, "Ultimate Heat Sink," of the ESBWR DCD, Revision 10. In addition, in FSAR Section 9.2.5, the applicant provided the following:

COL Item

- STD COL 9.2.5-1-A Post Seven Day Makeup to UHS

The applicant provided additional information in STD COL 9.2.5-1-A to address DCD COL Item 9.2.5-1-A. The applicant stated that procedures will be provided to identify and prioritize available makeup water seven days after an accident and provide instructions for establishing the necessary connections. The procedures will be developed in accordance with the procedure development milestone in Section 13.5.

9.2.5.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is in NUREG–1966, the FSER for the ESBWR DCD. In addition, the relevant requirements of the Commission regulations for the UHS and the associated acceptance criteria are in SRP Section 9.2.5.

The applicable regulatory guidance for the evaluation of COL 9.2.5-1-A is as follows:

- GDC 2, 4, 44, 45, and 46
- GDC 5, "Sharing of Structures, Systems, and Components"

9.2.5.4 Technical Evaluation

As documented in NUREG–1966, the staff reviewed and approved Section 9.2.5 of the certified ESBWR DCD, Revision 10. The staff reviewed Section 9.2.5 of the North Anna 3 COL FSAR, Revision 8 and checked the referenced ESBWR DCD to ensure that the combination of the information in the COL FSAR and the information in the ESBWR DCD represents the complete scope of information relating to this review topic.[1]

The staff's review confirms that the information in the application and information incorporated by reference address the required information related to the UHS.

The staff reviewed the information in the North Anna 3 COL FSAR as follows:

<u>*COL Item*</u>

- STD COL 9.2.5-1-A Post Seven Day Makeup to UHS

The staff reviewed STD COL 9.2.5-1-A related to the makeup water to the UHS included under Section 9.2.5 of the North Anna 3 COL FSAR, Revision 8. As discussed above in the Introduction Section, the UHS consists of both safety-related and nonsafety-related SSCs. The staff's evaluation of the UHS for the ESBWR design focuses primarily on assuring that sufficient makeup water is available and can be supplied to the IC/PCCS pools, or SFP for long-term cooling after the initial 7 days have elapsed following an accident. Acceptability is judged based upon conformance with the regulatory basis referred to above, as applied to the standard plant design and reflected in Tier 2 of the ESBWR DCD, Revision 10, Section 9.2.5.

This COL information item is listed in Tier 2 of the ESBWR DCD, Section 9.2.5.1, "COL Information," and specifies that COL applicants need to develop procedures for supplying makeup water to the IC/PCCS pools or SFP 7 days after an accident. During the period from 72 hours up to 7 days following an accident, the FPS is credited for providing post-accident makeup water to the UHS through safety-related FAPCS piping. After 7 days, the applicant can either use offsite makeup sources to replenish the UHS water supply via safety-related FAPCS connections that are located outside the RB and FB, or the applicant can use on-site water sources if they are available. The minimum required flow rate that is specified for post-72 hour makeup is 46 meter (m) ^{3}/hr or (200 gallon per minute (gpm)), and makeup water quality is normally required to meet demineralized water chemistry specifications. However, during accident conditions, makeup water quality that satisfies FPS or SWS chemistry specifications can be used. The post 7-day makeup water source is not required to be safety-related or subject to RTNSS, but should be from sources that are diverse or highly reliable. These considerations are discussed in Tier 2 of the ESBWR DCD, Section 9.2.5, which specifically states: "The COL applicant will develop procedures to supply makeup water 7 days after an accident (9.2.5-1-A)."

The applicant provided the following response for this COL Item:

> Procedures that identify and prioritize available makeup sources seven days after an accident, and provide instructions for establishing necessary connections, will be developed in accordance with the procedure development milestone in Section 13.5.

Except for the development milestones that are referred to by the proposed response, it is not clear to what extent the other provisions of Section 13.5, "Plant Procedures," will be implemented, what makeup considerations will be addressed, what criteria will be satisfied, and how soon after an accident the makeup capability will be assessed. Therefore, the staff asked the applicant in RAI 09.02.05-1 dated June 19, 2008 (ADAMS Accession No. ML081710161) to provide additional information to address these considerations. In a response to RAI 09.02.05-1 dated August 4, 2008 (ADAMS Accession No. ML082200626), the applicant described details associated with UHS makeup procedure development. For “STD COL 9.2.5-1-A,” the applicant has stated that procedures will be provided to identify and prioritize available makeup sources for 7 days after an accident. In addition, the applicant made reference to Section 13.5.2.1.4, “Emergency Operating Procedures,” and stated that this UHS makeup procedure under, "STD COL 9.2.5-1-A", will be developed through the implementation of the operating procedure development process. The staff determined that this approach is acceptable since the applicant will develop this procedure and develop the details to address available means of makeup delivery which includes permanent plant systems, portable equipment and temporary delivery/processing systems in North Anna 3 FSAR, Section 9.2.5. Based on the RAI response, the statement in FSAR Section 9.2.5, and the schedule defined in FSAR Section 13.5, the staff determined this issue and RAI 09.02.05-1 are closed.

The staff evaluated STD COL 9.2.5-1-A using the relevant NRC regulations and acceptance criteria in SRP Section 9.2.1, along with GDC 2, 4, 5, 44, 45, and 46. The staff finds that the applicant has satisfactorily addressed this COL Item.

9.2.5.5 Post Combined License Activities

Procedures that identify and prioritize available makeup sources 7 days after an accident, and provide instructions for establishing necessary connections, will be developed in accordance with the procedure development milestone in FSAR Section 13.5.

9.2.5.6 Conclusions

The staff’s finding related to information incorporated by reference is in NUREG–1966. The staff reviewed the application and checked the referenced DCD. The staff’s review confirms that the applicant has addressed the required information relating to the UHS, and no outstanding information is expected to be addressed in the COL FSAR related to this section. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to the UHS that were incorporated by reference are resolved.

In addition, the staff compared the additional supplemental information in the application to the relevant NRC regulations, regulatory guides and the guidance in SRP Section 9.2.5. The staff’s review concludes that the applicant’s information is acceptable and meets the requirements of GDC 2, 4, 5, 44, 45, and 46. Therefore, the staff finds that the applicant has satisfactorily addressed DCD COL Item 9.2.5-1-A.

9.2.6 Condensate Storage and Transfer System

9.2.6.1 Introduction

The condensate storage and transfer system (CS&TS) supplies condensate-quality water for makeup to selected plant systems. It consists of two independent and 100 percent redundant transfer pumps, that takes suction from a single condensate storage tank (CST), and provides water to interface systems as required. The CST serves as a reservoir for the CS&TS water inventory and is the normal source of water for makeup to selected plant systems. It also provides storage capacity for condensate rejected from the condensate and feedwater system, for condensate quality liquid waste management system effluent during normal operation, and for condensate and feedwater system and hotwell inventory during system maintenance outages. The CS&TS is not a safety-related system, and does not perform any safety-related function.

9.2.6.2 Summary of Application

Section 9.2.6, “Condensate Storage and Transfer System,” of the North Anna 3 COL FSAR, Revision 8, incorporates by reference Section 9.2.6,” Condensate Storage and Transfer System,” of the ESBWR DCD, Revision 10.

In addition, in FSAR Section 9.2.6, the applicant provided the following:

Supplemental Information

- STD SUP 9.2.6-1 System Description

The applicant provided the following supplemental information. The applicant stated that freeze protection is provided for the North Anna 3 CS&TS.

9.2.6.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is in NUREG–1966, the FSER for the ESBWR DCD. In addition, the relevant requirements of the Commission regulations for the CS&TS and the associated acceptance criteria are in SRP Section 9.2.6.

SRP Section 9.2.6 states that “The safety-related portions of the condensate storage facility are protected from the effects of natural phenomena including cold weather, tornadoes, and flooding such that the event will not adversely affect the safety function of the system.”

Since the CS&TS is not a safety-related system, and does not perform any safety-related functions, there is no applicable regulatory requirement for the freeze protection for the CS&TS.

9.2.6.4 Technical Evaluation

As documented in NUREG–1966, the staff reviewed and approved Section 9.2.6 of the certified ESBWR DCD, Revision 10. The staff reviewed Section 9.2.6 of the North Anna 3 COL FSAR, Revision 8, and checked the referenced ESBWR DCD to ensure that the combination of the information in the COL FSAR and the information in the ESBWR DCD represents the complete scope of information relating to this review topic.[1]

The staff’s review confirms that the information in the application and the information incorporated by reference address the required information related to the CS&TS.

The staff reviewed the information in the North Anna 3 COL FSAR as follows:

Supplemental Information

- STD SUP 9.2.6-1 System Description

The staff reviewed STD SUP 9.2.6-1 related to the freeze protection for the CS&TS included under Section 9.2.6 of the North Anna 3 COL FSAR. The staff reviewed conformance of Section 9.2.6 of the North Anna COL FSAR to the relevant NRC regulations and acceptance criteria defined in SRP Section 9.2.6, “Condensate Storage Facilities.” The staff’s review finds that the applicant appropriately incorporated by reference Section 9.2.6 of the ESBWR DCD, Revision 10, with the following Tier 2 supplemental information added:

> The applicant provided supplemental information as part of the FSAR with regards to CS&TS freeze protection. In FSAR Section 9.2.6, the applicant added the following text to the end of the first paragraph of Section 9.2.6.2 of the ESBWR DCD, Revision 10: "Freeze protection is provided for the CS&TS."

The staff reviewed the standard supplemental information provided in STD SUP 9.2.6-1. Freeze protection for the CS&TS is addressed in Tier 2, Section 1.2.2.12.2, "Condensate Storage and Transfer System," of the ESBWR DCD, Revision 10. Although the CS&TS does not perform or ensure any safety-related function, and is not required to achieve or maintain safe shutdown, DCD Tier 2, Section 1.2.2.12.2 specifies that if required, the CS&TS will be provided with freeze protection. A general discussion on freeze protection is provided in FSAR Section 1.2.2.12.16, "Freeze Protection." The incorporation of freeze protection in the CS&TS design is a system enhancement that has no impact on the system's regulatory compliance, but could result in increased system reliability and availability; therefore the staff finds the proposed standard supplement acceptable.

9.2.6.5 Post Combined License Activities

There are no post COL activities related to this section.

9.2.6.6 Conclusion

The staff's finding related to information incorporated by reference is in NUREG–1966. The staff reviewed the application and checked the referenced DCD. The staff's review confirms that the applicant has addressed the required information relating to the CS&TS, and no outstanding information is expected to be addressed in the COL FSAR related to this section. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to the CS&TS that were incorporated by reference are resolved.

In addition, the staff compared the additional supplemental information in the application to the relevant NRC regulations, regulatory guides, and the guidance in SRP Section 9.2.6. The staff's review concludes that the applicant's information provided in STD SUP 9.2.6-1 is acceptable. The staff bases its conclusion on the fact that freeze protection in the CS&TS design is a system enhancement that has no impact on the system's regulatory compliance.

9.2.7 Chilled Water System

Section 9.2.7, "Chilled Water System," of the North Anna 3 COL FSAR, Revision 8, incorporates by reference, with no departures or supplements Section 9.2.7, "Chilled Water System," of the certified ESBWR DCD, Revision 10, referenced in 10 CFR Part 52, Appendix E. As documented in NUREG–1966, the staff reviewed and approved Section 9.2.7 of the certified ESBWR DCD. The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remains for review.[1]

The staff's review confirmed that the applicant has addressed the required information, and there is no outstanding information related to this section that remains to be addressed in the COL FSAR. Pursuant to 10 CFR 52.63(a)(5) and Section VI.B.1 of Appendix E to 10 CFR Part 52, all nuclear safety issues relating to the "Chilled Water System" that were incorporated by reference have been resolved.

9.2.8 Turbine Component Cooling Water System

Section 9.2.8, "Turbine Component Cooling Water System," of the North Anna 3 COL FSAR, Revision 8, incorporates by reference, with no departures or supplements Section 9.2.8, "Turbine Component Cooling Water System," of the certified ESBWR DCD, Revision 10, referenced in 10 CFR Part 52, Appendix E. As documented in NUREG–1966, the staff reviewed and approved Section 9.2.8 of the certified ESBWR DCD. The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remains for review.[1]

The staff's review confirmed that the applicant has addressed the required information, and there is no outstanding information related to this section that remains to be addressed in the COL FSAR. Pursuant to 10 CFR 52.63(a)(5) and Section VI.B.1 of Appendix E to 10 CFR Part 52, all nuclear safety issues relating to the "Turbine Component Cooling Water System" that were incorporated by reference have been resolved.

9.2.9 Hot Water System

Section 9.2.9, "Hot Water System," of the North Anna 3 COL FSAR, Revision 8, incorporates by reference, with no departures or supplements Section 9.2.9, "Hot Water System," of the certified ESBWR DCD, Revision 10, referenced in 10 CFR Part 52, Appendix E. As documented in NUREG–1966, the staff reviewed and approved Section 9.2.9 of the certified ESBWR DCD. The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remains for review.[1]

The staff's review confirmed that the applicant has addressed the required information, and there is no outstanding information related to this section that remains to be addressed in the COL FSAR. Pursuant to 10 CFR 52.63(a)(5) and Section VI.B.1 of Appendix E to 10 CFR Part 52, all nuclear safety issues relating to the "Hot Water System" that were incorporated by reference have been resolved.

9.2.10 Station Water System

9.2.10.1 Introduction

The SWS provides filtered and treated water as makeup to the circulating water system (CWS) cooling tower basin, the PSWS cooling tower basin, the MWS and to fill the primary firewater tanks.

9.2.10.2 Summary of Application

Section 9.2.10, "Station Water System," of the North Anna 3 COL FSAR, Revision 8, incorporates by reference Section 9.2.10, "Station Water System," of the ESBWR DCD, Revision 10.

In addition, in FSAR Section 9.2.10, the applicant provided the following:

Site Specific Information Replacing Conceptual Design Information

- NAPS CDI Detailed System Description

The applicant provided additional site-specific information to replace CDI contained in the ESBWR DCD and described the SWS. The SWS is comprised of two subsystems: (1) the plant cooling tower makeup subsystem (PCTMS) which provides makeup to the plant service water cooling towers and the main CWS cooling tower and (2) the pretreated water supply system (PWSS) which is used for filling the primary firewater tanks. The applicant provided Tables 9.2-203, "Station Water System – Plant Cooling Tower Makeup System Component Design Parameters," and 9.2-204, "Station Water System – Pretreated Water Supply System Component Design Parameters," which list the design parameters of the SWS equipment. The applicant provided Figures 9.2-204, "Station Water System – Plant Cooling Tower Makeup System (PCTMS)," and 9.2-205, "Station Water System – Pretreated Water Supply System (PWSS)," which depict the SWS.

9.2.10.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is in NUREG–1966, the FSER for the ESBWR DCD. In addition, there is no associated SRP section for the SWS.

The applicable regulatory guidance for the evaluation of NAPS CDI is as follows:

- GDC 2, in that failure of the nonsafety-related system or component due to natural phenomena such as earthquakes, tornadoes, hurricanes, and floods should not adversely affect the safety-related SSCs.

9.2.10.4 Technical Evaluation

As documented in NUREG–1966, the staff reviewed and approved Section 9.2.10 of the certified ESBWR DCD, Revision 10. The staff reviewed Section 9.2.10 of the North Anna 3 COL FSAR, Revision 8, and checked the referenced ESBWR DCD to ensure that the combination of the information in the COL FSAR and the information in the ESBWR DCD represents the complete scope of information relating to this review topic.[1]

The staff's review confirms that the information in the application and the information incorporated by reference address the required information related to the SWS.

The staff reviewed the information in the COL FSAR as follows:

Site Specific Information Replacing Conceptual Design Information

- NAPS CDI Detailed System Description

The staff reviewed NAPS CDI related to the ESBWR conceptual design of the SWS and the design parameters for the SWS components included under Section 9.2.10 of the North Anna 3 COL FSAR.

In FSAR Section 9.2.10.2, “System Description,” the applicant replaced the “Detailed System Description” portion of this section in the reference ESBWR DCD, Revision 10. In FSAR Section 9.2.10.2, the applicant provided the site-specific detailed description of SWS design proposed for North Anna 3. The SWS consists of two subsystems as previously stated: (1) PCTMS, and (2) PWSS.

The PCTMS provides makeup water to the cooling tower basins for both PSWS and CWS. The supply of water makes up for losses resulting from evaporation, drift, and blowdown from the cooling towers. In addition, the PCTMS provides makeup water to replace water used for strainer backwashes. The PCTMS consists of a water source, pumps, strainers, connecting piping, valves, and instrumentation. The applicant provided a simplified system diagram in FSAR Figure 9.2-204, “Station Water System – Plant Cooling Tower Makeup System (PCTMS),” and component design parameters for the PCTMS in FSAR Table 9.2-203, “Station Water System – Plant Cooling Tower Makeup System Component Design Parameters.”

The PWSS chemically conditions and filters the water supplied to the MWS for further treatment for use as demineralized water. The PWSS also supplies water to the FPS for filling the primary firewater tanks. In addition, the PWSS provides cooling tower makeup to the PSWS as an alternate to the PCTMS. The PWSS also provides water for the strainers and filter backwashes. The PWSS consists of a water source, pumps, strainers, filters, chemical injection equipment, and station water storage tank, connecting piping, valves, and instrumentation. Further, the applicant provided a simplified system diagram in FSAR Figure 9.2-205, “Station Water System – Pretreated Water Supply System (PWSS),” and component design parameters for the PCTMS in Table 9.2-204, “Station Water System – Pretreated Water Supply System Component Design Parameters.”

The staff reviewed the site-specific design information provided in NAPS FSAR Section 9.2.10.2, and finds that the applicant replaced the detailed system description from the reference ESBWR DCD, Section 9.2.10.2, “System Description,” as the site-specific NAPS CDI.

The SWS design in the application is identical to that in the DCD. Also, the staff finds that the applicant did not identify any departures and/or supplements, except that the applicant included additional information by providing the SWS-PWSS flow diagram in FSAR Figure 9.2-205 and component design parameters in FSAR Table 9.2-204. Additionally, the staff referred to Section 9.2.10.3, “Safety Evaluation,” in the ESBWR DCD and finds that the SWS has no safety-related function. The DCD further states that failure of the SWS does not compromise any safety-related system or component, nor does it prevent a safe shutdown of the plant. Further, the NAPS SWS has no interface with any safety-related equipment, and no interconnections exist between the SWS and any potentially radioactive system. The design information provided in the North Anna 3 COLA does not impact the conclusions in the ESBWR staff SER, and therefore the staff finds the North Anna 3 SWS design acceptable.

Based on the above discussion, the staff finds that the North Anna 3 SWS meets the requirements of GDC 2, since, it is a nonsafety-related system, and failure of the system or its components due to natural phenomena will have no adverse effects on safety-related SSCs.

Site Specific Pre-Operational Tests

In NAPS SUP 14.2-3 the applicant provided information in Section 14.2.9.1.1, “Station Water System Pre-Operation Test,” to address SWS pre-operational testing. The preoperational testing review is performed under Section 14.2 of this SER.

9.2.10.5 Post Combined License Activities

There are no post COL activities related to this section.

9.2.10.6 Conclusion

The staff's finding related to information incorporated by reference is in NUREG–1966. The staff reviewed the application and checked the referenced DCD. The staff's review confirms that the applicant has addressed the required information relating to the SWS, and no outstanding information is expected to be addressed in the COL FSAR related to this section. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to the SWS that were incorporated by reference are resolved.

In addition, the staff concludes that the site-specific design portion of the North Anna 3 SWS is acceptable and meets the relevant NRC regulations and regulatory guides. The staff's review concludes that the applicant's information is acceptable and meets the requirements of GDC 2.

9.3 Process Auxiliaries

9.3.1 Compressed Air Systems

Section 9.3.1, "Compressed Air Systems," of the North Anna 3 COL FSAR, Revision 8, incorporates by reference, with no departures or supplements Section 9.3.1, "Compressed Air Systems," of the certified ESBWR DCD, Revision 10, referenced in 10 CFR Part 52, Appendix E. As documented in NUREG–1966, the staff reviewed and approved Section 9.3.1 of the certified ESBWR DCD. The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remains for review.[1]

The staff's review confirmed that the applicant has addressed the required information, and there is no outstanding information related to this section that remains to be addressed in the COL FSAR. Pursuant to 10 CFR 52.63(a)(5) and Section VI.B.1 of Appendix E to 10 CFR Part 52, all nuclear safety issues relating to the "Compressed Air Systems" that were incorporated by reference have been resolved.

9.3.2 Process Sampling System

9.3.2.1 Introduction

The process sampling system is designed to collect representative water and gaseous samples for analysis contained in the reactor coolant system (RCS) and associated auxiliary system process streams during all normal modes of operation and following an accident. The proposed design includes permanently installed sample lines, sampling panels with analyzers and associated sampling equipment, provisions for local grab sampling, and permanent shielding. Provisions are made to ensure that representative samples are obtained from turbulent flow zones to ensure adequate mixing. Continuous sample flows are routed from selected locations to the sampling stations where pressure, temperature, and flow adjustments are made as necessary. Effluents from sample stations are returned to an appropriate process stream or to the radwaste drain headers through a common return line.

9.3.2.2 Summary of Application

Section 9.3.2,"Process Sampling System," of the North Anna 3 COL FSAR, Revision 8 incorporates by reference Section 9.3.2,"Process Sampling System," of the ESBWR DCD, Revision 10.

In addition, in FSAR Section 9.3.2, the applicant provided the following:

COL Item

- STD COL 9.3.2-1-A Post Accident Sampling Program

The applicant provided additional information in STD COL 9.3.2-1-A to address DCD COL Item 9.3.2-1-A. The applicant described the post-accident sampling (PAS) program. The PAS program consists of emergency operating procedures that rely on installed post-accident radiation monitoring instrumentation, plant procedures for obtaining highly radioactive grab samples, a containment monitoring system capable of operation in post loss-of-coolant accident (LOCA) mode, and effluent radiation monitoring. The PAS program functions in lieu of a dedicated post-accident sampling system (PASS).

9.3.2.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is in NUREG–1966, the FSER for the ESBWR DCD. In addition, the relevant requirements of the Commission regulations for the PAS program and the associated acceptance criteria are in SRP Section 9.3.2.

The applicable regulatory requirements for the PAS program are as follows:

- GDC 64, "Monitoring Radioactivity Releases"
- Item (b) of 10 CFR 20.1101(b), "Radiation Protection Programs"
- Section IV.B of Appendix E, "Emergency Planning and Preparedness for Production and Utilization Facilities," to 10 CFR Part 50

9.3.2.4 Technical Evaluation

As documented in NUREG–1966, the staff reviewed and approved Section 9.3.2 of the certified ESBWR DCD, Revision 10. The staff reviewed Section 9.3.2 of the North Anna 3 COL FSAR, Revision 8, and checked the referenced ESBWR DCD to ensure that the combination of the information in the COL FSAR and the information in the ESBWR DCD represents the complete scope of information relating to this review topic.[1]

The staff's review confirms that the information in the application and the information incorporated by reference address the required information related to the PAS program.

COL Item

- STD COL 9.3.2-1-A Post Accident Sampling Program

The staff reviewed STD COL 9.3.2-1-A related to the PAS program included under Section 9.3.2 of the North Anna 3 COL FSAR. The staff reviewed conformance of Section 9.3.2 of the North Anna 3 COL FSAR to the guidance in RG 1.206, Section C.III.1, Chapter 9, C.I.9.3.2, “Process and Post-Accident Sampling Systems.” The staff’s review of the North Anna 3 COL FSAR, Section 9.3.2 finds that it appropriately incorporates by reference Section 9.3.2 of the ESBWR DCD, Revision 10. In addition the applicant provided information on the North Anna 3 PAS program as required by STD COL 9.3.2-1-A of the ESBWR DCD. The PAS program meets the guidance provided in SRP Section 9.3.2.I.6 for actions required in lieu of a PASS as follows:

> Emergency Operating Procedures that rely on Emergency Action Levels, defined in the Emergency Plan (EP), are used to classify fuel damage events. These procedures rely on installed post-accident radiation monitoring instrumentation described in DCD Section 7.5 and do not require the capability to obtain and analyze highly radioactive coolant samples although sample analyses may be used for classification as well.
>
> Plant procedures contain instructions for obtaining highly radioactive grab samples from the following:
>
> - Reactor Coolant – from the reactor water cleanup/shutdown cooling sample line using the RB Sample Station. These samples can be analyzed for the parameters indicated in DCD Table 9.3-1. If coolant activity is greater than 1.0 Ci/ml, handling of the samples is delayed to avoid overexposure of personnel.
>
> - Suppression Pool – from FAPCS sample line at the RB Sample Station. These samples can be analyzed for the parameters indicated in DCD Table 9.3-1. If coolant activity is greater than 1.0 Ci/ml, handling of the samples is delayed to avoid overexposure of personnel.
>
> - Containment Atmosphere - may be taken as described in DCD Section 11.5.3.2.11 and analyzed for fission products.
>
> - DCD Section 7.5.2.2 describes Containment Monitoring System operation in post-LOCA mode for gaseous sampling for O2 and H2.
>
> - Effluent radiation monitoring is described in DCD Section 7.5. Field sampling and monitoring capability is maintained in accordance with the EP.
>
> - Post-accident monitoring is adequate to implement the EP without reliance on post-accident sampling capability; therefore, the absence of a dedicated Post-Accident Sampling System does not reduce the effectiveness of the EP.

As part of the review of FSAR, Revision 0, Section 11.5, the staff noted that FSAR Section 9.3.2.2 (System Description) refers incorrectly to Section 11.5.3.2.12 of the ESBWR DCD (Tier 2) regarding available provisions for sampling the containment atmosphere. This section of the ESBWR DCD addresses the radiation monitoring system for the technical support center (TSC) air intake and not the containment.

Accordingly, the applicant was requested in RAI 9.03.02-1 dated June 11, 2008 (ADAMS Accession No. ML081640399), to update the reference citation in FSAR Section 9.3.2.2 with the proper DCD Tier 2, Chapter 11.5 section addressing provisions for the sampling of containment atmosphere. In response to RAI 09.03.02-1 dated July 23, 2008 (ADAMS Accession No. ML082140231), the applicant proposed a revision to the section of the FSAR by correcting the improper reference. The staff finds that the applicant has revised their FSAR accordingly and RAI 09.03.02-1 is resolved and closed. The staff finds that the North Anna 3 COL FSAR, Revision 8, has adequately addressed STD COL 9.3.2-1-A by providing information that adequately describes the North Anna 3 PAS program capability.

The staff evaluated COL Item STD COL 9.3.2-1-A using the relevant NRC regulations and acceptance criteria in SRP Section 9.3.2. The staff finds that the applicant has satisfactorily addressed DCD COL Item 9.3.2-1-A with respect to the requirements of GDC 64, 10 CFR 20.1101(b) and Section IV.B of Appendix E to 10 CFR Part 50.

9.3.2.5 Post Combined License Activities

There are no post COL activities related to this section.

9.3.2.6 Conclusion

The staff's finding related to information incorporated by reference is in NUREG–1966. The staff reviewed the application and checked the referenced DCD. The staff's review confirms that the applicant has addressed the required information relating to the PAS program, and no outstanding information is expected to be addressed in the COL FSAR related to this section. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to the PAS, that were incorporated by reference are resolved.

In addition, the staff compared the additional supplemental information in the application to the relevant NRC regulations, the guidance in SRP Section 9.3.2, and other NRC regulatory guides. The staff's review concludes that the applicant's information presented in this section of the FSAR is acceptable and meets the requirements of GDC 64, 10 CFR 20.1101(b), and Section IV.B of Appendix E to 10 CFR Part 50. Therefore, staff finds that the applicant has satisfactorily addressed DCD COL Item 9.3.2-1-A.

9.3.3 Equipment and Floor Drain System

Section 9.3.3, "Equipment and Floor Drain System," of the North Anna 3 COL FSAR, Revision 8, incorporates by reference, with no departures or supplements Section 9.3.3, "Equipment and Floor Drain System," of the certified ESBWR DCD, Revision 10, referenced in 10 CFR Part 52, Appendix E. As documented in NUREG–1966, the staff reviewed and approved Section 9.3.3 of the certified ESBWR DCD. The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remains for review.[1]

The staff's review confirmed that the applicant has addressed the required information, and there is no outstanding information related to this section that remains to be addressed in the COL FSAR. Pursuant to 10 CFR 52.63(a)(5) and Section VI.B.1 of Appendix E to 10 CFR Part 52, all nuclear safety issues relating to the "Equipment and Floor Drain System" that were incorporated by reference have been resolved.

9.3.4 Chemical and Volume Control System

Section 9.3.4, "Chemical and Volume Control System," of the North Anna 3 COL FSAR, Revision 8, incorporates by reference, with no departures or supplements Section 9.3.4, "Chemical and Volume Control System," of the certified ESBWR DCD, Revision 10, referenced in 10 CFR Part 52, Appendix E. As documented in NUREG–1966, the staff reviewed and approved Section 9.3.4 of the certified ESBWR DCD. The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remains for review.[1]

The staff's review confirmed that the applicant has addressed the required information, and there is no outstanding information related to this section that remains to be addressed in the COL FSAR. Pursuant to 10 CFR 52.63(a)(5) and Section VI.B.1 of Appendix E to 10 CFR Part 52, all nuclear safety issues relating to the "Chemical and Volume Control System" that were incorporated by reference have been resolved.

9.3.5 Standby Liquid Control System

9.3.5.1 Introduction

The Standby Liquid Control System (SLCS) is an independent reactivity control system designed to provide both manual and automatically initiated capability for bringing the reactor from full power and minimum control rod inventory to a subcritical condition with the reactor in the most reactive state without taking credit for control rod movement. The SLCS performs safety-related functions; therefore, it is classified as safety-related and is designed as a seismic Category I system. The SLCS meets the following safety design bases by providing: (1) a diverse backup capability, independent of normal reactor shutdown methods, to shut down the reactor when the control rods fail to insert during AOOs and anticipated transients without scram (ATWS), and (2) makeup water to the reactor pressure vessel (RPV) to mitigate the consequences of a LOCA.

The SLCS is a passive system that consists of two identical and separate trains. Each SLCS train includes a nitrogen-pressurized accumulator containing sodium pentaborate solution and is connected by piping through two parallel injection explosive-actuated (squib) valves to the RPV. Each train provides 50 percent of the required SLCS injection capacity required for an ATWS.

9.3.5.2 Summary of Application

Section 9.3.5 of the North Anna 3 COL FSAR, Revision 8, incorporates by reference Section 9.3.5 of the ESBWR DCD, Revision 10.

In addition, in FSAR Section 9.3.5, the applicant provided the following:

<u>Supplemental Information</u>

- STD SUP 9.3.5-1 System Description

The applicant provided the following supplemental information:

STD SUP 9.3.5-1 added the following to the end of the fifth paragraph under "Detailed System Description" of DCD Section 9.3.5.2, "System Description":

The above provisions adequately prevent loss of solubility of borated solutions (sodium pentaborate).

9.3.5.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is in NUREG–1966, the FSER for the ESBWR DCD. In addition, the relevant requirements of the Commission regulations for the SLCS and the associated acceptance criteria are in SRP Section 9.3.5.

The applicable regulatory requirements for the SLCS thermal environmental conditions are as follows:

- GDC 2, 4, and 5
- GDC 26, “Reactivity control system redundancy and capability”
- GDC 27, “Combined reactivity control systems capability”
- Item (c)(4) of 10 CFR 50.62, “Requirements for reduction or risk from ATWS events for light-water-cooled nuclear power plants”
- 10 CFR 52.80(a)

9.3.5.4 Technical Evaluation

As documented in NUREG–1966, the staff reviewed and approved Section 9.3.5 of the certified ESBWR DCD, Revision 10. The staff reviewed Section 9.3.5 of the North Anna 3 COL FSAR, Revision 8, and checked the referenced ESBWR DCD to ensure that the combination of the information in the COL FSAR and the information in the ESBWR DCD represents the complete scope of information relating to this review topic.[1]

The staff’s review confirms that the information in the application and the information incorporated by reference address the required information related to the SLCS.

The staff reviewed the information in the COL FSAR as follows:

Supplemental Information

- STD SUP 9.3.5-1 System Description

The staff reviewed STD SUP 9.3.5-1-A related to the SLCS included under Section 9.3.5 of the North Anna 3 COL FSAR. The staff reviewed conformance of Section 9.3.5 of the COL FSAR to the guidance in RG 1.206, Section C.III.1, Chapter 9, C.I.9.3.5, “Standby Liquid Control System (BWRs).” The staff’s review of Section 9.3.5 of the COL FSAR finds that it appropriately incorporates by reference Section 9.3.5 of the ESBWR DCD, Revision 10.

The staff review of this application is limited to STD SUP 9.3.5-1, in which the applicant summarized that the provisions adequately prevent loss of solubility of borated solutions (sodium pentaborate).

The staff reviewed the resolution to the supplementary item related to the provisions to prevent loss of solubility of borated solutions (sodium pentaborate) included under Section 9.3.5.2 of the North Anna 3 COL FSAR. STD SUP 9.3.5-1, a supplemental information item, is an editorial change that enlightens and summarizes the technical information of the previous paragraphs in the DCD with respect to preventing the loss of solubility of borated solutions of the SLCS. The statement does not alter the technical information related to preventing loss of solubility of borated solutions or affect compliance with the relevant regulatory requirements and hence is acceptable. Because it is just an editorial change, the staff expects no additional information in the COL FSAR related to STD SUP 9.3.5-1.

9.3.5.5 Post Combined License Activities

There are no post COL activities related to this section.

9.3.5.6 Conclusion

The staff's finding related to information incorporated by reference is in NUREG–1966. The staff reviewed the application and checked the referenced DCD. The staff's review confirms that the applicant addressed the required information relating to the SLCS, and no outstanding information is expected to be addressed in the COL FSAR related to this section. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to the SLCS that were incorporated by reference are resolved.

In addition, the staff compared the supplemental information in the COLA to the relevant NRC regulations, the guidance in SRP Section 9.3.5, and other NRC regulatory guides. The staff's review concludes that applicant's information in this section of the COL FSAR is acceptable and meets the requirements of GDC 2, 4, 5, 26, and 27; 10 CFR 50.62(c)(4); and 10 CFR 52.80(a).

9.3.6 Instrument Air System

Section 9.3.6, "Instrument Air System," of the North Anna 3 COL FSAR, Revision 8, incorporates by reference, with no departures or supplements Section 9.3.6, "Instrument Air System," of the certified ESBWR DCD, Revision 10, referenced in 10 CFR Part 52, Appendix E. As documented in NUREG–1966, the staff reviewed and approved Section 9.3.6 of the certified ESBWR DCD. The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remains for review.[1]

The staff's review confirmed that the applicant has addressed the required information, and there is no outstanding information related to this section that remains to be addressed in the COL FSAR. Pursuant to 10 CFR 52.63(a)(5) and Section VI.B.1 of Appendix E to 10 CFR Part 52, all nuclear safety issues relating to the "Instrument Air System" that were incorporated by reference have been resolved.

9.3.7 Service Air System

Section 9.3.7, "Service Air System," of the North Anna 3 COL FSAR, Revision 8, incorporates by reference, with no departures or supplements Section 9.3.7, "Service Air System," of the certified ESBWR DCD, Revision 10, referenced in 10 CFR Part 52, Appendix E. As documented in NUREG–1966, the staff reviewed and approved Section 9.3.7 of the certified ESBWR DCD. The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remains for review.[1]

The staff's review confirmed that the applicant has addressed the required information, and there is no outstanding information related to this section that remains to be addressed in the COL FSAR. Pursuant to 10 CFR 52.63(a)(5) and Section VI.B.1 of Appendix E to 10 CFR Part 52, all nuclear safety issues relating to the "Service Air System" that were incorporated by reference have been resolved.

9.3.8 High Pressure Nitrogen Supply System

Section 9.3.8, "High Pressure Nitrogen Supply System," of the North Anna 3 COL FSAR, Revision 8, incorporates by reference, with no departures or supplements Section 9.3.8, "High Pressure Nitrogen Supply System," of the certified ESBWR DCD, Revision 10, referenced in 10 CFR Part 52, Appendix E. As documented in NUREG–1966, the staff reviewed and approved Section 9.3.8 of the certified ESBWR DCD. The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remains for review.[1]

The staff's review confirmed that the applicant has addressed the required information, and there is no outstanding information related to this section that remains to be addressed in the COL FSAR. Pursuant to 10 CFR 52.63(a)(5) and Section VI.B.1 of Appendix E to 10 CFR Part 52, all nuclear safety issues relating to the "High Pressure Nitrogen Supply System" that were incorporated by reference have been resolved.

9.3.9 Hydrogen Water Chemistry System

9.3.9.1 Introduction

The hydrogen water chemistry system (HWCS) is designed to inject hydrogen into the feedwater system at the suction of the feedwater pumps to reduce oxidizing species in the RCS. The addition of hydrogen reduces the likelihood of corrosion failures that would adversely affect plant availability. Oxygen is injected into the off-gas system to ensure a proper mixture of hydrogen and oxygen.

ESBWR DCD Section 9.3.9 addresses information related to the ESBWR HWCS. The HWCS is not within the certified scope of the ESBWR. The ESBWR Standard Plant Design includes the capability to incorporate a HWCS, but the system itself is not part of the ESBWR Standard Plant Design.

9.3.9.2 Summary of Application

Section 9.3.9, "Hydrogen Water Chemistry," of the North Anna 3 COL FSAR, Revision 8, incorporates by reference Section 3.9, "Hydrogen Water Chemistry," of the ESBWR DCD, Revision 10.

In addition, in FSAR Section 9.3.9, the applicant provided the following:

COL Items

- STD COL 9.3.9-1-A		Implementation of Hydrogen Water Chemistry

The applicant provided additional information in STD COL 9.3.9-1-A to address DCD COL Item 9.3.9-1-A. The applicant stated that the hydrogen water chemistry (HWC) option is included in the plant's design.

- NAPS COL 9.3.9-2-A		Hydrogen and Oxygen Storage and Supply

The applicant provided additional information in NAPS COL 9.3.9-2-A to address DCD COL Item 9.3.9-2-A. The applicant stated that the hydrogen supply system for the HWCS is integrated with the generator hydrogen supply system and is described in DCD Section 10.2.2.2.8.

Site Specific Information Replacing Conceptual Design Information

- NAPS CDI		System Description

The applicant provided additional information to replace CDI in the ESBWR DCD. The applicant described the HWC injection points and states that a monitoring system is provided to track the effectiveness of the HWCS.

- NAPS CDI		Hydrogen Storage Facility

The applicant provided additional information to replace CDI in the ESBWR DCD. The applicant provided a description of the hydrogen storage facility.

The hydrogen is stored in two independent 6,000 gallon ASME Section VIII, Division 1 cryogenic tanks located outside the plant protected area.

Separate skid mounted gaseous bulk hydrogen storage bottles ensure hydrogen supply for generator cooling as a backup for the liquid hydrogen supply for North Anna 3.

- STD CDI		Power Generation Design Basis

The applicant provided additional information to replace CDI in the ESBWR DCD. The applicant stated that hydrogen is injected into the feedwater at the suction of the feedwater pumps and oxygen is injected into the off-gas system.

- STD CDI		Inspection and Testing Requirements

The applicant provided additional information to replace CDI in the ESBWR DCD. The applicant stated that the connections for the HWCS are tested and inspected with the feedwater and off-gas piping. Major components of the HWCS are inspected and tested as separate components prior to installation.

- STD CDI Instrumentation and Controls

The applicant provided additional information to replace CDI in the ESBWR DCD. The applicant stated that instrumentation is provided to control the injection of hydrogen and augment the injection of oxygen.

9.3.9.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is in NUREG–1966, the FSER for the ESBWR DCD.

There is no associated SRP section for the HWCS.

The applicable industry requirements for the HWCS, which have been endorsed by the NRC, are as follows:

- Electric Power Research Institute (EPRI) Report NP-4947-SR, “BWR Hydrogen Water Chemistry Guidelines,”

- EPRI Report NP-5283-SR-A, “Guidelines for Permanent BWR Hydrogen Water Chemistry Installations,”

9.3.9.4 Technical Evaluation

As documented in NUREG–1966, the staff reviewed and approved Section 9.3.9 of the certified ESBWR DCD, Revision 10. The staff reviewed Section 9.3.9 of the North Anna 3 COL FSAR, Revision 8, and checked the referenced ESBWR DCD to ensure that the combination of the information in the COL FSAR and the information in the ESBWR DCD represents the complete scope of information relating to this review topic.[1]

The staff’s review confirms that the information in the application and the information incorporated by reference address the required information related to the HWCS.

The staff reviewed the information in the COL FSAR as follows:

COL Items

- STD COL 9.3.9-1-A Implementation of Hydrogen Water Chemistry

The HWCS is composed of hydrogen and oxygen supply systems to inject hydrogen in the feedwater and oxygen in the off-gas while several monitoring systems track the effectiveness of the HWCS. Provisions are made in the design to allow for installation of a system adding hydrogen to the feedwater at the suction of the feedwater pumps. The ESBWR DCD requires that the HWCS utilizes the guidance included in the EPRI Report NP-4947-SR, “BWR Hydrogen Water Chemistry Guidelines,” 1987 Revision. The report provides guidelines on how to operate the HWCS. The staff has endorsed the report in its SER of the EPRI Utility Requirements Document and on that basis the staff finds EPRI Report NP-4947-SR, 1987 Revision acceptable. In addition, the staff finds that the North Anna COL FSAR has adequately addressed STD COL 9.3.2-1-A by providing information that adequately describes the North Anna 3 HWCS and incorporates the EPRI guidance.

- NAPS COL 9.3.9-2-A Hydrogen and Oxygen Storage and Supply

The HWCS is nonsafety-related; however, given the potential for hydrogen combustion or detonation, the handling of hydrogen at nuclear power plant facilities needs to be safe, reliable, and consistent with the requirements for using hydrogen gas. The ESBWR DCD requires that any HWCS installations including the means for storing and handling hydrogen meet the EPRI Report NP-5283-SR-A, "Guidelines for Permanent BWR Hydrogen Water Chemistry Installations." The report provides guidance to store and handle hydrogen at nuclear power facilities. The staff has endorsed EPRI Report NP-5283-SR-A in its letter J.E. Richardson to G.H. Niels dated July 13, 1987. Because it follows the NRC-endorsed report, the staff finds that the North Anna COL FSAR specifies an acceptable method to handle and store hydrogen for the HWCS and incorporates the EPRI guidance. The staff evaluated the potential accidents from hydrogen storage in Section 2.2.3 of this SER.

Site-Specific Information Replacing Conceptual Design Information

The staff finds that all the NAPS and STD CDIs listed below are acceptable because they do not affect the staff's safety evaluation of the HWCS in the ESBWR DCD. These site-specific CDIs also do not affect the COL applicant's incorporation of the EPRI guidelines as the main guidance for the proper operation and installation of the HWCS.

- NAPS CDI System Description

The staff finds the site-specific additional information acceptable because it provides the design details for the North Anna 3 monitoring system to track the effectiveness of the HWCS that meet the NRC-endorsed EPRI guidelines.

- NAPS CDI Hydrogen Storage Facility

The staff finds that the North Anna COL FSAR provides the additional site-specific information that specifies an acceptable method to store hydrogen that meet the NRC-endorsed EPRI guidelines.

- STD CDI Power Generation Design Basis

The staff finds the CDI acceptable because it provides the site-specific additional information as to the designed location where the gas is injected to meet the NRC-endorsed EPRI guidelines.

- STD CDI Inspection and Testing Requirements

The staff finds the CDI acceptable because the site-specific additional information will ensure that the HWCS will work as designed and will meet the NRC-endorsed EPRI guidelines.

- STD CDI Instrumentation and Controls

The staff finds the CDI acceptable because the site-specific additional information provides the design detailed information on the proper functionality of the HWCS to meet the NRC-endorsed EPRI guidelines.

9.3.9.5 Post Combined License Activities

There are no post COL activities related to this section.

9.3.9.6 Conclusion

The staff's finding related to information incorporated by reference is in NUREG–1966. The staff reviewed the application and checked the referenced DCD. The staff's review confirms that the applicant has addressed the required information relating to the HWCS, and no outstanding information is expected to be addressed in the COL FSAR related to this section. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to the HWCS that were incorporated by reference are resolved.

In addition, the staff compared the additional COL supplemental information in the application to the relevant NRC regulations, the guidance in applicable industry standards, and other NRC regulatory guides. The staff's review concludes that the applicant's information on STD CDI and NAP3 CDI in this FSAR section is acceptable and meets the NRC-endorsed EPRI guidelines.

The staff also finds that the applicant has satisfactorily addressed DCD COL Items 9.3.9-1-A and 9.3.9-2-A with respect to the NRC-endorsed EPRI guidelines.

9.3.10 Oxygen Injection System

9.3.10.1 Introduction

The oxygen injection system (OIS) is designed to add oxygen to the Condensate and Feedwater System in order to reduce corrosion and suppress corrosion product release. The OIS does not perform any safety-related function. This section of the North Anna 3 COL FSAR addresses information related to the ESBWR OIS. Industry experience has shown that the most beneficial oxygen concentration is between 30 to 200 ppb. The OIS is also designed to inject oxygen into the off-gas system when the HWC is implemented, to ensure that excess hydrogen in the off-gas stream is recombined.

9.3.10.2 Summary of Application

Section 9.3.10, "Oxygen Injection System," of the North Anna 3 COL FSAR, Revision 8 incorporates by reference Section 9.3.10 of the ESBWR DCD, Revision 10.

In addition, in FSAR Section 9.3.10, the applicant provided the following;

COL Item

- NAPS COL 9.3.10-1-A Oxygen Storage Facility

The applicant provided additional information in NAPS COL 9.3.10-1-A to address DCD COL Item 9.3.10-1-A. The applicant described the bulk oxygen storage facility which consists of a 9,000 gallon ASME Section VIII, Division 1 cryogenic tank located outside the plant fenced area. The tank is equipped with an atmospheric vaporizer, a pressure regulating valve, an excess flow check valve and relief valves.

9.3.10.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is in NUREG–1966, the FSER for the ESBWR DCD. In addition, there is no associated SRP section, for the oxygen storage facility. However, the staff uses the following applicable industry standards and requirements for the HWCS:

- EPRI Report NP-4947-SR, 1987 Revision
- EPRI Report NP-5283-SR-A, 1987 Revision

9.3.10.4 Technical Evaluation

As documented in NUREG–1966, the staff reviewed and approved Section 9.3.10 of the certified ESBWR DCD, Revision 10. The staff reviewed Section 9.3.10 of the North Anna 3 COL FSAR, Revision 8, and checked the referenced ESBWR DCD to ensure that the combination of the information in the COL FSAR and the information in the ESBWR DCD represents the complete scope of information relating to this review topic.[1]

The staff's review confirms that the information in the application and the information incorporated by reference address the required information related to the OIS.

The staff reviewed the information in the COL FSAR as follows:

COL Item

- NAPS COL 9.3.10-1-A Oxygen Storage Facility

The staff reviewed NAPS COL 9.3.10-1-A related to the oxygen storage facility included under Section 9.3.10 of the North Anna 3 COL FSAR, Revision 8. The OIS is designed to add sufficient oxygen (30 to 200 ppb) to reduce corrosion, general corrosion, and the release of corrosion products in the condensate and feedwater systems. The requirements for design, operation, maintenance, surveillance, and testing of the oxygen storage facility are specified in EPRI Report NP-5283-SR-A, "Guidelines for Permanent BWR Hydrogen Water Chemistry Installations." The ESBWR DCD specifies that any HWCS installations meet the EPRI Report NP-5283-SR-A. In addition, the oxygen storage facility is located in an area where the amount of combustible material is limited through design and administrative controls. North Anna 3 COL FSAR uses the guidance of EPRI Report NP-5283-SR-A to store and handle oxygen. The staff has endorsed EPRI Report NP-5283-SR-A in its letter J.E. Richardson to G.H. Niels dated July 13, 1987. Therefore, the staff finds that the North Anna COL FSAR specifies an acceptable method to handle and store oxygen.

In addition, the staff finds that the North Anna 3 COL FSAR has adequately addressed NAPS COL 9.3.10-1-A by providing information that adequately describes the North Anna 3 oxygen injection module of the HWCS and by providing an acceptable description of the oxygen storage facility.

9.3.10.5 Post Combined License Activities

There are no post COL activities related to this section.

9.3.10.6 Conclusion

The staff's finding related to information incorporated by reference is in NUREG–1966. The staff reviewed the application and checked the referenced DCD. The staff's review confirms that the applicant has addressed the required information relating to the OIS, and no outstanding information is expected to be addressed in the North Anna 3 COL FSAR related to this section. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to the OIS, that were incorporated by reference are resolved.

In addition, the staff compared the additional COL supplemental information in the application to the relevant NRC regulations, the guidance in applicable industry standards, and other NRC regulatory guides. The staff's review concludes that the applicant's information in this FSAR section is acceptable and meets the NRC endorsed EPRI guidelines. The staff also finds that the applicant has satisfactorily addressed DCD COL Item 9.3.10-1-A with respect to the NRC endorsed EPRI guidelines.

9.3.11 Zinc Injection System

9.3.11.1 Introduction

Minimizing the plateout of radioactive cobalt on reactor coolant piping can lead to potentially lower dose rates in the vicinity of this piping and result in correspondingly lower doses to personnel in the portions of the plant containing this piping. In order to minimize the plateout of radioactive cobalt on reactor coolant piping and other components, the North Anna 3 design will incorporate a Zinc Injection System (ZNIS). The ESBWR standard plant design includes the capability to connect a ZNIS and space, but the system itself is not part of the ESBWR standard plant design and is not a safety-related system. Each applicant first would determine based on material properties if a ZNIS system is needed. If it is needed then the applicant provides a system description.

9.3.11.2 Summary of Application

Section 9.3.11, "Zinc Injection System," of the North Anna 3 COL FSAR, Revision 8, incorporates by reference Section 9.3.11, "Zinc Injection System," of the certified ESBWR DCD, Revision 10.

In addition, in FSAR Section 9.3.11, the applicant provided the following;

- NAPS COL 9.3.11-1-A — Applicant Determination if a Zinc Injection System is needed

The site-specific design includes the ZNIS for control of reactor coolant cobalt.

- NAPS COL 9.3.11-2-A — System Description

A passive ZNIS system is provided which consists of a simple recirculation loop around the feedwater pumps that continuously injects small amounts of depleted zinc oxide into the reactor feedwater through the dissolution of depleted zinc oxide pellets contained in the ZNIS vessel.

Site-Specific Information Replacing Conceptual Design Information

- NAPS CDI System Description

The referenced DCD includes CDI for certain systems, or portions of systems, that are outside the scope of the standard plant design. The ESBWR standard plant design includes provisions for connecting an optional ZNIS which includes the following design considerations: (1) piping connections for a bypass loop around the feedwater pumps, and (2) space for ZNIS equipment that is considered site-specific CDI.

9.3.11.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is in NUREG–1966, the FSER for the ESBWR DCD.

There is no associated SRP section for the ZNIS.

The industry guidelines applicable to HWCS and related to the effects of water impurities on reactor internals, which have been endorsed by the NRC, are as follows:

- EPRI Report NP-4947-SR, “BWR Hydrogen Water Chemistry Guidelines,”
- EPRI Report NP-5283-SR-A, “Guidelines for Permanent BWR Hydrogen Water Chemistry Installations”

9.3.11.4 Technical Evaluation

As documented in NUREG–1966, the staff reviewed and approved Section 9.3.11 of the certified ESBWR DCD, Revision 10. The staff reviewed Section 9.3.11 of the North Anna 3 COL FSAR, Revision 8, and checked the referenced ESBWR DCD to ensure that the combination of the information in the COL FSAR and the information in the ESBWR DCD represents the complete scope of information relating to this review topic.[1]

The staff’s review confirms that the information in the application and the information incorporated by reference address the required information related to the ZNIS.

The staff reviewed the information in the COL FSAR as follows:

COL Item

- NAPS COL 9.3.11-1-A Applicant Determination if a Zinc Injection System is needed
- NAPS COL 9.3.11-2-A System Description

In the North Anna 3 FSAR, the applicant stated that these COL Items (STD COL 9.3.11-1-A and STD COL 9.3.11-2-A) address the provisions for a ZNIS for North Anna 3. The staff’s review confirms that the applicant has addressed the relevant information and no outstanding information is expected to be addressed in the COL FSAR related to this section. From a dose reduction perspective of the ZNIS, the staff in Section 12.3 of this SER, provides an evaluation of the applicant’s use of a ZNIS for North Anna 3.

- NAPS CDI System Description

The staff finds the CDI item acceptable because it provides for the optional provision for a ZNIS for North Anna 3 which would provide a reduction of on-site dose to plant personnel addressed in this SER in Section 12.3.

9.3.11.5 Post Combined License Activities

There are no post COL activities related to this section.

9.3.11.6 Conclusion

The staff's review confirmed that the applicant has addressed the required information, and there is no outstanding information related to this section that remains to be addressed in the COL FSAR. Pursuant to 10 CFR 52.63(a)(5) and Section VI.B.1 of Appendix E to 10 CFR Part 52, all nuclear safety issues relating to the "Zinc Injection System" that were incorporated by reference have been resolved.

In addition, the staff compared the additional COL supplemental information in the application to the relevant guidance in applicable industry standards. The staff's review concludes that the applicant's information in this FSAR section is acceptable and meets the NRC-endorsed EPRI guidelines.

9.3.12 Auxiliary Boiler System

Section 9.3.12, "Auxiliary Boiler System," of the North Anna 3 COL FSAR, Revision 8, incorporates by reference, with no departures or supplements Section 9.3.12, "Auxiliary Boiler System" of the certified ESBWR DCD, Revision 10, referenced in 10 CFR Part 52, Appendix E. As documented in NUREG–1966, the staff reviewed and approved Section 9.3.12 of the certified ESBWR DCD. The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remains for review.[1]

The staff's review confirmed that the applicant has addressed the required information, and there is no outstanding information related to this section that remains to be addressed in the COL FSAR. Pursuant to 10 CFR 52.63(a)(5) and Section VI.B.1 of Appendix E to 10 CFR Part 52, all nuclear safety issues relating to the "Auxiliary Boiler System" that were incorporated by reference have been resolved.

9.4 Heating, Ventilation, and Air Conditioning

Section 9.4, "Heating, Ventilation, and Air Conditioning," of the North Anna 3 COL FSAR, Revision 8, incorporates by reference, with no departures or supplements Section 9.4, "Heating, Ventilation, and Air Conditioning," of the certified ESBWR DCD, Revision 10, referenced in 10 CFR Part 52, Appendix E. As documented in NUREG–1966, the staff reviewed and approved Section 9.4 of the certified ESBWR DCD. The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remains for review.[1]

The staff's review confirmed that the applicant has addressed the required information, and there is no outstanding information related to this section that remains to be addressed in the COL FSAR. Pursuant to 10 CFR 52.63(a)(5) and Section VI.B.1 of Appendix E to 10 CFR

Part 52, all nuclear safety issues relating to the heating, ventilation, and air conditioning, that were incorporated by reference have been resolved.

9.5 Other Auxiliary Systems

9.5.1 Fire Protection System

9.5.1.1 Introduction

This section of the North Anna 3 COL FSAR describes the FPS which provides assurance, through a defense-in-depth philosophy, that the Commission's fire protection objectives are satisfied. These objectives are: (1) to prevent fires from starting; (2) to detect rapidly, control, and extinguish promptly those fires that do occur; and (3) to provide protection for SSCs important to safety so that a fire that is not promptly extinguished by the fire suppression activities will not prevent the safe shutdown of the plant. In addition, FPS must be designed such that their failure or inadvertent operation does not adversely impact the ability of the SSCs important to safety to perform their safety functions. The FPS has a RTNSS function to provide post 72-hour makeup to the IC/PCCS pools or the SFP depending on the makeup needs.

9.5.1.2 Summary of Application

Section 9.5.1, Appendix 9A, and Appendix 9B of the North Anna 3 COL FSAR, Revision 8 incorporates by reference Section 9.5.1, Appendix 9A, and Appendix 9B of the ESBWR DCD, Revision 10.

In addition, in FSAR Section 9.5.1, the applicant provided the following:

COL Items:

- NAPS COL 9.5.1-1-A Secondary Firewater Storage Source

The applicant provided additional information in NAPS COL 9.5.1-1-A to address DCD COL Item 9.5.1-1-A. The applicant identified Lake Anna as the secondary source of water. The lake has a capacity well in excess of 550,000 gallons as specified in ESBWR DCD, Revision 10, and as per guidance given in RG 1.189, Revision 2, "Fire Protection for Nuclear Power Plants**,"** Regulatory Position 3.2.1.

- NAPS COL 9.5.1-2-A Secondary Firewater Capacity

The applicant provided additional information in NAPS COL 9.5.1-2-A to address DCD COL Item 9.5.1-2-A. The applicant stated that tests will be performed to demonstrate that the secondary fire protection pump circuit supplies the required flow and pressure at the Turbine Building/Yard interface boundary. DCD Section 14.2.8.1.39 which is incorporated by reference states that FPS tests are in accordance with the criteria in codes and standards listed in Table 9.5-1. FSAR Table 1.9-201 and Table 1.9-204 supplements DCD Table 9.5-1 for those systems outside the scope of the DCD and operational aspects of the fire detection and suppression systems. Table 1.9-204 adds additional codes and standards applicable to the site-specific Yard criteria. Therefore, secondary pump curve tests and flow tests will be in accordance with National Fire Protection Association (NFPA) 20, "Standard for the Installation of Stationary Pumps for Fire Protection."

- NAPS COL 9.5.1-4-A Piping and Instrumentation Diagrams

The applicant provided additional information in NAPS COL 9.5.1-4-A to address DCD COL Item 9.5.1-4-A. The applicant provided Figures 9.5-201, 9.5-202 and 9.5-203 depicting the site-specific firewater supply piping.

- STD COL 9.5.1-5-A Fire Barriers

The applicant provided additional information in STD COL 9.5.1-5-A to address DCD COL Item 9.5.1-5-A. The applicant stated that the mechanical and electrical penetration seals are qualified to RG 1.189 through testing by an independent laboratory. Certification test results will be available for review at least 6 months before receipt of fuel.

- STD COL 9.5.1-6-A Smoke Control

The applicant provided additional information in STD COL 9.5.1-6-A to address DCD COL Item 9.5.1-6-A. The applicant stated that the procedures for manual smoke control will be developed as part of the Fire Protection Program implementation. The program will be operational for areas storing new fuel prior to receipt of the fuel. Other elements of the Fire Protection Program will be operational before initial fuel load.

- STD COL 9.5.1-7-A Fire Hazards Analysis (FHA) Compliance Review

The applicant provided additional information in STD COL 9.5.1-7-A to address DCD COL Item 9.5.1-7-A. The applicant stated that the compliance review of the as-built design against the assumptions and requirements stated in the FHA will be completed in accordance with the milestone schedule in FSAR Section 13.4. ESBWR DCD, Revision 10 includes the specific items to be reviewed.

- STD COL 9.5.1-8-A Fire Protection Program Description

The applicant provided additional information in STD COL 9.5.1-8-A to address DCD COL Item 9.5.1-8-A. The applicant stated that the Fire Protection Program elements necessary to support receipt and storage of fuel onsite for buildings storing new fuel and adjacent fire areas that could affect the fuel storage area are fully operational prior to receipt for new fuel. The remaining required elements of the Fire Protection Program will be fully operational prior to initial fuel load per FSAR Section 13.4.

- NAPS COL 9.5.1-10-A Fire Brigade

The applicant provided additional information in NAPS COL 9.5.1-10-A to address DCD COL Item 9.5.1-10-A. The applicant stated that the fire brigade will be implemented in accordance with the milestones in FSAR Section 13.4 for the Fire Protection Program.

- STD COL 9.5.1-11-A Quality Assurance

The applicant provided additional information in STD COL 9.5.1-11-A to address DCD COL Item 9.5.1-11-A. The applicant stated the following:

“Quality assurance controls are applied to the activities involved in the design, procurement, installation, and testing and the administrative controls of FPS, in accordance with the measures outlined in Chapter 17.

For the operational fire protection program, the Quality Assurance Program implements the requirements of RG 1.189 through site-specific administrative controls procedures. The procedures will be developed six months before fuel receipt and will be fully implemented prior to fuel receipt.”

- NAPS COL 9A.7-1-A Yard Fire Zone Drawings

The applicant provided additional information in STD COL 9A.7-1-A to address DCD COL Item 9A.7-1-A. STD COL 9A.7-1-A provides Yard fire zone drawings for the site-specific portions of the Yard.

- NAPS COL 9A.7-2-A Detailed Fire Hazards Analysis of the Yard

The applicant provided additional information in STD COL 9A.7-2-A to address DCD COL Item 9A.7-2-A. NAPS COL 9A.7-2-A commits to performing a detailed FHA of the Yard area that is outside the scope of the certified design.

Supplemental Information

- NAPS SUP 9.5.1-1 and NAPS SUP 9A-01 Codes, Standards and Regulatory Guidance

The applicant provided Table 9.5-201 to supplement DCD Table 9.5-1 for those portions of the Fire Protection Program that are not addressed in the ESBWR DCD and for operational aspects of the fire detection and suppression systems.

- STD SUP 9.5.1-3 Combustible and Ignition Source Controls

The applicant revised FSAR Section 9.5.1.15.6 to add combustible and ignition source controls for areas adjacent to the main control room (MCR) and in computer rooms that are not part of the MCR complex and prohibit storage of transient combustibles below the raised floor in the MCR complex and prohibit the storage of hazardous chemicals in areas that contain or expose equipment important to safety.

9.5.1.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is in NUREG–1966, the FSER for the ESBWR DCD. In addition, the relevant requirements of the Commission regulations for the Fire Protection Program and the associated acceptance criteria are given in SRP Section 9.5.1.

The applicable regulatory requirements for the Fire Protection Program are as follows:

- 10 CFR 50.48(a), “Fire protection,”
- 10 CFR Part 50 Appendix A, GDC 3, “Fire protection,”
- 10 CFR Part 50 Appendix A, GDC 5
- 10 CFR Part 50 Appendix A, GDC 19, ”Control Room,”

- 10 CFR Part 50 Appendix A, GDC 23, “Protection system failure modes,”
- RG 1.189, Revision 2

In addition to the regulatory requirements and guidance provided above, SRP Section 9.5.1 provides enhanced fire protection criteria for new reactor designs, as documented in SECY-90-016, “Evolutionary Light Water Reactor (LWR) Certification Issues and Their Relationship to Current Regulatory Requirements,” dated January 12, 1990; SECY-93-087, “Policy, Technical, and Licensing Issues Pertaining to Evolutionary and Advanced Light-Water Reactor (ALWR) Designs,” dated April 2, 1993; and SECY-94-084. SECY-90-016 provides enhanced fire protection criteria for evolutionary LWRs. SECY-93-087 recommends that the enhanced criteria be extended to include passive reactor designs. The Commission approved SECY-90-016 and SECY-93-087 in staff requirements memoranda. SECY-94-084, in part, provides criteria defining safe-shutdown conditions for passive LWR designs.

9.5.1.4 Technical Evaluation

As documented in NUREG–1966, the staff reviewed and approved Section 9.5.1 of the certified ESBWR DCD, Revision 10. The staff reviewed Section 9.5.1 of the North Anna 3 COL FSAR, Revision 8, and checked the referenced ESBWR DCD to ensure that the combination of the information in the COL FSAR and the information in the ESBWR DCD represents the complete scope of information relating to this review topic.[1]

The staff’s review confirms that the information in the application and the information incorporated by reference address the required information related to the FPS.

The staff reviewed the information in the COL FSAR as follows:

The staff reviewed the relevant information in the COL FSAR and the applicant’s responses to RAI letters accordingly and concludes that the relevant information in the COL and Supplemental Information Items, and responses to RAIs is acceptable and meets the requirements of GDC 3, 5, 19 and 23 of Appendix A to 10 CFR Part 50, 10 CFR 50.48 and is in conformance with SECY-90-016, SECY-93-087 and SECY-94-084 as shown below:

North Anna 3 conforms to the SRP Section 9.5.1 acceptance criteria with the following exceptions:

- SRP Acceptance Criterion 1 (RG 1.174, Revision 1 – PRA Insights) does not apply to North Anna 3. PRA has not been applied to the design of the plant-specific Fire Protection Program.

- SRP Acceptance Criterion 2 (RG 1.188, Revision 1 – License Renewal) and 4 (RG 1.191 – Decommissioning) are not applicable to the North Anna 3 COLA.

- SRP Acceptance Criterion 3 (RG 1.189, Revision 1 – Fire Protection): North Anna 3 conforms except that the site executive in charge of construction (Vice President – Nuclear Development) is in charge of fire protection during construction as described in North Anna 3 COL FSAR, Revision 7, Table 1.9-202 and Section 13.1.

- SRP Acceptance Criterion 5 (RG 1.206, Regulatory Position C.III.1, Section C.I.9.5.1 – Fire Protection Program): North Anna 3 conforms to the nine requirements listed in Section C.I.9.5.1 as per North Anna 3 COL FSAR, FSAR, Revision 8, Section 9.5.1, Appendix 9A, Appendix 9B, Section 13.1.1.2.1, Section 13.1.1.2.10, Section 13.1.1.3.2.2.4, and Section 13.1.2.1.1. See also the RAI technical evaluations shown below.

- SRP Acceptance Criterion 6 (SECY-90-016, SECY-93-087, and SECY-94-084): North Anna 3 conforms as per North Anna 3 COL FSAR, Revision 8, Table 1.9-201 and the technical evaluation below for RAI 09.05.01-16 and STD COL Item 9.5.1-6-A.

- SRP Acceptance Criterion 7 implementation milestones: North Anna 3 does not conform to the requirement for the Fire Protection Program to be fully implemented prior to fuel receipt at the plant site. North Anna 3 will use a two tier approach such that the elements of the Fire Protection Program necessary to support receipt and storage of fuel onsite for buildings storing new fuel and adjacent fire areas that could affect the fuel storage area are fully operational prior to receipt for new fuel. Other required elements of the Fire Protection Program described in this FSAR section are fully operational prior to initial fuel loading per FSAR Section 13.4.

The staff reviewed the relevant information in the COL FSAR:

COL Item

- NAPS COL 9.5.1-1-A Secondary Firewater Storage Source

The staff reviewed NAPS COL 9.5.1-1-A related to secondary firewater sources included under Section 9.5.1.4 of the North Anna 3 COL FSAR, Revision 8. The staff determined that the volume of the secondary firewater source, identified to be Lake Anna, is well in excess of the 550,000 gallons minimum specified in ESBWR DCD, Revision 10. The staff therefore finds that North Anna 3 COL FSAR, Revision 8 fully addresses this COL information item.

- NAPS COL 9.5.1-2-A Secondary Firewater Capacity

The staff reviewed NAPS COL 9.5.1-2-A related to secondary firewater capacity included under Section 9.5.1.4 of the North Anna 3 COL FSAR, Revision 8. The staff determined that each secondary fire pump will be tested to show that each pump can supply a minimum of 2,130 gpm with sufficient discharge pressure to develop a minimum of 107 psig line pressure at the Turbine Building/Yard interface boundary which is the same as the DCD requirement. This test cannot be performed until the system is built. This activity will be completed prior to fuel receipt. DCD Section 14.2.8.1.39, which is incorporated by reference, states that FPS tests are in accordance with the criteria in codes and standards listed in Table 9.5-1 and by FSAR Table 9.5-201. Therefore, secondary pump curve tests and flow test will be in accordance with NFPA 20. Accordingly, the staff finds that North Anna 3 COL FSAR, Revision 8 fully addresses this COL information item.

- NAPS COL 9.5.1-4-A Piping and Instrumentation Diagrams

The staff reviewed NAPS COL 9.5.1-4-A related to the site-specific simplified piping and instrumentation diagrams included under Section 9.5.1 of the North Anna 3 COL FSAR, Revision 8. The staff reviewed Figures 9.5.201, 9.5.202, and 9.5.203 of the North Anna 3 COLA and DCD Figure 9.5.1, and determined that these figures do provide simplified diagrams of the site-specific firewater piping as requested by the DCD. The staff requested in RAI 09.05.01-17 dated July 27, 2008 (ADAMS Accession No. ML082100346), the applicant to include all the appropriate fire water loads of the plant in these figures. The applicant responded to RAI 09.05.01-17 dated September 4, 2008 (ADAMS Accession No. ML082530448), clarifying a few inconsistencies between these figures in the ESBWR DCD and the North Anna 3 FSAR COL. Included in the response was a clarification that North Anna 3 does not have a dedicated warehouse but will utilize the existing warehouse buildings that support North Anna 1 and 2. The North Anna 3 sharing of the Units 1 and 2 existing warehouse buildings does not adversely affect the Fire Protection Program at North Anna 3 because there is no equipment important to safety and in use located in these structures. The staff finds that North Anna 3 COL FSAR, Revision 7 fully addresses this COL information item.

- STD COL 9.5.1-5-A Fire Barriers

The staff reviewed NAPS COL 9.5.1-5-A related to the qualification of fire barriers included under Section 9.5.1.10 of the North Anna 3 COL FSAR, Revision 8. The staff determined that mechanical and electrical penetration seals and electrical raceway fire barrier systems will be qualified to the requirements delineated in RG 1.189 by a recognized testing laboratory in accordance with the applicable guidance of NFPA 251, “Standard Methods of Tests of Fire Resistance of Building Construction and Materials,” and/or American Society for Testing and Materials (ASTM) E-119, “Standard Test Methods for Fire Tests of Building Construction and Materials.” Detailed design in this area is not complete. Specific design and certification test results for penetration seal designs and electrical raceway fire barrier systems will be available for inspection at least 6 months prior to fuel receipt. The staff therefore finds that North Anna 3 COL FSAR, Revision 8, fully addresses this COL information item.

- STD COL 9.5.1-6-A Smoke Control

The staff reviewed STD COL 9.5.1-6-A related to manual smoke control included under Section 9.5.1.11 of the North Anna 3 COL FSAR, Revision 8. The staff determined that procedures for manual smoke control will be developed as part of the Fire Protection Program implementation in accordance with milestones in FSAR Section 13.4. Smoke removal provisions are in accordance with NFPA 804, “Standard for Fire Protection for Advanced Light Water Reactor Electric Generating Plants,” except Sections 8.4.3 (3) and 8.4.3.2 as per the DCD. NFPA 804 has not been endorsed by the NRC but is considered acceptable where it does not conflict with regulatory requirements and guidance. The staff in RAI 09.05.01-3 dated June 11, 2008 (ADAMS Accession No. ML081630351) requested that the applicant should specify the appropriate NRC regulatory requirements and guidance when conflicts exist with NFPA 804. The applicant’s response to RAI 09.05.01-3 dated July 23, 2008 (ADAMS Accession No. ML082140230) stated that should a conflict exist between RG 1.189 and NFPA 804, the North Anna 3 COLA conforms to RG 1.189. Automatic sprinkler protection is provided where applicable to limit heat and smoke generation as per the DCD. The staff noted that the North Anna 3 COL FSAR did not provide enough information regarding the enhanced fire protection requirements for new reactors found in SECY 90-016 and SECY 93-087. Specifically, the requirement related to the mitigation of the spread of smoke, hot gases, and fire suppressants from the fire-affected safety division to any non-fire-affected safety division. The staff requested additional information describing how the FHA will evaluate the potential for the migration of smoke, hot gases, or fire suppressant to prevent safe shutdown and will verify that fire dampers that do not close on smoke detection are not to be relied upon to prevent the migration of smoke from one redundant train to another. The applicant's response to RAI 09.05.01-16 dated September 4, 2008 (ADAMS Accession No. ML082530448), stated that FSAR Section 9.5.1 incorporated by reference ESBWR DCD, Section 9.5.1, which describes the ESBWR plant design features that address building ventilation, fire barriers, and smoke control necessary for safe shutdown. As stated in the ESBWR DCD, the design satisfies the guidance SRP Section 9.5.1 and BTP SPLB 9.5-1, which state that smoke, hot gases, or fire suppressant does not migrate into other fire areas to the extent that safe shutdown capabilities, including operator actions, could be adversely affected. The ESBWR fire protection design satisfies this guidance with a combination of fire dampers and other barriers, smoke evacuation capabilities, and minimal required operator actions. Additionally, manual smoke control procedures will be developed as part of the Fire Protection Program implementation. Smoke–rated dampers that close on smoke detection are provided in areas where smoke migration into other areas can adversely affect safe shutdown. Details are provided in the FHA in Appendix 9A. There are no fire protection-related site-specific design features that are required to ensure safe-shutdown of the plant.

For the reasons discussed above, the staff finds that North Anna 3 COL FSAR, Revision 8 fully addresses this COL information item.

- STD COL 9.5.1-7-A FHA Compliance Review

The staff reviewed STD COL 9.5.1-7-A related to review for FHA compliance included under Section 9.5.1.12 of the North Anna 3 COL FSAR, Revision 8. The staff determined that a compliance inspection of the as-built design against the assumptions and requirements stated in the FHA will be completed in accordance with the milestones in FSAR Section 13.4. This is acceptable to the staff. ESBWR DCD, Revision 10 includes all the specific items to be inspected in STD 9.5.1-7-A and deleted STD SUP 9.5.1-2. The staff finds that North Anna 3 COL FSAR, Revision 7 fully addresses this COL information item.

- STD COL 9.5.1-8-A Fire Protection Program Description

The staff reviewed STD COL 9.5.1-8-A related to the operational status of the Fire Protection Program included under Section 9.5.1.15 of the North Anna 3 COL FSAR, Revision 8. The staff determined that the elements of the Fire Protection Program necessary to support receipt and storage of fuel onsite for buildings storing new fuel and adjacent fire areas that could affect the fuel storage area will be fully operational prior to receipt for new fuel. Remaining required elements of the Fire Protection Program described in this section will be fully operational prior to initial fuel loading per Section 13.4 of this SER. SRP Section 9.5.1.1, Revision 0 states that Fire Protection Program should be fully implemented prior to fuel receipt at the plant site. Additionally, the Fire Protection Program requirements are incorporated by reference to the DCD. The staff accepts North Anna 3's fire protection implementation milestones as given in Section 13.4 since they will provide appropriate protection consistent with the plant's completion schedule. The staff finds that North Anna 3 COL FSAR, Revision 8 fully addresses this COL information item.

- NAPS COL 9.5.1-10-A Fire Brigade

The staff reviewed NAPS COL 9.5.10-1-A related to implementation of the fire brigade included under Sections 9.5.1.15.4 and 13.1.2.1.5 of the North Anna 3 COL FSAR, Revision 8. The staff determined that implementation of the fire brigade will be in accordance with the milestones in

Section 13.4 for the Fire Protection Program. The staff accepts North Anna 3's fire brigade implementation milestones as given in Section 13.4 since they will provide appropriate protection consistent with the plant's completion schedule. Additionally, the fire brigade requirements are incorporated by reference to the DCD. The staff finds that North Anna 3 COL FSAR, Revision 8 fully addresses this COL information item.

- STD COL 9.5.1-11-A Quality Assurance

The staff reviewed STD COL 9.5.1-11-A related to implementation of the QA program included under Section 9.5.1 of the North Anna 3 COL FSAR, Revision 8. The staff determined that the QA controls for activities involved in the design, procurement, installation, and testing and administrative controls of FPS for safety-related areas is in accordance with the measures outlined in Chapter 17. The applicant's response to RAI 09.05.01-11 dated July 23, 2008 (ADAMS Accession No. ML082140230), stated that in addition to safety-related areas, QA controls will be applied to fire protection for nonsafety-related areas, consistent with FSAR Appendix 17BB. This includes areas with nonsafety-related SSCs that are significant contributors to plant safety. For the operational Fire Protection Program, the QA Program implements the requirements of RG 1.189 through site-specific administrative controls procedures. These operational QA procedures will be developed 6 months prior to fuel receipt and will be fully implemented prior to fuel receipt. The staff accepts North Anna 3's fire protection QA program milestones since they will provide appropriate protection consistent with the plant's completion schedule. The staff finds that North Anna 3 COL FSAR, Revision 7 fully addresses this COL information item.

- NAPS COL 9A.7-1-A Yard Fire Zone Drawings

The staff reviewed STD COL 9A.7-1-A related to site Yard fire zone drawings included under Appendix 9A of the North Anna 3 COL FSAR, Revision 7. The staff reviewed the revised Yard fire zone drawings, Figures 9A.2-201 through 9A.2-206, and the information in Section 9A.4.7, and determined that the site-specific Yard fire zones have been included as needed and reflect design evolution changes unrelated to fire protection, and added missing information. The staff finds that North Anna 3 COL FSAR, Revision 7 fully addresses this COL information item (see also NAPS COL 9.5.1-4-A evaluation above).

- NAPS COL 9A.7-2-A Detailed Fire Hazards Analysis of the Yard

The staff reviewed STD COL 9A.7-2-A related to site detailed FHA included under Appendix 9A of the North Anna 3 COL FSAR, Revision 7. The staff reviewed the information in Sections 9A.4.7, 9A.5.7, 9A.5.8, 9A.5.9, and 9A.5.12 and determined that the detailed FHA of the plant areas that are outside the scope of the certified design will be completed 6 months prior to fuel load. The staff accepts North Anna 3's site-specific FHA milestones since they will provide appropriate protection consistent with the plant's completion schedule. The staff finds that North Anna 3 COL FSAR, Revision 8, fully addresses this COL information item.

Supplemental Information

- NAPS SUP 9.5.1-1 and 9A-01 Codes, Standards and Regulatory Guidance

The staff reviewed NAPS SUP 9.5.1-1 and NAPS SUP 9A-01 related to the codes and standards included under Section 9.5.1 and Appendix 9A of the North Anna 3 COL FSAR, Revision 7. The staff determined that revised Table 9.5-201 added the codes and standards that are applicable for those portions of the Fire Protection Program outside the scope of the DCD and for the operational aspects of the Fire Protection Program. Section 9.5.1.15.1, Fire Protection Program Criteria, of the North Anna 3 COL FSAR also utilized Table 9.5-201 to supplement DCD Table 9.5-1. These added codes and standards are acceptable for North Anna 3 since the NFPA standards listed are referenced in RG 1.189; the Virginia Statewide Building Code is a local code that is required to be met by North Anna 3; Environmental Protection Agency standards are Federal standards that apply to North Anna 3; and the ASME Code, Section IX is approved for use by the NRC; where applicable. Additionally, two footnotes were removed from DCD Table 9.5-2 that do not apply to the North Anna 3 COLA.

- NAPS SUP 9.5.1-1 Primary and Secondary Firewater Source

The staff reviewed NAPS SUP 9.5.1-1 related to the water treatment of the primary and secondary firewater sources under Section 9.5.1.4 of the North Anna 3 COL FSAR, Revision 8. The staff determined that revised Section 9.5.1.4 under FSAR, Revision 7, changed the firewater treatment chemical for the primary fire source to Hydrogen Peroxide. The Hydrogen Peroxide is injected into the discharge side of the PWSS pumps which draws water from Lake Anna and then supplies the treated water to various areas of the plant including filling of the primary firewater storage tanks. The secondary firewater source is treated using Hypochlorite. The Hypochlorite is injected into the discharge side of the secondary fire pumps located in the Station Water Intake Building. The staff was concerned about the non-filtering of the secondary water source; however, the applicant stated that although strainers are used, filtering is not required because of the small amount of total suspended solids in the lake water. Based on the water quality requirements with NFPA 13, "Standard for Installation of Sprinkler Systems," and the applicant's maintenance program for maintaining the fire water at an acceptable level, the staff finds the use of strainers and chemical cleaning agents sufficient to maintain the water quality. The staff determined that Hydrogen Peroxide and Hypochlorite are acceptable water treatment agents for fire suppression systems for their ability to combat biofouling and microbiologically induced corrosion. These agents used in conjunction with strainers, and applicable filtering media form an acceptable level of water quality expected in fire suppression systems as per RG 1.189 and applicable NFPA codes.

- STD SUP 9.5.1-3 Combustible and Ignition Source Controls

The staff reviewed revised FSAR Section 9.5.1.15.6 and the applicant's responses to RAIs 09.05.01-5, 6, and 7 to add combustible and ignition source controls for areas adjacent to the MCR and in computer rooms that are not part of the MCR complex and prohibit storage of transient combustibles below the raised floor in the MCR complex and prohibit the storage of hazardous chemicals in areas that contain or expose equipment important to safety. The development of these procedures will be as per North Anna 3 COL FSAR, Section 13.5.

The staff noted that the ESBWR DCD took exception to the RG 1.189 guidance to provide automatic suppression in the rooms adjacent to the MCR. In RAI 09.05.01-5 dated June 11, 2008 (ADAMS Accession No. ML081630351), the staff requested the applicant to describe the program to control the fire hazard presented by paper or other combustible materials, as well as potential ignition sources (e.g., coffee makers) in the MCR complex. The applicant's response to RAI 09.05.01-5 dated July 23, 2008 (ADAMS Accession No. ML082140230), stated that in addition to the administrative controls described in ESBWR DCD Section 9.5.1.15.6, the North Anna 3 FSAR will be revised to include administrative requirements to specifically control combustible materials and potential ignition sources in rooms adjacent to the MCR. The staff finds that the response to this RAI is acceptable and that the proposed FSAR revision has been incorporated into the North Anna 3 COL FSAR, Revision 8 as required.

The staff also noted that the ESBWR DCD took exception to the RG 1.189 guidance to providing automatic fire suppression below the raised floor in the MCR complex. In RAI 09.05.01-6 dated June 11, 2008 (ADAMS Accession No. ML081630351), the staff requested the applicant to describe the approach restricting transient combustibles in this area and describe the extent to which cabling below the raised floor will be contained in conduit. The applicant's response to RAI 09.05.01-6 dated July 23, 2008 (ADAMS Accession No. ML082140230), stated that in addition to the administrative controls described in ESBWR DCD Section 9.5.1.15.6, the North Anna 3 COL FSAR will be revised to prohibit the storage of transient combustibles below the raised floor in the MCR complex. Regarding cables in conduit under the raised floor, the applicant stated that North Anna 3 does not specify any site-specific design criteria outside the scope of the DCD. The staff finds that the response to this RAI is acceptable and that the proposed FSAR revision has been incorporated into the North Anna 3 COL FSAR, Revision 7 as required.

The staff also noted that the ESBWR DCD took exception to the RG 1.189 guidance to providing fixed automatic suppression for computer rooms for computers performing functions important to safety that are not part of the MCR complex. In RAI 09.05.01-7 dated June 11, 2008 (ADAMS Accession No. ML081630351), the staff requested the applicant to describe the program controlling the fire hazard presented by paper or other combustible materials, as well as potential ignition sources in these rooms. The applicant's response to RAI 09.05.01-7 dated July 23, 2008 (ADAMS Accession No. ML082140230), stated that in addition to the administrative controls described in ESBWR DCD Section 9.5.1.15.6, the North Anna 3 COL FSAR will be revised to include administrative requirements to specifically control combustible materials and potential sources in computer rooms that are not part of the MCR complex. The staff finds that the response to this RAI is acceptable and that the proposed FSAR revision has been incorporated into the North Anna 3 COL FSAR, Revision 7 as required.

The staff finds that the combustible and ignition controls are acceptable and meet the guidance of RG 1.189. The staff also finds that the proposed FSAR revisions have been incorporated into the North Anna 3 COL FSAR, Revision 8 as required.

Multiple Spurious Actuations

The staff noted that the application lacked information regarding the assumptions and methodologies that will be used by the applicant to identify, assess, and resolve the potential for multiple spurious actuations that may prevent post-fire safe-shutdown. This is a subject area of great interest, and the NRC published and/or endorsed guidance in this matter. In a staff RAI 09.05.01-2 dated June 11, 2008 (ADAMS Accession No. ML081630351) a question in regards to this issue was submitted to the applicant. The applicant's response to RAI 09.05.01-2 dated July 23, 2008 (ADAMS Accession No. ML082140230), stated that GE Hitachi (GEH) will address this issue in a related DCD RAI and that the NRC stated during a July 9, 2008, conference call that the applicant did not need to provide a response to this RAI since GEH was to address this issue. This issue was subsequently addressed in the ESBWR DCD, Revision 10, which includes revised language in Section 9A.2.4 regarding acceptance criteria guidelines for the multiple spurious actuation analysis and resolution methodology. The ESBWR DCD, Revision 10, states the fire hazard analysis will be conducted in accordance with RG 1.189 and NFPA 804. The staff noted that the fire hazard analysis includes a multiple spurious actuation review. The ESBWR DCD states the circuit routing will conform to methodology provided in

Revision 1 of NEI 00-01, “Guidance for Post-Fire Safe Shutdown Analysis,” in accordance with Regulatory Issue Summary (RIS) 05-030, “Clarification of Post-Fire Safe-Shutdown Circuit Regulatory Requirements.” The ESBWR DCD also states that post-fire safe-shutdown circuit analysis will assume that any spurious actuations associated with a postulated fire occur simultaneously or in rapid succession. The staff finds this methodology acceptable and meets the guidance found in RG 1.189. The staff finds that the response to this RAI and current language of ESBWR DCD, Revision 10 is acceptable and that there are no FSAR changes required. Therefore, this DCD item is resolved and closed.

In RAI 09.05.01-18 dated July 27, 2008 (ADAMS Accession No. ML082100346) Fire Fighting Strategies for MCR Cabinets, the staff noted that the ESBWR DCD took exception to the RG 1.189 guidance to providing smoke detectors in the MCR cabinets and consoles. However, the COL applicant lacked the detailed descriptions of the cabinet design features that would facilitate rapid identification of the specific cabinet/console that is on fire and facilitate rapid access to the cabinets/consoles for firefighting. The applicant’s response to RAI 09.05.01-18 dated September 4, 2008 (ADAMS Accession No. ML082530448), stated that the requirements to develop specific firefighting procedures and train fire brigade members are addressed in the ESBWR DCD and in the North Anna 3 COL FSAR. ESBWR DCD, Section 9.5.1.15.5 requires that procedures be developed to, in part, define the strategies established for fighting fires in safety-related areas and areas presenting a hazard to safe shutdown equipment. Strategies for fighting fires in the MCR will be included in these procedures and will address specific cabinet design features, as appropriate. The development of these procedures will be as per North Anna 3 COL FSAR, Table 13.5-202. The staff finds that the response to this RAI is acceptable and that there are no FSAR changes required.

9.5.1.5 Post Combined License Activities

The applicant identified the following items:

- STD COL 9.5.1-2-A commits to testing each secondary firewater pump prior to fuel receipt to verify it can supply a minimum of 2,130 gpm with a minimum pressure of 107 psig line pressure at the Turbine Building/Yard interface boundary. (see FSAR 9.5.1.4 and 14.2.8.1.39)

- STD COL 9.5.1-5-A commits to having specific design and certification test results for penetration seals and electrical raceway fire barrier systems available for inspection 6 months prior to fuel receipt to address COL Item STD COL 9.5.1-5-A. (see FSAR 9.5.1.10)

- STD COL 9.5.1-6-A commits to establishing procedures for manual smoke control as part of the Fire Protection Program implementation to address COL Item 9.5.1-6-A. The smoke removal provisions will be completed in accordance with the milestone schedule established in FSAR Section 13.4. (see FSAR 9.5.1.11)

- STD COL 9.5.1-7-A commits to performing an as-built design compliance review against the assumptions and requirements stated in the FHA to address COL tem 9.5.1-7-A. The as-built FHA will be completed in accordance with the milestone schedule established in FSAR Section 13.4. (see FSAR 9.5.1.12)

- STD COL 9.5.1-8-A commits to having the Fire Protection Program operational to address COL Item 9.5.1-8-A. The Fire Protection Program elements necessary to support receipt and storage of fuel onsite for buildings storing new fuel and adjacent fire areas that could affect the fuel storage area will be fully operational prior to receipt for new fuel. The remaining required elements of the Fire Protection Program will be fully operational prior to initial fuel load. The Fire Protection Program elements will be operational in accordance with the milestone schedule established in FSAR Section 13.4. (see FSAR 9.5.1.15)

- NAPS COL 9.5.1-10-A commits to providing for fire brigade implementation in accordance with the milestones in FSAR Section 13.4 to address COL Item 9.5.1-10-A. In addition, the applicant's response to RAI 09.05.01-18 commits to developing fire-fighting strategies for the MCR complex along with those procedures discussed in ESBWR DCD, Section 9.5.1.15.5 and in accordance with North Anna 3 COL FSAR, Table 13.5-202. (see FSAR 9.5.1.15.4 and 9.5.1.15.5)

9.5.1.6 Conclusion

The staff's finding related to information incorporated by reference is in NUREG–1966. The staff reviewed the application and checked the referenced DCD. The staff's review confirms that the applicant has addressed the required information relating to the FPS, and no outstanding information is expected to be addressed in the COL FSAR related to this section. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to the MWS that were incorporated by reference are resolved.

The staff concludes that the relevant information presented within the COL FSAR is acceptable and meets the requirements of GDC 3, 5, 19, and 23 of Appendix A to 10 CFR Part 50, 10 CFR 50.48 and is in conformance with RG 1.189, SECY-90-016, SECY-93-087, and SECY-94-084. The staff based this conclusion on the above technical evaluations of the relevant information given in the COL and Supplemental Information Items, and responses to RAIs.

9.5.2 Communication Systems

9.5.2.1 Introduction

This section of the North Anna 3 COL FSAR describes the communication systems which provide interplant communications and plant-to-offsite communications during normal, maintenance, transient, fire, and accident conditions.

9.5.2.2 Summary of Application

Section 9.5.2, "Communication System," of the North Anna 3 COL FSAR, Revision 8, incorporates by reference Section 9.5.2, "Communication System," of the ESBWR DCD, Revision 10.

In addition, in FSAR Section 9.5.2.5, the applicant provided the following:

COL Items

- NAPS COL 9.5.2.5-1-A Emergency Notification System

This COL Item requested a description of the Emergency Notification System (ENS). The applicant stated that the information required is addressed in FSAR Section 9.5.2.2.

- NAPS COL 9.5.2.5-2-A Grid Transmission Operator

This COL Item requested a description of the transmission system operator communication link. The applicant stated that the information required is addressed in FSAR Section 9.5.2.2 and in the EP Sections II.F.1.

- NAPS COL 9.5.2.5-3-A Offsite Interfaces (1)

This COL Item requested a description of the means of communication with the MCR, TSC, emergency operations facility (EOF), state and local emergency operation centers and radiological field personnel in accordance with NUREG–0696, "Functional Criteria for Emergency Response Facilities," February 1981 and NUREG–0654,"Criteria for Preparation and Evaluation of Radiological Emergency Response Plans and Preparedness in Support of Nuclear Power Plants." The applicant stated that the information required is addressed in FSAR Section 9.5.2.2 and in the EP Sections II.E.1 and II.F.1.

- NAPS COL 9.5.2.5-4-A Offsite Interfaces (2)

This COL Item requested a description of the communication methods from the MCR, TSC, and EOF to the NRC headquarters including establishment of Emergency Response Data Systems (ERDS) in accordance with NUREG–0696. The applicant stated that the information required is addressed in FSAR Section 9.5.2.2 and in the EP Sections II.E.1 and II.F.1.

- NAPS COL 9.5.2.5-5-A Fire Brigade Radio System

This COL Item requested a description of the Fire Brigade Radio System. The applicant stated that the information required is addressed in FSAR Section 9.5.2.2.

9.5.2.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is in NUREG–1966, the FSER for the ESBWR DCD.

In addition, the relevant requirements of the Commission regulations for the communications systems and the associated acceptance criteria are given in SRP Section 9.5.2.

The applicable regulatory requirements for the ENS and prompt communications among principal response organizations and emergency response personnel are as follows:

- 10 CFR Part 50, Appendix E, Part IV.E.9
- 10 CFR 50.47(b)(5) and (b)(6)

The related acceptance criteria are as follows:

- NRC Bulletin (BL) 80-15, “Possible Loss of Emergency Notification System (ENS) with Loss of Offsite Power,” June 18, 1980

- NUREG–0696, February 1981.

- NUREG–0654/FEMA-REP-1, Revision 1

- RG 1.189, Section 4.1.7

- GL 91-14, “Emergency Telecommunications,” dated September 23, 1991

9.5.2.4 Technical Evaluation

As documented in NUREG–1966, the staff reviewed and approved Section 9.5.2 of the certified ESBWR DCD, Revision 10. The staff reviewed Section 9.5.2 of the North Anna 3 COL FSAR, Revision 8, and checked the referenced ESBWR DCD to ensure that the combination of the information in the COL FSAR and the information in the ESBWR DCD represents the complete scope of information relating to this review topic.[1]

The staff’s review confirms that the information in the application and the information incorporated by reference address the required information related to the Communication Systems.

The staff examined the EP Sections II.E and II.F which are relevant to the COL Item responses. The detailed review of EP Sections II.E and II.F is reflected in SER Section 13.3, “Emergency Planning.” The detailed review of the completely independent radio subsystem for security purposes is reflected in SER Section 13.6, “Physical Security.” The staff’s review confirmed that the information contained in the application and incorporated by reference addresses the relevant information related to the communications system. The staff reviewed conformance of Section 9.5.2 of the North Anna 3 COL FSAR to the guidance in RG 1.206, Section C.III.1, Chapter 9, C.I.9.5.2, “Communications Systems.” The staff’s review finds that the applicant appropriately incorporates by reference Section 9.5.2 of the ESBWR DCD, Revision 10.

The ESBWR DCD, Section 9.5.2, “Communications System," lists communications systems that are to provide the means to conveniently and effectively communicate between various parts of the nuclear power plant and with offsite company, governmental, support agencies, and other locations during normal operations, testing and drills, and during maintenance, transient, fire, emergency, and accident conditions under maximum potential noise levels.

In addition, DCD Section 9.5.2 identified site communication systems that are made up of the following subsystems

- Plant page/party-line subsystem;
- Private automatic branch exchange subsystem;
- Plant sound-powered telephone subsystem;
- Plant radio subsystem;
- Evacuation alarm and remote warning subsystem;

- Emergency offsite communication subsystem; and
- Completely independent radio subsystem for security purposes.

DCD Section 9.5.2.1 provides the safety design basis and the power generation design basis while DCD Section 9.5.2.2 provides a summary system description for these site communications except for the completely independent radio subsystem for security purposes that is described in DCD Section 13.6.

The staff reviewed the relevant information in the North Anna 3 COL Part 2: FSAR and examined the relevant information in Part 5: EP, Sections II.E and II.F. The detailed review of the completely independent radio subsystem for security purposes is reflected in SER Section 13.6, "Physical Security," of this SER.

The communications system is considered a nonsafety system, because it serves no safety-related function and the reactor can be shut down without the communications system. However, an adequate communications system is both required by regulation and considered important to overall safety as well as power generation. The subsystems identified above are independent of one another such that a failure in one subsystem does not adversely affect the performance of the other subsystems.

Based on the capability of these communications described in Section 9.5.2, the staff finds the design of the communications system adequately meets the requirements of 10 CFR Part 50, Appendix E, Section IV.E.9, because the multiple communication subsystems provide at least one onsite and one offsite communications system with each system having a backup power source.

COL Items

- NAPS COL 9.5.2.5-1-A Emergency Notification System

The staff reviewed NAPS COL 9.5.2.5-1-A related to the ENS included under Section 9.5.2 of the North Anna 3 COL FSAR. The DCD COL Item 9.5.2.5-1-A states that "The COL applicant will describe the ENS provisions required by 10 CFR 50.47(b)(6) and address recommendations described in BL 80-15." The applicant addressed this Item in Section 9.5.2.5 with departure/supplement NAPS COL 9.5.2.5-1-A in their application by stating, "This COL Item is addressed in Section 9.5.2.2." The staff reviewed the resolution to the DCD COL Item 9.5.2.5-1-A involving the ENS included under Section 9.5.2.2 of the North Anna 3 COLA. In Section 9.5.2.2 under Emergency Communication Systems, the parenthetical "(COL 9.5.2.5-1-A)" in the first bullet is replaced by a paragraph labeled "NAPS COL 9.5.2.5-1-A" that describes key features of the ENS.

The regulation at 10 CFR 50.47(b)(6) requires that provisions exist for prompt communications among response organizations to emergency personnel and to the public. The key provisions of NRC BL 80-15 states in part that, " … all extensions of the ENS located at your facility(ies) would remain fully operable from the facility(ies) to the NRC Operations Center in the event of a loss of offsite power to your facility(ies)." The ENS phone lines are fiber-optic phone lines through a telephone utility switch that is located on site in the telephone equipment building. They are routed directly to the local telephone company central office. The normal power source for the ENS telephone utility switch is nonsafety-related station power, which will be lost during a loss of offsite power event. The phone system normal power source is provided with a battery backup that lasts for a period of approximately 8 hours. Through NAPS

COL 9.5.2.5-1-A, North Anna 3 will take action to ensure that the ENS is in compliance with the recommendations of NRC BL 80-15, which is concerned with having a "… safeguards instrumentation bus backed up by automatic transfer to batteries and an inverter or equally reliable power supply." Accordingly, based on the description provided in NAPS COL 9.5.2.5-1-A, and North Anna 3 COLA Part 5, EP, Section F on emergency communications, and the IBR ESBWR DCD, Section 9.5.2, and verification by ITAAC in North Anna 3 COLA Part 10: Table 2.3-1, Section 3.0, the ENS has adequately addressed the recommendations in NRC BL 80-15. As a backup, in addition to the circuits to the local telephone company, a separate Company-owned communication network exists which provides communication between the nuclear power station, the Company system operations center, and the NRC. Based on the above, the staff finds that the applicant adequately addressed the DCD COL Item 9.5.2.5-1-A.

- NAPS COL 9.5.2.5-2-A Grid Transmission Operator

The staff reviewed NAPS COL 9.5.2.5-2-A related to the grid transmission operator communications included under Section 9.5.2 of the North Anna 3 COL FSAR. The DCD COL Item 9.5.2.5-2-A states "The COL applicant will describe the voice communication link availability with the grid transmission operator." The applicant addressed this Item in Section 9.5.2.5 with departure/supplement NAPS COL 9.5.2.5-2-A by stating "This COL Item is addressed in Section 9.5.2.2 and EP Section II.F.1. "

The staff reviewed the resolution to the DCD COL Item 9.5.2.5-2-A involving the grid transmission operator communication link included under Section 9.5.2.2 of the North Anna 3 COLA and addressed in EP Section II.F.1. In Section 9.5.2.2 under Emergency Communication Systems, the parenthetical "(COL 9.5.2.5-1-A)" in the last bullet is replaced by a paragraph labeled "NAPS COL 9.5.2.5-2-A" that states "Transmission System Operator Communications Link: Voice communications with the grid operator are provided via a Company-owned and maintained fiber optic transmission system that allows telephone communications with the entire Corporate System. Access to this mode of transmission is made via the plant telephone system. A dedicated handset is provided between the Control Room and the power system operator." Further, this mode of communication to the grid transmission operator is backed up by the regular commercial telephone system. The North Anna 3 COLA Part 5: EP, Section II.F.1 states that the applicant maintains reliable, 24-hour per day communications links within the plant and the plant and external emergency response organizations. Based on this, the staff finds that the applicant adequately addressed the DCD COL Item 9.5.2.5-2-A.

- NAPS COL 9.5.2.5-3-A Offsite Interfaces (1)

The staff reviewed NAPS COL 9.5.2.5-3-A related to the offsite interfaces included under Section 9.5.2 of the North Anna 3 COL FSAR and examined the EP, Sections II.E and II.F as related to emergency communications. The DCD COL Item 9.5.2.5-3-A states "the COL applicant will describe the means of communication between the control room, TSC, EOF, state and local emergency operation centers and radiological field personnel in accordance with NUREG–0696 and NUREG–0654." The applicant addressed this item with departure/supplement NAPS COL 9.5.2.5-3-A stating, "this COL Item is addressed in Section 9.5.2.2 and EP Sections II.E.1 and II.F.1." In Section 9.5.2.2, under Emergency Communication Systems, the parenthetical "(COL 9.5.2.5-3-A)" in the second bullet is replaced with "NAPS COL 9.5.2.5-3-A. The Health Physics Network (HPN) is described in the Emergency Plan." In Section 9.5.2.2, under Emergency Communication Systems, the parenthetical "(COL 9.5.2.5-3-A)" in the fourth bullet is replaced with "NAPS COL 9.5.2.5-3-A

The crisis management radio system is part of the plant radio system described in DCD Section 9.5.2.2." In Section 9.5.2.2, under Emergency Communication Systems, the following is added as an additional bullet after the last bullet "NAPS COL 9.5.2.5-3-A, Insta-Phone System." The primary method for notification of State and local authorities is the Insta-phone, which is accessible from the MCR, TSC, and EOF. The Insta-phone is described in the Emergency Plan." The North Anna 3 COLA Part 5: EP, including Sections II.E and II.F, is evaluated in SER Section 13.3, "Emergency Planning."

In the North Anna 3 COLA Part 5: EP, Section II.E and II.F, the applicant states that systems and procedures needed to provide the capability for 24-hour per day prompt notification to affected Commonwealth of Virginia, risk jurisdiction, and Federal authorities following the declaration of any emergency condition, consistent with emergency classification and action levels, are provided and maintained. The primary notification and communication method is the Insta-phone system, which is accessible from the MCR, TSC, and EOF. Back-up notification and communication is through the commercial telephone network system. Message content and verification methods are established in advance in implementing procedures. Communication systems that allow communications between the site and fixed and mobile medical support facilities are maintained and include both commercial telephone communications with fixed facilities and radio communications to ambulances. Further, the equipment, methods, and procedures for communication are tested and evaluated on a periodic basis through test and drills. For example, communications with the facility and EOF and the Commonwealth of Virginia and risk jurisdiction warning points are tested monthly, while communications between Virginia/risk jurisdiction emergency operating centers and field assessment teams are tested annually. Battery backup or alternate power in the case of the loss of AC power is provided for most subsystems. The North Anna 3 COLA Part 5: EP lists the requirements and the corresponding COLA EP provision where the requirement is addressed. Based on the above and that onsite and offsite emergency communications will be verified by ITAAC described in COLA Part 10: Table 2.3-1, the staff finds that the applicant adequately addressed the DCD COL Item 9.5.2.5-3-A.

- NAPS COL 9.5.2.5-4-A Offsite Interfaces (2)

The staff reviewed NAPS COL 9.5.2.5-4-A related to the offsite interfaces included under Section 9.5.2 of the North Anna 3 COL FSAR and examined the EP Sections II.E and II.F. The DCD COL Item 9.5.2.5-4-A states "the COL applicant will describe the communication method from the control room, TSC, and EOF to NRC headquarters, including establishment of Emergency Response Data Systems (ERDS) in accordance with NUREG–0696." The applicant addressed this Item with departure/supplement NAPS COL 9.5.2.5-4-A stating "this COL Item is addressed in Section 9.5.2.2 and EP Sections II.E.1 and II.F.1." In Section 9.5.2.2, under Emergency Communication Systems, the parenthetical "(COL 9.5.2.5-4-A)" in the third bullet is replaced with "NAPS COL 9.5.2.5-4-A." Communication from the MCR, TSC, and EOF to NRC headquarters including establishment of ERDS is described in the EP. The North Anna 3 COLA Part 5: EP including Sections II.E and II.F is evaluated in SER Section 13.3, "Emergency Plan."

In the North Anna 3 COLA Part 5: EP, Section II.F.1, the applicant states that separate telephone lines are dedicated and maintained for communications with the NRC. These include the ENS, the Management Counterpart Link (MCL), the HPN, the Reactor Safety Counterpart Link (RSCL), the Protective Measures Counterpart Link (PMCL), the Local Area Network (LAN) Access, and an ERDS. The ENS lines located in the MCR, TSC, and EOF are used for initial notifications, as well as ongoing information about plant systems, status, and parameters. The MCL lines located in the TSC and EOF provide for internal discussion between the NRC

Executive Team Director and members of his/her team and the NRC site director, or between licensee site management. The HPN lines located in the TSC and EOF provide for communication concerning radiological and meteorological matters. The RSCL lines located in the TSC and EOF provide for internal NRC discussions regarding plant and equipment conditions. PMCL lines located in the TSC and EOF provide for internal NRC discussions on radiological releases, meteorological conditions, and protective measures. The LAN Access with jacks in the TSC and EOF provides access to the NRC LAN. The applicant will take action to ensure that North Anna 3 will have an ERDS that will be activated within 1 hour of the declaration of an Alert or higher emergency classification in accordance with regulations and facility procedures. The North Anna 3 COLA Part 5: EP lists the requirements and the corresponding COLA EP provision where the requirement is addressed. Based on the above and that offsite communication with the NRC including the ERDS between the onsite computer system and the NRC Operations Center will be verified by ITAAC described in COLA Part 10: Table 2.3-1, the staff finds that the applicant has adequately addressed the DCD COL Item 9.5.2.5-4-A.

- NAPS COL 9.5.2.5-5-A Fire Brigade Radio System

The staff reviewed NAPS COL 9.5.2.5-5-A related to the Fire Brigade Radio System included under Section 9.5.2 of the North Anna 3 COL FSAR. The DCD COL Item 9.5.2.5-5-A states "the COL applicant will describe the Fire Brigade Radio System." The applicant addressed this item with departure/supplement NAPS COL 9.5.2.5-5-A stating "This COL Item is addressed in Section 9.5.2.2." In Section 9.5.2.2 under Emergency Communication Systems the parenthetical "(COL 9.5.2.5-5-A)" in the fifth bullet is replaced with "NAPS COL 9.5.2.5-5-A. The Fire Brigade Radio System is part of the plant radio system described in DCD Section 9.5.2.2." The ESBWR DCD, Section 9.5.2.2 described the plant radio system for use during normal and emergency communications within the plants. The plant radio system radios are equipped with multiple channels including a fire brigade channel and an emergency channel, each which can be used as alternate security channels if required. Portable, hand-held radios provide two-way voice communication between the various units for fire brigade members who need mobile communications and communications to communication consoles in selected plant locations including the MCR and remote shutdown rooms. The radio system includes antennas distributed throughout the plant with a centralized rebroadcast transmitter providing communication within the plant and satellite buildings. Lower power portable radios are used with this system to ensure that there is no Electromagnetic Interference with Instrumentation and Control circuits, and operate at frequencies that ensure they do not interfere with the plants instrument and controls distributed control and information systems (DCIS) functions. By using radio equipment equipped with tone-coded squelch communications can be directed to an individual, all-channel (zoned), or all-system calls except the emergency channel is not coded. Capability is provided whereby calls can be made between the telephone system and the in-plant radio system. The power for base stations and consoles is provided by security system power supply backed by batteries and a standby generator. Based on the above, the staff finds that the applicant adequately addressed the DCD COL Item 9.5.2.5-5-A.

9.5.2.5 Post Combined License Activities

There are no post COL activities related to this section.

9.5.2.6 Conclusion

The staff's finding related to information incorporated by reference is in NUREG–1966. The staff reviewed the application and checked the referenced DCD. The staff's review confirms that the applicant has addressed the required information relating to the communication systems, and no outstanding information is expected to be addressed in the COL FSAR related to this section. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to the communication systems that were incorporated by reference are resolved.

In addition, to the extent that an item addresses that portion of the communications system used in intra-plant and plant-to-offsite communications, the staff concludes that the site-specific COL information items discussed in this section of the COL FSAR are acceptable and meet the requirements of 10 CFR Part 50, Appendix E, Section IV.E.9 and 10 CFR 50.47(b)(5) and (b)(6); and guidance in RG 1.189, Regulatory Position 4.1.7. The staff bases its conclusion on the following: (1) The design provides for at least one acceptable onsite and one acceptable offsite communication system, each with a backup power source as described directly through COLA information or information incorporated by reference of the ESBWR DCD; (2) the design provides communications systems with a capability for prompt notification and continuing communication to the NRC; (3) the design provides communications systems with capability for prompt notification and continuing communication with site, local and state response organizations; (4) the design provides a variety of diverse communication systems involving both private links, commercial links, site public address, microwave, facsimiles, and radio with the capability of adequately supporting both normal use and emergency situations; and (5) the nonsafety communication systems do not prevent completion of safety functions.

9.5.3 Lighting System

Section 9.5.3, "Lighting System," of the North Anna 3 COL FSAR, Revision 8, incorporates by reference, with no departures or supplements Section 9.5.3, "Lighting System" of the certified ESBWR DCD, Revision 10 referenced in 10 CFR Part 52, Appendix E. As documented in NUREG–1966, the staff reviewed and approved Section 9.5.3 of the certified ESBWR DCD. The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remains for review.[1]

The staff's review confirmed that the applicant has addressed the required information, and there is no outstanding information related to this section that remains to be addressed in the COL FSAR. Pursuant to 10 CFR 52.63(a)(5) and Section VI.B.1 of Appendix E to 10 CFR Part 52, all nuclear safety issues relating to the "Lighting System," that were incorporated by reference have been resolved.

9.5.4 Diesel Generator Fuel Oil Storage and Transfer System

9.5.4.1 Introduction

This section of the North Anna 3 COL FSAR describes the diesel generator (DG) fuel oil system which stores and transfers fuel oil for the diesel engines that provide standby onsite power. The system for each diesel engine includes a fuel oil storage tank, fuel oil day tank, fuel oil transfer pump, strainers/filters, oil purifier (or tank connections for tying into a purification system), instrumentation, controls, and the necessary interconnecting piping and valves. The ESBWR design provides two sets of DGs – standby diesel generators (SDGs) and ancillary diesel generators (ADGs).

9.5.4.2 Summary of Application

Section 9.5.4, “Diesel Generator Fuel Oil Storage and Transfer System,” of the North Anna 3 COL FSAR, Revision 8, incorporates by reference Section 9.5.4, “Diesel Generator Fuel Oil Storage and Transfer System,” of the ESBWR DCD, Revision 10.

In addition, in FSAR Section 9.5.4, the applicant provided the following:

COL Items

- STD COL 9.5.4-1-A Fuel Oil Capacity

The applicant provided additional information in STD COL 9.5.4-1-A to address DCD COL Item 9.5.4-1-A. The applicant described the procedural controls in place to ensure that sufficient fuel oil is available onsite to allow each DG to operate continuously for 7 days at its calculated design load.

- NAPS COL 9.5.4-2-A Protection of Underground Piping

The applicant provided additional information in NAPS COL 9.5.4-2-A to address DCD COL Item 9.5.4-2-A. The applicant stated that the underground piping portion of the fuel oil transfer system is made of carbon steel and that it is protected with a waterproof coating and an impressed current cathodic protection system to control external corrosion.

9.5.4.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is in NUREG–1966, the FSER for the ESBWR DCD. In addition, the relevant requirements of the Commission regulations for the Diesel Generator Fuel Oil Storage and Transfer System (DGFOSTS) and the associated acceptance criteria are in SRP Section 9.5.4.

The specific regulatory requirements are as follows:

- GDC 17, “Electric power systems,” requires an onsite electric power system to permit functioning of SSCs important to safety. The SDGs and ADGs are not classified as safety- related. However, since the SDGs and ADGs are RTNSS Criterion B and C systems respectively, availability of both SDGs and ADGs are required according to the Availability Controls Manual (Availability Control Limiting Condition for Operation 3.8.1 and 3.8.2).

- RG 1.137, “Fuel-Oil Systems for Standby Diesel Generators,” provides regulatory guidance with respect to maintaining a 7-day supply of fuel oil and for protection of the system from internal and external corrosion.

9.5.4.4 Technical Evaluation

As documented in NUREG–1966, the staff reviewed and approved Section 9.5.4 of the certified ESBWR DCD, Revision 10. The staff reviewed Section 9.5.4 of the North Anna 3 COL FSAR, Revision 8, and checked the referenced ESBWR DCD to ensure that the combination of the information in the COL FSAR and the information in the ESBWR DCD represents the complete scope of information relating to this review topic.[1]

The staff's review confirms that the information in the application and the information incorporated by reference address the required information related to the DGFOSTS.

The SDG and ADG are not classified as safety-related. However, since the diesels are RTNSS Criterion B and C systems, availability of both SDG and ADG is required according to the Availability Controls Manual (Availability Control Limiting Condition for Operation 3.8.1 and 3.8.2).

COL Items

- STD COL 9.5.4-1-A Fuel Oil Capacity

The staff reviewed STD COL 9.5.4-1-A related to the fuel oil capacity included under Section 9.5.4 of the North Anna 3 COL FSAR. DCD COL Item 9.5.4-1-A in Section 9.5.4.6, "COL Information," of the ESBWR DCD specifies that the COL applicant needs to establish procedural controls to ensure a minimum fuel oil capacity is maintained onsite. In FSAR Section 9.5.4.2, "System Description," the applicant addressed DCD COL Item 9.5.4-1-A (STD COL 9.5.4-1-A) by indicating that procedures will be developed in accordance with the milestone and processes described in FSAR Section 13.5, "Plant Procedures." Those procedures will ensure sufficient diesel fuel oil inventory is available onsite so that the DG can operate continually for 7 days. The procedures will ensure that the quantity of DG fuel oil in the fuel oil storage tanks is monitored on a periodic basis and that the diesel fuel oil usage is tracked against planned deliveries. Regular transport will replenish the fuel oil inventory during periods of high demand and ensure continued supply in the event of adverse weather conditions. The staff finds that the applicant has satisfactorily addressed DCD COL Item 9.5.4-1A in that the necessary procedures will be developed in accordance with FSAR Section 13.5.

The applicant stated that the procedures will ensure sufficient fuel oil to operate the DGs continually for 7 days. In RAI 09.05.04-2 dated June 24, 2008 (ADAMS Accession No. ML081760334), the staff asked the applicant to verify that enough fuel oil inventory is available to operate the DGs at continuous maximum rating for 7 days. In their response to RAI 09.05.04-2 dated August 4, 2008 (ADAMS Accession No. ML081760334), the applicant provided an FSAR markup stating that procedures ensure sufficient diesel fuel oil inventory is available onsite so that the SDGs and ADGs can operate continually for 7 days with each operating at its calculated design load, with appropriate margins. The staff found that the term "appropriate margins" is an ambiguous term for use in the FSAR. Therefore the staff requested the applicant in supplemental RAI 09.05.04-7 dated May 6, 2009 (ADAMS Accession No. ML091260337), to specify that the margins are in accordance with American Nuclear Society 59.51-1997, "Fuel Oil Systems for Safety-Related Emergency Diesel Generators."

In response to supplemental RAI 09.05.04-7 dated August 3, 2009 (ADAMS Accession No. ML092180975), the applicant (Dominion) stated that ANS 59.51-1997, "Fuel Oil Systems for Safety-Related Emergency Diesel Generators," is not applicable to the ESBWR nonsafety-related SDGs and ADGs. The applicant updated the North Anna FSAR to describe the sufficient margin for the 7-day fuel oil inventory requirement that accounts for usable fuel in the tank, level instrument uncertainty, and the potential for future load growth. The staff finds this response acceptable since the 7-day fuel oil inventory is maintained in accordance with RG 1.137 with sufficient margin that is clearly defined in the FSAR. Therefore, this RAI 09.05.04-7 is closed.

The staff evaluated COL Item STD COL 9.5.4-1-A to the relevant NRC regulations and acceptance criteria in SRP Section 9.5.4. The staff finds that the applicant has satisfactorily addressed DCD COL Item 9.5.4-1*.*

- NAPS COL 9.5.4-2-A Protection of Underground Piping

The staff reviewed NAPS COL 9.5.4-2-A related to the protection of underground piping included under Section 9.5.4 of the North Anna 3 COL FSAR. DCD COL Item 9.5.4-2-A in Section 9.5.4.6, “COL Information,” of the ESBWR DCD specifies that the COL applicant needs to describe the material and corrosion protection for the underground piping portion of the fuel oil transfer system. In FSAR Section 9.5.4.2, the applicant addressed DCD COL Item 9.5.4-2-A (NAPS COL 9.5.4-2-A) by indicating that the material for the underground piping portion of the fuel oil transfer system is carbon steel and that a corrosion protection system is in place for the internal and external surfaces of piping systems. The buried section of the piping is protected with a waterproof protective coating and an impressed current type cathodic protection is used to control external corrosion.

Section 9.5.4.2 of the DCD states the system will be designed and constructed according to “the latest industry standards for buried pipe including provisions for corrosion protection,” but it does not identify the standards to be used. Therefore, the staff asked the applicant to clarify the corrosion protection methods for the internal and external surfaces of buried DG fuel oil piping and identify the applicable industry standards in RAI 09.05.04-6 dated October 20, 2008 (ADAMS Accession No. ML082940356).

The applicant’s response to RAI 09.05.04-6 dated December 3, 2008 (ADAMS Accession No. ML083460148), stated a corrosion allowance, rather than a corrosion protection system, is included in the pipe wall thickness to address the possibility of internal corrosion. This is acceptable to the staff because it is a method listed in ASME B31.1, which is the code applicable to this piping system. For the coating and impressed current cathodic protection system for external corrosion control, the applicant stated it would follow the applicable guidance in ASME B31.1 Non-mandatory Appendix IV (“Corrosion Control for ASME B31.1 Power Piping Systems”) and American Petroleum Institute (API) Recommended Practice 1632 (“Cathodic Protection of Underground Petroleum Storage Tanks and Piping Systems”). The staff finds the API Recommended Practice acceptable because it refers users to National Association of Corrosion Engineers (NACE) RP-0169 and recommends the same corrosion protection criteria contained therein. NACE RP-0169 is the cathodic protection guidance accepted by RG 1.137. ASME B31.1 Appendix IV is an acceptable industry standard for external corrosion control because it addresses underground piping.

Based on the RAIs, the applicant proposed the paragraph below for NAPS COL 9.5.4-2-A. This deletes the reference to a corrosion protection system for the internal surface and adds a sentence to identify piping as the only underground component:

> The only underground component of the SDGs fuel oil storage and transfer system is carbon steel piping. A corrosion protection system consistent with the guidance contained in ASME B31.1, Power Piping Code, Nonmandatory Appendix IV, Corrosion Control for ASME B31.1 Power Piping Systems, and American Petroleum Institute (API) Recommended Practice 1632 is provided for external surfaces of buried piping systems.

The buried sections of the piping are provided with waterproof protective coating and an impressed current type cathodic protection to control external corrosion.

As discussed above, the corrosion control methods and industry standards applied to the buried piping are appropriate and meets the industry acceptance criteria as stated. Since the applicant included this statement in its FSAR, Revision 8, the staff considers this issue and RAI closed.

9.5.4.5 Post Combined License Activities

There are no post COL activities related to this section.

9.5.4.6 Conclusions

The staff's finding related to information incorporated by reference is in NUREG–1966. The staff reviewed the application and checked the referenced DCD. The staff's review confirms that the applicant has addressed the required information relating to the DGFOSTS, and no outstanding information is expected to be addressed in the COL FSAR related to this section. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to the DGFOSTS that were incorporated by reference are resolved.

In addition, the staff compared the additional COL supplemental information in the application to the relevant NRC regulations, the guidance in SRP Section 9.5.4, and other NRC regulatory guides. The staff's review concludes that the applicant's information in this section of the COL FSAR is acceptable and meets the requirements of GDC 17 and RG 1.137. The staff also finds that the applicant has satisfactorily addressed DCD COL Items 9.5.4-1-A and 9.5.4-2-A.

9.5.5 Diesel Generator Jacket Cooling Water System

Section 9.5.5, "Diesel Generator Jacket Cooling Water System," of the North Anna 3 COL FSAR, Revision 8, incorporates by reference, with no departures or supplements Section 9.5.5, "Diesel Generator Jacket Cooling Water System" of the certified ESBWR DCD, Revision 10, referenced in 10 CFR Part 52, Appendix E. As documented in NUREG–1966, the staff reviewed and approved Section 9.5.5 of the certified ESBWR DCD. The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remains for review.[1]

The staff's review confirmed that the applicant has addressed the required information, and there is no outstanding information related to this section that remains to be addressed in the COL FSAR. Pursuant to 10 CFR 52.63(a)(5) and Section VI.B.1 of Appendix E to 10 CFR Part 52, all nuclear safety issues relating to the diesel generator jacket cooling water system, that were incorporated by reference have been resolved.

9.5.6 Diesel Generator Starting Air System

Section 9.5.6, "Diesel Generator Starting Air System," of the North Anna 3 COL FSAR, Revision 8, incorporates by reference, with no departures or supplements Section 9.5.6, "Diesel Generator Starting Air System" of the certified ESBWR DCD, Revision 10, referenced in 10 CFR Part 52, Appendix E. As documented in NUREG–1966, the staff reviewed and approved Section 9.5.6 of the certified ESBWR DCD. The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remains for review.[1]

The staff's review confirmed that the applicant has addressed the required information, and there is no outstanding information related to this section that remains to be addressed in the COL FSAR. Pursuant to 10 CFR 52.63(a)(5) and Section VI.B.1 of Appendix E to 10 CFR Part 52, all nuclear safety issues relating to the diesel generator starting air system, that were incorporated by reference have been resolved.

9.5.7 Diesel Generator Lubrication System

Section 9.5.7, "Diesel Generator Lubrication System," of the North Anna 3 COL FSAR, Revision 8, incorporates by reference, with no departures or supplements Section 9.5.7, "Diesel Generator Lubrication System," of the certified ESBWR DCD, Revision 10, referenced in 10 CFR Part 52, Appendix E. As documented in NUREG–1966, the staff reviewed and approved Section 9.5.7 of the certified ESBWR DCD. The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remains for review.[1]

The staff's review confirmed that the applicant has addressed the required information, and there is no outstanding information related to this section that remains to be addressed in the COL FSAR. Pursuant to 10 CFR 52.63(a)(5) and Section VI.B.1 of Appendix E to 10 CFR Part 52, all nuclear safety issues relating to the diesel generator lubrication system, that were incorporated by reference have been resolved.

9.5.8 Diesel Generator Combustion Air Intake and Exhaust System

Section 9.5.8, "Diesel Generator Combustion Air Intake and Exhaust System," of the North Anna 3 COL FSAR, Revision 8, incorporates by reference, with no departures or supplements Section 9.5.8, "Diesel Generator Combustion Air Intake and Exhaust System," of the certified ESBWR DCD, Revision 10, referenced in 10 CFR Part 52, Appendix E. As documented in NUREG–1966, the staff reviewed and approved Section 9.5.8 of the certified ESBWR DCD. The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remains for review.[1]

The staff's review confirmed that the applicant has addressed the required information, and there is no outstanding information related to this section that remains to be addressed in the COL FSAR. Pursuant to 10 CFR 52.63(a)(5) and Section VI.B.1 of Appendix E to 10 CFR Part 52, all nuclear safety issues relating to the diesel generator combustion air intake and exhaust system, that were incorporated by reference have been resolved.

10.0 STEAM AND POWER CONVERSION SYSTEM

10.0 STEAM AND POWER CONVERSION SYSTEM

This chapter of the U.S. Nuclear Regulatory Commission's (NRC's) safety evaluation report (SER) provides the NRC staff evaluation and introduces the principle design features, systems, and components of the North Anna 3 Combined License (COL) steam and power conversion system of the Economic Simplified Boiling–Water Reactor (ESBWR) design. The systems discussed in this chapter include the turbine generator system used to convert energy in the steam from the nuclear steam supply system (NSSS) into electrical energy, the main steam supply system used to transport steam from the NSSS to the power conversion system and various safety related and nonsafety related auxiliaries, and other features of the steam and power conversion system.

10.1 Summary Description

Section 10.1 of the North Anna 3 COL Final Safety Analysis Report (FSAR), Revision 8, incorporates by reference Section 10.1, "Summary Description," of the ESBWR Design Control Document (DCD), Revision 10, referenced in Title10 *Code of Federal Regulations* (CFR) Part 52, "Licenses, Certifications, and Approvals for Nuclear Power Plants," Appendix E, "Design Certification Rule for the ESBWR Design," without any departures or supplements. The staff's finding related to information incorporated by reference is in NUREG 1966, "Final Safety Evaluation Report Related to the Certification of the Economic Simplified Boiling-Water Reactor Standard Design," issued April 2014, and it's Supplement 1, issued September 2014. The staff reviewed the application and checked the referenced DCD to ensure that no issue related to this section remains for review[1]. The staff's review confirmed that no outstanding information related to this section is expected to be addressed in the COL FSAR. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues related to the summary description that were incorporated by reference have been resolved.

10.2 Turbine Generator

10.2.1 Introduction

This FSAR section describes the turbine generator equipment design and design bases, including programs to ensure the integrity of the turbine rotor to minimize potential impacts on safety related structures, systems, and components (SSCs).

10.2.2 Summary of Application

Section 10.2 of the North Anna 3 COL FSAR, Revision 8, incorporates by reference Section 10.2 of the certified ESBWR DCD, Revision 10, referenced in 10 CFR Part 52, Appendix E. In addition, in FSAR Section 10.2, the applicant provided the following information:

COL Items

- STD COL 10.2-1-A Turbine Maintenance and Inspection Program

The applicant addressed DCD COL Item 10.2 1 A in FSAR Section 10.2.2.4, "Turbine Overspeed Protection System"; Section 10.2.2.7, "Testing"; Section 10.2.3.6, "In-service

[1] See *"Finality of Referenced NRC Approvals"* in SER Section 1.2.2, for a discussion on the staff's review related to verification of the scope of information to be included in a COL application that references a design certification.

Maintenance and Inspection of Turbine Rotors"; and Section 10.2.3.7, "In-service Inspection of Turbine Valves." In FSAR Section 10.2.3.6, the applicant stated that DCD, Tier 2, Sections 10.2.2.7, 10.2.3.5, and 10.2.3.6 and General Electric (GE) ST 56834/P, "ESBWR Steam Turbine—Low Pressure Rotor Missile Generation Probability Analysis," Revision 4, dated October 18, 2011, describe the Turbine Maintenance and Inspection Program that supports the original equipment manufacturers (OEM's) turbine missile generation probability calculation. GE ST 56834/P, Revision 4, is a bounding missile probability calculation report that sets forth the associated maintenance and inspection recommendations.

The applicant further addressed COL Item 10.2 1 A in FSAR Section 10.2.3.7. This section states that the inspection of all valves of one functional type or size will be conducted if a detrimental, unusual condition is discovered during the inspection of any single valve. This section also states that GE ST-56834/P, Revision 4, describes the Valve Inspection Program, including the valve and control system maintenance, inspections, testing, and associated frequencies.

In FSAR Sections 10.2.2.4 and 10.2.2.7, the applicant described how the information in Sections 10.2.3.6 and 10.2.3.7 applies to the turbine overspeed protection system and nonreturn valve inspection and testing.

- STD COL 10.2-2-A Turbine Missile Probability Analysis

In FSAR Section 10.2.3.8, the applicant provided information to address DCD COL Item 10.2-2-A. The applicant stated that the probability of generating a turbine missile is based on bounding material property values in the GE ST-56834/P, Revision 4 report. Because the applicant relies on this report to address the COL items described above, the staff reviewed it as part of the technical evaluation of the North Anna 3 COL application (COLA).

Supplemental Information

- STD SUP 10.2-1 Turbine Design

In FSAR Section 10.2.3.4, the applicant identified the turbine design model as N3R-6F52 from the GE nuclear steam turbine series.

10.2.3 Regulatory Basis

The regulatory basis for the information incorporated by reference is in NUREG 1966. In addition, Section 10.2, "Turbine Generator," of NUREG 0800, "Standard Review Plan for the Review of Safety Analysis Reports for Nuclear Power Plants: LWR Edition" (SRP), includes the relevant requirements of the Commission's regulations for the turbine generator and the associated acceptance criteria.

The following documents establish the applicable regulatory requirements and associated guidance for the turbine generator:

- General Design Criterion (GDC) 4, "Environmental and Dynamic Effects Design Bases," of Appendix A, "General Design Criteria for Nuclear Power Plants," to 10 CFR Part 50, "Domestic Licensing of Production and Utilization Facilities," as it relates to SSCs important to safety being appropriately protected against the effects of missiles that may result from a turbine rotor failure

- Regulatory Guide (RG) 1.115, Revision 2, "Protection against Turbine Missiles," issued January 2012.

- NUREG–0800, SRP Section 3.5.1.3, "Turbine Missiles," and SRP Section 10.2.3, "Turbine Rotor Integrity"

10.2.4 Technical Evaluation

As documented in NUREG–1966, the staff reviewed and approved Section 10.2 of the certified ESBWR DCD. The staff reviewed Section 10.2 of the North Anna 3 COL FSAR and checked the referenced ESBWR DCD to ensure that the combination of information in the COL FSAR and information in the ESBWR DCD represents the complete scope of information relating to this review topic.[1] The staff's review confirmed that the information in the application and the information incorporated by reference address the required information related to the turbine generator.

The staff reviewed the information in the North Anna 3 COL FSAR as follows:

COL Items

- STD COL 10.2-1- A Turbine Maintenance and Inspection Program

DCD COL 10.2-1-A requires the COL applicant to provide a description of the plant-specific Turbine Maintenance and Inspection Program required to satisfy the OEM's turbine missile generation probability calculation, including the acceptance criteria listed in Section II of SRP Section 3.5.1.3, and to address any valve and control system maintenance, inspections, and tests that are needed.

In Revision 1 of FSAR Section 10.2.3.6, the applicant addressed COL Item 10.2-1-A, "Turbine Maintenance and Inspection Program," which stated that "the turbine maintenance and inspection frequencies will be established upon completion of the bounding missile probability analysis." This analysis was then scheduled to be completed in the second quarter of 2009, and the FSAR would be revised to incorporate the maintenance and inspection frequencies as part of a subsequent FSAR update. The staff tracked this activity as Open Item 10.2-1 from the North Anna 3 Phase 2 SER.

In a letter dated June 24, 2014 (Agencywide Documents Access and Management System (ADAMS) Accession No. ML14199A360), the applicant submitted Revision 8 of the COL FSAR, which changed how it addressed STD COL 10.2 1 A. The applicant addressed DCD COL Item 10.2 1 A in FSAR Sections 10.2.2.4, 10.2.2.7, 10.2.3.6, and 10.2.3.7. In Section 10.2.3.6, the applicant stated that the Turbine Maintenance and Inspection Program supports the OEM's turbine missile generation probability calculation and is described in DCD Tier 2, Sections 10.2.2.7, 10.2.3.5, and 10.2.3.6 and in GE ST 56834/P, Revision 4, which is a bounding missile probability calculation report that sets forth the associated maintenance and inspection recommendations.

The applicant further addressed COL Item 10.2-1-A in FSAR Section 10.2.3.7. This section states that the inspection of all valves of one functional type or size will be conducted if a detrimental, unusual condition (as defined by the turbine Valve Inspection Program) is discovered during the inspection of any single valve. This section also states that the bounding missile probability analysis report (GE ST 56834/P, Revision 4) describes the Valve Inspection Program, including the valve and control system maintenance, inspections, testing, and associated frequencies.

In FSAR Sections 10.2.2.4 and 10.2.2.7, the applicant described how the information in Sections 10.2.3.6 and 10.2.3.7 applies to the turbine overspeed protection system and nonreturn valve inspection and testing.

In a letter dated December 6, 2013 (ADAMS Accession No. ML13346A647), the applicant provided the bounding missile probability analysis report (GE ST–56834/P Revision 4) for North Anna 3, which used Detroit Edison Company's (DTE's) responses to requests for additional information (RAIs) concerning this same technical topic on the Fermi 3 COL docket and is now part of the North Anna 3 COLA. The staff reviewed STD COL 10.2-1-A as submitted on the North Anna COL docket. Similar to the staff's review of the Fermi 3 COLA on this technical topic in the Fermi 3 docket, the review includes the bounding missile probability analysis report (ST–56834/P Revision 4). For both Fermi 3 COL Safety Evaluation Report (SER) Section 10.2.4 and this section of the North Anna 3 SER, this information satisfies the OEM's missile probability calculation called for in DCD COL Item 10.2-1-A. In addition, the applicant submitted a supplemental letter dated September 30, 2014 (ADAMS Accession No. ML14274A285), which also identifies the Fermi 3 RAI responses concerning this topic that are now submitted on the docket as part of an incorporation by reference per 10 CFR 52.8(b). The Fermi 3 RAIs referred to are 10.02.03-3, 10.02.03-7, 10.02.03-8, 10.02.03-9, and 10.02.03-10.

DCD COL Item 10.2-1-A states that "the COL applicant will provide a description of the plant specific turbine maintenance and inspection program required to satisfy the OEM's turbine missile generation probability calculation including each of the criteria identified in Section II of SRP Section 3.5.1.3, and to address any valve and control system maintenance, inspections, and tests that are needed."

The applicant addressed COL Item STD COL 10.2-1-A in the following four FSAR Sections, which also correspond to the Section numbers and titles in the DCD:

1) Section 10.2.2.4, "Turbine Overspeed Protection System," which states that "inspection programs required by the turbine missile probability analysis and implementation of the inspection, maintenance, and testing programs discussed in Section 10.2.3.6 and Section 10.2.3.7 ensure operability."

2) Section 10.2.2.7, "Testing," which states that "non-return valves are inspected and tested in accordance with vendor recommendations, as discussed in Section 10.2.3.7."

3) Section 10.2.3.6, "In-service Maintenance and Inspection of Turbine Rotors."

4) Section 10.2.3.7, "In-service Inspection of Turbine Valves." The description of the valve in-service inspection provision in this Section is consistent with the DCD and refers to the bounding missile probability analysis in the ST–56834/P Revision 4 report for the valve and control system maintenance, inspections, testing, and associated frequencies.

The staff confirmed that Section 10.2 of GE ST 56834/P, Revision 4, contains this information. The staff therefore finds that the portion of COL Item STD COL 10.2-1-A that is in FSAR Section 10.2.2.4 is acceptable. Based on its review of the turbine bounding missile probability analysis in the GE ST 56834/P, Revision 4, the staff finds the analysis acceptable. This SER further discusses this topic below under COL Item STD COL 10.2 2 A.

According to Acceptance Criterion 4 of SRP Section 3.5.1.3, an applicant obtaining a turbine from a manufacturer with an NRC-approved missile probability analysis for the turbine should meet the probabilities listed in SRP Table 3.5.1.3-1 based on the turbine orientation. This table includes the probability of a turbine failure resulting in the ejection of turbine rotor fragments through the turbine casing, P_1, of less than $1x10^{-4}$ per year for loading a favorably oriented turbine and bringing the system online. For the ESBWR, Section 10.2.1 of DCD Tier 2 states that a more conservative P_1 value of less than 10^{-5} per year will be used if the recommended inspections and tests are conducted at the recommended frequencies.

Acceptance Criterion 4 of SRP Section 3.5.1.3 also states that the turbine manufacturer should provide applicants with the relationship between the probability and the time that can be used to establish the in-service inspection and valve testing intervals that meet the missile probability criterion. Because the North Anna 3 applicant (similar to the Fermi 3 applicant) submitted a missile probability analysis from the manufacturer for NRC approval as part of the COL application, the manufacturer should also provide the inspection and valve testing intervals. In Sections 10.2.3.6 and 10.2.3.7 of the FSAR, Revision 8, the applicant stated that DCD Sections 10.2.2.7, 10.2.3.5, and 10.2.3.6 and GE ST 56834/P, Revision 4, describe this information.

The staff finds the FSAR discussions acceptable because referencing GE ST 56834/P, Revision 4, provides additional maintenance and inspection information to supplement the DCD requirements. The staff discusses its review of GE ST 56834/P, Revision 4, below under COL Item STD COL 10.2 2 A. This information therefore satisfies the OEM’s missile probability calculation called for in DCD COL Item 10.2 1 A.

The staff reviewed the entire turbine missile probability analysis in GE ST 56834/P, Revision 4, as discussed below under COL Item STD COL 10.2 2 A. GE ST 56834/P addresses the maintenance and inspection of rotors in Section 10.1 and the inspection of turbine valves in Section 10.2. Section 10.1 of the report is divided into Section 10.1.1, “In service Volumetric Rotor Inspections,” and Section 10.1.2, “Rotor Dovetail Inspections,” and includes the following types of inspections:

- visual, magnetic particle, and ultrasonic examination of all accessible surfaces of the rotors
- visual and magnetic particle or liquid penetrant examination of all turbine blades
- visual and magnetic particle examination of couplings and coupling bolts
- rotor dovetail inspections

DCD Tier 2, Section 10.2.3.6, also lists the first three types of inspections. The description of the maintenance and inspection program in Section 10.1 of GE ST 56834/P is consistent with the DCD. In addition, for all of these inspections, GE ST 56843/P recommends an interval of no more than 12 years. This recommendation applies to the surfaces of both high pressure and low pressure rotors and rotor dovetails. The DCD identifies the inspection interval and the rotor dovetail inspections. Therefore, the staff reviewed this issue as new information that the applicant provided as part of COL Item STD COL 10.2 1 A.

The in-service inspections for the rotors consist of visual, surface, and volumetric examinations, as described above. Section 10.1.1 of GE ST 56834/P also states that performing a volumetric examination of 100 percent of the rotor is not possible because of the outside surface geometry and features. The report states that this inspection is not essential for meeting the missile probability requirements, because the growth of an internal flaw in the rotor body to the critical crack size is never the most probable missile generation mechanism. Because a 100 percent in-service volumetric examination is not possible, GE uses controls on the rotor metallurgy; the manufacturing; and the preservice inspection to limit undetected flaws in the rotor. Section 3.1.3 of the ST–56834/P report describes the preservice inspection and testing, which includes a 100 percent volumetric examination and a 100 percent surface examination (including the bore surface of the bored rotors).

As discussed in the GE ST-56834/P report, the probability of a missile generation is dominated by a turbine overspeed in the first 15 to 20 years of operation and by stress corrosion cracking (SCC) in an axial-entry dovetail slot bottom thereafter. Section 10.1.2 of the ST–56834/P report addresses the rotor dovetail inspections and recommends the following:

- magnetic particle surface examination of axial entry wheel dovetail faces
- ultrasonic examination of axial entry dovetail bottoms
- inspection of tangential entry dovetails (Stages 1 through 4) using a technique such as the phased array ultrasonic examination
- engineering disposition of flaw indications (and the possible removal of buckets for the additional surface examination)
- in-service inspection measurements used to recalculate a missile probability and to determine subsequent inspection intervals if necessary (e.g., if cracks are found)

The applicant's bounding missile probability analysis in the ST–56843/P Revision 4 report shows that the criterion of a 10^{-5} annual missile generation probability is met for both bored and solid rotors for a period longer than the proposed 12-year inspection interval. The staff finds that the applicant's proposed rotor inspection program, including the 12-year inspection interval, is consistent with the DCD and meets the missile probability criterion in SRP Section 3.5.1.3 for bounding material properties. The program is therefore acceptable.

The staff finds that the information in Section 10.2 of the COL FSAR describes the Turbine Maintenance and Inspection Program, which is used to satisfy the manufacturer's turbine missile generation probability calculation. The staff finds that the program description is consistent with the corresponding information in the DCD and meets the criteria in SRP Section 3.5.1.3, which is related to periodic inspection and testing. The applicant's information in STD COL 10.2-1-A as updated in the North Anna 3 FSAR Revision 8, is therefore acceptable with respect to valve maintenance, inspections, testing, and frequency of the Turbine Valve Inspection Program. Open Item 10.2-1, from the North Anna 3 Phase 2 SER is thus resolved and closed. The staff also evaluated these requirements and frequencies as part of the review of COL Item STD COL 10.2-2-A, the missile probability analysis, which is described below.

- STD COL 10.2-2-A Turbine Missile Probability Analysis

DCD COL Item 10.2-2-A requires the COL applicant to provide an evaluation of the probability of a turbine missile generation using criteria in accordance with NRC requirements (based, if necessary, on bounding material property values until the actual material specimens are available).

In FSAR Revision 1 Section 10.2.3.8, the applicant provided information to address DCD COL Item 10.2-2-A. This COL item states that the COL applicant will provide an evaluation of the main turbine missile generation analysis in accordance with the acceptance criterion of SRP Section 3.5.1.3. The applicant stated that the bounding analysis would be completed in the second quarter of 2009, and the FSAR would be revised to reflect this analysis as part of a subsequent FSAR update. The staff tracked this activity from the Phase 2 North Anna 3 SER as Open Item 10.2-2.

In the letter dated December 6, 2013, the applicant provided the bounding missile probability analysis report (GE ST–56834/P, Revision 4) to address DCD COL Item 10.2-2-A. According to this COL item, "The COL applicant will provide an evaluation of the probability of a turbine missile generation using criteria in accordance with NRC requirements. If necessary, bounding material property values may be used to perform the analysis until actual material test specimens are available for testing (Section 10.2.3.8)."

The staff reviewed the applicant's information on COL Item STD COL10.2-2-A, which is related to providing the turbine missile probability analysis using the criteria and guidance in Regulatory Guide (RG) 1.115, Revision 2 and in SRP Section 3.5.1.3 and Section 10.2.3. The staff's review of the turbine missile probability analysis included the sequential RAI responses in the Fermi 3 COLA (the response dated October 5, 2010, to RAIs 10.02.03-1 through 10.02.03-11 [ADAMS Accession No. ML102800185]; the response dated July 29, 2011, to RAIs 10.02.03-12 through 10.02.03-16 [ADAMS Accession No. ML112140345]; and the response dated October 28, 2011, to RAIs 10.02.03-17 through 10.02.03-19 [ADAMS Accession No. ML113050573]), which resulted in corresponding changes to the missile analysis report as summarized in the following paragraphs.

In the letter dated December 6, 2013, the applicant provided the bounding missile probability analysis report (GE ST–56834/P, Revision 4) for North Anna 3 that uses DTE's responses to RAIs concerning the same technical topic on the Fermi 3 COL docket, which is now part of the North Anna 3 COLA. The staff reviewed STD COL 10.2-2-A as submitted on the North Anna 3 COL docket and is similar to the staff's review of the Fermi 3 COLA and this technical topic on the Fermi docket, which includes the bounding missile probability analysis report (ST–56834/P Revision 4). In addition, the applicants supplemental letter dated September, 30, 2014, also identifies that the Fermi 3 RAI responses concerning this topic are now submitted on the docket as part of an incorporation by reference per 10 CFR 52.8(b). The Fermi 3 RAIs referred to are 10.02.03-3, 10.02.03-7, 10.02.03-8, 10.02.03-9, and 10.02.03-10. For Fermi 3 COL SER, Section 10.2.4 and for this section of the North Anna 3 SER, this information provides the OEM's missile probability calculation called for in DCD COL Item 10.2-2-A.

The staff noted that Revision 4 of ST–56834/P is referenced as the applicant's turbine missile probability analysis for the GE turbine generator, model number N3R-6F52. The analysis applies to both the Fermi 3 and North Anna 3 turbine generators.

The GE ST-56834/P report provides the analysis for the probability of generating missiles for GE turbine generator model number N3R-6F52, which the COL applicant specified in Supplemental Information STD SUP 10.2-1. GE ST-56834/P, Revision 4 provides the methodology, assumptions, and results of the turbine missile generation probability, along with the manufacturer's recommendations for in-service testing and inspections. The methodology is consistent with the GE report entitled, "Probability of Missile Generation in General Electric Nuclear Turbines," issued in January 1984, as approved by the NRC in Appendix U, "Probability of Missile Generation in General Electric Nuclear Turbines," to NUREG 1048, "Safety Evaluation

Report Related to the Operation of Hope Creek Generating Station," Supplement 6, issued July 1986. GE ST–56834/P, Revision 4 also updates data such as valve failure rates to demonstrate that the destructive overspeed analysis is conservative. The methodology used consists of calculating the probability of a turbine overspeed in conjunction with the probability of a rotor burst and the probability of a turbine rotor fragment penetrating the turbine casing. The failure modes assumed in the analysis include a ductile burst (destructive overspeed), a brittle fracture of a missed internal flaw growing to a critical size due to cyclic fatigue, and SCC at the rotor dovetails.

The material used for the rotor forgings is a nickel-chromium-molybdenum-vanadium (NiCrMoV) alloy. The staff first reviewed the detailed description of the material in Revision 2 of GE ST-56834/P, which states in Section 3.1 that the rotor material will be produced in accordance with GE material specification B50A373B8. The staff determined that Revision 2 of GE ST-56834/P did not provide enough details about the material properties, including the chemistry, as required by the ESBWR DCD. In addition, the staff's SER for ESBWR DCD (NUREG-1966) Section 10.2.3.2.3 states that the COL applicant will provide the material properties (e.g., sulfur and phosphorus content) as part of the turbine missile analysis. In the responses to Fermi 3 RAI 10.02.03-4 and RAI 10.02.03-12 dated October 5, 2010, and July 29, 2011, respectively; DTE states that the rotors for the subject turbine use GE material specification B50A373B8 or an equivalent specification with a more restrictive chemistry. The responses point out that this material has been used since the 1980s for numerous integral (nonbored) rotors, with no rotor failures. The responses also state that the geometry of the buckets has been modified since the 1980s to reduce the stresses, and the use of shot-peening applies compressive forces on the surfaces of the rotor to mitigate SCC.

However, the staff requested DTE to provide the material specification for the staff's review to ensure that the material specification, including the chemistry, is adequate to meet the guidance in SRP Section 10.2.3 concerning the chemistry and processing to ensure characteristics such as adequate fracture toughness for the turbine rotor. The DTE response to Fermi 3 RAI 10.02.03-12 dated July 29, 2011, clarifies that GE material specification B50A373B8 was revised to GE material specification B50A373B12. The only change in this revision (from B8 to B12) was to restrict the nickel range to achieve the desired material properties in nuclear nonbored monoblock rotor forgings. The staff conducted an audit of the GE material specification documented in an NRC memorandum dated September 26, 2011 (ADAMS Accession No. ML112640028). The audit confirmed that the material has been used since the 1980s for turbine rotors and was only revised to restrict the nickel range. The staff also confirmed that the material is a vacuum-treated NiCrMoV alloy with the amounts of alloying impurity elements in the range of typical modern nuclear turbines, which is consistent with Section 10.2.3.1 of the ESBWR DCD and SRP Section 10.2.3. Therefore, the staff found in Section 10.2.4 of the Fermi 3 SER that the material composition included in Revision 4 of GE ST-56834/P is acceptable and will be used for the procurement of the Fermi 3 and North Anna 3 turbine rotors.

In the response to Fermi 3 RAI 10.02.03-17 dated October 28, 2011, DTE refers to bounding material properties and states that Revision 4 of ST–56834/P was updated to include the bounding assumption of the minimum tensile strength in the material specification. The bounding fracture appearance transition temperature (FATT) value of -1.1 degrees Celsius (C) (+30 degrees Fahrenheit [F]) described in the ESBWR DCD and the applicable GE material specification B50A373B12 were also used in Revision 4 of the analysis, as discussed in DTE's response to Fermi 3 RAI 10.02.03-13 dated July 29, 2011. As stated in the response to Fermi 3 RAI 10.02.03-5 dated October 5, 2010, this FATT value of -1.1 degrees C (+30 degrees F) will be determined on the site-specific rotor forgings using deep-seated impact specimens machined from radial trepans between the rotor wheels to ensure that the specified FATT value in the internal rotor region is met. In addition, the responses to Fermi 3 RAIs 10.02.03-6 and 10.02.03-7 dated October 5, 2010, show that 11 nuclear turbine rotor forgings in the past 20 years have been tested and the corresponding FATT values were well below -1.1 degrees C (+30 degrees F) throughout the rotor forgings. Statistically, the forging data resulted in a mean FATT value of -36.7 degrees C (-34 degrees F) with a plus two-sigma value (two standard deviations) of 6.1 degrees C (+11 degrees F), which demonstrates that these large monoblock forgings can achieve the specified FATT value of -1.1 degrees C (+30 degrees F). Accordingly, the staff finds that the bounding material properties of the turbine rotor were used in the analysis.

In addition, in the response to Fermi 3 RAI 10.02.03-18 dated October 28, DTE clarified that the analysis used design overspeed stresses based on the postulated conditions and events in Section 7 of GE ST-56834/P. The design overspeed was clarified to be 120 percent of the rated speed in the October 5, 2010, response to Fermi 3 RAI 10.02.03-3, which is consistent with the ESBWR design overspeed. In the response to Fermi 3 RAI 10.02.03-15 dated July 29, 2011, DTE stated that the tangential stresses at the slot bottoms of the axial entry dovetails are lower than the previous shrunk-on-wheel keyways and therefore, the use of the shrunk-on-wheel crack initiation and growth characteristics is conservative. The Fermi 3 RAI response also stated that shot-peening the rotor imparts compressive stresses to remove tensile residual stresses on the surface, thereby reducing the occurrence of SCC. Therefore, based on the above information, the staff finds that the analysis used conservative and appropriate stresses in the turbine rotor.

The cyclic propagation of an assumed internal forging defect due to tangential stresses from mechanical and thermal loading was performed in the analysis. As stated in the response to Fermi 3 RAI 10.02.03-18 dated October 28, 2011, the loading was determined based on both normal and abnormal turbine speeds with an assumed annual cyclic loading resulting from starts, stops, and load swings of the turbine. These stresses were derived using a finite element analysis based on the geometry for the N3R-6F52 rotor using corresponding startup transient thermal loadings, as clarified in the response to Fermi 3 RAI 10.02.03-9 dated October 5, 2010.

The ST–56834/P report includes an analysis of a rupture of the turbine rotor due to SCC in the slot bottoms of the rotor dovetails for the axial entry dovetails. The crack growth rate of shrunk-on-wheel keyways was used as a conservative basis, because operating experience indicates that stresses at these keyways are higher than those in the current monoblock forgings. The tangential stress of the dovetail slots in the monoblock forgings is much lower than in the previous shrunk-on-wheel keyways, as illustrated in the October 5, 2010, response to Fermi 3 RAI 10.02.03-10. Also, shot-peening of the turbine rotor surfaces reduces residual stresses and adds compressive stresses to mitigate the occurrence of SCC, as discussed in the July 29, 2011, response to Fermi 3 RAI 10.02.03-15. The analysis demonstrated that the critical crack size in the dovetail slots would be reached in approximately 40 years and the crack size is well within the nondestructive inspection capabilities, as discussed in the July 29, 2011, response to Fermi 3 RAI 10.02.03-13.

The ductile tensile burst of the rotor was analyzed using the average tangential stress of each rotor stage and the corresponding tensile strength of the material. The minimum ultimate tensile strength of the material specification was used in order to be a bounding analysis.

These three failure modes—cyclic fatigue, SCC, and ductile tensile burst—were used to calculate the probability of rupturing the rotor; and they were then combined to achieve a single probability of rupturing a turbine rotor. This probability analysis was conducted for various scenarios and turbine speeds and the resulting probabilities of rupturing a rotor, combined with the probability of the ruptured rotor fragment penetrating the turbine casing, resulted in a final probability of generating a turbine missile. Figures 9-1 and 9-2 of ST–56834/P present the results of the annual probability of generating a turbine missile.

These annual probability results in Figures 9-1 and 9-2 of ST–56834/P demonstrate that the probability of generating turbine missiles is less than 10^{-5} for an inspection interval greater than 12 years. Therefore, the proposed inspection interval of 12 years, as stated in Section 10.1 of GE ST-56834/P, Revision 4, meets the criteria in RG 1.115, Revision 2. Section 10.1 of GE ST-56834/P, Revision 4 also provides the turbine manufacturer's recommendations for the inspection and maintenance program description for the turbine rotors, which includes the following:

- visual, magnetic particle, and ultrasonic examination of all accessible rotor surfaces
- visual and magnetic particle or liquid penetrant examination of all turbine blades
- visual and magnetic particle examination of couplings and coupling bolts

These inspection methods are consistent with ESBWR DCD, Section 10.2.3.6. As clarified in the response to Fermi 3 RAI 10.02.03-19 dated October 28, 2011, the turbine manufacturer also recommends that the rotor dovetail inspections detailed in Section 10.1.2 of ST–56834/P, Revision 4 be performed within a 12-year interval; because in Section 9 of ST–56834/P, Revision 4, GE determined that SCC in the dovetail slot bottoms controls the probability of generating a turbine missile after 20 years of operation. The staff finds that the proposed description of the inspection program and the inspection interval of 12 years are acceptable because they meet the criteria of RG 1.115, Revision 2 and are consistent with the guidelines of SRP Section 10.2.3, thus ensuring that the turbine rotor integrity will be maintained to preclude the generation of a missile.

As DTE clarified in the response to RAI 10.02.03-2 dated October 5, 2010, the Fermi 3 turbine generator uses a MARK VIe turbine generator control system (TGCS). This TGCS has the same functional design and component specifications as previous GE turbine generators, with improvements made based on operating experience. Some of the improvements detailed in the response to Fermi 3 RAI 10.02.03-11 dated October 5, 2010, include the use of direct mechanical connections to the valve stem to reduce the number of moving parts and eliminate potential linkage binding on the control and intercept steam valves. These direct linkages have also been used in current operating plants on the main stop valve and on intercept stop valves. In addition, this Fermi 3 response includes the steam valve failure rates based on failure assessment data reports collected in 1993 and 2008, which were used in ST–56834/P for the main stop and control valves and the intermediate stop and intercept valves. As stated in the response to Fermi 3 RAI 10.02.03-16 dated July 29, 2011, the improvements made after 1984 effectively reduced the probability of failures. The failure rates are listed in Section 5 of GE ST-56834/P, Revision 4.

Section 5.4.1 of ST–56834/P, Revision 4 provides the hydraulic system reliability model based on the following common failure modes: water contamination caused by leaking oil coolers and corrosion of non-stainless steel mechanical and/or electrical hydraulic trip valves. After 1984, GE made improvements to the designs and materials in current operating plants, such as using titanium hydraulic oil coolers and new hydraulic fluid conditioning equipment that resolved these common failure modes. However, the analysis used the pre-1984 hydraulic failure rate model as a conservative assumption, which bounds the improved hydraulic system proposed for the North Anna 3 turbine. The overspeed probability from valve failures was calculated for valve test intervals of 90 and 120 days and resulted in similar annual missile probabilities, which were provided in the response to Fermi 3 RAI 10.02.03-16 dated July 29, 2011. The overspeed probability for a valve test interval of 120 days was well within the criteria of 10^{-5} per year specified in RG 1.115, Revision 2 and the guidance in SRP Section 3.5.1.3. The staff therefore finds the 120-day test interval acceptable because it meets the annual missile probability criteria of 10^{-5} per year in RG 1.115, Revision 2 and the specified guidelines in SRP Section 3.5.1.3 and Section 10.2.3, which ensure that the turbine rotor integrity is maintained to preclude the generation of missiles.

Based on the above discussion, the staff finds that the applicant's referenced turbine missile probability analysis in ST–56834/P, Revision 4 provides an acceptable analysis that substantiates the turbine manufacturer's recommendations, for inspecting and testing the turbine rotor and associated valves using the criteria in RG 1.115, Revision 2. The staff therefore determined that the applicant has adequately addressed COL Item STD COL 10.2-2-A, in the North Anna 3 FSAR Revision 8, with respect to evaluating the probability of a turbine missile generation using criteria in accordance with NRC requirements. Open Item 10.2-2 from the staff Phase 2 North Anna 3 SER is thus resolved and closed.

Supplemental Information

- STD SUP 10.2-1 Turbine Design

In FSAR Section 10.2.3.4, the applicant states that GE will manufacture the turbine and the generator for North Anna 3. The applicant selected turbine Model N3R-6F52, which is one of GE's N series nuclear steam turbines. The staff finds this turbine design model acceptable because GE has provided an acceptable turbine missile analysis for this model, as discussed above in the evaluation of STD COL 10.2-2-A.

10.2.5 Post Combined License Activities

There are no post COL activities related to this section.

10.2.6 Conclusion

The staff's finding related to information incorporated by reference is in NUREG–1966. The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the required information relating to the turbine generator, and no outstanding information is expected to be addressed in the COL FSAR related to this section. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to the turbine generator that were incorporated by reference have been resolved.

In addition, the staff compared the supplemental information in the COLA to the relevant NRC regulations, the guidance in SRP Sections 10.2 and 10.2.3, and NRC RGs. The staff's review confirmed that the applicant has adequately addressed the COL license information items in the ESBWR DCD. For the reasons set forth above, the staff concluded that the information in this section of the COL FSAR is acceptable and meets the requirements of GDC 4. Specifically, the staff evaluated COL Items STD COL 10.2-1-A and STD COL 10.2-2-A according to the relevant NRC regulations and acceptance criteria in SRP Section 10.2.3 and Section 3.5.1.3. The staff finds that the applicant has satisfactorily addressed DCD COL Item 10.2-1-A, because the proposed maintenance and inspection program is consistent with the corresponding information in the DCD and meets the criteria in SRP Section 3.5.1.3 related to periodic inspection and testing. The staff also finds that the applicant has satisfactorily addressed DCD COL Item 10.2-2-A, because the turbine missile probability analysis in GE ST–56834/P, Revision 4 provides the turbine manufacturer's recommendations for inspecting and testing the turbine rotor and associated valves using the criteria in RG 1.115, Revision 2. Additionally, the staff reviewed Supplemental Information STD SUP 10.2-1, which provides the turbine model number. The staff's review finds this supplemental information acceptable because the applicant has provided an acceptable turbine missile analysis for this turbine model, as discussed in the evaluation of COL Item STD COL 10.2-2-A.

10.3 Turbine Main Steam System

Section 10.3 of the North Anna 3 COL FSAR, Revision 8, incorporates by reference Section 10.3 of the certified ESBWR DCD, Revision 10, referenced in 10 CFR Part 52, Appendix E, without any departures or supplements. The staff reviewed the application and checked the referenced DCD to ensure that no issue related to this section remains for review.[1] The staff's review confirms that no outstanding information is expected to be addressed in the North Anna 3 COL FSAR related to this section. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to the turbine main steam supply system that were incorporated by reference have been resolved.

10.4 Other Features of Steam and Power Conversion System

This section of the COL FSAR describes other features of the steam and power conversion system.

The main condenser system (Section 10.4.1) functions as the steam cycle heat sink in receiving, condensing, and deaerating steam from the main turbine and other vents and drains in the steam cycle system.

The main condenser evacuation system (Section 10.4.2) establishes and maintains the main steam condenser vacuum and removes noncondensable gases and air from the main condenser.

The turbine gland seal system (Section 10.4.3) prevents air leakage into and steam out of the annulus space between the turbine and steam valve shafts.

The turbine bypass system (Section 10.4.4) enables a system to allow some main steam flow directly to the main condensers, thus bypassing the turbine.

The circulating water system (CWS) (Section 10.4.5) provides a continuous supply of cooling water to the main condenser.

The condensate purification system (CPS) (Section 10.4.6) purifies the condensate and minimizes corrosion/erosion products in the power conversion cycle.

The condensate and feedwater system (Section 10.4.7) supplies high-purity feedwater to the reactor at the required flow rate, pressure, and temperature.

10.4.1 Main Condenser

Section 10.4.1 of the North Anna 3 COL FSAR, Revision 8, incorporates by reference Section 10.4.1, "Main Condenser," of the certified ESBWR DCD, Revision 10, referenced in 10 CFR Part 52, Appendix E, without any departures or supplements. The staff reviewed the application and checked the referenced DCD to ensure that no issue related to this section remains for review.[1] The staff's review confirms that no outstanding information is expected to be addressed in the North Anna 3 COL FSAR related to this section. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to the main condenser that were incorporated by reference have been resolved.

10.4.2 Main Condenser Evacuation System

Section 10.4.2 of the North Anna 3 COL FSAR, Revision 8, incorporates by reference Section 10.4.2, "Main Condenser Evacuation System," of the certified ESBWR DCD, Revision 10, referenced in 10 CFR Part 52, Appendix E, without any departures or supplements. The staff reviewed the application and checked the referenced DCD to ensure that no issue related to this section remains for review.[1] The staff's review confirms that no outstanding information is expected to be addressed in the North Anna 3 COL FSAR related to this section. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to the main condenser evacuation system that were incorporated by reference have been resolved.

10.4.3 Turbine Gland Seal System

Section 10.4.3 of the North Anna 3 COL FSAR, Revision 8, incorporates by reference Section 10.4.3, "Gland Seal Steam System," of the certified ESBWR DCD, Revision 10, referenced in 10 CFR Part 52, Appendix E, without any departures or supplements. The staff reviewed the application and checked the referenced DCD to ensure that no issue related to this section remains for review.[1] The staff's review confirms that no outstanding information is expected to be addressed in the North Anna 3 COL FSAR related to this section. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to the turbine gland seal system that were incorporated by reference have been resolved.

10.4.4 Turbine Bypass System

Section 10.4.4 of the North Anna 3 COL FSAR, Revision 8, incorporates by reference Section 10.4.4, "Turbine Bypass System," of the certified ESBWR DCD, Revision 10, referenced in 10 CFR Part 52, Appendix E, without any departures or supplements. The staff reviewed the application and checked the referenced DCD to ensure that no issue related to this section remains for review.[1] The staff's review confirms that no outstanding information is expected to be addressed in the North Anna 3 COL FSAR related to this section. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to the turbine bypass system that were incorporated by reference have been resolved.

10.4.5 Circulating Water System

10.4.5.1 Introduction

The CWS provides cooling water for the removal of the power cycle heat from the main condensers and transfers this heat to the normal power heat sink.

10.4.5.2 Summary of Application

Section 10.4.5 of the North Anna 3 COL FSAR, Revision 8, incorporates by reference Section 10.4.5 of the certified ESBWR DCD, Revision 10, referenced in 10 CFR Part 52, Appendix E. In addition, in FSAR Section 10.4.5.2.1, the applicant provides the following conceptual design information (CDI):

Site-Specific Information Replacing Conceptual Design Information

- NAPS CDI Circulating Water System

The applicant replaced the CDI in the DCD with a detailed description of the site-specific system for North Anna 3.

10.4.5.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is in NUREG–1966. In addition, SRP Section 10.4.5 contains the relevant requirements of the Commission's regulations for the CWS and the associated acceptance criteria.

10.4.5.4 Technical Evaluation

As documented in NUREG–1966, the staff reviewed and approved Section 10.4.5 of the certified ESBWR DCD. The staff reviewed Section 10.4.5 of the North Anna 3 COL FSAR, Revision 8, and checked the referenced ESBWR DCD to ensure that the combination of the information in the COL FSAR and the information in the ESBWR DCD represents the complete scope of the information relating to this review topic.[1] The staff's review confirmed that the information in the application and the information incorporated by reference address the required information related to this section.

The staff reviewed the information in the North Anna 3 COL FSAR as follows:

Site-Specific Information Replacing Conceptual Design Information

- NAPS CDI Circulating Water System.

The staff reviewed the NAPS CDI related to the design description and operation of the CWS in FSAR Section 10.4.5. The staff's reviews of the specific CDI sections are provided below.

- NAPS CDI FSAR Section 10.4.5.2.1, "General Description"

In FSAR Section 10.4.5.2.1, the applicant described the CWS by replacing the CDI in the DCD with a more detailed general description of the site-specific system proposed for Unit 3. The applicant provided the design for the condenser water boxes, piping, and valves; condenser tube cleaning equipment; water box drain subsystem; circulating water pumps; screens; and cooling towers. The system configuration for the CWS is depicted in FSAR Figures 10.4-201 through 10.4-203, which replaces the conceptual diagram in Figure 10.4-1 of the DCD.

FSAR Section 10.4.5.2.1 describes the CWS, which consists of four motor-driven pumps, each with the capability of pumping 25 percent of the CWS design water flow; a dry-cooling tower array; one combination (hybrid) of a wet/dry mechanical draft cooling tower; and associated piping, valves, and instrumentation. The CWS and the dry- and hybrid-cooling towers provide a heat sink for waste heat exhausted from the main steam turbine. The four motor-driven pumps normally circulate the water through the condenser and back to the cooling towers. Depending on ambient conditions and heat load, one CWS pump may be taken out of operation with the flow of the remaining three pumps providing sufficient water for condenser heat removal. The four pumps are arranged in parallel and the discharge line of each pump is fitted with a remotely operated valve. This arrangement permits the isolation and maintenance of any one pump while the other pumps remain in operation and minimizes the backward flow through a tripped pump. The staff's review of the design information in FSAR Section 10.4.5.2.1 finds that the applicant has addressed the final configuration of the North Anna 3 CWS, as specified in Section 10.4.5.2.1 of ESBWR DCD, Revision 10.

Also, in FSAR Table 10.4-3R, "Circulating Water System," the applicant provides site-specific parameters to replace the values in ESBWR DCD, Table 10.4-3. The staff finds that the operating temperatures and circulating water pump information in FSAR Table 10.4-3R are acceptable, because they are bounded by the design values of these parameters in the DCD.

Furthermore, the CWS design includes vents to help fill in and remove air and other gases from the condenser water-boxes during startup and normal operations. The system includes design features such as slow-stroke, motor-operated valves; air- and vacuum-release valves; and control and interlock features that ensure proper valve lineup between the pump's discharge valves and consistency between the pump's startup and shutdown (stop signals) sequences. The staff determined that these provisions will minimize hydraulic transients, including water hammer, during startup and normal operations of the system because they are located and sized so as to be capable of performing the required functions. Accordingly, the staff finds that these vents, air releases, and vacuum relief valve provisions in the CWS adequately address the requirements of GDC 4; as it relates to the design features to accommodate the effects of discharging water, and to prevent water hammer and subsequent CWS piping or component failures from occurring at pump startup from initial system depressurization.

- NAPS CDI FSAR Section 10.4.5.2.2, "Component Description"

In FSAR Section 10.4.5.2.2, the applicant provided information regarding industry codes and standards that are applicable to the CWS design. In FSAR Section 10.4.5.2.2, Revision 0, the applicant stated that the codes and standards applicable to the CWS are in accordance with DCD Section 3.2; with the exception of large-bore piping (i.e., piping with a nominal diameter of 700 millimeters [27.6 inches] and larger). The applicant further stated that the large-bore CWS piping is constructed using American Water Works Association (AWWA) standards, and the system is designed and constructed in accordance with Quality Group D specifications.

However the staff finds that Table 3.2-3 of the DCD specifies American Society of Mechanical Engineers (ASME) Standard B31.1, "Power Piping," for Quality Group D piping. Also, RG 1.26, Revision 4, "Quality Group Classifications and Standards for Water-, Steam-, and Radioactive-Waste-Containing Components of Nuclear Power Plants," Revision 4, issued March 2007, recommends ASME Standard B31.1 2004. In accordance with SRP Section 10.4.5 Review Procedures Item 1, design provisions are to be incorporated that minimize the effects of hydraulic transients on the functional capability and integrity of the components of the system. Therefore, in RAI 10.4.5-1 dated June 23, 2008 (ADAMS Accession No. ML081750645), the staff asked the applicant to justify the above deviation from the DCD and its compliance with the applicable regulations. In addition, the staff asked the applicant to explain and ensure that the failure of this large-bore piping will not affect the intended functions of safety related equipment and systems.

In its response to RAI 10.4.5-1 dated August 7, 2008 (ADAMS Accession No. ML082240134), the applicant stated that it was not necessary to take an exception to DCD Section 3.2 and that it would revise FSAR Section 10.4.5.2.2 to delete this exception for large bore piping. Later, the staff confirmed that the above exception was deleted in FSAR, Revision 1. In addition, according to FSAR, Revision 8, the codes and standards in ESBWR DCD Section 3.2 are incorporated by reference into FSAR Section 10.4.5.2.2. Based on the above discussion, the staff finds that the applicant's response to RAI 10.4.5-1 is acceptable and that the staff's concerns are resolved and closed.

In FSAR Table 10.4-3R, the applicant provided site specific parameters to replace the values in ESBWR DCD Table 10.4-3. The staff finds that the operating temperatures and circulating water pump information in FSAR Table 10.4-3R are acceptable because this system does not perform any safety function and the system's failure cannot affect any safety system function.

- NAPS CDI FSAR Section 10.4.5.2.2.1, "CWS Chemical Injection"

FSAR Section 10.4.5.2.2.1 provides information about the chemical injection in the CWS that is not included in the DCD. The proposed chemical injection maintains a noncorrosive, non-scale forming condition within the CWS and ensures that any biological film growth that may affect the cooling tower and condenser heat transfer rate does not occur. Circulating water chemistry is maintained by the chemical storage and transfer system. Chemical feed equipment injects the chemicals used into the circulating water at the pump bay before water enters the circulating water pumps or into the circulating water cooling tower basin. FSAR Table 2.2-202 specifies the chemicals to be used within the system such as sodium hypochlorite, acid, bromide, dispersants, and non-oxidizing biocides, which are all compatible with selected materials or components used in the CWS. These chemicals are based upon five functions: biocide, algaecide, pH adjuster, corrosion inhibitor, and scale inhibitor. The pH adjuster, corrosion inhibitor, and scale inhibitor are metered into the system continuously or as needed to maintain proper concentrations. Biocide application frequency may vary with seasons; and algaecide is applied as needed to control algae formation in the cooling towers. Circulating water chemistry is also controlled as needed with blowdown.

The staff reviewed the information in the FSAR and finds that the applicant has adequately identified the chemicals to be used for the chemical treatment of CWS materials. The applicant also specifies the criteria that will ensure compatibility with the system materials. Furthermore, the identified chemicals will perform the appropriate functions to minimize the fouling of heat transfer surfaces and the corrosion of the CWS. Although the NRC has no specific regulatory criteria for the CWS materials and chemistry, the use of materials that are corrosion-resistant in the environment and water treatment chemicals that are compatible with system materials ensures that corrosion and biological film growth will not affect the condenser heat transfer rate.

- NAPS CDI FSAR Section 10.4.5.2.3, "System Operation"

In FSAR Section 10.4.5.2.3, the applicant described the site-specific CWS operation. The applicant stated that blowdown flow from the CWS is discharged into the plant discharge canal at a maximum temperature of 37.8 degrees C (100 degrees F). The applicant stated that leakage from the main condenser into the CWS via a condenser tube leak is not likely during power operation, because the CWS normally operates at a greater pressure than the shell (condensate) side of the condenser. The staff finds the applicant's discussion of the CWS operation acceptable.

- NAPS CDI — FSAR Section 10.4.5.5, “Instrumentation Applications”

The applicant provided the following additional measurement capability:

(1) level instrumentation in the circulating water pump forebay where the CWS pumps take suction and provide alarms in the main control room upon abnormally low or high water levels

(2) pressure indications on the CWS pump discharge and differential pressure instrumentation across the inlet and outlet to the condenser to determine the frequency of operating the condenser tube cleaning system

(3) local grab sample locations to enable periodic testing of the circulating water quality

The staff finds these additional new instrumentation and test practices acceptable, because they enhance the design and operational capability of the CWS.

- NAPS CDI — FSAR Section 10.4.5.6, “Flood Protection” and FSAR Section 10.4.5.8, “Normal Power Heat Sink”

FSAR Section 10.4.5.8 describes the site-specific normal power heat sink, which consists of the combined dry-cooling tower array and a hybrid wet/dry-cooling tower. The combination of dry- and hybrid-cooling tower arrangements supports a condenser-inlet maximum cold water temperature of 37.8 degrees C (100 degrees F). The station water system supplies makeup water to the CWS resulting from losses in evaporation and blowdown. The dry- and hybrid-cooling towers are both located at a distance from seismic Category 1 and 2 structures that is at least equal to their height. Therefore, there is no potential for the cooling towers to fall or damage safety-related structures or components. Both the dry- and the hybrid-cooling towers use fans; a failure of the fans could generate missiles. The applicant stated that the site arrangement and cooling tower construction will prevent damage to any seismic Category 1 or 2 structures or to any safety-related SSCs from possible missiles generated by the failure of a cooling tower mechanical fan, because the fans rotate at relatively slow speeds and the fan blades are made of relatively low-density material. Even if a failure of a fan could result in the generation of missiles, any damage would be confined to the cooling towers because of the site arrangement and construction of the respective towers.

However, in Revision 0 of the FSAR, the applicant did not specifically address flooding considerations from a hybrid-cooling tower failure in the application. Also, the applicant initially did not provide any information with respect to Section 10.4.5.6 of the DCD. In accordance with SRP Section 10.4.5 Acceptance Criterion Item 1, design provisions need to be provided to accommodate the effects of discharging water that may result from a failure of a component or piping in the CWS. Therefore, the staff requested the applicant in RAI 10.4.5-2 (ADAMS Accession No. ML081750645), dated June 23, 2008, to provide additional information regarding the cooling tower failure analysis. In the response to RAI 10.4.5-2 (ADAMS Accession No. ML082240134), dated August, 7, 2008, the applicant stated that a failure of a pipe or component in the hybrid-cooling tower or other CWS piping in the yard would not have an adverse impact on safety-related SSCs. The bounding piping failure for the hybrid-cooling tower is a failure of the two vertical large-bore CWS pipes that connect to the distribution header of the hybrid-cooling tower. In this failure scenario, the site grading will divert the flow of water from the ruptured pipes away from the plant to the drainage ditch on the west side of the cooling tower area. A failure of the hybrid-cooling tower basin will not lead to any discharge of water to the surface, because it is an in-ground structure. The maximum water level elevation in the basin is lower than the elevations of the surrounding areas. If a surface discharge were to occur, the water would flow away from the plant toward Lake Anna.

The staff finds that the applicant's response to RAI 10.4.5-2 provides acceptable design provisions to accommodate the effects of discharging water that may result from a failure of a component or piping in the CWS, in that a failure scenario from the cooling tower water would flow to the west side of the tower and away from the plant. The staff's concern described in RAI 10.4.5-2 is thus resolved. The staff confirmed that Revision 1 of the FSAR includes this additional information. Therefore, the staff finds that the conclusions in the ESBWR DCD FSER (NUREG–1966) regarding the requirements of GDC 4 and SRP guidance remain valid with respect to flooding.

10.4.5.5 Post Combined License Activities

There are no post COL activities related to this section.

10.4.5.6 Conclusion

The staff's finding related to information incorporated by reference is in NUREG–1966. The staff reviewed the application and checked the referenced DCD. The staff's review confirms that the applicant has addressed the required information related to the CWS, and that no outstanding information is expected to be addressed in the COL FSAR related to this section. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to the CWS that were incorporated by reference have been resolved.

In addition, the staff compared the supplemental information in the COLA to the relevant NRC regulations, the guidance in SRP Section 10.4.5, and other NRC RGs. The staff's review concludes that the applicant has adequately addressed the site-specific CDI for the CWS, in accordance with the guidance in SRP Section 10.4.5 and RG 1.26 and meets the requirements of GCD 4.

10.4.6 Condensate Purification System

10.4.6.1 Introduction

This FSAR section includes information related to the purification and treatment of condensate, as needed, to maintain reactor feedwater purity. The CPS uses filtration to remove suspended solids, including corrosion products, and ion exchange to remove dissolved solids and other impurities.

10.4.6.2 Summary of Application

Section 10.4.6 of the North Anna 3 COL FSAR, Revision 8, incorporates by reference Section 10.4.6 of the certified ESBWR DCD, Revision 10, referenced in 10 CFR Part 52, Appendix E. In addition, in FSAR Section 10.4.6, the applicant provides the following:

COL Item

- STD COL 10.4-1-A Leakage (Circulating Water into the Condenser)

The applicant provided threshold values and recommended operator actions for chemistry excursions in the condensate system to address this COL item.

10.4.6.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is in NUREG–1966. In addition, the relevant requirements of Commission regulations for the CPS and associated acceptance criteria are in SRP Section 10.4.6.

The applicable regulatory requirements and associated guidance for the CPS are as follows:

- GDC 14, "Reactor coolant pressure boundary," as it relates to the reactor coolant pressure boundary being designed, fabricated, erected, and tested; so as to have an extremely low probability of an abnormal leakage, a rapidly propagating failure, and a gross rupture.

- Electric Power Research Institute (EPRI) Report NP-4947-SR, "BWR Hydrogen Water Chemistry Guidelines," 1987 Revision.

10.4.6.4 Technical Evaluation

As documented in NUREG–1966, the staff reviewed and approved Section 10.4.6 of the certified ESBWR DCD. The staff reviewed Section 10.4.6 of the North Anna 3 COL FSAR, Revision 8, and checked the referenced ESBWR DCD to ensure that the combination of the information in the COL FSAR and the information in the ESBWR DCD represents the complete scope of the information relating to this review topic.[1] The staff's review confirmed that the information in the application and the information incorporated by reference address the required information related to this section.

The staff reviewed the information in the North Anna 3 COL FSAR as follows:

COL Item

- STD COL 10.4-1-A Leakage (Circulating Water into the Condenser)

The applicant provided threshold values and recommended operator actions to address STD COL 10.4-1-A in FSAR Table 10.4-201, "Recommended Water Quality and Action Levels."

FSAR Table 10.4-201 summarizes the manufacturer's recommended threshold values of the chemistry parameters and the associated operator actions. These parameters enable the operation of the system within the EPRI Boiling-Water Reactor (BWR) water chemistry guidelines. The staff finds the applicant's information addressing COL Item STD COL 10.4-1-A acceptable, because the chemistry parameters meet the recommendations of SRP Section 10.4.6 and the EPRI BWR water chemistry guidelines.

10.4.6.5 Post Combined Operating License Activities

There are no post COL activities related to this section.

10.4.6.6 Conclusion

The staff's finding related to information incorporated by reference is in NUREG 1966. The staff reviewed the application and checked the referenced DCD. The staff's review confirms that the applicant has addressed the required information related to the CPS and that no outstanding information related to this section is expected to be addressed in the COL FSAR. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues related to the CPS that were incorporated by reference have been resolved.

In addition, the staff compared the information in the COL application to the relevant NRC regulations, the guidance in SRP Section 10.4.6, and other NRC RGs and industry standards. The staff's review concludes that the information in this section of the North Anna 3 COL FSAR is acceptable and meets the NRC endorsed EPRI guidelines for BWR water chemistry and the requirements of GDC 14. The staff evaluated COL Item STD COL 10.4 1 A and Supplemental Information North Anna 3 SUP 10.4 1 in this section. The staff finds that the applicant has satisfactorily addressed these items.

10.4.7 Condensate and Feedwater System

Section 10.4.7 of the North Anna 3 COL FSAR, Revision 8, incorporates by reference Section 10.4.7, "Condensate and Feedwater System," of the certified ESBWR DCD, Revision 10, without any departures or supplements. The staff reviewed the application and checked the referenced DCD to ensure that no issue related to this section remains for review.[1] The staff's review confirms that no outstanding information is expected to be addressed in the North Anna 3 COL FSAR related to this section. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to this section that were incorporated by reference have been resolved.

11.0 RADIOACTIVE WASTE MANAGEMENT

11.0 RADIOACTIVE WASTE MANAGEMENT

This chapter of the U.S. Nuclear Regulatory Commission's (NRC's) safety evaluation report (SER) provides the NRC staff evaluation of the North Anna 3 radioactive waste management systems (RWMS) designed to control, collect, handle, process, store, and dispose of liquid, gaseous, and solid wastes that may contain radioactive materials. The systems include the instrumentation used to monitor and control the release of radioactive effluents and wastes and are designed for both normal operations (including refueling; purging; fuel handling and storage; radioactive material handling, processing, use, storage, and disposal; maintenance; routine operational surveillance; in-service inspection; and calibration) and anticipated operational occurrences (AOOs) (activities such as tripping of the turbine generator set, isolation of the main condenser, and loss-of-offsite power).

11.1 Source Terms

This section of the North Anna 3 Combined License (COL) final safety analysis report (FSAR) addresses sources of radioactivity that are generated within the core and have the potential of leaking into the reactor coolant system during normal operation, including an AOO, by way of defects in the fuel cladding. There are two types of source terms for the reactor primary coolant and steam. The first addresses the design basis, and the second describes the anticipated average concentrations in reactor coolant and steam over the life of a boiling-water reactor.

Section 11.1 of the North Anna 3 COL FSAR, Revision 8, incorporates by reference with no departures or supplements Section 11.1, "Source Terms," of Revision 10 of the Design Control Document (DCD) for the Economic Simplified Boiling-Water Reactor (ESBWR), referenced in Appendix E to Title 10 of the *Code of Federal Regulations* (10 CFR) Part 52, "Licenses, Certifications, and Approvals for Nuclear Power Plants." The staff reviewed the application and checked the referenced DCD to ensure that no issues relating to this section remained for review.[1] The staff's review confirmed that there are no outstanding issues related to this section. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to the source term have been resolved.

11.2 Liquid Waste Management System

11.2.1 Introduction

The liquid waste management system (LWMS) is designed to control, collect, process, handle, store, and dispose of liquid radioactive waste generated as a result of normal operations, including AOOs. The LWMS is designed to reduce and control radioactive releases into the environment. The LWMS is comprised of four types of major subsystems that are permanently installed equipment connected to other plant equipment, thus permitting liquid wastes from various plant systems to be segregated and processed separately:

1) equipment (low conductivity) drain subsystem;
2) floor (high conductivity) drain subsystem;
3) chemical drain subsystem; and
4) detergent drain subsystem.

---

[1]See *"Finality of Referenced NRC Approvals"* in in SER Section 1.2.2 for a discussion on the staff's review related to verification of the scope of information to be included in a COL application that references a design certification.

The LWMS processing subsystems rely on mixed bed demineralizers, charcoal filters and beds and cartridge filters, reverse osmosis, and organic and neutralization treatments. Cross-connections between radwaste subsystems provide additional flexibility in processing wastes by alternate methods and provide redundancy if one subsystem is inoperative. The LWMS is located in the radwaste building (RWB). The LWMS is designed to process the maximum design basis input in one week, assuming a 40-hour work week, or processing one tank of liquid waste in one operating shift. Releases from the LWMS are conducted as each batch releases through a single liquid waste discharge line. The LWMS is equipped with radiation monitoring instrumentation that automatically terminates effluent releases if radioactivity levels in discharges exceed effluent concentration limits under 10 CFR Part 20. The system provides for sampling at several process points, administrative controls, and detection and alarm of abnormal conditions against accidental discharges in the environment. Radioactive liquid wastes are collected in various collection sumps and tanks located within the plant. Airborne releases from LWMS components (e.g., tanks) and ventilation exhaust systems servicing radiologically controlled areas are conducted through the radioactive waste vent stack, which is evaluated in Subsection 11.3.4 of this SER.

11.2.2 Summary of Application

Section 11.2 of the North Anna 3 COL FSAR incorporates by reference Section 11.2 of the ESBWR DCD, Revision 10. In addition, in FSAR Section 11.2 and Part 7, "Departures Report," the applicant provided the following departures, exemptions, and supplements.

Exemption and Tier 1 and Tier 2 Departures

- Exemption 4: Design Of The Cooling Tower Blow-Down Line

The applicant proposed a site-specific Tier 1 DCD departure from DCD Tier 1, Section 2.10.1, "Design Description," in regards to the design of the cooling tower blow-down line.

- NAPS DEP 12.3-1 Liquid Radwaste Effluent Discharge Piping Flow Path

This departure will change the North Anna 3 liquid effluent discharge pathway description to the environment as described in the DCD as Tier 2 information. The liquid effluent discharges from the LWMS to the environment will use only the liquid radioactive waste effluent discharge pipeline and not discharge the processed liquid effluent into the cooling tower blow-down line and then on to the environment. This departure will simplify design and construction of the cooling tower blow-down line.

COL Items

- STD COL 11.2-1-A Implementation of Inspection and Enforcement (IE) Bulletin 80-10

This COL item addresses LWMS subsystem interfaces and connections that are considered nonradioactive but that could later become radioactive through improper interfaces with radioactive systems, as described in the guidance and information in Inspection and Enforcement (IE) Bulletin 80-10, "Contamination of Nonradioactive System and Resulting Potential for Unmonitored, Uncontrolled Release to Environment," dated May 6, 1980.

- STD COL 11.2-2-A Implementation of 10 CFR 20.1406

This COL item addresses compliance with 10 CFR 20.1406, “Minimization of Contamination,” as it relates to the design and operational procedures of LWMS treatment subsystems. In Subsection 11.2.2.3 of the North Anna 3 COL FSAR, the applicant provided additional information identifying various sections of the FSAR (Sections 12.3, 13.5, 12.4, and 12.5) that address how to comply with the requirements of 10 CFR 20.1406.

Supplemental Information

- NAPS SUP 11.2-1 Implementation of Section II.D of Appendix I to 10 CFR Part 50 (Cost-Benefit Analysis)

Section 11.2.1 of the North Anna 3 COL FSAR provides plant-and site-specific cost-benefit analysis. The cost-benefit analysis is based on the guidance of Regulatory Guide (RG) 1.110, “Cost-Benefit Analysis for Radwaste Systems for Light-Water-Cooled Nuclear Power Reactors (for Comment),” issued in March 1976. RG 1.110 describes the results that demonstrate compliance with the as low as is reasonably achievable (ALARA) cost-benefit requirements in Section II.D of Appendix I, “Numerical Guides for Design Objectives and Limiting Conditions for Operation to Meet the Criterion As Low as is Reasonably Achievable for Radioactive Material in Light-Water-Cooled Nuclear Power Reactor Effluents,” to 10 CFR Part 50, “Domestic Licensing of Production and Utilization Facilities.” The supplemental information presents a cost-benefit analysis demonstrating that any augmentation of the LWMS treatment subsystem is not cost beneficial. The applicant provided additional information regarding the cost parameters used to determine the total annual cost for the lowest cost systemic augmentation and concluded that no augmentations would be cost beneficial.

- NAPS SUP 11.2-2 Ground Water Protection

In Subsection 11.2.3.2 of the North Anna 3 COL FSAR, the applicant provided supplemental information addressing the monitoring program for the LWMS and plant blow-down underground piping. This supplemental information describes features to reduce the potential for unmonitored and uncontrolled releases to the environment. Nuclear Energy Institute (NEI) 08-08A, “Generic FSAR Template Guidance for Life Cycle Minimization of Contamination,” is also cited as a reference and template for monitoring for leakage downstream of LWMS connections. FSAR Section 12.3.1.5.2 also describes the ground water monitoring program.

- Branch Technical Position 11-6 Postulated Radioactive Releases Due to Liquid-containing Tank Failures

The review of the impacts of an accidental release of radioactive liquids in groundwater or surface water and effects on existing users or likely future users of groundwater or surface water resources is performed using the guidance in NUREG–0800, Standard Review Plan (SRP) Sections 2.4.1, “Hydrologic Description”; 2.4.12, “Groundwater”; and 2.4.13, “Accidental Releases of Radioactive Liquid Effluents in Ground and Surface Waters”; and information and guidance from Branch Technical Position (BTP) 11-6, “Postulated Radioactive Releases Due to Liquid-containing Tank Failures”. BTP 11-6 provides guidance in assessing, in accordance with 10 CFR Part 20 concentration limits, a potential release of radioactive liquids following the postulated failure of a tank and its components, located outside of containment, and impacts of the release of radioactive materials at the nearest potable water supply, located in an unrestricted area, for direct human consumption or indirectly through animals, crops, and food processing.

- ISG-013 — Assessing the Radiological Consequences of Accidental Releases of Radioactive Materials from Liquid Waste Tanks

Interim Staff Guidance (ISG)-013, issued January 2013, is used for "Assessing the Radiological Consequences of Accidental Releases of Radioactive Materials from Liquid Waste Tanks," for a COL application (COLA). The purpose of this ISG is to clarify previous NRC guidance regarding reviewing the analysis of the radiological consequences of accidental releases of radioactive materials to groundwater and surface water. Such analyses are required as part of the licensing review for new nuclear power reactor applications under 10 CFR Part 50 and 10 CFR Part 52. SRP Sections 2.4.13 and 11.2, and BTP 11-6, describe acceptable guidance on how to assess the radiological consequences of such releases.

11.2.3 Regulatory Basis

The regulatory basis for information incorporated by reference is in NUREG–1966, "Final Safety Evaluation Report Related to the Certification of the Economic Simplified Boiling-Water Reactor Standard Design," (the Final Safety Evaluation Report related to the ESBWR DCD). In addition, the relevant requirements of the Commission regulations for the LWMS, and the associated acceptance criteria, are in SRP Section 11.2.

The staff also followed the guidance in RG 1.206, "Combined License Applications for Nuclear Power Plants (LWR Edition)," issued in June 2007, to evaluate Section 11.2 of the North Anna 3 FSAR for compliance with NRC regulations.

An applicant who seeks to depart from information in Tier 1 of a DCD for a certified standard design must request an exemption, as does an applicant who believes its proposed design need not comply with one or more NRC regulations. Exemptions are submitted pursuant to 10 CFR 52.7 and 52.93 and special circumstances as defined in 10 CFR 50.12(a) must be present.

In particular, the regulatory basis for the acceptance of the COL items and supplementary information on the LWMS appears in the following:

- Appendix B, "Annual Limits on Intake and Derived Air Concentrations of Radionuclides for Occupational Exposure; Effluent Concentrations; Concentrations for Release to Sewerage," to 10 CFR Part 20, "Standards for Protection against Radiation";

- 10 CFR 20.1406;

- 10 CFR 50.34a, "Design objectives for equipment to control releases of radioactive material in effluents—nuclear power reactors";

- Sections II.A and II.D of Appendix I to 10 CFR Part 50;

- 10 CFR Part 52.63(b)(1); and

- 10 CFR 52.93, exceptions and variances.

The following RGs and NRC documents contain regulatory positions and guidance in demonstrating compliance with the relevant requirements of the regulations identified above:

- ISG-013, SRP Sections 2.4.13 and 11.2 with BTP 11-6 address the radiological consequences of an accidental release of radioactive liquid to the environment. The focus and objective of each guidance document, however, is different.

- BTP 11-6, SRP Section 11.2, “Liquid Waste Management System,” and BTP 11-6, “Postulated Radioactive Releases Due to Liquid-Containing Tank Failures,” as they relate to the assessment of radiological impacts associated with liquid effluent releases.

- RG 1.109, Revision 1, “Calculation of Annual Doses to Man from Routine Releases of Reactor Effluents for the Purpose of Evaluating Compliance with 10 CFR Part 50, Appendix I,” issued October 1977.

- RG 1.110, Revision 1, “Cost-Benefit Analysis for Radwaste Systems for Light-Water-Cooled Nuclear Power Reactors,” issued October 2013.

- IE Bulletin 80-10

- NEI 08-08A, “Nuclear Energy Institute, Generic FSAR Template Guidance for Life Cycle Minimization of Contamination.” (ADAMS Accession Nos. ML093220461, ML093220530).

11.2.4 Technical Evaluation

As documented in NUREG–1966, the staff reviewed and approved Section 11.2 of the certified ESBWR DCD, Revision 10. The staff reviewed Section 11.2 of the North Anna 3 COL FSAR, Revision 8, and checked the referenced ESBWR DCD to ensure that the combination of the information in the COL FSAR and the information in the ESBWR DCD appropriately represents the complete scope of information relating to this review topic[1]. The staff’s review confirmed that the information in the application and the information incorporated by reference address the required information related to the LWMS.

In addition, the staff reviewed the applicant’s proposed resolution to the departures, exemptions, COL items, and supplemental information, in the North Anna 3 COL FSAR, Section 11.2 and in the COL Part 7, “Departures Report” as follows.

Exemption and Tier 1 and Tier 2 Departures

- Exemption 4: Design Of The Cooling Tower Blow-Down Line

As permitted by 10 CFR 52.7 and Section VIII.A.4 of the Design Certification Rule, an exemption is requested for certain information described in ESBWR DCD Tier 1, Section 2.10.1, “Design Description.” The last sentence of the fourth paragraph states: “The LWMS either returns processed water to the condensate system or discharges to the environment via the circulating water system.” This description is revised to: “The LWMS either returns processed water to the condensate system or discharges to the environment using the liquid radwaste effluent discharge pipeline." This departure is included in Section 11.2.3.2. This departure also changes the label in FSAR Figure 11.2-1bR to: "Discharge via Radiation Monitor to Liquid Radwaste Effluent Discharge Pipeline." DCD Section 12.3.1.5.1, "Design Considerations," indicates the "Cooling Tower Blowdown Line" is one of four piping segments designed to contain radioactive materials, will have to run underground, and will be designed to preclude inadvertent or unidentified leakage to the environment. DCD Tier 1 describes the use of the circulating water system for discharge of LWMS effluent. The applicant requests an exemption from DCD Tier 1 information in Part 7 of the COLA (Exemption 4).

The ESBWR DCD Tier 1, Section 2.10.1, describes that the LWMS discharges processed water "to the environment via the circulating water system." This description refers to the expected use of the cooling tower blow-down line in the circulating water system to transfer liquid radwaste effluent to the environment. To simplify the design of the cooling tower blow-down line for North Anna 3, the liquid radwaste effluent discharge pipeline in the LWMS will be designed to not discharge to the cooling tower blow-down line. The liquid radwaste effluent discharge pipeline will be extended to transfer liquid radwaste effluent from the LWMS in the RWB to the environment. As a result, an exemption from ESBWR DCD, Tier 1 to revise the discharge piping information for the LWMS was requested by the applicant.

An exemption must be obtained if information proposed in the COLA is inconsistent with one or more NRC regulations. Exemptions are submitted pursuant to 10 CFR 52.7 and 10 CFR 52.93 and must comply with the special circumstances in 10 CFR 50.12(a).

Pursuant to 10 CFR 52.7 and Section VIII.A.4 of the Design Certification Rule, Dominion requests an exemption from ESBWR DCD, Tier 1 information. The applicant proposed this exemption to allow Departure 12.3-1. The basic exemption request is to change the last sentence of the fourth paragraph. The sentence reads: "The LWMS either returns processed water to the condensate system or discharges to the environment via the circulating water system". This description would be changed to read: "The LWMS either returns processed water to the condensate system or discharges to the environment using the liquid radwaste effluent discharge pipeline."

This departure refers to the initial expected Tier 1 design of the cooling tower blow-down line in the circulating water system to provide dilution water flow to transfer liquid radwaste effluent to the environment and at the same time decrease the concentration and liquid effluent dose to the environment by maintaining at least a dilution factor (DF) of 1000.

In a Request for Additional Information (RAI) 11.02-8, dated November 14, 2014 (Agencywide Documents Access and Management System (ADAMS) Accession Number No. ML14318A620), the staff requested that the applicant provide information concerning the "independent dilution pump," its location, general procedure for use, interlocks, actuations and capabilities. This information should be able to support and maintain the liquid effluent release DF of 1000 for North Anna 3, with or without the dilution flow from Units 1 and 2. This information should also be described in the FSAR.

In its response to RAI 11.02-8, dated January 8, 2015 (ADAMS Accession No. ML15009A235), the applicant stated that the LWMS will be designed to recycle all processed water with a goal to operate North Anna 3 as a zero liquid release plant. Under some conditions such as high water inventory some liquid effluent release may be required (Reference FSAR Section 12.2.2.3). Liquid effluent releases are batch processes that are considered to be infrequent evolutions, and a liquid effluent release from North Anna 3 will be procedurally controlled to occur when adequate dilution flow is available. FSAR Section 11.2.3.2 describes that a release point DF of 1000 (minimum) is maintained, with dilution flow provided by either Units 1 or 2's circulating water system or an independent dilution pump. FSAR Section 11.2.3.2 was written to provide the option to use an alternate dilution method, an independent dilution pump, in the event circulating water flow from Units 1 and 2 was unavailable (e.g., both units shut down and their circulating water systems out of service). However, Dominion does not intend to install an alternate method of providing dilution and will rely on the existing Units 1 and 2 circulating water systems to provide the required dilution flow.

Additionally, in an RAI 12.03-55 (ADAMS Accession No. ML14318A573), dated November 14, 2014**,** the staff requested additional design information concerning the changes to be made to accommodate the new liquid effluent release point. These questions related to: 1) providing drawings and distances for the routing of the radwaste effluent discharge line, 2) questions on whether the discharge line is accessible for inspection, how much of the line is buried, how it will be monitored for leak detection, 3) the material and diameter of the discharge line, 4) at what point will the dilution in the route of the discharge line be input, 5) what criteria will be used for dilution from the independent dilution pump or the Unit 1 and 2 circulating water system, 6) what design features will be employed to meet the requirements of 10 CFR 20.1406, and 7) clarify the use of in-line components in this radwaste effluent discharge line. These specific items related to the radwaste effluent discharge line are addressed in Section 12.3 of this SER.

To simplify the design of the cooling tower blow-down line, the liquid radwaste effluent discharge pipeline in the LWMS will be designed to not discharge to the cooling tower blow-down line. The liquid radwaste effluent discharge pipeline will be extended to transfer liquid radwaste effluent from the LWMS in the RWB directly to the environment. In order to maintain a DF of 1000 while releasing liquid radwaste effluent to the environment, the applicant must ensure that the circulating water system from Units 1 and 2 must be turned on. The applicant, by providing dilution water flow to maintain a DF of 1000 during liquid effluent releases from North Anna 3, has met the effluent release requirements as described in the application. An exemption from DCD Tier 1 to revise the discharge piping information for the LWMS is acceptable by the staff based upon the applicant maintaining a DF of 1000 as described in Section 11.2.3.2 of this SER. Therefore, RAI 12.03-55 is resolved and closed.

Exemption Approval determination:

In the North Anna 3 COLA, Revision 8, Part 7, "Departures Report," the applicant requested an exemption from the provisions of 10 CFR Part 52, Appendix E, Section III.B, "Design Certification Rule for the ESBWR Design, Scope and Contents," which requires an applicant referencing a certified design to incorporate by reference Tier 1 information. Specifically, in North Anna Part 7, Exemption 4, the applicant proposed to revise the ESBWR DCD, Tier 1, Section 12.3.1.5.1, "Design Considerations," to accommodate site specific design considerations that would simplify the cooling tower blow-down line by not sending liquid radwaste discharge through that section of piping.

<u>Regulations</u>

- 10 CFR Part 52, Appendix E, Section VIII.A.4 states that exemptions from Tier 1 information are governed by the requirements of 10 CFR 52.63(b) and 10 CFR 52.98(f). 10 CFR Part 52, Appendix E, Section VIII.A.4 also states that the Commission will deny such a request if it finds that the design change will result in a significant reduction in the level of safety otherwise provided by the design.

- 10 CFR Part 52.63(b)(1) allows an applicant to request NRC approval for an exemption from one or more elements of the certification information. The Commission may only grant such a request if it determines that the request complies with the requirements of 10 CFR 52.7, which, in turn, points to the requirements listed in 10 CFR 50.12 for specific exemptions, and if the special circumstances present outweigh the potential decrease in safety due to reduced standardization. Therefore, any exemption from the Tier 1 information certified by 10 CFR Part 52, Appendix E must meet the requirements of 10 CFR 50.12, 10 CFR 52.7, and 10 CFR 52.63(b)(1).

Evaluation of Exemption

As stated in 10 CFR Part 52, Appendix E, Section VIII.A.4, an exemption from Tier 1 information is governed by the requirements of 10 CFR 52.63(b)(1) and 52.98(f). Additionally, the Commission will deny an exemption request if it finds that the requested change to Tier 1 information will result in a significant decrease in safety. Pursuant to 10 CFR 52.63(b)(1), the Commission may, upon application by an applicant or licensee referencing a certified design, grant exemptions from one or more elements of the certification information, as long as the criteria given in 10 CFR 50.12 are met and the special circumstances as defined by 10 CFR 50.12 outweigh any potential decrease in safety due to reduced standardization.

Applicable criteria for when the Commission may grant the requested specific exemption are provided in 10 CFR 50.12(a)(1) and (a)(2). 10 CFR 50.12(a)(1) provides that the requested exemption must be authorized by law, not present an undue risk to the public health and safety, and be consistent with the common defense and security. The provisions of 10 CFR 50.12(a)(2) list six special circumstances for which an exemption may be granted. It is necessary for one of these special circumstances to be present in order for NRC to consider granting an exemption request. The applicant stated that the requested exemption meets the special circumstances of 10 CFR 50.12(a)(2)(ii). That subsection defines special circumstances as when "…[a]pplication of the regulation in the particular circumstances would not serve the underlying purpose of the rule or is not necessary to achieve the underlying purpose of the rule." The staff's analysis of each of these findings is presented below.

Authorized by Law

This exemption would allow the applicant to implement approved changes to Tier 1 information. This is a permanent exemption limited in scope to particular Tier 1 information, and subsequent changes to this Tier 1 information or any other Tier 1 information would be subject to full compliance by the applicant as specified in 10 CFR Part 52, Appendix E, Section III.B.
As stated above, 10 CFR 52.63(b)(1) allows the NRC to grant exemptions from one or more elements of the certification information, namely, Tier 1. The staff determined that granting of the applicant's proposed exemption will not result in a violation of the Atomic Energy Act of 1954, as amended, or NRC regulations. Therefore, as required by 10 CFR 50.12(a)(1), the exemption is authorized by law.

No Undue Risk to Public Health and Safety

The underlying purpose of ESBWR DCD, Tier 1, design of the cooling tower blow-down line identifies the standard ESBWR cooling tower blow-down configuration that will function in a manner in which the staff has determined, satisfies NRC requirements. The change in design function of the cooling tower blow-down line will not change the requirements of liquid rad-waste release and the applicant has stated that there will not be plans to release liquid rad-waste from the plant except in unusual circumstances where the releases will be done in a controlled procedure manner ensuring that the proper amount of effluent dilution is available. The plant-specific Tier 1 DCD will continue to reflect the approved licensing basis for the applicant and will maintain a level of detail consistent with that which is currently provided elsewhere in Tier 1 of the plant-specific DCD. The affected design description in the plant-specific Tier 1 DCD will continue to provide the detail necessary to support the LWMS release requirements and the associated design function. These proposed changes are evaluated and found to be acceptable. Therefore, the staff finds the exemption presents no undue risk to public health and safety as required by 10 CFR 50.12(a)(1).

Consistent with Common Defense and Security

The proposed exemption would allow the applicant to implement modifications to the Tier 1 information requested in the applicant's submittal. This is a permanent exemption limited in scope to particular Tier 1 information. Subsequent changes to this Tier 1 information or any other Tier 1 information would be subject to full compliance by the applicant as specified in 10 CFR Part 52, Appendix E, Section VIII.A.4. This change is not related to security issues. Therefore, as required by 10 CFR 50.12(a)(1), the staff finds that the exemption is consistent with the common defense and security.

Special Circumstances

Special circumstances, in accordance with 10 CFR 50.12(a)(2)(ii), are present whenever application of the regulation in the particular circumstances would not serve the underlying purposes of the rule or is not necessary to achieve the underlying purpose of the rule. The underlying purpose of the specific ESBWR DCD, Tier 1, cooling tower blow-down line being modified is to allow liquid radwaste effluent dilution when discharging to the environment. Since North Anna 3 does not plan to discharge any liquid waste referred to as a "0" release plant except under very unusual circumstances where dilution from the North Anna 1 or North Anna 2 plants are available in accordance with procedures. Accordingly, special circumstances are present because application of the requirement to incorporate the certified design information in specific ESBWR DCD, Tier 1, Section 12.3.1.5.1, "Design Considerations," is not necessary to achieve the underlying purpose of the rule. Therefore, the staff finds that special circumstances required by 10 CFR 50.12(a)(2)(ii) for the granting of an exemption from Tier 1, exist.

Special Circumstances Outweigh Reduced Standardization

This exemption would allow the applicant to change certain ESBWR DCD, Tier 1 information proposed in the North Anna 3 COLA. The key design functions of the LWMS will be maintained. Based on the nature of the proposed changes to the generic ESBWR DCD, Tier 1 cooling tower blow-down line design, and the understanding that these changes support the design function of the LWMS, it is likely that all other ESBWR licensees and applicants would request the same exemption given a similar "0" liquid release operational consideration.

However, this exemption request and the associated changes to North Anna 3 COL Tier 1 information, demonstrate that there is a minimal change from the standard information provided in the ESBWR DCD. Consequently, the decrease in safety due to reduced standardization would also be minimal. For this reason, the staff determined that even if other ESBWR licensees and applicants do not request similar departures, the special circumstances outweigh the potential decrease in safety due to reduced standardization of the ESBWR design, as required by 10 CFR 52.63(b)(1).

No Significant Reduction in Safety

The proposed exemption would modify the function of the North Anna 3 LWMS discharge flow path described in the ESBWR DCD. Therefore, the staff finds that granting the exemption would not result in a significant decrease in the level of safety otherwise provided by the design, as required by 10 CFR Part 52, Appendix E, Section VIII.A.4.

Conclusion

For the reasons set forth above, the staff has concluded that pursuant to 10 CFR Part 52, Appendix E, Section VIII.A.4, the exemption: (1) is authorized by law, (2) presents no undue risk to the public health and safety, (3) is consistent with the common defense and security, (4) has special circumstances that outweigh the potential decrease in safety due to reduced standardization, and (5) does not significantly reduce the level of safety at the licensee's facility. Therefore, the staff finds that the applicant's request to depart from the information in ESBWR DCD Tier 1, design of the cooling tower blow-down line, to be acceptable and the applicant's request for an exemption from these Tier 1 requirements is granted.

- NAPS DEP 12.3-1 Liquid Radwaste Effluent Discharge Piping Flow Path

This Tier 2 departure is permitted by 10 CFR 52.7 and Section VIII.A.3 of the Design Certification Rule. This Tier 2 departure from the ESBWR DCD describes the liquid radwaste effluent discharge piping flow path. The pipeline to transfer liquid radwaste from the RWB to the environment does not adversely affect any intended DCD design function. This departure evaluation was determined to comply with the requirements of the ESBWR Design Certification Rule, 10 CFR Part 52, Appendix E, Section VIII.B.5.b which states that an applicant who references this appendix may depart from Tier 2 information, without prior NRC approval.

The staff has reviewed this departure submittal and agrees with the applicant's determination concerning the departure to describe the liquid radwaste effluent discharge and this Tier 2 departure does not change the function of this line as described in the ESBWR DCD. The liquid radwaste effluent discharge pipeline will be extended to transfer liquid radwaste effluent from the LWMS in the RWB directly to the environment only as necessary.

COL Items

- STD COL 11.2-1-A Implementation of IE Bulletin 80-10

The guidance from IE Bulletin 80-10 includes information on the identification and restriction of non-contaminated systems that have the potential of becoming contaminated. The applicant has addressed this COL information item in the COLA with STD COL 11.2-1-A. In FSAR Section 11.2.2.3, "Detailed System Component Description," the applicant proposes to use specific equipment connection configurations and plant sampling. Specifically, the use of double-check valves in each line where a non-radioactive system is connected to a radioactive or potentially radioactive system. A tell-tale connection is proposed for installation in each line to confirm the integrity of the line and check valves. The FSAR stated that to ensure that contamination has not occurred in permanently installed clean systems, sampling of these systems further upstream has been included in the plant sampling program.

FSAR Section 11.2.2.3 presents an updated description of some portions of the LWMS that sample the permanently installed non-radioactive plant system in upstream locations of radioactive systems, to avoid uncontrolled and unmonitored releases into the environment. A review of that information indicates that there is no specific information describing those sampling provisions or where samples would be collected to confirm that clean plant systems have not been cross-contaminated by radioactive process streams. This information would ensure that appropriate provisions are identified in advance and would not likely be omitted during the development of the sampling and analysis program for the North Anna 3 Offsite Dose Calculation Manual (ODCM), confirming compliance with liquid effluent concentration limits of Table 2 in Appendix B to 10 CFR Part 20 and design objectives in Appendix I to 10 CFR Part 50. The applicant provided additional information and proposed a revision to STD COL 11.2-1-A. The revision clarified that the plant procedures would describe the sampling of non-radioactive systems that could become potentially contaminated through the improper interface with radioactive systems. The proposed revision also notes that the determination of which system to consider and sample would be based on the requirements contained in the plant ODCM. The ODCM takes into account site-specific conditions and guidance from RG 1.109 in identifying exposure pathways and offsite dose receptors. The staff finds that these design features and operational program demonstrate compliance with IE Bulletin 80-10 and are therefore acceptable.

The staff thus concluded that STD COL 11.2-1-A is consistent with IE Bulletin 80-10 and is therefore acceptable.

- STD COL 11.2-2-A Implementation of 10 CFR 20.

Subsection 12.3.1.5 of the North Anna 3 COL FSAR addresses this COL item by providing information on design, operational, and programmatic considerations to minimize contamination and ensure compliance with 10 CFR 20.1406. The staff's evaluation of this information is in Section 12.3.4 of this SER.

Supplemental Information

- NAPS SUP 11.2-1 Implementation of Section II.D of Appendix I to 10 CFR Part 50 (Cost-Benefit Analysis)

FSAR Section 11.2.1 (STD SUP 11.2-1) includes the basis of the cost-benefit analysis in justifying, in part, the LWMS design. This is a plant and site-specific cost-benefit analysis demonstrating compliance with Section II.D of Appendix I to 10 CFR Part 50. The applicant is to provide sufficient information for the staff to evaluate the bases and assumptions used in the analysis and for the staff to conduct an independent confirmation of compliance with NRC regulations and guidance. The FSAR includes the results of a cost-benefit analysis and supporting data using the guidance in RG 1.110. The applicant's analysis showed that the lowest-cost option for the LWMS augment is a 20 gallon per minute (gpm) filter cartridge at a cost of $11,380 per year, resulting in a corresponding collective dose of 11.38 person-rem to the total body or thyroid.

FSAR Section 12.2.2.4.2 states that annual collective population doses due to liquid effluent releases are estimated to be 0.84 person-rem to the total body and 0.99 person-rem to the thyroid, based on the LWMS described in the ESBWR DCD. Assuming that the 20 gpm filter cartridge augment removes all remaining radioactivity in liquid effluents after treatment through the LWMS, the resulting lowest cost liquid radwaste augment is $11,380/year. This value is above the $1,000 per person-rem (total body or thyroid) ALARA criterion in Section II.D of Appendix I to 10 CFR Part 50 for both the total body and the thyroid. Thus, the applicant concluded that the LWMS meets the ALARA requirement and no further system augments are necessary.

The staff conducted an independent assessment of the applicant's cost-benefit analysis using the information presented in FSAR Sections 11.2.1 and 12.2.2.4.2 and the NRC calculated collective population doses, and guidance in RGs 1.110 and 1.109. The staff analysis confirmed the applicant's conclusions.

None of the radwaste augments that are provided in RG 1.110 are found to be cost beneficial in reducing the annual population total body and thyroid doses. The staff analysis also confirmed that the cost-benefit ratios are above the $1,000 per person-rem (total body or thyroid) ALARA criterion in Section II.D of Appendix I to 10 CFR Part 50 and that the LWMS augment would not further reduce collective doses below the FSAR estimates. The staff found that NAPS-SUP-11.2-1 meets the requirements of Section II.D of Appendix I to 10 CFR Part 50 and is therefore acceptable.

The staff's review and evaluation of compliance with liquid effluent concentration limits and dose limits for maximally exposed individuals are addressed in Section 12.2 of the North Anna 3 FSAR and Section 12.2 of this SER.

- NAPS SUP 11.2-2 Ground Water Protection

In Subsection 11.2.3.2 of the North Anna 3 COL FSAR, the applicant provided supplemental information addressing the monitoring program for the LWMS and plant blow-down underground piping. In SER Section 12.3.4 under COL Item STD COL 12.3-4-A, the staff evaluated the required monitoring program for the underground piping to ensure that the potential for unmonitored, uncontrolled releases of radioactivity into the environment is minimized, in accordance with the requirements of 10 CFR 20.1406. Therefore, the staff found NAPS SUP 11.2-2 acceptable.

- Branch Technical Position 11-6

The review of the impacts of an accidental release of radioactive liquids in groundwater or surface water and effects on existing users or likely future users of groundwater or surface water resources is performed using the guidance in SRP Sections 2.4.1, "Hydrologic Description;" 2.4.12, "Groundwater;" and 2.4.13, "Accidental Releases of Radioactive Liquid Effluents in Ground and Surface Waters;" and information and guidance from BTP 11-6, "Postulated Radioactive Releases Due to Liquid-Containing Tank Failures." BTP 11-6 provides guidance in assessing, in accordance with 10 CFR Part 20 concentration limits, a potential release of radioactive liquids following the postulated failure of a tank and its components, located outside of containment, and impacts of the release of radioactive materials at the nearest potable water supply, located in an unrestricted area, for direct human consumption or indirectly through animals, crops, and food processing.

The primary focus of ISG-013, is to provide guidance defining the mechanism of the assumed tank failure, development of the radioactive source term, assumptions and level of conservatism used in the analysis, and approach applied in assessing the radiological impacts at the assumed location of the dose receptor. Because of the complexity of the issues related to the radiological consequences of groundwater contamination, guidance on this topic has been divided between this ISG-013 and ISG-014," Assessing the Radiological Consequences of Accidental Releases of Radioactive Materials from Liquid Waste Tanks in Ground and Surface Waters for Combined License Applications." These two ISGs are intended to be used together.

Concerning liquid containing tank failure, the applicant is responsible for providing site-specific hydrogeological data (such as contaminant migration time), and analysis to demonstrate that the potential groundwater contamination resulting from radioactive release due to liquid containing tank failure is bounded by the analysis. This information is usually discussed in FSAR Subsection 11.2.3.2. From the staff's review of FSAR Sections 11.2.3.2 and 2.4.13 the staff determined that information in the FSAR required updating and/or needed to be addressed for conformance to SRP Sections 11.2.3 and 2.4.13, and BTP 11-6. As a result, the staff requested in RAI 11.02-9 (ADAMS Accession No. ML14318A702), dated November 14, 2014, that the applicant update FSAR Sections 11.2.3.2 and 2.4.13. ESBWR DCD Section 11.2.3.2, states that an assessment of liquid releases following a postulated failure of a LWMS tank and its components in accordance with BTP 11-6 is provided in DCD Section 15.3.16. FSAR Section 15.3.16 did not contain an assessment of liquid releases following a postulated failure of a LWMS tank and its components in accordance with BTP 11-6. Neither BTP 11-6 nor ISG-013 are mentioned in FSAR Section 15.3.16.

The applicant responded to RAI 11.02-9, by letter dated November 8, 2014, (ADAMS Accession No. ML15009A235), concerning information added in FSAR Sections 2.4.13, 15.3.16 and 11.2.3.2. The applicant's response addressed the staff's concerns by adding additional information in FSAR Sections 15.3.16 and 11.2.3.2 stating that the assessment of liquid releases following a postulated failure of a LWMS tank and its components in accordance with BTP 11-6 is addressed in FSAR Section 2.4.13. Additionally, the applicant's assessment of liquid release following a postulated failure of a LWMS tank and its components in accordance with BTP 11-6, in FSAR Section 2.4.13, did not include reference to a source term utilized to aid in the assessment of a postulated liquid tank rupture. As a result, the staff requested in RAI 2.4.13-06 (ADAMS Accession No. ML14347A001) dated January 07, 2014, that the applicant provide the source term for the postulated Condensate Storage Tank (CST), liquid tank rupture, and list the source term in the FSAR. In its response to RAI 2.4.13-06 (ADAMS Accession No. ML15028A392), dated January 27, 2015, the applicant described the CST source term in FSAR Section 2.4.13, and provided the basis for the CST source term in the RAI response. The applicant then provided a table of the CST source term developed in FSAR Section 12.2, FSAR Table 12.2-205, "Bounding Radionuclide Concentration in the Condensate Storage Tank."

Finally, the applicant's assessment of the dose to the environment, in FSAR Section 2.4.13, resulting from the postulated CST liquid tank rupture, in accordance with ISG-013, did not provide a summary all of the parameters used, with the CST source term, to develop a dose assessment evaluation of 28 mrem, using the NRC approved computer code LADTAP II. This evaluation is to demonstrate that the applicant can show the dose assessment is within the 10 CFR 20.1301 regulation limit of 100 mrem. As a result, in RAI 2.4.13-05 (ADAMS Accession No. ML14353A468), dated December 19, 2014, the staff requested that the applicant provide the information used to determine the effluent dose assessment evaluation, the input and output files from the LADTAP II analysis, and any basis required for any input parameters to the LADTAP II computer code.

In its response to RAI 2.4.13-05 (ADAMS Accession No. ML15042A219), dated January 29, 2015, the applicant provided the standard information described in SRP Section 2.4.13 as necessary to perform the dose assessment relating to the postulated CST liquid tank rupture. The staff evaluated the body of information provided in response to RAIs 2.4.13-05, RAI 2.4.13-06, and 11.02-9, to show compliance with 10 CFR 20.1301 and consistent with BTP 11-6. The staff determined that this package of material, along with a staff analysis to verify and validate the applicant's calculations, was acceptable. Therefore, RAIs 2.4.13-05, RAI 2.4.13-06, and 11.02-9 are resolved and closed. The staff verified that the North Anna 3 FSAR Revision 9 incorporated the appropriate changes described in the applicants response to RAIs 2.4.13-05, 2.4.13-06, and 11.02-9. Therefore Confirmatory Item 11.2-01 from the staff advanced SER for North Anna 3 is resolved and closed.

11.2.5 Post Combined License Activities

There are no post COL activities for this section.

11.2.6 Conclusion

The staff's finding related to information incorporated by reference is in NUREG–1966. The staff reviewed the application and checked the referenced DCD. The staff finds that the application included all required information related to the LWMS relevant to this section, and the staff confirmed that no outstanding information related to this section remains to be addressed in the COL FSAR. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to the LWMS that were incorporated by reference have been resolved.

In addition, the staff compared the information in the COLA to the relevant NRC regulations, the guidance in SRP Section 11.2, NRC RGs, and industry standards. The staff's review concluded that the LWMS (as a permanently installed system and in combination with other plant systems) includes the equipment necessary to control releases of radioactive materials in liquid effluents, in accordance with the requirements in 10 CFR 50.34a. Furthermore, the staff concluded that the LWMS is acceptable and meets the requirements in 10 CFR 50.34a and Section II.D of Appendix I to 10 CFR Part 50, as well as the guidance in RGs 1.109, RG 1.110 and IE Bulletin 80-10. This conclusion is based on the following:

- Using site-specific conditions, the applicant has met the ALARA criterion required in Section II.D of Appendix I to 10 CFR Part 50. The staff considered the potential effectiveness of augmenting the LWMS using items of reasonably demonstrated technology. The staff determined that further treatment is not expected to produce further reductions in collective population doses reasonably expected within an 80-kilometer (50-mile) radius of the reactor, at a cost of less than $1,000 per person-rem or person-thyroid-rem.

- The staff determined that the applicant has adequately addressed the standard COL items regarding IE Bulletin 80-10 and 10 CFR 20.1406.

- The staff found it reasonable that the identified Tier 2 departure regarding the description of the LWMS flow path is characterized as not requiring prior NRC approval per 10 CFR Part 52, Appendix E, Section VIII.B.5.

- To simplify the design of the cooling tower blow-down line, the liquid radwaste effluent discharge pipeline in the LWMS will be designed to not discharge to the cooling tower blow-down line. The liquid radwaste effluent discharge pipeline will be extended to transfer liquid radwaste effluent from the LWMS in the RWB directly to the environment. In order to maintain a DF of 1000 while releasing liquid radwaste effluent to the environment, the applicant must ensure that the circulating water system from Units 1 and 2 must be turned on. The applicant, by providing dilution water flow to maintain a DF of 1000 during liquid effluent releases from North Anna 3, has met the effluent release requirements as described in the application. An exemption from DCD Tier 1 to revise the discharge piping information for the LWMS is approved by the staff based upon the applicant maintaining a DF of 1000 as described in Section 11.2.3.2.

11.3 Gaseous Waste Management System

11.3.1 Introduction

The gaseous waste management system (GWMS) is designed to receive and process radioactive gases and hydrogen-bearing gases generated during process operation. The gaseous radioactive effluents come from two main sources in the plant: (1) building ventilation systems servicing radiologically controlled areas; and (2) the power cycle off gas system (OGS). The GWMS and its OGS are used to control, collect, process, hold for decay, and discharge gaseous radioactive wastes generated during normal operation, including AOOs. The OGS is located in the turbine building and its major components include preheaters; recombiners; cooler/condensers; dryers; activated charcoal beds (guard and delay); and associated valves, pumps, and instrumentation. The gases removed from the condenser are radioactive. They must therefore be treated before being released into the environment to ensure that radioactivity levels are reduced to acceptable levels and are ALARA. The GWMS is designed to reduce and control radioactivity releases into the environment. Releases from the OGS are conducted via the turbine building stack. Releases from building ventilation exhaust systems servicing radiologically controlled areas are conducted through their respective buildings: reactor/fuel building stack, turbine building stack, and RWB stack.

11.3.2 Summary of Application

Section 11.3 of the North Anna 3 COL FSAR, Revision 8, incorporates by reference Section 11.3 of the certified ESBWR DCD, Revision 10. In addition, in FSAR Section 11.3, the applicant provided the following:

COL Items

- NAPS ESP COL 11.1-1 — Implementation of Section II.D of Appendix I to10 CFR Part 50 (cost-benefit analysis)

A COL or construction permit applicant should verify that the calculated gaseous and liquid effluent concentrations and radiological doses to members of the public from radioactive gaseous and liquid effluents for any facility to be built on the North Anna site are bounded by the radiological doses and gaseous and liquid effluent concentrations included in the Early Site Permit (ESP) application and reviewed by the NRC. The COL applicant should also include in the radwaste (gaseous and liquid effluents) system all items of reasonably demonstrated technology that effect reductions in population dose to maintain doses ALARA in accordance with Appendix I, Section II.D, to 10 CFR Part 50.

The applicant used RG 1.110 as the basis for a cost-benefit evaluation to assess gaseous radwaste system augmentations. The results of the cost-benefit analysis demonstrate compliance with the ALARA cost-benefit requirements in Section II.D of Appendix I to 10 CFR Part 50. The applicant considered augmentations applicable to the ESBWR conceptual design and concluded that no gaseous radioactive waste system augmentations are cost beneficial.

11.3.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is in NUREG–1966. In addition, the relevant requirements of the Commission regulations for the GWMS and the associated acceptance criteria are in Section 11.3 of the SRP.

The staff also followed the guidance in RG 1.206 to evaluate Section 11.3 of the North Anna 3 COL FSAR for compliance with NRC regulations.

In particular, the regulatory basis for acceptance of the supplementary information on GWMS appears in the following:

- 10 CFR 50.34a.
- Sections II.B, II.C, and II.D of Appendix I to 10 CFR Part 50.
- The following RGs and NRC documents contain regulatory positions and guidance in demonstrating compliance with the relevant requirements of the regulations identified above:
- RG 1.109
- RG 1.110

11.3.4 Technical Evaluation

As documented in NUREG–1966, the staff reviewed and approved Section 11.3 of the certified ESBWR DCD, Revision 10. The staff reviewed Section 11.3 of the North Anna 3 COL FSAR Revision 8, and checked the referenced ESBWR DCD to ensure that the combination of the information in the COL FSAR and the information in the ESBWR DCD appropriately represents the complete scope of information relating to this review topic.[1] The staff's review confirmed that the information in the application and the information incorporated by reference address the relevant information related to the GWMS.

The staff reviewed the relevant information in the FSAR supplement. The following paragraphs discuss the staff's evaluations of the applicant's information on specific technical and regulatory topics.

COL Items

- NAPS ESP COL 11.1-1 — Implementation of Section II.D of Appendix I to10 CFR Part 50 (cost-benefit analysis)

The applicant included a plant and site-specific cost-benefit analysis to justify, in part, the FSAR Section 11.3 GWMS design. The cost-benefit analysis is based on the guidance in RG 1.110 and 1.109, with the results demonstrating compliance with ALARA cost-benefit requirements in Section II.D of Appendix I to 10 CFR Part 50.

The applicant considered the lowest-cost option for a gaseous radwaste treatment system augment that applies to a boiling-water reactor (BWR) as a threshold cost value. The lowest-cost option for a gaseous radwaste treatment system augment that applies to BWRs is the 1000 cfm Charcoal/HEPA Filtration System at $7,960 per year, which yields a threshold value of 7.96 person-rem whole body or thyroid from gaseous effluents for BWRs.

As shown in FSAR Table 12.2-204, the calculated North Anna 3 whole body dose is 4.3 person-rem, which is lower than 7.96 person-rem whole body dose. This comparison determines by the guidance in RG 1.110 that there is not any gaseous radwaste treatment system augment that is cost beneficial at $1,000 per person-rem to reduce whole body dose.

The North Anna 3 thyroid dose shown in FSAR Table 12.2-204 from gaseous effluents is 25 person-rem/yr, which exceeds the 7.96 person-rem/yr threshold value for a BWR. Additional analysis was provided to address the thyroid dose. Based on the estimated 25 person-rem/year thyroid dose, those radwaste augments with a total annual cost (TAC) values less than $25,000 were considered. In some cases, the radwaste augments had insufficient capacity to be considered. Other radwaste augments with greater process capacities were eliminated because they had TAC values greater than $25,000. RG 1.110 radwaste system augments were considered, including the 15,000 cfm HEPA Filtration System, the 3-Ton Charcoal Adsorber, a Charcoal/(HEPA) Filtration System, a 600 ft3 Gas Decay Tank, or a 1000 cfm Charcoal/HEPA Filtration System.

In some cases, the normal flow rates exceed the proposed HEPA filtration system and the augment is not effective for North Anna 3, and is eliminated from further consideration. Other plant design capacities of a system, the normal design flow exceeds the design capacity of the radwaste augment, therefore, this augment is not effective for North Anna 3 and is eliminated from further consideration. Additional radwaste augments provide minimal reduction in the thyroid dose such that the calculated annual benefit is less than the annual cost of the radwaste augment and is eliminated from further consideration. None of the gaseous radwaste augments are cost-beneficial in reducing the annual thyroid dose from gaseous effluents for Unit 3.

The staff evaluated this analysis and determined that in accordance with RG 1.110 guidance there were no radwaste augments that are cost-beneficial in reducing either the annual whole body or thyroid dose. Based on this comparison, no gaseous radwaste treatment system augment is cost-beneficial in reducing annual whole body or thyroid dose and the cost-benefit analysis demonstrates compliance with 10 CFR 50, Appendix I, Section II.D.

11.3.5 Post Combined License Activities

There are no post COL activities for this section.

11.3.6 Conclusion

The staff's finding related to information incorporated by reference is in NUREG–1966. The staff reviewed the application and checked the referenced DCD. The staff finds that the application includes all required information related to the GWMS relevant to this section and the staff confirmed that no outstanding information related to this section remains to be addressed in the COL FSAR. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to the GWMS that were incorporated by reference, have been resolved.

In addition, the staff compared the information in the COLA to the relevant NRC regulations, the guidance in SRP Section 11.3, NRC RGs, and industry standards. The staff concluded that the GWMS includes the equipment necessary to control releases of radioactive materials in gaseous effluents in accordance with the requirements in 10 CFR 50.34a. Furthermore, the staff concluded that the GWMS is acceptable and meets the requirements in 10 CFR 50.34a and Section II.D of Appendix I to 10 CFR Part 50, as well as the guidance of RGs 1.109 and 1.110.

11.4 Solid Waste Management System

11.4.1 Introduction

The solid waste management system (SWMS) is designed to provide collection, processing, packaging, and storage for radioactive wastes such as spent resins, sludge, oil waste, and dry active waste produced during normal operation and AOOs including startup, shutdown, and refueling operations. The SWMS is located in the RWB and is designed to collect, process, control, package, and temporarily store wet and dry solid radioactive wastes before shipment. The SWMS processes wastes from the LWMS, reactor water cleanup/shutdown cooling system, fuel and auxiliary pools cooling system, and condensate purification system. The SWMS comprises the following four subsystems: SWMS collection subsystem, SWMS processing subsystem, dry solid waste accumulation, and conditioning subsystem container storage subsystem.

The SWMS collection subsystem consists of high- and low-activity resin holdup tanks, phase separators, a condensate resin holdup tank, decant pumps, sampling points, control panels, instrumentation, vents and drains, and high and low activity transfer pumps. There are no provisions to release liquid and gaseous wastes directly from the SWMS system. All liquid effluent releases are conducted through the LWMS for process liquids generated during the operation of the SWMS. Airborne releases from the SWMS and ventilation exhaust systems servicing radiologically controlled areas, where process equipment is located, are monitored and discharged through the RWB stack.

The container storage subsystem and the dry solid waste accumulation and conditioning subsystem are conceptual descriptions of methods the COL licensee would use to handle and process solid wastes and packaged solid wastes. Therefore, the DCD describes the process without including equipment and system flow diagrams. Figures 11.4-1 and 11.4-4 in DCD Tier 2 provide overviews of the processes that would be used to handle dry solid and wet wastes. The COL licensee will address the actual processes in the operational programs and procedures, which will consider the regulatory requirements of the NRC, U.S. Department of Transportation (DOT), and State and local agencies for processing, storing, packaging, shipping, radiological monitoring, and disposing of radioactive wastes.

11.4.2 Summary of Application

Section 11.4 of the North Anna 3 COL FSAR incorporates by reference Section 11.4 of the ESBWR DCD, Revision 10.

North Anna 3 COL FSAR Section 11.4 describes the development and implementation of a plant-specific process control program (PCP) for operating procedures and technical specifications on the classification, treatment, and disposal of radioactive wastes processed by the SWMS. The applicant endorses by reference NEI Template 07-10, "Generic FSAR Template Guidance for Process Control Program (PCP)," for the development of the PCP in meeting the intent of Generic Letter (GL) 89-01, "Implementation of Programmatic Controls for Radiological Effluent Technical Specifications in the Administrative Controls Section of the Technical Specifications and the Relocation of Procedural Details of RETS to the Offsite Dose Calculation Manual or to the Process Control Program." The implementation milestone for the development of the PCP is described in FSAR Section 13.4. FSAR Section 11.5 describes the process to control and monitor all liquid and gaseous effluent releases associated with the processing of radioactive wastes. FSAR Section 12.2 presents information on the estimated amounts of radioactivity in liquid and gaseous effluent releases, effluent concentrations released into the environment, and associated doses to members of the public. FSAR Section 13.5 outlines the types of operational procedures that would be used to operate the SWMS. FSAR Section 14.2 describes the initial test program, including pre-operational and startup tests for the SWMS. North Anna 3 COLA, Part 10: Inspections, Tests, Analyses, and Acceptance Criteria (ITAAC) presents the specific ITAAC for the SWMS.

In addition, in FSAR Section 11.4, the applicant provided supplemental information as follows:

Tier 2 Departure Not Requiring Prior NRC Approval

- NA3 DEP 11.4-1 — Long-Term, Temporary Storage of Class B and C Low-Level Radioactive Waste

The ESBWR DCD identifies that the RWB provides onsite storage space for a 6-month volume of packaged waste. The applicant stated that Departure NA3 DEP 11.4-1 configures the North Anna 3 RWB to accommodate a minimum of 10 years of Class B and C waste, while maintaining space for at least 3 months of packaged Class A waste. This departure is accomplished by reconfiguring the arrangement of systems and components within the design of the ESBWR RWB. The applicant provided various revised tables and figures for the new arrangement of systems and components in the reconfigured RWB.

COL items

- STD COL 11.4-1-A — SWMS Processing Subsystem Regulatory Guide Compliance

The COL applicant is responsible for ensuring that SWMS subsystems comply with the guidance of RG 1.143, Revision 2 and RG 8.8, Revision 3, "Information Relevant to Ensuring that Occupational Radiation Exposures at Nuclear Power Stations Will Be as Low as Is Reasonably Achievable," issued in June 1978 for the testing and operation of all SWMS subsystems. The applicant provided additional information regarding the SWMS testing according to guidance in RG 1.143 and RG 8.8.

- STD COL 11.4-2-A Compliance with IE Bulletin 80-10

This COL item evaluates SWMS subsystems against the guidance and information in IE Bulletin 80-10 in identifying and rectifying connections to systems that are considered nonradioactive, but that could become radioactive through improper interfaces with radioactive systems (i.e., a nonradioactive system that could become contaminated as a result of leakage, valving errors, or other operating conditions in radioactive systems). The applicant provided additional details about the types of design features, including the installation of double check valves and tell-tale connections, for the purpose of confirming the integrity of SWMS piping and connections. There are normal sample points further upstream that will be included in the plant-specific sampling program.

- STD COL 11.4-3-A Process Control Program

The applicant included, by reference, NEI 07-10A Revision 0, “Generic FSAR Template Guidance for Process Control Program (PCP),” issued in March 2009 (ADAMS Accession No. ML091460627), as the basis for the PCP. The applicant noted that Section 13.4 of the North Anna 3 COL FSAR addresses the milestones for developing and implementing the PCP.

- STD COL 11.4-4-A Temporary Storage Facility

In the North Anna 3 COL FSAR, the applicant indicated that the RWB was reconfigured to accommodate at least 10 years of packaged Class B and C waste and approximately 3 months of packaged Class A waste, during routine operations and AOOs. The COL item addresses the use of a temporary storage facility and an overall site management plan for radioactive wastes using the guidance in SRP Section 11.4 (March 2007).

- STD COL 11.4-5-A Compliance with 10 CFR 20.1406

This COL item addresses site-specific information for demonstrating compliance with 10 CFR 20.1406 and RG 4.21, “Minimization of Contamination and Radioactive Waste Generation: Life-Cycle Planning,” issued in June 2008, as it relates to the design and operational procedures of SWMS treatment subsystems to minimize contamination, facilitate eventual decommissioning, and minimize the generation of radioactive waste. In Section 11.4.1 of the North Anna 3 COL FSAR, the applicant provided additional information identifying various sections of the FSAR (Sections 12.3, 12.4, 12.5, and 13.5) that address how to comply with the implementation of 10 CFR 20.1406.

Supplemental Information

- STD SUP 11.4-1 Implementation of Section II.D of Appendix I to 10 CFR Part 50 (Cost-Benefit Analysis)

In Section 11.4.1 of the North Anna 3 COL FSAR the applicant presented supplemental information regarding the cost-benefit analysis for the SWMS and references the cost-benefit analyses in FSAR Sections 11.2.1 and 11.3.1, for processing and treating liquid and gaseous effluents as byproducts of the SWMS operation. Hence, no augmentations are needed for the SWMS.

11.4.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is in NUREG–1966. In addition, the relevant requirements of the Commission regulations for the SWMS, and the associated acceptance criteria, are in SRP Section 11.4.

The staff also followed the guidance in RG 1.206 to evaluate Section 11.4 of the North Anna 3 COL FSAR for compliance with NRC regulations.

In particular, the regulatory basis for acceptance of the supplementary information on the SWMS appears in the following:

- 10 CFR 20.1406.
- Sections II.A, II.B, II.C and II.D of Appendix I to 10 CFR Part 50.
- 10 CFR Part 61, “Licensing Requirements for Land Disposal of Radioactive Waste.”

The following RGs and NRC documents contain regulatory positions and guidance in demonstrating compliance with the relevant requirements of the regulations identified above:

- RG 1.109.
- IE 80-10.
- RG 8.8, Revision 3.
- RG 1.143, Revision 2.
- GL 89-01.

In addition, in accordance with Section VIII, “Processes for Changes and Departures,” of “Appendix E to Part 52-Design Certification Rule for the Economic Simplified Boiling Water Reactor,” the applicant identified a Tier 2 departure. Tier 2 departures not requiring prior NRC approval are subject to the requirements of 10 CFR Part 52, Appendix E, Section VIII.B.5, which are similar to the requirements of 10 CFR 50.59.

11.4.4 Technical Evaluation

As documented in NUREG–1966, the staff reviewed and approved Section 11.4 of the certified ESBWR DCD, Revision 10. The staff reviewed Section 11.4 of the North Anna 3 COL FSAR, Revision 8, and checked the referenced ESBWR DCD to ensure that the combination of the information in the COL FSAR and the information in the ESBWR DCD represents the complete scope of information relating to this review topic.[1] The staff's review confirmed that the information in the application and the information incorporated by reference address the required information related to the SWMS.

The staff reviewed the applicant's proposed resolution to the COL items and the departure included in Section 11.4 of the North Anna 3 COL FSAR as follows:

Tier 2 Departure Not Requiring Prior NRC Approval

- NAPS DEP 11.4-1 Long-Term, Temporary Storage of Class B and C Low-Level Radioactive Waste

The ESBWR DCD identifies that the RWB provides onsite storage space for a 6-month volume of packaged waste. The applicant stated that Departure NAPS3 DEP 11.4-1 configures the North Anna 3 RWB to accommodate a minimum of 10 years of Class B and C waste, while maintaining space for at least 3 months of packaged Class A waste.

This departure identifies a plant-specific deviation from design information in the ESBWR DCD for low-level radioactive waste storage. The North Anna 3 RWB is configured to accommodate a minimum of 10 years of Class B and C waste, while maintaining space for at least 3 months of packaged Class A waste. The departure is accomplished by reconfiguring the arrangement of systems and components within the ESBWR RWB. The applicant provided various figures and tables in Section 11.4 of the North Anna 3 COL FSAR to identify changes in equipment and systems. The applicant also added figures and tables to Section 12.3 that identify the revised layout and radiation protection needs. The major change to Section 11.4 is the elimination of the condensate resin transfer pumps and the addition of high- and low-activity circulation pumps (Figures 11.4-1R and 11.4-2R and Table 11.4-1R). In addition, the applicant identified the estimated annual volume of radwaste requiring long-term management in FSAR Table 11.4-2R.

In Part 7, "Departure Report," of the COLA, the applicant provided the results of the evaluation of this departure. The applicant added that the departure affects Tier 2 information, but the departure has no safety significance.

The staff reviewed the applicant's information in Parts 2, 7, and 10 of the COLA. The changes affecting the RWB layout, specifically to the renaming of the assigned locations does not present a risk to public health and safety.

During the review of Section 11.4, the staff noticed in Section 11.4.2.2.4, "Container Storage Subsystem," that the high integrity containers (HICs) are provided with shield "bells." The applicant stated, a shield bell is a steel, vertical right circular cylinder with an open bottom. It is capable of venting to the general area. Shield bells are placed over HICs to provide radiation shielding and also provide structural integrity to permit stacking of HICs.

The guidance contained in RG 1.206 notes that the applicant is to describe the design features provided to maintain occupational radiation exposure (ORE) ALARA. The guidance contained in SRP Appendix 11.4-A, "Design Guidance for Temporary Storage of Low-Level Radioactive Waste," states that storage plans should address container protection and that good engineering judgment should be used to ensure that radioactive materials are contained safely. The guidance of SRP Appendix 11.4-A also states that when significant handling and personnel exposure can be anticipated, licensees should incorporate ALARA methodology in accordance with RG 8.8.

North Anna 3 COL FSAR 11.4.2.2, "Container Storage Subsystems," states, "Shield bells also provide structural integrity to permit stacking of HICs. The HICs must be stacked two levels high to accommodate the storage needs." CNS-8 120B is the designation for a shielded transportation cask that is not designed to be stacked. HICs such as the model PL8-120 High Density Polyethylene (HDPE) or L8-120 carbon steel containers are also not designed to be directly stacked. However, North Anna 3 COL FSAR 11.4.2.2.4 states that "The HICs are provided with shield “bells.” A shield bell is a steel, vertical right circular cylinder with an open bottom. It is capable of venting to the general area. Shield bells are placed over HICs to provide radiation shielding.”

In RAI 11.04-12, dated December 05, 2014 (ADAMS Accession No. ML14344A105), the staff requested that the applicant revise and update the North Anna 3 COL FSAR Section 11.4.2.2.4 to appropriately describe the waste storage container (i.e., container type and volume), the design features provided to protect the structural integrity of stored waste and the design provisions for maintaining ORE ALARA while stacking waste containers, or provide the specific alternative approaches used and the associated justification. The staff also requested that the applicant revise and provide the design to be used (e.g., stacking rings) to allow stacking HICs two levels high.

In its response to RAI 11.04-12 (ADAMS Accession No. ML15022A198), dated January 20, 2015, the applicant stated that the FSAR will be revised to clarify the design characteristics of the HICs and the design features provided for stacking HICs in order to maintain structural integrity and ORE ALARA. The shield bells will provide the full structural support to permit stacking of the 120 cubic foot HICs. The HICs themselves will not support any load due to stacking. The FSAR Section 11.4.2.2.4, “Container Storage Subsystem,” has been revised to clarify the design features that allow the stacking of HICs. The HDPE HICs will have shield bells that provide complete structural integrity to permit the stacking of HICs two levels to accommodate storage needs. The staff finds that this clarification is acceptable, and RAI 11.04-12 is resolved and closed. The staff verified that the North Anna 3 FSAR Revision 9 incorporated the appropriate changes described in the applicants’ response to RAI 11.04-12. Therefore Confirmatory Item 11.2-02 from the staff advanced SER for North Anna 3 is resolved and closed.

With regard to storage capacity, Table 11.4-2-R shows that Class B and C wastes are generated at a rate of about 15.6 cubic meters per year (m^3/yr) (552 cubic feet per year [ft^3/yr]), requiring 156 m^3 (5,520 ft^3) of storage volume for a 10-year inventory. The same table shows a 3-month Class A waste volume of 91 m^3/yr (3,210 ft^3/yr) for dry active waste and about 24 m^3/yr (874.6 ft^3/yr) for wet solid waste. Figure 1.2-23R (depicting the RWB at elevation 4650) indicates the storage of Class B and C wastes in Room 6390, Class A wet solid waste in Room 6391, and Class A dry active waste in Room 6392. The staff reviewed these rooms and determined that all three rooms have sufficient surface area and volume to store the waste for the required period. Therefore, the staff concluded that the new storage areas for managing Classes A, B, and C radioactive wastes have sufficient volume to accommodate the accumulated waste.

The applicant stated that Departure North Anna 3 DEP 11.4-1 only affects Tier 2, and its evaluation determined that this departure does not require prior NRC approval in accordance with Appendix E to 10 CFR Part 52. The staff found it reasonable that the departure does not require prior NRC approval. The applicant's process for evaluating departures and other changes to the DCD is subject to NRC inspections.

COL Items

- STD COL 11.4-1-A SWMS Processing Subsystem Regulatory Guide Compliance

The COL item addresses the compliance of the SWMS subsystems with the guidance in RG 1.143, Revision 2, and RG 8.8 for the testing and operation of all SWMS subsystems. The applicant addressed this information item in STD COL 11.4-1-A. The applicant noted that SWMS subsystems used to process wet solid radioactive wastes, are tested using a process that complies with RG 1.143. The staff determined that the information provided by the applicant is acceptable. Therefore, COL Item 11.4.-1-A has been satisfied. The evaluation of the compliance with RG 8.8 is addressed in Section 12.1 of the SER.

The applicant supplemented STD COL 11.4-1-A with North Anna 3 SUP 11.4-1. As described in Section 12.1 of the SER, the applicant's additional information is consistent with RG 1.143 and RG 8.8 and is therefore acceptable.

- STD COL 11.4-2-A Compliance with IE Bulletin 80-10

The COL item addresses the evaluation of the SWMS subsystems against the guidance and information in IE Bulletin 80-10. The purpose is to identify and rectify connections to systems that are considered nonradioactive but that could become radioactive through improper interfaces with radioactive systems (i.e., a non-radioactive system that could become contaminated due to leakage, valving errors, or other operating conditions in radioactive systems). IE Bulletin 80-10 includes information on identifying and restricting non-contaminated systems that could become contaminated.

The applicant has addressed this COL information item in the COLA with STD COL 11.4-2-A. FSAR Section 11.4.2.3, "Detailed System Component Description," presents an updated description of some portions of the SWMS on sampling permanently installed non-radioactive plant system in upstream locations of radioactive systems. These provisions are intended to avoid uncontrolled and unmonitored releases into the environment. Specifically, the applicant proposed using double-check valves in each line where a non-radioactive system is connected to a radioactive or potentially radioactive system. These valves are expected to service subsystems connected to non-radioactive portable systems. The installation of tell-tale connection in each line is expected to confirm the integrity of the line and check valves. The FSAR stated that to ensure that contamination has not occurred in permanently installed clean systems, sampling these systems further upstream is included in the plant sampling program.

In Subsection 11.4.2.3.5 of the North Anna 3 COL FSAR, the applicant stated that the plant-specific procedures describe the sampling of nonradioactive systems that could potentially become contaminated by cross-connecting with systems that contain radioactive material. In addition, the ODCM will address potential conditions where normally nonradioactive systems might become contaminated. The staff found this information to be consistent with IE Bulletin 80-10 and is therefore acceptable.

- STD COL 11.4-3-A Process Control Program

The COL item addresses the implementation of a plant-specific PCP using operating procedures and technical specifications, as they relate to the classification, treatment, and disposal of radioactive wastes processed by the SWMS in accordance with the

NRC, DOT and State and local agency regulatory requirements. The applicant included, by reference, NEI Template 07-10A as the basis for the PCP. The NEI template presents the functional elements of a PCP, which, if met, would demonstrate compliance with 10 CFR 50.34a and 50.36a, "Technical specifications on effluents from nuclear power reactors." The template describes technical and regulatory considerations used to process solid, wet, and liquid wastes with selected waste processing technologies and methods. The PCP identifies surveillance requirements that are consistent with the plant's technical specifications, administrative procedures, operational procedures, quality assurance and quality control program, radiological controls and monitoring program, information to be contained in annual radiological effluent release reports, reporting requirements to the NRC, instructions on using the NRC uniform radioactive shipping waste manifest, and the process for initiating and documenting changes to the North Anna 3 PCP and its supporting procedures. The basis for acceptance in the staff's review is conformance of the applicant's endorsement of the DCD SWMS design and proposed North Anna 3 PCP. The milestones for the development and implementation of the PCP are addressed in FSAR Section 13.4 of the North Anna 3 COL. The staff determined that this item is satisfactorily addressed in FSAR Section 13.4, Table 13.4-201 (Item 9), which lists the milestones for the development and implementation of the PCP before fuel load, with the requirement identified as a license condition. The applicant updated FSAR Section 11.4.2.3, STD COL 11.4-3-A by referencing NEI PCP Template 07-10A in applicable FSAR subsections and references. NEI PCP Template 07-10A (Revision 0, March 2009) has been reviewed and found acceptable by the staff. The staff concluded that STD COL 11.4-3-A meets the requirements and is acceptable (process control program compliance with 10 CFR 50.34a and 50.36a).

In Subsection 11.4.2.3.5 of the North Anna 3 COL FSAR, the applicant's resolution of STD COL 11.4-3-A for waste classification and process control is consistent with NEI 07-10A and is therefore acceptable. Section 13.4, "Operational Programs Required by NRC Regulations," of the North Anna 3 COL FSAR addresses the milestones for developing and implementing the PCP before the fuel loading. In Table 13.4-201, "Operational Programs Required by NRC Regulations," the applicant identified the implementation milestones for operational programs including the operational program related to the PCP. The staff reviewed the applicant's milestones for developing and implementing the PCP and found the applicant's license condition of North Anna 3 COL Part 10, Section 3.6, "Operational Program Readiness," to be acceptable.

- STD COL 11.4-4-A Temporary Storage Facility

In previous revisions of the North Anna 3 COL FSAR, the applicant stated that North Anna 3 does not use any temporary storage facilities to support plant operation. The corresponding ESBWR DCD, Tier 2 COL item states that it is the responsibility of the COL applicant to consider the development of an overall site management plan for the storage of radioactive waste using the guidance of SRP Section 11.4. In the RAI 11.04-3 response dated May 21, 2009, ADAMS Accession No. ML091540526) the applicant stated that temporary storage would be added as necessary if needed.

- STD COL 11.4-5-A Compliance with 10 CFR 20.1406

The applicant stated that Subsection 12.3.1.5 addresses this COL item. Subsection 12.3.1.5 provides information on design features as well as on measures used in operating procedures to minimize contamination and to ensure compliance with 10 CFR 20.1406. Section 12.3.4 of this SER provides the staff's evaluation of this information.

Supplemental Information

- STD SUP 11.4-1 — Implementation of Section II.D of Appendix I to 10 CFR Part 50 (cost-benefit analysis)

The applicant added a new supplement (STD SUP 11.4-1) to Section 11.4.1 of the North Anna 3 COL FSAR, which states that the cost-benefit analyses in Sections 11.2.1 and 11.3.1 include the incremental amounts of liquid and gaseous wastes that would be produced during the operation of the SWMS. As a result, no other SWMS design augmentations are necessary to handle the incremental amounts of liquid and gaseous wastes. The staff found the applicant's supplemental information acceptable because the cost-benefit analyses in FSAR Sections 11.2 and 11.3 consider routinely expected sources of radioactivity discharged via the three plant stacks. For example, releases from the RWB ventilation exhaust systems servicing radiologically controlled areas—including the SWMS components—and the venting of SWMS tanks and vessels are conducted through the RWB stack. As a result, all releases from the SWMS are monitored and controlled at the release point, and all releases controlled through the implementation of the ODCM. Therefore, the staff concluded that the applicant has adequately addressed STD SUP 11.4-1.

11.4.5 Post Combined License Activities

For the reasons discussed in the technical evaluation section above, the staff has identified the following license condition from North Anna 3 COL Part 10, Section 3.6, which establishes the operational program for process and effluent monitoring and sampling (including the PCP):

> The licensee shall submit to the Director of NRO, a schedule, no later than 12 months after issuance of the COL, for implementation of the operational programs listed in FSAR Table 13.4-201. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until the operational programs in the FSAR table have been fully implemented. This schedule shall also address:
>
> - The implementation of site-specific Severe Accident Management Guidelines.
> - The spent fuel rack coupon monitoring program implementation.

The applicant's Table 13.4-201, included the following elements:

a. Radiological Effluent Technical Specifications/Standard Radiological Effluent Controls.

b. Offsite Dose Calculation Manual.

c. Radiological Environmental Monitoring Program.

11.4.6 Conclusion

The staff's finding related to information incorporated by reference is in NUREG–1966. The staff reviewed the application and checked the referenced DCD. The staff determined that the application includes all required information relating to the SWMS relevant to this section, and the staff confirmed that no outstanding information related to this section remains to be addressed in the COL FSAR. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to the SWMS that were incorporated by reference have been resolved.

In addition, the staff compared the information in the COLA to the relevant NRC regulations, the guidance in SRP Section 11.4, NRC RGs, and industry standards. The staff concluded that the SWMS (as a permanently installed system and in combination with other plant systems) includes the equipment necessary to process liquid, wet, and dry solid wastes and contains provisions for controlling the release of radioactive materials in effluents in accordance with the requirements in 10 CFR 50.34a. The staff's review concluded that the SWMS is acceptable and meets the requirements in 10 CFR 50.34a and Section II.D of Appendix I to 10 CFR Part 50, as well as the guidance in RGs 8.8, 1.143, 1.109 and 1.110 and IE Bulletin 80-10. This conclusion is based on the following:

- Using site-specific conditions, the applicant has met the ALARA criterion required in Section II.D of Appendix I to 10 CFR Part 50 because all associated effluent releases are expected to be managed through the operation of the LWMS and GWMS. The staff considered the potential effectiveness of augmenting the LWMS and GWMS using items of reasonably demonstrated technology. The staff determined that additional treatment is not expected to produce further reductions in collective population doses reasonably expected within an 80-kilometer (50-mile) radius of the reactor, at a cost of less than $1,000 per person-rem or person-thyroid-rem.

- The staff determined that the applicant has adequately addressed the standard COL items regarding IE Bulletin 80-10 and 10 CFR 20.1406.

- The applicant's proposed PCP as it relates to classifying, processing, and disposing of radioactive wastes meets the requirements of 10 CFR Part 61. The staff concluded that the endorsement of NEI 07-10A, Revision 0, and the SWMS supplemental information in FSAR Section 11.4 are consistent with the requirements of GL 89-01.

11.5 Process Radiation Monitoring System

11.5.1 Introduction

The process radiation monitoring system (PRMS), is used to monitor liquid and gaseous process streams and effluent releases from the RWMS during normal operation, AOOs, and post-accident conditions. The system includes radiation monitors to detect and measure radioactivity and radiation levels and to provide indication of radioactive release rates or concentration levels in process and effluent streams. The PRMS includes sampling systems to extract samples from process or effluent streams and to provide the means to collect samples on filtration and in adsorbent media. The PRMS provides the means to establish alarm set points for the purpose of indicating when excessive radioactivity levels are present, track and record rates of radioactivity releases, and initiate protective isolation actions, such as terminating or diverting process or effluent flows.

Typically, the system consists of skid-mounted radiation monitoring equipment and permanently installed sampling lines with the equipment being located at points to measure radioactivity or collect samples that are representative of process flows and effluent releases. Samples collected on filtration and in adsorbent media are evaluated by laboratory analyses in confirming measurement results recorded by radiation monitors and determining radioactivity levels associated with radionuclides that are not readily detected by radiation monitoring devices. The system includes local instrumentation readout panels and alarm functions in addition to those located in control rooms. The PRMS does not generate additional sources of radioactive materials associated with its operation given that it is used only to control and monitor liquid and gaseous process streams and effluents discharged to the environment. Fluid samples collected from process and effluent streams are returned to their origins and are not discharged locally.

11.5.2 Summary of Application

Section 11.5 of the North Anna 3 COL FSAR, Revision 8, incorporates by reference Section 11.5 of the ESBWR DCD, Revision 10. In addition, in FSAR Section 11.5, the applicant provided the following:

COL Items

- STD COL 11.5-1-A — Sensitivity or Subsystem Lower Limit of Detection

This COL item addresses the derivation of lower limits of detection or detection sensitivity levels for each PRMS effluent subsystem, following the requirements of the ODCM for North Anna 3. The applicant stated that the ODCM provides the methodology for deriving the lower limit of detection for each effluent monitor.

- STD COL 11.5-2-A — Offsite Dose Calculation Manual (ODCM)

This COL item addresses the development of a plant- and site-specific ODCM for calculating offsite doses resulting from liquid and gaseous effluents. In FSAR Subsection 11.5.4.5, the applicant incorporated by reference NEI 07-09A, Revision 0, “Generic FSAR Template Guidance for Offsite Dose Calculation Manual (ODCM) Program Description,” dated March 31, 2009 (ADAMS Accession No. ML091050234). The ODCM is used to control and monitor all liquid and gaseous effluent releases and to implement an environmental sampling and monitoring program. Section 13.4 of the North Anna 3 COL FSAR addresses the milestones for the development and implementation of the ODCM.

- STD COL 11.5-3-A — Process and Effluent Monitoring and Sampling Program

This COL item addresses the implementation of a site-specific monitoring and sampling program, as described in the ODCM for North Anna 3. In addition, the applicant included Table 11.5-201 as a replacement for Table 11.5-5 in ESBWR DCD, Tier 2, which details provisions for sampling liquid streams.

- STD COL 11.5-4-A Site-Specific Offsite Dose Calculation

This COL item addresses compliance with the design objectives in Appendix I to 10 CFR Part 50 for controlling doses to a hypothetical maximally exposed member of the public and populations living near North Anna 3.

- STD COL 11.5-5-A Instrumentation Sensitivities

The COL item addresses the derivation of instrumentation detection sensitivity levels and bases for sampling all expected liquid and gaseous effluent release points described in the ODCM for North Anna 3.

11.5.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is NUREG–1966. In addition, the relevant requirements of the Commission regulations for the PRMS and the associated acceptance criteria are in SRP Section 11.5.

The staff also followed the guidance in RG 1.206 to evaluate Section 11.5 of the North Anna 3 FSAR for compliance with NRC regulations.

In particular, the regulatory basis for accepting the additional information related the PRMS appears in the following:

- 10 CFR 20.1301(e),
- 10 CFR 20.1302, “Compliance with dose limits for individual members of the public.”
- 10 CFR 50.34a.
- 10 CFR 50.36a.
- Sections II.A, II.B, II.C, and II.D of Appendix I to 10 CFR Part 50.

The following RGs and NRC documents contain regulatory positions and guidance in demonstrating compliance with the relevant requirements of the regulations identified above:

Additional requirements include those of 10 CFR 50.34(f)(2)(xvii) and 10 CFR 50.34(f)(2)(xxvii) for monitoring gaseous effluents from potential accident release points, consistent with GDC 63,” Monitoring Fuel and Waste Storage” and GDC 64, “Monitoring Radioactivity Releases.”

SRP acceptance criteria include industry codes and standards, such as American National Standards Institute/Health Physics Society N13.1,”Sampling and Monitoring Releases of Airborne Radioactive Substances From The Stacks and Ducts of Nuclear Facilities,” and American National Standards Institute (ANSI) N42.18,” Specification and Performance of on-Site Instrumentation for Continuously Monitoring Radioactivity in Effluents,” and the guidance in the following NRC documents:

- RG 1.109.

- RG 1.110.

- RG 1.206.

- RG 1.21, Revision 1, “Measuring, Evaluating, and Reporting Radioactivity in Solid Wastes and Releases of Radioactive Materials in Liquid and Gaseous Effluents from Light-Water-Cooled Nuclear Power Plants,” June 1974.

- RG 1.33, Revision 2, “Quality Assurance Program Requirements (Operation),” February 1978.

- RG 1.97, Revision 4, “Criteria for Accident Monitoring Instrumentation for Nuclear Power Plants,” June 2006.

- RG 4.1, Revision 2, “Radiological Environmental Monitoring for Nuclear Power Plants,” June 2009.

- RG 4.15, Revision 2, “Quality Assurance for Radiological Monitoring Programs (Inception through Normal Operations to License Termination)—Effluent Streams and the Environment,” July 2007.

- BTP 7-10, Revision 5, “Guidance on Application of Regulatory Guide 1.97,” issued March 2007, in SRP Section 7.5.

- GL 89–01.

- IE Bulletin 80-10.

11.5.4 Technical Evaluation

As documented in NUREG–1966, the staff reviewed and approved Section 11.5 of the certified ESBWR DCD, Revision 10. The staff reviewed Section 11.5 of North Anna 3 COL FSAR, Revision 8, and checked the referenced ESBWR DCD to ensure that the combination of the information in the COL FSAR and the information in the ESBWR DCD appropriately represents the complete scope of information relating to this review topic.[1] The staff's review confirmed that the information in the application and the information incorporated by reference address the relevant information related to the PRMS.

The staff reviewed the applicant's proposed resolution to the COL items included under Section 11.5 of the North Anna 3 COL FSAR as follows:

<u>*COL Items*</u>

- STD COL 11.5-1-A Sensitivity or Subsystem Lower Limit of Detection

The COL item addresses the derivation of lower limits of detection for each effluent PRMS subsystem, following the requirements of the ODCM for North Anna 3. The applicant outlined, given the endorsement of NEI ODCM Template 07-09A, methods used to derive the lower limits of detection for PRMS subsystems in monitoring and controlling liquid and gaseous effluent releases. The milestones for the development and implementation of the ODCM are addressed in FSAR Section 13.4 of the North Anna 3 COL. The staff finds this item satisfactorily addressed in FSAR Section 13.4, Table 13.4-201 (Item 9), which lists the milestones for the development and implementation of the ODCM before fuel load, as a license condition as described in North Anna 3 COLA Part 10, Section 3.6, “Operational Program Readiness.”

In Subsection 11.5.4.7 of the North Anna 3 COL FSAR, the applicant stated that the ODCM will provide the methodology for deriving the lower limit of detection for the PRMS subsystem in monitoring and controlling liquid and gaseous effluent releases. DCD Tables 11.5-2 and 11.5-4 provide the estimated sensitivities of process radiation monitors. If the plant configuration and radiation background require changes to these sensitivity ranges, the ranges will be adjusted in accordance with written procedures consistent with the bases defined in DCD Table 11.5-9. The applicant will update the FSAR if changes to values in DCD Tables 11.5-2 and 11.5-4 are needed. The staff’s review found that the applicant’s response adequately addresses STD COL 11.5-1-A and the guidance in RGs 1.21, 1.33, 1.97, 1.206, 4.1, and 4.15 and complies with 10 CFR Part 20, 10 CFR Part 50, and BTP 7-10.

- STD COL 11.5-2-A Offsite Dose Calculation Manual

The COL item addresses the development of a plant- and site-specific ODCM for calculating offsite doses resulting from liquid and gaseous effluents. In the North Anna 3 FSAR, Section 11.5.4.5 the applicant endorsed by reference, NEI ODCM Template 07-09A as the basis of its ODCM as an operational program document. The NEI template presents the functional elements of an ODCM that, if met, would demonstrate compliance with Part 50.34a and 50.36a and Appendix I to 10 CFR Part 50. The NEI ODCM Template identifies monitoring criteria, liquid and gaseous radiological effluent controls, monitoring instrumentation, methods for deriving lower limits of detection and detection sensitivities, methods for establishing instrumentation alarm set-points, dose limits for members of the public, requirements for process and effluent sampling in various plant systems, requirements limiting effluent releases, surveillance requirements, methods for calculating effluent release rates and doses, elements of a radiological environmental monitoring program, elements of a quality assurance and quality control program, information to be contained in annual radiological effluent release reports, reporting requirements to the NRC, process for initiating and documenting changes to the North Anna 3 ODCM and supporting procedures, and record keeping. The staff finds this item satisfactorily addressed in FSAR Section 13.4, Table 13.4-201 (Item 9), which lists the milestones for the development and implementation of the ODCM before fuel load as a license condition in North Anna 3 COL Application Part 10, Section 3.6, “Operational Program Readiness.” Accordingly, the applicant updated the provisions of FSAR Section 11.5.4.5, (STD COL 11.5-2-A), by referencing NEI ODCM Template 07-09A in applicable FSAR subsections and references.

In addition, the applicant will include in the ODCM, before fuel load, the provisions for sampling liquid and gaseous waste streams identified in Table 11.5-201 and DCD Table 11.5-7 and batch liquid releases identified in DCD Table 11.5-7. Section 13.4, “Operational Programs Required by NRC Regulations,” of the North Anna 3 COL FSAR addresses the milestones for developing and implementing the ODCM.

- STD COL 11.5-3-A Process and Effluent Monitoring Program

This COL item addresses the development and implementation of a site-specific monitoring and sampling program described in the ODCM for North Anna 3. Section 13.4 of the North Anna 3 COL FSAR addresses the milestones for developing and implementing the radiological environmental monitoring program in Table 13.4-201 under Item 9.

Subsection 11.5.4.6 of the North Anna 3 COL FSAR, regarding process and effluent monitoring and sampling presents information in Table 11.5-201, "Provisions for Sampling Liquid Streams," on sampling for several North Anna 3 plant systems, including the plant service water system (PSWS) (Item 2), storm drains and cooling tower blow-down (Item 11), and sanitary wastewater (Item 14).

The staff verified that the applicant has incorporated the changes noted above in the North Anna 3 COL FSAR. In addition, STD COL 11.5-3-A is acceptable because it meets the guidance in RGs 1.21, 1.33, 1.97, 1.206, 4.1, and 4.15 and complies with 10 CFR Part 20, 10 CFR Part 50, and BTP 7-10.

- STD COL 11.5-4-A Site-Specific Offsite Dose Calculation

This COL item addresses compliance with the design objectives in Appendix I to 10 CFR Part 50 of controlling doses to a hypothetical, maximally exposed member of the public and populations living near North Anna 3. In Subsection 11.5.4.8 of the North Anna 3 COL FSAR, the applicant stated that the ODCM addresses the guidelines in Appendix I to 10 CFR Part 50 and FSAR Section 12.2.2 provides the site-specific doses to members of the public. The staff's evaluation under COL Item STD COL 11.5-2-A provides further discussion on the ODCM, which is in compliance with Sections II.A through II.C of Appendix I to 10 CFR Part 50. The staff determined that the applicant's response adequately addresses this COL item, and is therefore acceptable.

- STD COL 11.5-5-A Instrumentation Sensitivities

In Subsection 11.5.4.9 of the North Anna 3 COL FSAR, the applicant stated that the ODCM will describe the instrument sensitivities, sampling, and analytical frequencies and the basis for each gaseous and liquid sample. The applicant referenced FSAR Subsection 11.5.4.5 for a discussion on the development and implementation of the ODCM. The staff's evaluation under COL Item STD COL 11.5-2-A provides further discussion on the ODCM (in terms of compliance with the guidance in RGs 1.21, 1.33, 1.97, 4.1, and 4.15 and complies with 10 CFR Part 20, 10 CFR Part 50, and BTP 7-10). The staff found that the applicant adequately addresses STD COL 11.5-5-A, and is therefore acceptable.

11.5.5 Post Combined License Activities

For the reasons discussed in the technical evaluation section above, the staff has identified the following license condition from North Anna 3 COL Part 10, Section 3.6:

> The licensee shall submit to the Director of NRO, a schedule, no later than 12 months after issuance of the COL, for implementation of the operational programs listed in FSAR Table 13.4-201. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until the operational programs in the FSAR table have been fully implemented. This schedule shall also address:
>
> - The implementation of site-specific Severe Accident Management Guidelines.

- The spent fuel rack coupon monitoring program implementation.

The applicant's Table 13.4-201, includes the following elements:

a. Radiological Effluent Technical Specifications/Standard Radiological Effluent Controls.

b. Offsite Dose Calculation Manual.

c. Radiological Environmental Monitoring Program.

11.5.6 Conclusion

The staff's finding related to information incorporated by reference is in NUREG–1966. The staff reviewed the application and checked the referenced DCD. The staff determined that the application includes all required information related to the PRMS relevant to this section, and the staff confirmed that no outstanding information related to this section remains to be addressed in the COL FSAR. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to the PRMS that were incorporated by reference have been resolved.

In addition, the staff compared the information in the COLA to the relevant NRC regulations, the guidance in SRP Section 11.5, NRC RGs, and industry standards. The staff's review concluded that the applicant has presented adequate information in the North Anna 3 COL FSAR to meet the requirements of the PRMS, which includes the equipment necessary to monitor process and effluent streams; describes an operational program to control releases of radioactive materials associated with the operation of the LWMS, GWMS, and SWMS; and incorporates provisions to implement a sampling and monitoring program. Furthermore, the staff concluded that the PRMS is acceptable and meets the requirements in 10 CFR 50.34a and Section II.D of Appendix I to 10 CFR Part 50, as well as the guidance of RGs 1.109 and 1.110 and IE Bulletin 80-10. This conclusion is based on the following:

- The PRMS includes the instrumentation for monitoring and sampling radioactivity in contaminated liquid and gaseous process and effluent streams and in solid wastes during routine operations, AOOs, and accident conditions. The staff evaluated the proposed provisions for sampling and monitoring appropriate process streams and effluent release points, including nonradioactive systems that could become contaminated through interfaces with radioactive systems.

- The applicant's proposed development of the ODCM for North Anna 3, as it relates to controlling and monitoring effluent releases and doses to members of the public, meets the requirements of Appendix I to 10 CFR Part 50; 10 CFR 20.1301(e); and 10 CFR 20.1302. Therefore, the staff concluded that the endorsement of NEI 07-09A, Revision 0, and the PRMS supplemental information in FSAR Section 11.5 are consistent with GL 89-01.

12.0 RADIATION PROTECTION

12.0 RADIATION PROTECTION

This chapter of the U.S. Nuclear Regulatory Commission's (NRC's) safety evaluation report (SER) provides the NRC staff evaluation of the North Anna 3 radiation protection methods and estimated occupational radiation exposures (ORE) of operating and construction personnel during normal operations (including refueling; purging; fuel handling and storage; radioactive material handling, processing, use, storage, and disposal; maintenance; routine operational surveillance; in-service inspection (ISI); and calibration), and anticipated operational occurrences (AOO). Specifically, this chapter provides information on facility and equipment design, planning and procedures programs, and techniques and practices employed by the applicant to meet the radiation protection standards set forth in Title 10 of the *Code of Federal Regulations* (CFR) Part 20, "Standards for Protection Against Radiation," and to be consistent with the guidance given in the appropriate regulatory guides (RG), where the practices set forth in such guides are used to implement the NRC regulations. Finally, this chapter provides updated information that supplements the certified Economic Simplified Boiling-Water Reactor (ESBWR) Design Control Document (DCD) with a site-specific assessment of doses to members of the public from anticipated routine liquid and airborne effluent releases.

12.1 Ensuring that Occupational Radiation Exposures are As Low as Is Reasonably Achievable

12.1.1 Introduction

Section 12.1 addresses policy and design considerations to ensure that the ORE to personnel will be kept as low as is reasonably achievable (ALARA). The ALARA program and Radiation Protection Program (RPP) are addressed in Appendices 12AA and 12BB, respectively, in the North Anna 3 Combined License (COL) Final Safety Analysis Report (FSAR). The North Anna 3 COL FSAR adopts the following final versions of the Nuclear Energy Institute (NEI) generic templates accepted by the NRC: NEI 07-03A, "Generic FSAR Template Guidance for Radiation Protection Program Description" (Agencywide Documents Access and Management System (ADAMS) Accession Number No. ML091490684) and NEI 07-08A, "Generic FSAR Template Guidance for Ensuring that Occupational Radiation Exposures are as Low as is Reasonably Achievable (ALARA)" (ADAMS Accession No. ML093220178).

12.1.2 Summary of Application

Section 12.1 of the North Anna 3 COL FSAR, Revision 8, incorporates by reference Section 12.1 of the ESBWR DCD, Revision 10, referenced in Appendix E, "Design Certification Rule for the ESBWR Design," to 10 CFR Part 52, "Licenses, Certifications, and Approvals for Nuclear Power Plants," In addition, in FSAR Section 12.1, the applicant provides the following:

COL Items

- STD COL 12.1-1-A Regulatory Guide 8.10

The applicant is responsible for demonstrating compliance with the guidance of RG 8.10 Revision 1-R, "Operating Philosophy for Maintaining Occupational Radiation Exposures ALARA." The applicant references FSAR Appendices 12AA and 12BB, which in turn adopt NEI 07–08A and NEI 07–03A to meet the needs of this COL item.

- STD COL 12.1-2-A Regulatory Guide 1.8

The applicant is responsible for demonstrating compliance with the guidance of RG 1.8, Revision 3, “Qualification and Training of Personnel for Nuclear Power Plants.” The applicant references FSAR Appendices 12AA and 12BB, which in turn adopt NEI 07-08A and NEI 07-03A to meet the needs of this COL item.

- STD COL 12.1-3-A Operational Considerations

The applicant is responsible for providing criteria and conditions for implementing various operating procedures and techniques ensuring that occupational exposures are ALARA according to the guidance of NUREG–1736, “Consolidated Guidance: 10 CFR Part 20 — Standards for Protection Against Radiation.” The applicant references FSAR Appendices 12AA and 12BB, which in turn adopt NEI 07–08A and NEI 07–03A to meet the needs of this COL item.

- STD COL 12.1-4-A Regulatory Guide 8.8

The applicant is responsible for demonstrating compliance with the guidance of RG 8.8, Revision 3, “Information Relevant to Ensuring that Occupational Radiation Exposures at Nuclear Power Stations Will Be ALARA.” The applicant references FSAR Appendices 12AA and 12BB, which in turn adopt NEI 07–08A and NEI 07–03A to meet the needs of this COL item.

Supplemental Information

- STD SUP 12.1-1 ALARA Program

The applicant provides supplemental information in FSAR Appendices 12AA and 12BB to address the ALARA Program and the RPP at the site. These appendices reference NEI 07–08A and NEI 07–03A, which in turn provide additional operating policy guidance for developing and implementing an ALARA program.

12.1.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is in NUREG–1966, “Final Safety Evaluation Report Related to the Certification of the Economic Simplified Boiling Water Reactor Standard Design.”

The staff followed the guidance in RG 1.206, “Combined License Applications for Nuclear Power Plants (LWR Edition),” to evaluate North Anna 3 FSAR Section 12.1 for compliance with NRC regulations.

The relevant requirements of the Commission regulations for ensuring that occupational radiation exposures are ALARA, and the associated acceptance criteria, are in Section 12.1 of NUREG–0800, “Standard Review Plan for the Review of Safety Analysis Reports for Nuclear Power Plants, (LWR Edition),” the Standard Review Plan (SRP).

In particular, the regulatory basis for the acceptance of the COL items and the supplemental information is established in 10 CFR 19.12, “Instructions to workers”; 10 CFR Part 20; and the guidance of RG 1.206; RG 8.10, Revision 1-R; RG 1.8, Revision 3; and RG 8.8, Revision 3.

Moreover, the acceptance of the COL items and the supplemental information in this section are based on guidance in the following RGs and NEI templates:

- RG 8.2, “Guide for Administrative Practices in Radiation Monitoring”
- RG 8.7, Revision 2, “Instructions for Record Keeping and Recording Occupational Radiation Exposure Data”
- RG 8.9, Revision 1, “Acceptable Concepts, Models, Equations, and Assumptions for a Bioassay Program”
- RG 8.13, Revision 3, “Instruction Concerning Prenatal Radiation Exposure”
- RG 8.15, Revision 1, “Acceptable Programs for Respiratory Protection”
- RG 8.27, “Radiation Protection Training for Personnel at Light-Water-Cooled Nuclear Power Plants”
- RG 8.28, “Audible-Alarm Dosimeters”
- RG 8.29, Revision 1, “Instructions Concerning Risks from Occupational Radiation Exposure”
- RG 8.34, “Monitoring Criteria and Methods to Calculate Occupational Radiation Doses.”
- RG 8.35, “Planned Special Exposures”
- RG 8.36, “Radiation Dose to the Embryo/Fetus”
- RG 8.38, Revision 1, “Control of Access to High and Very High Radiation Areas in Nuclear Power Plants”
- RG 1.206, NEI 07–03A, and NEI 07–08A

12.1.4 Technical Evaluation

As documented in NUREG–1966, the staff reviewed and approved Section 12.1 of the certified ESBWR DCD, Revision 10. The staff reviewed Section 12.1 of the North Anna 3 COL FSAR, Revision 8 and checked the referenced ESBWR DCD to ensure that the combination of the information in the COL FSAR and the information in the ESBWR DCD appropriately represents the complete scope of information relating to this review topic.[1] The staff’s review confirmed that the information in the application and the information incorporated by reference address the required information related to “Ensuring that Occupational Radiation Exposures are ALARA.”

In addition, the staff reviewed the applicant’s proposed resolution to the COL items and the supplemental information included under Section 12.1 of the North Anna 3 COL FSAR. In this review, the staff used the applicable sections of the SRP and RG 1.206 as guidance.

[1] See “*Finality of Referenced NRC Approvals*” in SER Section 1.2.2 for a discussion on the staff’s review related to verification of the scope of information to be included in a COL application that references a design certification.

Section 1.2.3 of this safety evaluation report (SER) discusses the NRC's strategy for performing one technical review for each standard issue outside the scope of the DC and to use this review to evaluate the subsequent COL applications. To ensure that the staff's findings on the standard content that were documented in the SER for the Fermi 3 application are equally applicable to the North Anna 3 COL application (COLA), the staff undertook the following reviews:

- The staff compared the Fermi 3 COL FSAR, Revision 8, to the North Anna 3 COL FSAR, Revision 8. In this comparison, the staff considered changes to the North Anna 3 COL FSAR (and other parts of the COLA, as applicable) resulting from requests for additional information (RAI) identified in the Fermi SER.

- The staff confirmed that the applicant has endorsed all responses to the RAIs in the corresponding standard content (the Fermi SER) evaluation.

- The staff verified that the site-specific differences are not relevant to this section.

The staff completed the review and finds the evaluation of the Fermi standard content to be directly applicable to the North Anna 3 COLA.

The staff reviewed the information in the North Anna 3 COL FSAR as follows:

COL Items

- STD COL 12.1-1-A Regulatory Guide 8.10

The applicant provided additional information in STD COL 12.1-1-A to address the resolution of DCD COL Item 12.1-1-A, which states:

> The COL applicant will demonstrate compliance with Regulatory Guide 8.10

The FSAR states that this COL information item is addressed in NEI Template 07-03A, which is referenced in Appendix 12BB of the FSAR.

The staff reviewed NEI 07-03A with respect to compliance with RG 8.10. RG 8.10 describes the operating philosophy for maintaining OREs ALARA and states that the management of the licensed facility should be committed to maintaining exposures ALARA, and the personnel responsible for radiation protection should be continually vigilant for means to reduce exposures. NEI 07-03A states that the plant management will establish a written policy on radiation protection that is consistent with the guidance in RG 8.10. The radiation protection responsibilities of the Radiation Protection Manager will be consistent with the guidance in RG 8.10 and will include establishing, implementing, and enforcing the RPP. In addition, management is committed to assuring that each individual working at the facility understands and accepts the responsibility to follow radiation protection procedures and instructions provided by radiation protection staff and to maintain his or her dose ALARA.

In North Anna 3 COL FSAR Revision 8, the applicant states that compliance with RG 8.10 is addressed in Appendices 12AA and 12BB, which in turn adopt NEI 07-08A and NEI 07–03A for meeting the needs of this COL item. The staff has reviewed and approved these NEI templates for addressing this COL item (ADAMS Accession Nos. ML090510379 and ML091130034).

Therefore, the applicant has adequately addressed COL Item STD COL 12.1-1-A (compliance with the guidance of RG 8.10).

- STD COL 12.1-2-A Regulatory Guide 1.8

The applicant provided additional information in STD COL 12.1-2-A to address the resolution of DCD COL Item 12.1-2-A, which states:

> The COL applicant will demonstrate compliance with Regulatory Guide 1.8.

The FSAR states that this COL information item is addressed in NEI Template 07-03A, which is referenced in Appendix 12BB of the FSAR.

The staff has reviewed NEI 07-03A with respect to compliance with RG 1.8. RG 1.8 states that the American National Standards Institute (ANSI)/American Nuclear Society (ANS)-3.1-1993, with certain additions, exceptions, and clarifications delineated in the RG, provides acceptable criteria for the selection, qualification, and training of personnel for nuclear power plants. NEI 07-03A states that the Radiation Protection Manager, Radiation Protection Technicians, and Radiation Protection Supervisory and Technical Staff will be trained and qualified in accordance with the guidance in RG 1.8.

In North Anna 3 COL FSAR, Revision 8, the applicant states that compliance with this RG is addressed in Appendices 12AA and 12BB, which in turn adopt NEI 07–08A and NEI 07–03A to meet the needs of this COL item. The staff has reviewed and approved these NEI templates for addressing this COL item; therefore, the applicant has adequately addressed COL Item STD COL 12.1-2-A (compliance with the guidance of RG 1.8).

- STD COL 12.1-3-A Operational Considerations

The applicant provided additional information in STD COL 12.1-3-A to address the resolution of DCD COL Item 12.1-3-A, which states:

> The COL applicant will provide the criteria and/or conditions under which various operating procedures and techniques will be implemented to ensure that occupational radiation exposures are ALARA using the guidance of NUREG–1736, to the level of detail provided in RG 1.206.

The staff reviewed the applicant's response to STD COL 12.1-3-A related to criteria and conditions under which various operating procedures and techniques will be implemented to ensure that OREs are ALARA, using the guidance in NUREG–1736 to the level of detail provided in RG 1.206. The staff also reviewed the applicant's response to ensure that the applicant has committed to follow the guidance in the following RGs: 8.2, 8.7, 8.9, 8.13, 8.15, 8.27, 8.28, 8.29, 8.34, 8.35, 8.36, and 8.38. The criteria and conditions in STD COL 12.1-3-A are addressed in NEI 07-03A, which is referenced in Appendix 12 BB of the FSAR. NEI 07-03A addresses various operating procedures and techniques used in dose-related activities found in typical nuclear plants. These activities include refueling, in-service inspections, radwaste handling, spent fuel handling, normal operations, routine maintenance, sampling, and calibration. The template allows for COL applicant's to modify procedures based on design-specific and site-specific information. The staff reviewed the categories listed in the template for coverage of the ESBWR activities. On the basis of this review, the staff determined that NEI 07-03A, as supplemented by material presented in the DCD, provides the criteria and/or conditions under which various operating procedures and techniques will be implemented to ensure that OREs are ALARA.

In North Anna 3 COL FSAR Revision 8, the applicant states that the operational considerations for the ALARA Program are addressed in Appendices 12AA and 12BB, which in turn adopt NEI 07-08A and NEI 07–03A to meet the needs of this COL item. The staff has reviewed and approved these NEI templates for addressing this COL item; therefore, the applicant has adequately addressed COL Item STD COL 12.1-3-A (providing criteria and conditions for implementing various operating procedures and techniques to ensure that occupational exposures are ALARA, according to the guidance of NUREG–1736 to the level of detail in RG 1.206).

- STD COL 12.1-4-A Regulatory Guide 8.8

The applicant provided additional information in STD COL 12.1-4-A to address the resolution of DCD COL Item 12.1-4-A, which states:

> The COL applicant will demonstrate compliance with Regulatory Guide 8.8.

The FSAR states that this COL information item is addressed in NEI Template 07-03A, which is referenced in Appendix 12BB of the FSAR. The staff has reviewed NEI 07-03A with respect to compliance with RG 8.8. NEI 07-03A addresses the operational portions of RG 8.8 that were not addressed in the ESBWR DCD, including a description of the plant organization, personnel, and personnel responsibilities; facilities (to the extent that they were not described in the DCD), instrumentation, and equipment. NEI 07-03A also includes a description of radiation protection procedures sufficient to provide adequate control over the receipt, possession, use, transfer, and disposal of byproduct, source, and special nuclear material and assure compliance with the applicable requirements in 10 CFR Parts 19, 20, 50, 70, “Domestic Licensing of Special Nuclear Material,” and 71, “Packaging and Transportation of Radioactive Material.” The procedures described in NEI 07-03A include procedures for radiation protection training, access control of radiation areas, methods to maintain exposures ALARA, personnel monitoring, respiratory protection, and contamination control.

In North Anna 3 COL FSAR Revision 8, the applicant states that compliance with this RG is addressed in Appendices 12AA and 12BB, which in turn adopt NEI 07–08A and NEI 07–03A to meet the needs of this COL item. The staff has reviewed and approved these NEI templates for addressing this COL item; therefore, the applicant has adequately addressed COL Item STD COL Item 12.1-4-A (compliance with the guidance of RG 8.8).

Supplemental Information

- STD SUP 12.1-1 ALARA Program

The STD SUP 12.1-1 of the North Anna COL FSAR references Appendices 12 AA and 12 BB for a description of the ALARA program. Appendix 12 AA refers to NEI 07-08A and Appendix 12 BB refers to NEI 07-03A. The staff reviewed NEI Templates 07-08A and 07-03A with respect to a description of the ALARA program. NEI 07-08A states that company and station policies are to keep all radiation exposures of personnel within the limits defined by 10 CFR Part 20. The ALARA policy is consistent with and will be implemented in accordance with the ALARA provisions of RGs 8.8 and 8.10. As stated in FSAR Section 13.1, “Organizational Structure of Applicant,” and in NEI 07-03A, specific individuals will be assigned the responsibility and authority for implementing the ALARA policy at North Anna 3. All station personnel are responsible for the ALARA program. Individual workers are responsible for complying with ALARA requirements, which are presented in worker training in accordance with the training requirements contained in 10 CFR 19.12. The extent of the training is commensurate with the worker's job responsibilities.

North Anna's ALARA policies and practices are consistent with the applicable regulations in 10 CFR Part 20 and the guidance in RGs 1.8, 1.206, 8.2, 8.7, 8.8, 8.9, 8.10, 8.13, 8.15, 8.27, 8.28, 8.29, 8.34, 8.35, 8.36, and 8.38 and the applicable portions of NUREG–1736.
The ALARA program is based on mature programs in use at other operating commercial nuclear facilities and incorporates lessons-learned from plant operating experience. Industry operating experience is regularly reviewed and applicable exposure control technique lessons-learned are incorporated into plans, procedures, and policies developed in accordance with RGs 1.8, 8.8, and 8.10.

Overall facility operations, as well as the RPP, integrate the procedures necessary to ensure that radiation doses are ALARA. Radiation protection procedures, which are described in FSAR Section 12.5, are developed in FSAR Sections 13.5 and 17.5 and meet the applicable requirements in 10 CFR Parts 19, 20, 50, 70, and 71. Examples of some ALARA work practices incorporated in these procedures, and described in NEI 07-08A, to help ensure that exposures to personnel will be ALARA include use of:

- Appropriate dosimetry to record personnel doses

- Pre-job briefings and post-job debriefings to ascertain lessons-learned

- Dry-run training and mockups to improve worker efficiency for complex jobs in high-radiation areas

- Protective clothing, respiratory equipment, and special ventilation systems for working in contaminated environments

- Remote monitoring of personnel to reduce worker exposures, and the establishment of low dose "waiting areas," and

- Permanent or temporary shielding to reduce worker exposure at the work site

In North Anna 3 COL FSAR, Revision 8, the applicant provides supplemental information in Appendices 12AA and 12BB to address the ALARA Program and the RPP at the site. These appendices reference NEI 07–08A and NEI 07–03A, which provide additional operating policy guidance for developing and implementing an ALARA Program. The applicant also provides site-specific information regarding access control in these appendices. The staff's evaluation of the site-specific information on access control is in Section 12.5 of this SER.

As stated earlier, the staff reviewed and approved these NEI templates for addressing the ALARA Program. Therefore, the applicant has adequately addressed the ALARA Program and has identified the locations of very high radiation areas that require access control.

12.1.5 Post Combined License Activities

There are no post COL activities related to this section.

12.1.6 Conclusion

The staff's findings related to information incorporated by reference are documented in NUREG–1966. The staff reviewed the application and checked the referenced DCD. The staff's review confirms that the applicant has addressed the required information relating to policy and design considerations to ensure that ORE to personnel will be kept ALARA, and there is no outstanding information expected to be addressed in the North Anna 3 COL FSAR related to this section. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to "Ensuring that Occupational Radiation Exposures Are ALARA" that were incorporated by reference are resolved.

In addition, the staff compared the information in the COLA to the relevant NRC regulations, the guidance in SRP Section 12.1, and other pertinent NRC RGs. The staff's review concludes that the applicant has adequately addressed the following:

- STD COL Items 12.1-1-A through 12.1-4-A, relating to ALARA and operational considerations and conformance with RGs 1.8, 8.8, and 8.10, are acceptable because the applicant incorporates approved references NEI 07–03A (which incorporates the guidance in RGs 1.8, 8.8, and 8.10) and NEI 07-08A into the North Anna 3 COL FSAR and meets the applicable regulatory requirements and guidance specified in Sections 12.1.3 and 12.1.4 of this SER.

- STD SUP 12.1-1 pertains to the ALARA Program at the site. NEI Templates NEI 07-03A and 07-08A, which are addressed in FSAR Appendices 12AA and 12BB, describe an ALARA program that meets the ALARA provisions in 10 CFR 20.1101(b), the training requirements in 10 CFR 19.12, and the guidance in RGs 8.8 and 8.10. These templates meet the acceptance criteria defined in SRP Section 12.1. Therefore, the staff finds STD SUP 12.1-1 acceptable because the information contained in these templates adequately addresses an acceptable ALARA program.

The staff concludes that the information pertaining to North Anna COL FSAR Section 12.1 is within the scope of the DC and adequately incorporates by reference Section 12.1 of the ESBWR DCD. The information is thus acceptable.

12.2 <u>Plant Sources</u>

12.2.1 Introduction

Section 12.2 addresses the issues related to contained radiation sources and airborne radioactive material sources during normal operations, AOOs, and accident conditions affecting in-plant radiation protection.

This section also addresses doses to members of the public from radioactive effluent releases. All liquid effluent releases are conducted and monitored through the liquid waste management system (LWMS) for process liquids generated during the operation of the LWMS, the gaseous waste management system (GWMS), and the solid waste management system (SWMS). Airborne releases from the operation of the LWMS, GWMS, and SWMS and ventilation exhaust systems servicing radiologically controlled areas, where process equipment are located, are monitored and discharged through their respective stacks, specifically, the reactor/fuel building stack, turbine building stack, and the radwaste building (RWB) stack.

12.2.2 Summary of Application

Section 12.2 of the North Anna 3 COL FSAR, Revision 8, incorporates by reference Section 12.2 of the certified ESBWR DCD, Revision 10, referenced in 10 CFR Part 52, Appendix E.

In addition, in FSAR Section 12.2, the applicant provides the following:

Departures

- NAPS DEP 11.4-1 — Long-Term, Temporary Storage of Class B and C Low-Level Radioactive Waste

The ESBWR DCD identifies that on-site storage space for a 6-month volume of packaged waste is provided in the RWB. In this departure, the North Anna 3 RWB is configured to accommodate a minimum of 10 years volume of packaged Class B and C waste, while maintaining space for at least 3 months of packaged Class A waste. This departure reconfigures the arrangement of systems and components within the ESBWR RWB volume. The systems, structures, and components requiring re-arrangement are associated with the LWMS and SWMS. The existing RWB Fire Protection and heating, ventilation, and air conditioning systems have sufficient capacity to accommodate the extra volume of Class B and C wastes, and require no modification.

COL Items

- NAPS COL 12.2-2-A — Airborne Effluents and Doses

The applicant provided updated information to supplement the DCD with the site-specific parameters for addressing DCD COL Item 12.2-2-A, airborne effluent releases and doses to members of public. This information addresses compliance with the regulatory dose limits in Sections II.B and II.C of Appendix I to 10 CFR Part 50; compliance Section II.D of Appendix I to Part 50; airborne effluent concentration limits in Table 2 (Column 1) of Appendix B to 10 CFR Part 20; and dose limits in 10 CFR 20.1301 and 20.1302. Compliance with the requirements in Section II.D of Appendix I to Part 50 for airborne effluents is addressed in FSAR Section 11.3.1.

- NAPS COL 12.2-3-A — Liquid Effluents and Doses

The applicant provided updated information to supplement the DCD with the site-specific parameters for addressing DCD COL Item 12.2-3-A, liquid effluent releases and doses to members of public. This information addresses compliance with the regulatory dose limits in Section II.A of Appendix I to 10 CFR Part 50; compliance with Section II.D of Appendix I to Part 50; liquid effluent concentration limits in Table 2 (Column 2) of Appendix B to 10 CFR Part 20; and dose limits in 10 CFR Parts 20.1301 and 20.1302. Compliance with the requirements in Section II.D of Appendix I to Part 50 for liquid effluents is addressed in FSAR Section 11.2.1.

- NAPS COL 12.2-4-A — Other Contained Sources

In Subsection 12.2.1.5, “Other Contained Sources,” the applicant provided information about additional contained radioactive sources not described in the DCD that contain by-product, source, or special nuclear materials that may be maintained on site. These contained sources, which are not part of the permanent plant design, are used as calibration, check, or radiography sources.

- NAPS ESP COL 11.1-1 Compliance with 10 CFR Part 50, Appendix I, Section II.D

The applicant provided updated information to supplement the DCD with a site-specific analysis in addressing North Anna 3 Early Site Permit (ESP) COL 11.1-1. This information addresses compliance with the requirements in Section II.D of Appendix I to Part 50 for liquid and airborne effluents in confirming that liquid and gaseous radwaste systems include all items of reasonably demonstrated technology in reducing population doses to ALARA levels. FSAR Section 12.2.2 includes assessments of population doses for both liquid and gaseous effluents. The results of the 10 CFR Part 50, Appendix I, Section II.D, cost-benefit analyses are presented in FSAR Section 11.2.1 for liquid effluents and FSAR Section 11.3.1 for gaseous effluents.

Variances

A *variance* is a plant-specific deviation from one or more of the site characteristics, design parameters, or terms and conditions of an ESP or from the site safety analysis report (SSAR). A variance to an ESP is analogous to a departure from a standard DC. The applicant provided a request for a variance from a site characteristic for the North Anna ESP and from the ESP SSAR. The requests comply with the requirements of 10 CFR 52.39(d) and 10 CFR 52.93(b). To support a decision whether to grant a variance, each variance request provides the technical justification and supporting cross-references to the North Anna 3 FSAR information that meet the technically relevant regulatory acceptance criteria.

- NAPS ESP VAR 12.2-1 Gaseous Pathway Doses

The applicant submitted, under variance NAPS ESP VAR 12.2-1, a request to use updated information on offsite doses associated with gaseous effluents. The request states that the variance is necessary because FSAR dose estimates are higher than those reported in the North Anna ESP SSAR and the ESP-Environmental Review (ER). The doses are higher because of a change in long-term atmospheric dispersion and deposition parameters.

- NAPS ESP VAR 12.2-3 Annual Liquid Effluent Releases

The applicant submitted, under variance NAPS ESP VAR 12.2-3, a request to use updated information for the estimate of liquid effluent releases. The request states that the variance is necessary because FSAR estimates are different from those reported in the North Anna ESP SSAR and ESP-ER. The differences are associated with ESP estimates that were based on a composite source term reflecting different types of reactor technologies, while the FSAR applies the ESBWR DCD, Tier 2, source term. Also, the FSAR estimates for some radionuclides are higher than the ESP because the source term is based on the ESBWR design.

- NAPS ESP VAR 12.2-4 Existing Units' and Site Total Doses

The applicant submitted, under variance NAPS ESP VAR 12.2-4, a request to use updated dose information in characterizing doses from both existing units and total offsite doses. The request states that the variance is necessary as FSAR dose estimates are higher in the FSAR than that reported in the North Anna ESP SSAR and ESP-ER. The doses are higher because of the application of conservative assumptions used in presenting doses from the existing units and the Independent Spent Fuel Storage Installation (ISFSI) facility.

North Anna 3 COL FSAR, Sections 11.2, 11.3, and 11.5 present supporting details on the operation of the LWMS, GWMS, and the Process Radiation Monitoring System (PRMS). North Anna 3 COL, FSAR Section 13.5 describes the major elements of the operational procedures that will be used to operate the LWMS, GWMS, and PRMS. North Anna 3 FSAR Section 13.4 presents the milestones for the development and implementation of the offsite dose calculation manual (ODCM), standard radiological effluent controls (SREC), and radiological environmental monitoring program (REMP) for controlling all radioactive effluent releases and limiting doses to members of the public. In FSAR Section 11.5.4.5, NAPS COL 11.5-2-A, the applicant commits to the development of these programs using NEI ODCM Template 07-09A in monitoring and controlling effluent releases and doses to members of the public. The NEI ODCM Template 07-09A (Revision 0, March 2009) has been reviewed and found acceptable by the staff (see the staff's SER (in ADAMS Accession No. ML083530745) and NEI ODCM Template 07-09A (in ADAMS Accession No. ML091460258)). The staff's evaluation of these systems and operational programs is addressed in their respective sections of this SER.

- NAPS ESP VAR 12.2-5 Annual Gaseous Effluent Releases

The applicant submitted, under variance NAPS ESP VAR 12.2-5, a request to use updated information for the estimate of gaseous effluent releases. The request states that the variance is necessary because FSAR estimates are different from those reported in the North Anna ESP SSAR and ESP-ER. The differences are associated with ESP estimates that were based on a composite source term reflecting different types of reactor technologies, while the FSAR applies the ESBWR DCD, Tier 2, source term. Also, the FSAR estimates for some radionuclides are higher than the ESP because the source term is based on the ESBWR design.

Supplemental Information

- STD SUP 12.2-1

The applicant provides supplemental information in FSAR Subsection 12.2.1.1.2, "Other Radioactive Sources," to provide details regarding the Californium-252 (Cf-252) reactor startup source.

North Anna 3 COL, FSAR Sections 11.2, 11.3, and 11.5 present supporting details on the operation of the LWMS, GWMS, and the PRMS. North Anna 3 COL, FSAR Section 13.5 describes the major elements of the operational procedures that will be used to operate the LWMS, GWMS, and PRMS. North Anna 3 FSAR Section 13.4 presents the milestones for the development and implementation of the ODCM, SREC, and REMP for controlling all radioactive effluent releases and limiting doses to members of the public. In FSAR Section 11.5.4.5, NAPS COL 11.5-2-A, the applicant commits to the development of these programs using NEI ODCM Template 07-09A in monitoring and controlling effluent releases and doses to members of the public. The NEI ODCM Template 07-09A (Revision 0, March 2009) has been reviewed and found acceptable by the staff (see the staff's SER in (ADAMS Accession No. ML083530745) and NEI ODCM Template 07-09A in (ADAMS Accession No. ML091460258). The staff's evaluation of these systems and operational programs is addressed in their respective sections of this SER.

12.2.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is in NUREG–1966. In addition, the relevant requirements of the Commission regulations for the radiation sources, and the associated acceptance criteria, are in SRP Section 12.2.

The staff followed the guidance in RG 1.206 to evaluate North Anna 3 FSAR Section 12.2 for compliance with NRC regulations.

In accordance with Section VIII, "Processes for Changes and Departures," of Appendix E to Part 52, the applicant identifies one Tier 2 departure. Tier 2 departures not requiring prior NRC approval are subject to the requirements of 10 CFR Part 52, Appendix E, Section VIII.B.5, which are similar to the requirements of 10 CFR 50.59, "Changes, tests, and experiments."

The regulatory basis for the acceptance of the COL items in this section include the applicable requirements of 10 CFR Part 20, 10 CFR Part 50, and the guidance of RG 1.206.
In particular, the regulatory basis for the acceptance of the COL Items for assessing doses to members of the public from liquid and gaseous effluent releases in unrestricted areas is established in:

- 10 CFR 20.1301(e), 10 CFR 20.1302, 10 CFR 50.34a, and 50.36a.
- Appendix A, "General Design Criteria for Nuclear Power Plants," to 10 CFR Part 50, General Design Criterion (GDC) 60, "Control of releases of radioactive materials to the environment," and GDC 64, "Monitoring radioactivity releases."
- Appendix I to 10 CFR Part 50, Sections II.A, II.B, II.C, and II.D.

The regulatory basis for the performance of the LWMS, GWMS, and SWMS is in 10 CFR 52.80(a) and Generic Letter (GL) 89–01, "Implementation of Programmatic and Procedural Controls for Radiological Effluent Technical Specifications." The criteria for a variance from an ESP is found in 10 CFR 52.39(d).

The SRP acceptance criteria include:

- RG 1.109, "Calculation of Annual Doses to Man from Routine Releases of Reactor Effluents for the Purpose of Evaluating Compliance with 10 CFR Part 50, Appendix I."
- RG 1.110, "Cost-Benefit Analysis for Radwaste Systems for Light-Water-Cooled Nuclear Power Reactors (for comment)."
- RG 1.111, Revision 1, "Methods for Estimating Atmospheric Transport and Dispersion of Gaseous Effluents in Routine Releases from Light-Water-Cooled Reactors."
- RG 1.112, Revision 1, "Calculation of Releases of Radioactive Materials in Gaseous and Liquid Effluents from Light-Water-Cooled Power Reactors."
- RG 1.113, Revision 1, "Estimating Aquatic Dispersion of Effluents from Accidental and Routine Reactor Releases for the Purpose of Implementing Appendix I."

* RG 1.206.

Full descriptions of the applicable regulatory and acceptance criteria are in SRP Section 11.1 through Section 11.5.

12.2.4 Technical Evaluation

As documented in NUREG–1966, the staff reviewed and approved Section 12.2 of the certified ESBWR DCD, Revision 10. The staff reviewed Section 12.2 of the North Anna 3 COL FSAR, Revision 8, and checked the referenced ESBWR DCD to ensure that the combination of the information in the COL FSAR and the information in the ESBWR DCD appropriately represents the complete scope of information relating to this review topic.1 The staff's review confirmed that the information in the application and the information incorporated by reference address the required information related to "Radiation Sources."

In addition, the staff reviewed the applicant's proposed departure, variances from the North Anna 3 ESP, and the proposed resolution to the COL items included under Section 12.2 of the North Anna 3 COL FSAR. The staff's review used the applicable sections of the SRP and RG 1.206 as guidance. The staff performed an independent evaluation of doses from liquid and gaseous effluents using the LADTAP II computer code (NUREG/CR–1276, "User's Manual for LADTAP II – A Computer Program for Calculating Radiation Exposure to Man from Routine Release of Nuclear Reactor Liquid Effluents") and the GASPAR II computer code (NUREG/CR–4653, "GASPAR II – Technical Reference and User Guide"). The staff reviewed the basis for the liquid and gaseous effluents source terms and the applicant's assumptions and data used to model exposure pathways and to estimate doses to offsite receptors.

Section 1.2.3 of this SER discusses the NRC's strategy for performing one technical review for each standard issue outside the scope of the DC and to use this review to evaluate the subsequent COL applications. To ensure that the staff's findings on the standard content that were documented in the SER for the Fermi 3 application are equally applicable to the North Anna 3 COLA, the staff undertook the following reviews:

* The staff compared the Fermi 3 COL FSAR, Revision 8, to the North Anna 3 COL FSAR, Revision 8. In this comparison, the staff considered changes to the North Anna 3 COL FSAR (and other parts of the COLA, as applicable) resulting from RAIs in the Fermi SER.

* The staff confirmed that the applicant has endorsed all responses to the RAIs in the corresponding standard content (the Fermi SER) evaluation.

* The staff verified that the site-specific differences are not relevant to this section.

The staff completed the review and finds the evaluation of the Fermi standard content to be directly applicable to the North Anna 3 COLA.

The staff reviewed the following information in the North Anna 3 COL FSAR:

Tier 2 Departure Not Requiring Prior NRC Approval

- NAPS DEP 11.4-1 — Long-Term, Temporary Storage of Class B and C Low-Level Radioactive Waste

The North Anna 3 RWB was reconfigured to accommodate a minimum 10-year volume of packaged Class B and C waste, while maintaining space for at least 3 months of packaged Class A waste. This reconfiguration results in changes to equipment location and layout. The applicant provides revised radiation source parameters in FSAR Table 12.2-22R. The staff reviewed the equipment location and compared FSAR Table 12.2-22R with DCD Tier 2, Table 12.2-22. This comparison confirmed that the radiation source parameters remained unchanged, except for sources in DCD Rooms 6171 and 6172, which are now located in the reconfigured FSAR Room 6171. In the new configuration, the equipment drain sample tank and floor drain sample tank will be in one room (FSAR Room 6171). These tanks were originally in two separate rooms (DCD Rooms 6171 and 6172). A review of DCD Figure 12.3-19 and FSAR Figure 12.3-19R revealed that FSAR Room 6171 has a larger overall area than the two DCD rooms (6171 and 6172) combined. The staff therefore concluded that given the size of Room 6171, the radiation level and the required shielding will remain the same as those identified for Rooms 6171 and 6172 in the DCD, regardless of the tank locations.

The applicant's evaluation determined that this departure does not require prior NRC approval in accordance with 10 CFR Part 52, Appendix E, Section VIII.B.5. Within the review scope of this section, the staff finds it reasonable that the departure does not require prior NRC approval. The applicant's process for evaluating departures and other changes to the certified ESBWR DCD is subject to NRC inspections.

COL Items

- NAPS COL 12.2-2-A — Airborne Effluents and Doses, (including NAPS ESP COL 11.1-1, Compliance with 10 CFR Part 50, Appendix I, Section II.D; NAPS ESP VAR 12.2-1, Gaseous Pathway Doses; NAPS ESP VAR 12.2-4, Existing Units' and Site Total Doses; and NAPS ESP VAR 12.2-5, Annual Gaseous Effluent Releases)

The applicant provides information for compliance with the airborne effluent requirements in FSAR Subsections 12.2.2.1, 12.2.2.2, and Table 2.0-201 which address the resolution of NAPS COL 12.2-2-A, which states:

> The COL Applicant is responsible for ensuring that offsite dose (using site-specific parameters) due to radioactive airborne effluents complies with the regulatory dose limits in Sections II.B and II.C of 10 CFR Part 50, Appendix I. In addition, the COL Applicant is responsible for compliance with Section II.D of 10 CFR Part 50, Appendix I; airborne effluent concentration limits of 10 CFR Part 20, Appendix B (Table 2, Column 1); and dose limits of 10 CFR Parts 20.1301 and 20.1302 to members of the public (Subsection 12.2.2.2).

The staff reviewed the North Anna 3 FSAR for compliance with the NAPS COL Items. The FSAR also presents comparisons with the information presented in the ESP Application and ER for North Anna 3. These comparisons and variances from the ESP are identified as NAPS ESP COL 11.1-1, and NAPS ESP VAR 12.2-1 and 12.2-4 (North Anna 3 Part 7, Departures Report). Any ESP variance or ESP COL Item in the FSAR and the ESP and ER are reviewed to ensure all regulatory requirements have been addressed in the application.

In addition, the staff listed parts of the gaseous and liquid effluent compliance process defined in the COL items to ensure compliance with the regulations noted above. These parts are the effluent Source Term, the 10 CFR Part 20 Gaseous Compliance, and the 10 CFR Part 50, Appendix I Gaseous Dose Compliance.

Airborne Source Term

In the staff review of the gaseous effluent source term, the staff used the design basis noble gas, iodine, and other fission product concentrations (uCi/g) for the reactor coolant from the tables in the ESBWR DCD Chapter 11. Airborne sources (Ci/yr) for normal operating releases are calculated using the source terms given in DCD Section 11.1 along with the site design specific parameters from FSAR Table 12.2-15R (the same parameters from DCD Table 12.2-15) for North Anna 3. The staff used the boiling water reactor (BWR) methodology of NUREG–0016, Revision 1, "Calculation of Releases of Radioactive Materials in Gaseous and Liquid Effluents from Boiling Water Reactors (BWR-GALE CODE)," January 1979, (GALE) in determining the annual airborne sources release values (Ci/yr) presented in DCD Table 12.2-16. The staff found that the site-specific design parameters and the approved DCD Section 11.1 source term information was appropriate for the gaseous source term released from the North Anna 3 reactor design.

10 CFR Part 20 Gaseous Compliance

In addition, the COL applicant is responsible for compliance with site airborne effluent concentration limits of 10 CFR Part 20, Appendix B (Table 2, Column 1), effluent concentration limits (ECL). The annual North Anna 3 airborne sources release values presented in DCD Table 12.2-16 (Ci/yr) are utilized with the site-specific parameters listed in FSAR Table 12.2-15R including the meteorology dispersion values to determine the concentrations released to the environment to the site boundary from North Anna 3. The North Anna 3 concentrations are then combined with the North Anna Units 1 and 2 concentrations to determine a total site concentration. These total site release concentrations are compared to the 10 CFR Part 20, Appendix B, Table 2, Column 1 ECL concentration values to determine if the sum of the ratios of the calculated concentration values divided by the 10 CFR Part 20, Table 2, Column 1 ECL values are less than 1.0 (Unity). Table 12.2-17R indicates that the applicant fraction of ECLs for all site radionuclides concentrations is 0.053 and is less than 1.0 (Unity). The staff reviewed the FSAR information submitted and verified all applicant calculations presented. The staff also verified the applicant methodology and results by independently calculating the gaseous effluent concentrations and comparing with the applicant results. The staff finds that these site-specific gaseous effluent releases comply with the ECLs in Table 2, Column 1 of Appendix B to 10 CFR Part 20 using the sum-of-fractions given in FSAR Tables 12.2-17R.

As the applicant points out in its variance request (See NAPS ESP COL 11.1-1; NAPS ESP VAR 12.2-1; NAPS ESP VAR 12.2-4; NAPS ESP VAR 12.2-5; FSAR sections 12.2.2.2; 12.2.2.4; 12.2.2.5; and 12.2.2.6), there are various values of North Anna 3 doses and curies per year released that are higher than the North Anna 3 ESP calculated curies per year and regulatory compliance required.

The applicant's variance request, NAPS ESP VAR 12.2-5, "Annual Gaseous Effluent Releases," states:

> This is a request to use the Unit 3 maximum annual gaseous effluent release values provided in FSAR Table 12.2-17R rather than the corresponding ESP values in EIS (Reference 6) Appendix I and ESP-ER Section 5.4, as referenced in SSAR Section 2.3.5.1. The Unit 3 values for some nuclides do not fall within (are larger than) the ESP and ER values, as shown in bold font in FSAR Table 12.2-17R. This variance results from a change in the annual release values for the ESBWR since the ESP-ER table was submitted. ESP-ER Table 5.4-7 presented the annual release values for a single unit nuclear plant, based on a composite of possible radionuclide releases from a number of reactor designs, including the ESBWR. ESP-ER Table 5.4-7 also contained more radionuclides than FSAR Table 12.2-17R, due to the use of the composite set of nuclides from multiple reactor designs.

The staff reviewed variance NAPS ESP VAR 12.2-5, and found that the applicant incorporated by reference the major parts of Section 12.2.2.2 of the ESBWR DCD concerning airborne dose evaluation offsite. The applicant also provided information in the COLA as required by the ESBWR DCD for a site-specific application. However, additional information had been supplied from the North Anna 3 ESP or ER site evaluation. When changes are made from the ESP results, it is designated as a variance. The variance applied in Section 12.2.2.2 of the FSAR, states that the Unit 3 values for some nuclides are larger than the ESP and ER values, as shown in bold font in FSAR Table 12.2-17R. This variance results from a change in the annual release values for the ESBWR since the original ESP and ER and tabulated results were submitted. ESP-ER Table 5.4-7 presented the annual release values for a single unit nuclear plant, based on a composite of possible radionuclide releases from a number of reactor designs, including the ESBWR. The staff reviewed the change and the justification of the change and found the change acceptable because the estimated North Anna 3 concentrations of normal gaseous effluent releases remain within the 10 CFR Part 20 concentration limits and the annual doses from normal gaseous effluent releases also remain within 10 CFR Part 50 limits. These calculation results are acceptable based on the use of approved industry standards and industry practices. The applicant's variance is acceptable because the estimated North Anna 3 concentrations of normal gaseous effluent releases for all nuclides meet the 10 CFR Part 20 concentration limits as shown in FSAR Table 12.2-17R. Therefore, the staff considers NAPS ESP VAR 12.2-5 to be acceptable and the issue is therefore resolved.

10 CFR Part 50, Appendix I Gaseous Dose Compliance

The FSAR Tables 12.2-18aR and 12.2-18bR present information submitted to demonstrate compliance with Sections II.B and II.C of Appendix I to Part 50. The parameters used for the calculation of NA3 airborne offsite doses are provided in Table 12.2-18aR. The methodology of RG 1.109 was used in determining the annual airborne dose values. The bases include values that are default parameters in RG 1.109 and other values that are site-specific NA3 parameters. The annual gaseous pathway doses are provided in Table 12.2-18bR and FSAR Table 12.2-201, "Comparison of Annual Doses to the MEI from Gaseous Effluents per Unit." The applicant's estimated annual doses from North Anna 3 to the maximally exposed individual (MEI) from gaseous effluent releases are compared with the applicable regulatory limits in FSAR Table 12.2-201. The North Anna 3 doses are within the 10 CFR Part 50, Appendix I, gaseous effluent limits, and most of the North Anna 3 dose estimates are lower than the corresponding ESP values. (See variance NAPS ESP VAR 12.2-1 below)

The staff reviewed the parameters submitted by the applicant as well as the results and the computer input and output data files submitted for GASPAR II dose calculations. In its review, the staff found insufficient information provided in the North Anna 3 FSAR to independently confirm the calculated individual doses and annual population pathway doses for compliance to applicable regulations. Therefore, in RAI 12.02-18, dated August 01, 2014 (ADAMS Accession No. ML14283A559), the staff requested additional information to include design parameters and values used in the applicant's GASPAR II code calculation, including value derivations and references. In addition, the staff requested that the applicant provide any changes made to the GASPAR II code input/output files used in the calculation of the gaseous effluent doses in Table 12.2-18bR, of the North Anna 3 FSAR, and provide a detailed breakdown of population doses by pathway and organ. On August 26, 2014, the applicant provided the details to validate the information in North Anna 3 FSAR Table 12.2-bR (ADAMS Accession No. ML14241A467). Therefore, RAI 12.02-18 is resolved and closed.

The RG 1.111 states that for gaseous effluents released from points less than the height of adjacent solid structures, ground-level release should be assumed. Ground-level releases under these circumstances account for the initial mixing of the effluent plume within the building wake.

In considering the source configuration criteria set forth in RG 1.111 and the modeling methodology used in the ESBWR DCD, the staff determined that the FSAR should be updated to include a justification for modeling the RWB vent stack as a mixed-mode release or to implement the ground-level source configuration guidance provided in RG 1.111.

Therefore, on September 09, 2014, in RAI 02.03.05-5 (ADAMS Accession No. ML 14283A554), the staff requested information regarding long-term atmospheric dispersion estimates for routine releases, the staff noted that the North Anna 3 COL, FSAR Section 2.3.5, "Long-Term (Routine) Diffusion Estimates," which describes the input data and assumptions that are used in the XOQDOQ model for routine effluent releases from the vent stacks on the Reactor Building/Fuel Building, Turbine Building, and RWB, are all modeled as mixed-mode releases. The North Anna COL FSAR also states that the RWB stack is close enough to the Turbine Building that the stack will experience building downwash effects from the Turbine Building. According to Tier 2, Table 2B-1 of the ESBWR DCD, the RWB stack height is 18.15 m (59.5 ft) above grade whereas the Turbine Building height is 52.0 m (170.6 ft) above grade.

The applicant responded on October 17, 2014, to RAI 02.03.05-5 (ADAMS Accession No. ML14295A659). After further consideration of the source configuration criteria set forth in RG 1.111, the applicant changed the type of release assumed for modeling routine releases from the RWB ventilation stack from mixed-mode to a ground-level release. The applicant stated that estimates of long-term atmospheric dispersion from routine effluent releases will be updated, and associated dose calculations, which use the estimated X/Q and D/Q from the RWB vent stack as inputs, will be revised to implement the updated values. The COLA will be revised to reflect updated values for long-term X/Q and D/Q from the RWB vent stack releases, along with the associated doses. The resulting doses remain within the appropriate acceptance criteria. The affected sections included FSAR Sections 2.3.5.1, 11.3.1, 12.2.2.2.2, and 12.2.2.4.4 and FSAR Tables 1.8-202, 2.0-201, 2.3-16R, 2.3-208, 2.3-209, 2.3-210, 2.3-211, 2.3-212, 2.3-213, 2.3-214, 2.3-215, 12.2-17R, 12.2-18bR, 12.2-201, 12.2-203, and 12.2-204. This change also involved extensive changes in ER sections 2.7.6 and 5.4.2.2 and many ER Tables. Since the applicant revised its Radwaste Stack release point to align with the guidance of RG 1.111, the staff finds that RAI 02.03.05-5 is resolved and closed. The staff verified that the

North Anna 3 COLA Part 2 FSAR Revision 9, Part 3 Revision 8, and Part 7, Revision 7, incorporated the appropriate changes described in the applicant's response to RAI 02.03.05-5. Therefore Confirmatory Item 12.2.4-01 from the staff advanced SER for North Anna 3 is resolved and closed.

The staff found, while reviewing the new effluent information provided by the applicant in response to RAI 02.03.05-5, which the dose quantities in FSAR Table 12.2-17R required additional information in order to evaluate the source term values listed in this table. The staff requested in RAI 12.02-21, that the applicant provide the calculations for all radionuclides in uCi/cc, and Ci/yr, and provide footnote(s) at the end of the Table 12.2-17R for explanation.

The applicant's response on January 08, 2015 (ADAMS Accession No. ML15009A235), explained the assumptions and equations used to calculate the concentrations and quantities of all radionuclides in the gaseous effluents from North Anna 3. This calculational process was included in the RAI response, and the applicant provided footnotes at the end of Table12.2-17R that also explained the Table 12.2-17R radionuclide values. The staff again reviewed and compared the applicant results by independently calculating the gaseous effluent doses based upon the new information provided by the applicant. Table 12.2.4-1 below indicates the comparison of the staff review and the applicant results. The comparison of the MEI doses from the gaseous pathway yielded mostly consistent results, for the Air-Gamma and Air-Beta Design Objective. The applicant Total Body, Organ (Thyroid) dose and Skin doses were acceptable and below the regulatory requirements. The NRC confirmatory results verified that the applicant's data provided and the applicant's results were acceptable. The NRC finds that the applicant has shown that offsite dose (using site-specific parameters) due to radioactive airborne effluents complies with the regulatory dose limits in Sections II.B and II.C of 10 CFR Part 50, Appendix I.

This additional information allowed the staff to complete their review understanding the bases for the gaseous effluent against applicable regulatory requirements. Therefore, RAI 12.02-21, is resolved and closed.

Table 12.2.4-1 Site-Specific Gaseous Effluent Doses

Description	Design Objective[1] Or Dose Limit	Applicant Site-Specific Calculated Dose	NRC Staff Calculated Doses
MEI doses from gaseous pathway[1,2]	10 mrad/yr (Air-gamma)	0.27 mrad/yr (Air-gamma)	0.28 mrad/yr (Air-gamma)
	20 mrad/yr (Air-beta)	0.25 mrad/yr (Air-beta)	0.25 mrad/yr (Air-beta)
	5 mrem/yr (Total Body)	0.32 mrem/yr (Total Body)	0.18 mrem/yr (Total Body)
	15 mrem/yr (Skin)	0.59 mrem/yr (Skin)	0.43 mrem/yr (Skin)
	15 mrem/yr (Organ)	4.4 mrem/yr (Organ)	4.56 mrem/yr (Organ)
Population doses from gaseous pathway[2]	-	4.5 person-rem/yr (Total Body)	4.5 person-rem/yr (Total Body)
	-	25.0 person-rem/yr (Thyroid)	25.3 person-rem/yr (Thyroid)

Table 12.2.4-1 Notes:

1. Numerical design objectives in 10 CFR Part 50, Appendix I for estimating annual doses above background from gaseous effluents for any individual in an unrestricted area, for one unit, from all exposure pathways are 5 mrem/yr (Total Body) or 15 mrem/yr (Organ).

2. FSAR Section Table 12.2-18bR, Table 12.2-201 and FSAR Table 12.2-204

The applicant's variance request, NAPS ESP VAR 12.2-1, is a request to use updated information for Unit 3 gaseous effluent doses rather than the SSAR information, which referred to ESP-ER Section 5.4. Several of the gaseous pathway doses to the MEI in FSAR Table 12.2-18bR do not fall within (are greater than) the corresponding values in ESP-ER Table 5.4-9. The North Anna 3 values which are higher are shown in bold font in FSAR Table 12.2-18bR. This variance is due in part to changes in maximum long-term dispersion estimates from those used in the ESP application as discussed above under NAPS ESP VAR 2.0-1. The variance is also due to changes in maximum annual gaseous release values from those used in the ESP Application, as discussed below in NAPS ESP VAR 12.2-5.

Compliance with the U.S. Environmental Protection Agency Standard 40 CFR Part 190

Compliance with the U.S. Environmental Protection Agency (EPA) standard in 40 CFR Part 190, "Environmental Radiation Protection Standards for Nuclear Power Operations," as implemented under 10 CFR Part 20.1301(e), is demonstrated in FSAR Tables 12.2-201 and 12.2-203. The applicant estimated the site-specific dose calculations from gaseous and liquid effluent releases for all three North Anna nuclear station units to address the North Anna 3 NAPS COL 12.2-2-A item and to demonstrate compliance with the dose limits to members of the public specified in 10 CFR 20.1302 and 40 CFR Part 190 as referenced in 10 CFR 20.1301(e).

The applicant addressed this requirement in FSAR 12.2.2.4.4, stating that "This section demonstrates that offsite doses due to North Anna 3, combined with offsite doses due to Units 1 and 2 and the NAPS independent spent fuel storage installation (ISFSI), comply with the regulatory limits in 10 CFR 20.1301 for doses to members of the public." The applicant used the North Anna 3 gaseous and liquid effluent release activities in FSAR Tables 12.2-17R for gaseous effluents and Table 12.2-19bR for liquid effluents, and the total annual doses to the MEI and the population resulting from North Anna 3 liquid and gaseous effluents calculated and presented in FSAR Tables 12.2-203 and 12.2-204.

The applicant states that the direct radiation contribution due to contained sources from operation of North Anna 3 is negligible. The direct dose contribution due to Turbine Building skyshine from North Anna 3 at two distances is provided in DCD Table 12.2-21. That table shows the annual dose at 1000 m (0.62 miles) to be 1.66E-06 mSv/yr (1.66E-04 mrem/yr). Section 9.3.9 shows that North Anna 3 uses hydrogen water chemistry, and DCD Section 12.2.1.3 explains that the direct dose contribution takes into account hydrogen water chemistry. The distance from North Anna 3 to the nearest residence is assumed to be 1190 m (0.74 miles) in the NW direction, as described in Section 2.3.5.1. The distance from North Anna 3 to the location on the site boundary with the highest gaseous effluent annual dose is 1416 m (0.88 miles) in the NNE direction. This is the distance from North Anna 3 to the site boundary, that is, the exclusion area boundary or as commonly referred to as the "EAB" in the direction of maximum annual χ/Q, as shown in Table 2.3-16R. These distances from North Anna 3 to each type of receptor location are greater than those presented in the DCD, so the North Anna 3 direct radiation dose rate at each location is even lower than the very low rate cited above for 1000 m (0.62 miles).

The total annual doses to the MEI resulting from North Anna Units 1 and 2 liquid and gaseous effluents are provided in Table 12.2-203. The values shown are representative based on review of Units 1 and 2 annual radiological environmental operating reports (e.g., Reference 12.2-203). The direct radiation contribution from operation of Units 1 and 2 is negligible. An evaluation of operating plants by the NRC states that:

> …because the primary coolant of an LWR is contained in a heavily shielded area, dose rates in the vicinity of light water reactors are generally undetectable and are less than 1 mrem/year at the site boundary.

The staff concludes that the direct radiation from normal operation results in “small contributions at site boundaries” (Reference 12.2-204, Section 4.6.1.2). For the North Anna Power Station site, the nearest residence is at a distance typical of a site boundary evaluated by NRC. An assumed value of 1E-2 mSv/yr (1 mrem/yr) is included in Table 12.2-203 to account for the dose to the MEI at the nearest residence from operation of Units 1 and 2.

Discharged fuel assemblies from North Anna Units 1 and 2 are stored in the North Anna ISFSI (Reference 12.2-205). The direct radiation contribution from operation of the North Anna ISFSI is small, both at the residence nearest to the ISFSI, which is south and slightly east of the ISFSI at about 870 m (0.54 miles), and at the closest point to the site boundary, which is south and slightly west of the ISFSI at approximately 760 m (0.47 miles). The annual contribution at the site boundary from the ISFSI is no more than 3.6E-02 mSv/yr (3.6 mrem/yr). This value is based on a conservatively estimated peak dose rate from a fully-filled ISFSI with 84 casks/modules, which bounds the planned 68 casks, containing NAPS Units 1 and 2 fuel assemblies and the distance from the ISFSI to the site boundary, which is shorter than that to the residence nearest the ISFSI. This ISFSI dose contribution is then conservatively applied to the MEI for the nearest residence from North Anna 3, which is assumed to be 760 m (0.47 miles) in the northwest direction and even further from the ISFSI.

Table 12.2-203 shows that the total North Anna site doses resulting from the normal operation of Units 1, 2, and 3 and applied at the nearest residence meet 10 CFR 20.1301(e) and are well within the regulatory limits of 40 CFR Part 190. These doses are applied at the distance to the nearest residence from North Anna 3, which is assumed to be 760 m (0.47 miles). These doses bound those at the site boundary.

The staff has reviewed the information provided by the applicant and has displayed the data in SER Table 12.2.4-2, “Estimated Site Gaseous and Liquid Effluent Doses,” shown below. The staff has used the Total Body, Thyroid, and Bone (or Organ) doses for 1) liquid effluents; 2) gaseous effluents; 3) Direct dose maximum from the ISFSI (provided by the applicant); and 4) the total dose from the existing two units on site to calculate the maximum hypothetical maximum dose from all sources at this site to compare to the EPA standard doses in 40 CFR Part 190. As shown in the SER Table 12.2.4-2, using the four inputs stated above for the maximum site dose, the staff calculates a maximum 9.02E-2 mSv/yr (9.02 mrem/yr) Total Body dose, 13.56E-2 mSv/yr (13.56 mrem/yr) Thyroid dose, and 10.22E-2 mSv/yr (10.22 mrem/yr) Bone (Organ) dose, compared to the EPA 40 CFR 190 Limits of 25E-2, 75E-2, and 25E-2 mSv/yr (25, 75, and 25 mrem/yr) for Total Body, Thyroid and Bone (Organ) doses, respectively. These maximum doses are within the guidelines of 40 CFR Part 190.

Investigating the applicant's total site doses listed in FSAR Table 12.2-203, their similar totals are 6.8E-2 mSv/yr (6.8 mrem/yr) total body, 27E-2 mSv/yr (27 mrem/yr) thyroid, and 12E-2 mSv/yr (12 mrem/yr), within the EPA 40 CFR Part 190 limits and lower than the staff calculations. Further review shows that by excluding the maximum ISFSI direct dose provided by the applicant, 3.6E-2 mSv/yr (3.6 mrem/yr), in FSAR section 12.2.2.4.4, in the staff maximum dose calculations in SER Table 12.2.4-2, and replacing the maximum dose from the ISFSI with the FSAR Table 12.2-203, footnote 2, combined ISFSI and the two existing units dose of 1.0E-2 mSv/yr (1.0 mrem/yr) due to direct radiation used by the applicant, the staff total doses compare very favorably with the applicant's total doses. Again, well below the EPA 40 CFR 190 dose limits.

Therefore, the staff has reviewed the information presented in the FSAR including the variance 12.2-1 to the ESP by the applicant and found it acceptable for compliance with 20.1301(e), which references EPA 40 CFR Part 190, as demonstrated in FSAR Tables 12.2-202 and 12.2-203. The compliance with this regulatory requirement has been independently reviewed and is considered acceptable to the staff.

Table 12.2.4-2 Estimated Site Gaseous and Liquid Effluent Doses.

	NRC calculated individual doses			Existing unit doses	NRC calculated total dose	NRC calculated total dose without direct[2]	40 CFR 190 dose limit	Applicant Totals[3]
	Liquid mrem/yr	Gas mrem/yr	Direct (mrem/yr)[1]					
Total Body	0.08	0.34	3.6	5	9.02	5.42	25	5.5
Thyroid	0.26	4.6	3.6	5.1	13.56	9.96	75	10
Bone	1.1	0.42	3.6	5.1	10.22	6.62	25	6.8

Notes:

1. Maximum direct dose assumed from fully loaded ISFSI pad from applicant

2. NRC totals without the maximum direct dose contribution

3. The applicant states that the existing units consider 1 mrem/yr direct dose radiation, which includes the ISFSI doses

The applicant's variance request, NAPS ESP VAR 12.2-4, "Existing Units' and Site Total Doses," states:

> This is a request to use updated information for doses for the existing units and the site total doses in FSAR Table 12.2-203 rather than the information in SSAR Section 2.3.5.1 that refers to ESP ER Section 5.4, which contains ESP ER Table 5.4-11. The doses for total body, thyroid, and bone due to the existing units, as shown in FSAR Table 12.2-203, do not fall within (are greater than) the corresponding values in ESP ER Table 5.4-11. Because these values are higher, they are shown in bold font in FSAR Table 12.2-203. This variance is due to the conservative dose estimates for direct radiation from Units 1 and 2 and the Independent Spent Fuel Storage Installation

(ISFSI), which were added to the doses for liquid and gaseous effluents from Units 1 and 2. The direct radiation dose contributions were included in the FSAR dose estimates, but not in the ESP Application dose estimates. The addition of these direct radiation doses to the existing units' doses (annual total body, thyroid, and bone) caused the FSAR values to exceed the SSAR values."

The applicant justification states:

> This variance is acceptable because the dose estimates are more conservative and complete with the addition of the dose contributions from direct radiation from the existing units and the ISFSI. As shown in FSAR Table 12.2-203, the annual total body, thyroid, and bone doses for the site, including the doses from the existing units and the ISFSI, meet the applicable 40 CFR 190 limits."

The staff review of variance NAPS ESP VAR 12.2-4, found that the applicant incorporated by reference the major parts of Section 12.2.2.2 of the ESBWR DCD concerning airborne dose evaluation offsite. The applicant also provided information in the COLA as required by the ESBWR DCD for a site-specific application. However, additional information has been supplied concerning the possible design and the site by the ESP or ER. This particular variance, as stated above, applied in section 12.2.2.2 of the FSAR, is a request stating this variance is due to the conservative dose estimates for direct radiation from Units 1 and 2 and the ISFSI, which were added to the doses for liquid and gaseous effluents from Units 1 and 2. The staff reviewed the change and the justification of the change and found that, as shown in FSAR Table 12.2-203, the doses are acceptable because the dose estimates are more conservative and complete with the addition of the dose contributions from direct radiation from the existing units and the ISFSI. The doses from the existing units and the ISFSI meet the applicable 40 CFR Part 190 limits, as referenced in 10 CFR 20.1301(e). The calculations and results requirements are acceptable based on the use of the applicable industry standards and industry practices. Therefore, the staff considers NAPS ESP VAR 12.2-4 to be acceptable and that the issue is resolved.

10 CFR Part 50 Compliance with Section II.D of Appendix I

The 10 CFR Part 50, as it relates to ALARA, is addressed in FSAR Section 11.3 for gaseous effluents. Evaluation of 10 CFR Part 50, Appendix I, Section II.D is performed in the North Anna 3 Chapter 11 SER, Section 11.3, using data from FSAR Table 12.2-204, Collective Total Body (Population) Doses Within 50 Miles. The compliance with this regulatory requirement has been reviewed and is considered acceptable to the staff.

- NAPS COL 12.2-3-A — Liquid Effluents and Doses, (NAPS ESP COL 11.1-1, Compliance with 10 CFR Part 50, Appendix I, Section II.D; NAPS ESP VAR 12.2-3, Annual Liquid Effluent Releases; and NAPS ESP VAR 12.2-4, Existing Units' and Site Total Doses)

The applicant provides information for compliance with the liquid effluent requirements in FSAR Subsections 11.2.1, 11.2.2.3, 11.2.3.2, 12.2.2.4.1-6, Tables 12.2-19bR, 12.2-20aR, 12.2-20bR, and Table 2.0-202 which address the resolution of NAPS COL 12.2-3-A, which states:

> As stated in DCD section 12.2.4, the COL Applicant is responsible for ensuring that offsite dose (using site-specific parameters) due to radioactive liquid effluents complies

with the regulatory dose limits in Section II.A of 10 CFR 50, Appendix I. In addition, the COL Applicant is responsible for compliance with Section II.D of 10 CFR Part 50, Appendix I; liquid effluent concentration limits of 10 CFR Part 20, Appendix B (Table 2, Column 2); and dose limits of 10 CFR Parts 20.1301 and 20.1302 to members of the public (Subsection 12.2.2.4).

The staff reviewed the various aspects of the FSAR for compliance with the NAPS COLs, "Departures, Variances, and Exemptions." The FSAR also presents comparisons with the information presented in the ESP application and ER for North Anna 3. These comparisons and variations are identified as NAPS ESP COL 11.1-1, and NAPS ESP VAR 12.2-1 and 12.2-4 (Part 7, Departures Report). Any ESP variances or ESP COLs noted in the FSAR and the ESP and ER are presented to ensure all commitments have been made in the application.

In addition, the staff listed parts of the gaseous and liquid effluent compliance process defined in the COLs to ensure compliance with the regulations noted above. These parts are the effluent Source Term, the 10 CFR Part 20 Liquid Compliance, and the 10 CFR Part 50, Appendix I Liquid Dose Compliance.

Liquid Source Term

Liquid sources (Ci/yr) for normal operating releases are calculated using the reactor coolant system source terms given in ESBWR DCD Section 11.1 along with the site-specific design parameters from ESBWR DCD Table 12.2-19a for North Anna 3. The staff used the BWR methodology of NUREG–0016 (GALE) in determining the annual airborne sources release values (Ci/year) presented in DCD Table 12.2-19b and FSAR Table 12.2-19bR. The staff found that the site-specific design parameters and the approved DCD Section 11.1 source term information was determined to be appropriate for the liquid source term released from the North Anna 3 reactor design.

10 CFR Part 20 Liquid Compliance

In addition, the COL applicant is responsible for compliance with site liquid effluent concentration limits of 10 CFR Part 20, Appendix B (Table 2, Column 1), ECLs. The annual North Anna 3 liquid sources release values presented in DCD Table 12.2-19b (and FSAR Table 12.2-19bR) (Ci/yr) are utilized with the site-specific parameters to determine the concentrations released to the environment to the site boundary from North Anna 3 in FSAR Table 12.2-19bR. The North Anna 3 concentrations are combined with the North Anna Units 1 and 2 concentrations in FSAR Table 12.2-19bR to determine a total site concentration. These total site release concentrations are compared to the 10 CFR Part 20, Appendix B, Table 2, Column 1 ECL concentration values to determine if the sum of the ratios of the calculated concentration values divided by the 10 CFR Part 20 Table 2, Column 1 ECL values is less than 1.0 (Unity). Table 12.2-19bR indicates that the applicant's fraction of ECLs for all site radionuclides concentrations is 0.22.

The staff issued RAI12.02-22 dated November 14, 2014 (ADAMS Accession No. ML14318A652), after the review of the independent source term and dose calculations for the purpose of assessing the performance of the LWMS against the NRC requirements of 10 CFR 20.1302; Table 2, of Appendix B to 10 CFR Part 20; and the dose objectives of Appendix I to 10 CFR Part 50. The calculations in Table 12.2-19bR concerning the concentrations of radioactive materials in liquid effluents released to unrestricted areas should not exceed the concentration limits in Table 2, of Appendix B, to 10 CFR Part 20. The staff requested that the applicant explain the source term calculations related to assessing the 10 CFR Part 20 requirement calculation(s) involved for all radionuclide values in the Annual Release column, Ci/yr and the Concentration, uCi/ml column in a footnote or note at the end of the table. The current calculations for FSAR Table 12.2-19bR require additional information to evaluate the source term quantities.

The applicant responded on January 8, 2015 (ADAMS Accession No. ML15009A235), and provided the explanations required to calculate the source term and concentrations in FSAR Table 12.02-19bR. The revised response provides further clarification of the information presented in FSAR Table 12.2-19bR, as requested by the NRC during an audit of the underlying calculations on July 1, 2015. FSAR Table 12.2-19bR was revised to include footnotes that explain the source term calculations related to 10 CFR Part 20 requirements for all radionuclide values in columns 2-5 of the table. Examples were also provided explaining the calculations of the values for particular radionuclides. The applicant also provided models showing the discharge canal and the dilution and evaporation terms for the North Anna Reservoir and the Waste Heat Treatment Facility (WHTF). The applicant also provided the equations used to calculate the values seen in the FSAR table.

The staff reviewed the FSAR information submitted and compared all of the applicant's calculation results by independently calculating the liquid effluent concentrations. The staff concludes that liquid effluents released in unrestricted areas comply with effluent concentration requirement in Table 2 (Column 1) of Appendix B to Part 20.

As the applicant points out (See NAPS ESP COL 11.1-1, NAPS ESP VAR 12.2-3, NAPS ESP VAR 12.2-4, sections 12.2.2.4.2, 12.2.2.4.4 and 12.2.2.4.6) there are various values of North Anna 3 curies per year released that are higher than the NA3 ESP calculated curies per year.

The applicant's variance request, ESP VAR 12.2-3, states:

> This is a request to use the North Anna 3 maximum annual liquid release values provided in FSAR Table 12.2-19bR rather than the corresponding ESP values in EIS Appendix I (Reference 6) and ESP-ER Section 5.4 as referenced in SSAR Section 2.3.5.1. The North Anna 3 values for some nuclides do not fall within (are larger than) the ESP and ER values, as shown in bold font in FSAR Table 12.2-19bR.
>
> This variance results from a change in the annual release values for the ESBWR since the ESP-ER table was submitted. ESP-ER Table 5.4-6 presented the annual release values for a single unit nuclear plant, based on a composite of possible radionuclide releases from a number of reactor designs including the ESBWR. ESP-ER Table 5.4-6 also contained more radionuclides than FSAR Table 12.2-19bR, due to the use of the composite set of nuclides from multiple reactor designs.

The applicant's justification states:

> This variance is acceptable because the estimated North Anna 3 concentrations of normal liquid effluent releases remain within the applicable concentration limits and the annual doses from normal liquid effluent releases remain within applicable limits. The estimated Unit 3 concentrations of normal liquid effluent releases for all nuclides meet the 10 CFR Part 20 concentration limits as shown in FSAR Table 12.2-19bR. The estimated annual doses from Unit 3 to the MEI from liquid effluents are compared with the applicable limit in FSAR Table 12.2-202. The Unit 3 dose meets the 10 CFR Part 50,

Appendix I, limit, and the Unit 3 dose estimates are lower than the corresponding ESP values.

The staff's review of variance NAPS ESP VAR 12.2-3 found that the applicant incorporated by reference the major parts of Section 12.2.2.2 of the ESBWR DCD concerning airborne dose evaluation offsite. The applicant also provided information to the COL as required by the ESBWR DCD for a site-specific application. However, additional information has been supplied concerning the possible design and the site by the ESP or ER. This variance as stated above, applied in Section 12.2.2.2 of the FSAR, is a request stating that the North Anna 3 values for some nuclides are larger than the ESP and ER values, as shown in bold font in FSAR Table 12.2-19bR. This variance results from a change in the annual release values for the ESBWR since the ESP-ER table was submitted. ESP-ER Table 5.4-6 presented the annual release values for a single unit nuclear plant, based on a composite of possible radionuclide releases from a number of reactor designs including the ESBWR. The staff reviewed the change and the justification of the change and found that acceptable because the estimated North Anna 3 concentrations of normal liquid effluent releases remain within the applicable concentration limits and the annual doses from normal liquid effluent releases remain within applicable limits. The estimated North Anna 3 concentrations of normal liquid effluent releases for all nuclides meet the 10 CFR Part 20 concentration limits as shown in FSAR Table 12.2-19bR. The calculations and results requirements are acceptable based on the use of the applicable industry standards and industry practices. The applicant provided an acceptable reason that this variance is acceptable because the North Anna 3 dose meets the 10 CFR Part 50, Appendix I, limit, and the North Anna 3 dose estimates are lower than the corresponding ESP values. Therefore, the staff considers NAPS ESP VAR 12.2-3 to be acceptable and therefore the issue is resolved.

10 CFR Part 50, Appendix I Liquid Dose Compliance

The FSAR Tables 12.2-20aR and 12.2-20bR present information submitted to demonstrate compliance with Sections II.B and II.C of Appendix I to 10 CFR Part 50. The parameters used for the calculation of North Anna 3 liquid offsite doses are provided in Table 12.2-20aR. The methodology of RG 1.109 was used in determining the annual liquid dose values. The basis include values that are default parameters in RG 1.109 and other values that are North Anna 3 parameters. The annual liquid pathway doses are provided in Table 12.2-20bR and FSAR Table 12.2-202, "Comparison of Annual Doses to the MEI from Liquid Effluents per Unit." The applicant's estimated annual doses from North Anna 3 to the MEI from liquid effluent releases are compared with the applicable regulatory limit in FSAR Table 12.2-202. The North Anna 3 doses are within the 10 CFR Part 50, Appendix I, liquid effluent limits, and the North Anna 3 dose estimates are lower than the corresponding ESP values.

The staff reviewed the parameters submitted by the applicant as well as the results and the computer input and output data files submitted for LADTAPII dose calculations. The staff also compared the applicant's results by independently calculating the liquid effluent doses to the MEI. The table below indicates the comparison of the staff review and the applicant results. The staff used the input provided by the applicant and duplicated the applicant's results. Therefore the staff accepts the liquid dose calculations provided.

Table 12.2.4-3 Site-Specific Liquid Effluent Doses

Description	Design Objective[1] Or Dose Limit	Applicant Site-Specific Calculated Dose	NRC Staff Calculated Doses
MEI doses from liquid pathway[1,2]	3.0 mrem/yr (Total Body)	0.079 mrem/yr (Total Body)	0.08 mrem/yr (Total Body)
	10.0 mrem/yr (Bone)	1.1 mrem/yr (Bone)	1.1 mrem/yr (Bone)
Population doses from liquid pathway[2]	-	0.84 person-rem/yr (Total Body)	0.84 person-rem/yr (Total Body)
	-	0.99 person-rem/yr (Thyroid)	0.99 person-rem/yr (Thyroid)

Notes:

1. Numerical design objectives in 10 CFR Part 50, Appendix I for estimating annual doses above background from liquid effluents for any individual in an unrestricted area, for one unit, from all exposure pathways are 3 mrem/yr (Total Body) or 10 mrem/yr (Organ).

2. FSAR Section Table 12.2-20aR, Table 12.2-20bR, Table 12.2-202, Table 12.2-203 and Table 12.2-204.

Compliance with the U.S. Environmental Protection Agency Standard 40 CFR Part 190

Compliance with the EPA standard in 40 CFR Part 190, as implemented under 10 CFR 20.1301(e), is demonstrated in FSAR Table 12.2-204. (Liquid and Gaseous). Compliance with the EPA standard in 40 CFR Part 190, as implemented under Part 20.1301(e), is demonstrated in FSAR Table 12.2-203. The compliance with this regulatory requirement has been reviewed in Table 12.2.4-2 and is considered acceptable to the staff.

10 CFR Part 50 Compliance with Section II.D of Appendix I

The 10 CFR Part 50 on ALARA is addressed in FSAR Section 11.2 for liquid effluents. Evaluation of 10 CFR Part 50 Appendix I Section II.D is performed in the North Anna 3, Chapter 11 SER, Section 11.2, using data from FSAR Table 12.2-204, “Collective Total Body (Population) Doses Within 50 Miles.” The compliance with this regulatory requirement has been reviewed and is considered acceptable to the staff.

- STD COL 12.2-4-A Other Contained Sources

The applicant provided additional information under STD COL 12.2-4-A that addresses the resolution of DCD COL Item 12.2-4-A, which states:

> The COL applicant will address any additional contained radiation sources (including sources for instrumentation and radiography) not identified in Subsection 12.2.1.5.

The COL applicant stated that additional contained sources which contain by-product, source, or special nuclear materials may be used and maintained on site. These sources are typically used as calibration or radiography sources. In addition, the contained sources described in Subsection 12.2.1.5 will also be used as check sources.

Calibration sources will be used to calibrate the process and effluent radiation monitors, the area radiation monitors, and portable and laboratory radiation detectors and radiation measurement instruments. In addition to gamma calibration sources, beta and alpha calibration radiation sources are also available. All calibration sources will be traceable to the National Institute of Standards and Technology, or equivalent. Radiography sources will be surveyed upon entry to the site and radiation protection personnel will maintain copies of the most recent leak test records for owner-controlled sources. Radiography will be conducted in accordance with approved procedures. Check sources, which are not necessarily calibrated, are used to confirm the continuing satisfactory operation of an instrument. The applicant stated that check sources which are an integral part of (i.e., physically located in) area, process, and effluent monitors and are not easily removed do not require special handling, storage, or use procedures for radiation protection purposes. The staff finds this acceptable, since these check sources consist of small quantities of by-product material and access to these sources would require procedures and tools to disassemble components of the monitors. Except for check sources physically located in monitors, as described above, and exempt quantities or concentrations of solid and liquid sources used for instrument calibration, the applicant stated that RPP procedures will be used to govern the use and control of these additional contained radiation sources. The applicant stated that these procedures will consider guidance provided in RG 8.8 to ensure that occupational doses from the control and use of these sources are ALARA.

In addition, Section 12.5.4.10 of NEI 07-03A, referenced in the North Anna 3 COL FSAR Appendix 12BB, describes RPP radioactive material control procedures. This section states that procedures will be established, implemented, and maintained to ensure compliance with the relevant requirements in 10 CFR Part 20 to ensure positive control over licensed radioactive material to avoid unnecessary or inadvertent exposures and releases of such material into uncontrolled areas in a manner that is not authorized by regulation or the license. The applicant verified that these procedures will apply to byproduct, source, and special nuclear material, including the contained sources described in Subsection 12.2.1.5. The staff has reviewed and approved NEI 07-03A and the staff, therefore, finds this acceptable.

The RG 1.206 states that the applicant should describe any required radiation sources containing byproduct, source, and special nuclear material that may warrant shielding considerations, and, for any such sources, should provide a listing by isotope, quantity, form, and use for all of these sources that exceed 3.7 E+9 Bq (100 millicuries). FSAR Appendix 12BB (which incorporates by reference NEI 07-03A) addresses shielding requirements for all byproduct, source, and special nuclear material, including the portable sources described in NA3 FSAR Subsection 12.2.1.5. The applicant stated that they will utilize two standard calibration sources, a neutron (Am-Be) source and a Cs-137 source, that exceed 3.7 E+9 Bq (100 millicuries). Details of isotope type, quantity, form, shielding requirements, and use of future contained sources will be available when these required sources are purchased. As discussed above, these sources will be controlled by the applicant's RPP.

On the basis of the information provided in Subsection 12.2.1.5 of the North Anna 3 FSAR, the staff finds that the applicant has adequately addressed DCD COL Item 12.2-4-A regarding the description of any other contained radiation sources not described in Subsection 12.2.1.5 of the ESBWR DCD. Therefore, the staff finds DCD COL Item 12.2-4-A to be resolved.

As stated above, the applicant's radioactive material control procedures (which are part of the RPP) will apply to byproduct, source, and special nuclear materials. FSAR Subsection 12.2.1.5 provides a description of the specific types of byproduct, source, and special nuclear materials (including their chemical or physical forms and maximum quantities held at any one time) for the requested material licenses under 10 CFR Part 30, “Rules of General Applicability to Domestic Licensing of Byproduct Material”; 10 CFR Part 40, “Domestic Licensing of Source Material”; and 10 CFR Part 70) that will be received; possessed; or used during the period between the issuance of the COL and the 10 CFR 52.103(g) finding.

In FSAR Subsection 12.2.1.5, the applicant states that no 10 CFR Part 40 (“Domestic Licensing of Source Material”) specifically licensed material—including natural uranium, depleted uranium, or uranium hexafluoride—will be received; possessed; or used during the period between the issuance of the COL and the 10 CFR 52.103(g) finding. Pursuant to 10 CFR Part 30, the FSAR provides a description of the nominal values of projected radioactive byproduct materials (in the form of sealed sources) that will be used for radiation monitoring and laboratory and portable monitoring instrumentation. This information is in FSAR Table 12.2-206. The applicant stated that no byproduct material will be received, possessed, or used in a physical form that is “in unsealed form, on foils or plated sources, or sealed in glass,” and that exceeds the quantities in Schedule C in 10 CFR 30.72, “Schedule C–Quantities of radioactive materials requiring consideration of the need for an emergency plan for responding to a release.” The applicant stated that special nuclear material shall be in the form of reactor fuel and spent fuel, in accordance with limitations for storage and amounts required for reactor operation as described in COLA Part 2. Pursuant to 10 CFR Part 70, the FSAR provides a description of the non-fuel special nuclear material specifically required for use at North Anna 3. This non-fuel special nuclear material consists of local power range monitor assemblies and startup range nuclear monitor assemblies. This information is listed in FSAR Table 12.2-207. The applicant stated that the special nuclear material to be received, possessed, or used does not involve enriched uranium for which a criticality accident alarm system is required; uranium hexafluoride in excess of 50 kilograms (110 pounds) in a single container or 1,000 kilograms (2,200 pounds) total; or plutonium in excess of 7.4E+10 Becquerels (Bq) (2 curies (Ci)) in an unsealed form or on foils or plated sources. The staff finds that the specific material information described above satisfies the requirements of 10 CFR 30.32, “Application for specific licenses”; 10 CFR 40.31, “General domestic licenses for byproduct material”; 10 CFR 70.21, “filing”; and 10 CFR 70.22, “Contents of applications,” to receive, possess, and use byproduct, source, and special nuclear material. Therefore, this information is acceptable.

In addition, as part of the North Anna 3 review of plant-specific information on other contained sources under COL Item STD COL 12.2-4-A, the staff issued RAI 02.04.13-6 to determine the applicant’s basis and assumptions used to develop the condensate storage tank (CST) radionuclide inventories listed in North Anna 3 FSAR Table 12.2-205. The staff also issued RAI 12.02-20 requesting that the applicant describe the dimensions, wall composition, and wall thickness of the CST and provide the applicant’s basis for stating in the FSAR that the maximum expected exposure rate at 30 centimeters (cm) (1 ft) from the outside surface of the CST would not exceed 5E-2 mSv/hr (5 mrem/hr). The staff requested this information to evaluate the dose rates in the vicinity of the CST and ascertain whether the applicant will need to implement any physical or administrative features to limit the access to the CST to ensure that radiation exposures to personnel in the vicinity of the tank are maintained ALARA. In the applicant’s response to RAI 02.04.13-16 dated January 27, 2015 (ADAMS Accession No. ML15028A392), the applicant stated that the CST is fed by the following four fluid streams; makeup water transfer pumps, control rod drive pump recirculation, LWMS, and condensate reject. Of these four CST input streams, only the streams from the LWMS and condensate reject contribute to the CST radionuclide inventory. The applicant first determined the activity concentrations of the radionuclides in the CST input streams from both the LWMS and condensate reject. Then, in order to ensure the highest potential radionuclide material inventory is represented in the CST, the applicant selected the bounding concentration for each radionuclide from these two CST input streams to be the maximum concentration from all contaminated CST input streams.

In the applicant's responses to RAI 12.02-20 dated December 3, 2014 and August 31, 2015 (ADAMS Accession No. ML14338A782 and ADAMS Accession No. ML15245A229, respectively), the applicant provided the requested information including the projected CST design dimensions and material of construction and the estimated radionuclide inventory of the CST based on the various potentially contaminated liquid inputs into the tank. The applicant amended the FSAR to include a new table (Table 12.2-205), which lists the estimated radionuclide source term concentrations and source term inventories in the CST. The ESBWR DCD states that the capacity of the CST is 4,885 cubic meters (1.29 million gallons). The ESBWR DCD does not provide any further design parameters for the CST, so the applicant considered two different CST design configurations based on tank aspect ratios (ratio of the tank height to tank diameter) of 0.5 and 2 that limit the tank diameter and height. Based on these tank configurations, the applicant calculated the potential dose rate at 30 cm (1 ft) from the surface of the tank to be 1.84E-2 mSv/hr (1.84 mrem/hr) for the shorter tank (aspect ratio of 0.5) and 1.78E-2 mSv/hr (1.78 mrem/hr) for the taller tank (aspect ratio of 2). Because these estimated dose rates are below the threshold considered to be a radiation area per 10 CFR 20.1003, the applicant concluded that no special physical or administrative features are needed to maintain the exposures ALARA in the vicinity of the CST.

The staff reviewed the applicant's information, assumptions, and the method of analysis and found them acceptable. The staff performed confirmatory analyses to determine the expected dose rates in the vicinity of the CST. The staff's analyses confirmed the applicant's cited results. Therefore, the staff considers RAI 12.02-20, resolved and closed. Overall, the staff finds that the applicant's resolution of COL Item STD COL 12.2-4-A meets the requirements of 10 CFR Part 20 and is therefore acceptable. The staff verified that the North Anna 3 FSAR Revision 9 incorporated the appropriate changes described in the applicant's responses to RAI 12.02-20 and RAI 02.04.13-16. Therefore Confirmatory Item 12.2.4-02 from the staff advanced SER for North Anna 3 is resolved and closed.

Supplemental Information

- STD SUP 12.2-1

The STD SUP 12.2-1 specifies that each of the required six Cf-252 sealed sources required for reactor startup contains 0.5 to 0.822 mg (1.76E-5 to 2.9E-5 ounces (oz)) of Cf-252, for a total of 3 to 5 mg (1.06E-4 to 1.74E-4 oz) of Cf-252. This supplemental information relating to the material description of the Cf-252 reactor startup source satisfies the requirements of 10 CFR 30.32 and, therefore, the staff finds STD SUP 12.2-1 to be acceptable.

12.2.5 Post Combined License Activities

There are no post COL activities related to this section.

12.2.6 Conclusion

The staff's finding related to information incorporated by reference is in NUREG–1966. The staff reviewed the application and checked the referenced DCD. The staff's review confirms that the applicant has addressed the relevant information relating to plant radiation sources, and no outstanding information is expected to be addressed in the North Anna 3 COL FSAR related to this section. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to the radiation sources that were incorporated by reference are resolved.

In addition, the staff compared the information in the COLA to the relevant NRC regulations, the guidance in SRP Section 12.2, and other NRC RGs.

- STD COL 12.2.4-A states that the applicant should provide information about additional contained radioactive sources not described in the DCD that contain by-product, source, or special nuclear materials that may be maintained on site. In response to this COL information item, the applicant specified that the additional sources not described in the DCD would be used as calibration, radiography, or check sources. The staff concluded that the applicant had adequately responded to this DCD COL information item by providing a description of the contained sources that were not described in the ESBWR DCD. In the response to this DCD COL information item, the applicant also stated that the procedures used to govern the control and use of these contained sources considers the guidance in RG 8.8.

- STD SUP 12.2-1-As discussed in the staff's evaluation above, the staff finds the information in STD SUP 12.2-1 acceptable.

12.3 Radiation Protection Design Features

12.3.1 Introduction

The FSAR Section 12.3 addresses the issues related to radiation protection equipment and design features used to ensure that occupational radiation exposures are ALARA. The discussion takes into account design dose rates, AOOs, and accident conditions. These issues include the facility design features, shielding, ventilation, area radiation and airborne radioactivity monitoring instrumentation, and dose assessment.

12.3.2 Summary of Application

Section 12.3 of the North Anna 3 COL FSAR, Revision 8 incorporates by reference Section 12.3 of the certified ESBWR DCD, Revision 10, referenced in 10 CFR Part 52, Appendix E.
In addition, in FSAR Section 12.3, the applicant provided the following:

Tier 2 Departure Not Requiring Prior NRC Approval

- NAPS DEP 11.4-1 — Long-Term, Temporary Storage of Class B and C Low-Level Radioactive Waste

The North Anna 3 RWB was reconfigured to accommodate a minimum 10 years of volume from packaged Class B and C waste, while maintaining space for at least 3 months of packaged Class A waste. This reconfiguration results in changes in equipment location and layout affecting various DCD figures and tables. The replacement table and figures are in: FSAR Sections 1.2.2.10.2, 1.2.2.16.9, 11.4, 11.4.1, 11.4.2.2.1, 11.4.2.2.2, 11.4.2.2.4, 11.4.2.3.1, 12.2 and 12.3; FSAR Tables 1.9-11R, 9A.5-5R, 11.4-1R, 11.4-2R, 12.2-22R, and 12.3-8R; and FSAR Figures 1.2-21R, 1.2-22R, 1.2-23R, 1.2-24R, 1.2-25R, 9A.2-20R, 9A.2-21R, 9A.2-22R, 9A.2-23R, 9A.2-24R, 11.4-1R, 11.4-2R, 12.3-19R, 12.3-20R, 12.3-21R, 12.3-22R, 12.3-39R, 12.3-40R, 12.3-41R, 12.3-42R, 12.3-61R, 12.3-62R, 12.3-63R, and 12.3-64R. The applicant performed a qualitative evaluation of each wall in the reconfigured RWB against the same wall and functions described in the DCD. This evaluation confirmed that the radiation zones in the departure will be maintained the same as those in the DCD.

COL Items

- STD COL 12.3-2-A Operational Considerations

The STD COL 12.3-2-A addresses the operational considerations for airborne radiation monitoring, such as the procedures for operations and calibration of the monitors, as well as the placement of the portable monitors. The applicant references NEI 07-03A for addressing the resolution of DCD COL Item 12.3-2-A.

- CWR COL12.3-4-A Compliance with 10 CFR 20.1406

This COL item addresses the operational and post-construction objectives of RG 4.21, "Minimization of Contamination and Radioactive Waste Generation: Life-Cycle Planning." The applicant states that implemented programs and procedures are consistent with NEI 08–08A, "Generic FSAR Template Guidance for Life Cycle Minimization of Contamination" (ADAMS Accession No. ML093220530) and meet the objectives of RG 4.21 and the requirements of 10 CFR 20.1406, "Minimization of contamination."

Supplemental Information

- NAPS SUP 12.3-1 Radwaste Building

In FSAR Subsection 12.3.1.4.5, "Radwaste Building," the applicant adds the following design features to minimize occupational exposure:

- Provision for control of fluids exiting high activity rooms, including provision to isolate floor drains, and remote operation of control valves from the radwaste control room.
- Piping from high activity rooms (process and drain piping) are arranged to minimize exposure to normally occupied areas, and are designed to maintain radiation levels in the RWB process system area, as shown in Figure 12.3-19R through Figure 12.3-22R.

- NAPS SUP 12.3-2 North Anna 3 Groundwater Monitoring

In FSAR Subsection 12.3.1.5, "Minimization of Contamination and Radioactive Waste Generation," the applicant adds a description of the North Anna 3 groundwater monitoring program which meets the guidelines established in NEI 08-08A.

12.3.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is in NUREG–1966. In addition, the relevant requirements of the Commission regulations for the radiation protection design features, and the associated acceptance criteria, are in SRP Section 12.3-12.4.

The staff followed the guidance in RG 1.206 to evaluate North Anna 3 FSAR Section 12.3 for compliance with NRC regulations.

In accordance with Section VIII, "Processes for Changes and Departures," of "Appendix E to Part 52, the applicant identifies two Tier 2 departures. Tier 2 departures not requiring prior NRC approval are subject to the requirements of 10 CFR Part 52, Appendix E, Section VIII.B.5, which are similar to the requirements of 10 CFR 50.59.

In particular, the regulatory basis for the acceptance of the COL items and the supplemental information is in the applicable requirements of 10 CFR Part 20; Part 50; and Part 70; and in the following guidelines:

- Item III.D.3.3 of NUREG–0737, "Clarification of TMI Action Plan Requirements"
- RG 1.97, Revision 4, "Criteria for Accident Monitoring Instrumentation for Nuclear Power Plants"
- RG 4.21, RG 8.2, and RG 8.8

12.3.4 Technical Evaluation

As documented in NUREG–1966, the staff reviewed and approved Section 12.3 of the certified ESBWR DCD, Revision 10. The staff reviewed Section 12.3 of the North Anna 3 COL FSAR, Revision 8 and checked the referenced ESBWR DCD to ensure that the combination of the information in the COL FSAR and the information in the ESBWR DCD appropriately represents the complete scope of information relating to this review topic.[1] The staff's review confirmed that the information in the application and the information incorporated by reference address the required information related to the "Radiation Protection Design Features."

The staff also reviewed the applicant's proposed departure, the proposed resolution to the COL items, and the supplemental information included under Section 12.3 of the North Anna 3 COL FSAR. In the review, the staff used the applicable sections of the SRP and RG 1.206 as guidance.

Section 1.2.3 of this SER discusses the NRC's strategy for performing one technical review for each standard issue outside the scope of the DC and to use this review to evaluate the subsequent COL applications. To ensure that the staff's findings on the standard content that were documented in the SER issued for the Fermi 3 application are equally applicable to the North Anna 3 COLA, the staff undertook the following reviews:

- The staff compared the Fermi 3 COL FSAR Revision 8, to the North Anna 3 COL FSAR, Revision 8. In this comparison, the staff considered changes to the North Anna 3 COL FSAR (and other parts of the COLA, as applicable) resulting from RAIs identified in the Fermi SER.

- The staff confirmed that the applicant has endorsed all responses to the RAIs in the corresponding standard content (the Fermi SER) evaluation.

- The staff verified that the site-specific differences are not relevant to this section.

The staff completed the review and finds the evaluation of the Fermi standard content to be directly applicable to the North Anna 3 COLA.

The staff reviewed the information in the North Anna 3 COL FSAR as follows:

Tier 2 Departure Not Requiring Prior NRC Approval

- NAPS DEP 11.4-1 Long-Term, Temporary Storage of Class B and C Low-Level Radioactive Waste

The FSAR Section 12.3, Revision 2, provides revised DCD tables and figures as a result of Departure NAPS DEP 11.4-1. In Part 7 of the North Anna 3 COLA, the applicant states that, consistent with the guidance of SRP, Section 11.4, the North Anna 3 RWB waste storage space is configured to accommodate approximately 10 years of Class B and C waste generated during plant operation. In addition, a shielding analysis was performed for this design change showing that the resultant dose rates in surrounding areas—within the building and externally—are maintained below the allowable limits in accordance with the radiological area classification in DCD Tier 2, Subsection 12.3.1.3. Long-term temporary storage of Class B and C waste in high integrity containers, with design lifetimes of 300 years, will not adversely affect the integrity of the waste containers. Furthermore, periodic inspections will be performed to confirm container integrity during storage.

The staff reviewed the information in Part 7 of the COLA. A comparison of the revised FSAR tables and figures with those in Section 12.3 of the DCD Tier 2, Revision 7 revealed numerous changes in room layout and dimensions, with some FSAR rooms/walls showing elevations above the grade level, where, as in Section 12.3 of the DCD, they are below grade. Although this departure reconfigured the RWB to accommodate increased storage space capacity for Class B and C solid waste, the applicant stated that the equipment size, content, and source terms remained unchanged. The applicant revised the thickness of various RWB shield walls to maintain the same radiation zones in accessible areas as those identified in the DCD. The staff finds that the revised configuration enhances the arrangement of equipment locations. In this arrangement, the rooms with lower radiation zones are usually located between the corridor and the rooms with equipment containing higher radiation sources. Equipment cubicles with high radiation sources that are adjacent to a corridor have thicker concrete walls than the comparable cubicle walls in the DCD, in order to reduce the doses in the adjacent corridors. North Anna 3 FSAR Table 12.3-8R and Figures 12.3-19R through 12.3-22R show the revised wall thicknesses and the reconfigured equipment locations in the RWB. The staff reviewed the applicant's information, compared the revised figures and tables against those in the DCD, and found the changes in accordance with this departure to increase storage space beyond the requirements of the DCD is acceptable.

COL Items

- STD COL 12.3-2-A Operational Considerations

The applicant provided additional information in STD COL 12.3-2-A to address the resolution of DCD COL Item 12.3-2-A, which states:

> Airborne radiation monitoring operational considerations, such as the procedures for operations and calibration of the monitors, as well as the placement of the portable monitors, are the COL applicant's responsibility.

The staff reviewed STD COL 12.3-2-A in regards to airborne radiation monitoring operational considerations included in Section 12.3.4 of the North Anna COL FSAR. The COL applicant stated that the airborne radioactivity monitors are classified as non-safety related. Although airborne radioactivity monitors are classified as non-safety related, they are necessary to show compliance with 10 CFR 20.1501.

The COL applicant stated that operation considerations and portable monitor placement are discussed in COL Section 12.5. COL Section 12.5 references NEI 07-03A. NEI 07-03A describes several monitoring instruments that will be maintained and used at the facility, including:

- High and low volume air samplers used to take grab samples to assess airborne radioactivity concentrations to determine respiratory protection measures;
- Continuous air monitors (CAM) to observe trends in airborne radioactivity concentrations and to alert personnel of sudden changes in airborne radioactivity concentrations;
- Portable air sampling and analysis system to determine airborne radioiodine concentrations during and following an accident; and
- Portable sampling and on-site analysis capability to assess airborne radio-halogens and particulates released during and following an accident.

Section 12.5.4.1 of NEI 07-03A describes the operational considerations of these monitors. The template states that airborne radioactivity levels are surveyed by using CAMs and by taking grab samples using portable high and low volume air samplers. The CAM alarm set points are set at a fraction of the concentration values in 10 CFR Part 20, Appendix B, Table 1 (Column 3) for radionuclides expected to be encountered.

Section 12.5.4.1 of NEI 07-03A also describes calibration frequency and procedures for airborne monitors. The template states that CAMs have daily operational checks to test function or response. All monitors used to perform surveys are calibrated before initial use, after maintenance or repairs that might affect the calibration, and at least annually. In addition, emergency and special-use monitors will have operational checks on a regular schedule as specified in written procedures.

Section 12.5.3.2 of NEI 07-03A states that CAMs equipped with local alarm capability are used in occupied areas where needed to alert personnel to sudden changes in airborne radioactivity concentrations. This section also states that radiation monitoring instrumentation and equipment will provide the appropriate detection capabilities, ranges, sensitivities, and accuracies required for the types and levels of radiation anticipated in the plant and in the environs during routine operations, major outages, abnormal occurrences, and postulated accident conditions. Milestone 1.c. of NEI 07-03A ensures that an adequate number of instruments is available to provide for appropriate detection capabilities to conduct radiation surveys in accordance with 10 CFR 20.1501 and 20.1502, including the capability to sample air at all normally occupied locations where airborne radioactivity may exist. The staff finds that the applicant has adequately described the airborne radiation monitoring operational considerations to resolve DCD COL Item 12.3-2-A.

The 10 CFR 20.1101, “Radiation Protection Programs,” states that the licensee shall use, to the extent practical, procedures and engineering controls based on sound radiation protection principles to achieve occupational doses that are ALARA. Cobalt-60 is one of the primary long-term source of radiation fields in BWRs. Minimizing the plateout of radioactive cobalt on reactor coolant piping can lead to potentially lower dose rates in the vicinity of this piping and result in correspondingly lower doses to personnel in the portions of the plant containing this piping. In order to minimize the plateout of radioactive cobalt on reactor coolant piping and other components, the North Anna 3 design will incorporate a Zinc Injection System (ZNIS). This system, which is described in North Anna 3 FSAR Section 9.3.11, “Zinc Injection System,” is available at startup, along with the Hydrogen Water Chemistry System and On-Line Noble Chem, to provide defense-in-depth against the plateout of radioactive cobalt. The presence of trace quantities of zinc injected into the reactor feedwater reduces occupational exposure to plant personnel by forming a thin oxide layer on stainless steel piping and components. This protective oxide layer inhibits corrosion by reducing soluble Co-60 buildup and is a primary factor in reducing shutdown dose rates on piping and components in low flow rate areas, like the vessel lower plenum, and in primary piping like the Reactor Water Cleanup/Shutdown Cooling System. The use of the ZNIS complies with the requirements of 10 CFR 20.1101 since its use contributes to a reduction in occupational exposure and the decontamination burden.

- CWR COL 12.3-4-A Compliance with 10 CFR 20.1406

The applicant provided information in CWR COL 12.3-4-A related to compliance with 10 CFR 20.1406 in regards to operating procedures that the applicant will implement to prevent the spread of contamination and thereby facilitate decommissioning. This information is described in the COL FSAR Section 12.3.1.5.2. The COL applicant lists several measures used to prevent the spread of contamination, including the use of engineering controls to reduce concentrations of radioactivity in air or fluids; criteria for selecting tools, materials, and equipment used in contaminated areas; the segregation of contaminated tools and equipment from clean tools and equipment; the use of containments, caches, and enclosures to promptly contain spills and releases; conducting surveys of potentially contaminated systems, equipment, and components; and the use of procedures that ensure that equipment performs and is operated in accordance with the design requirements. Most of the items listed in CWR COL 12.3-4-A were taken from the list of practical measures to prevent the spread of contamination in Section 12.5.4.8 of NEI 07-03A. The applicant references this NEI template in Appendix 12BB of the North Anna 3 COL FSAR.

The applicant implements programs and procedures that are consistent with NEI 08-08A, to meet the operational and post-construction objectives of RG 4.21 and the requirements of 10 CFR 20.1406. These objectives include:

- Periodic review of operational practices to ensure that operating procedures reflect the installation of new or modified equipment, personnel qualification and training are kept current, and personnel are following the operating procedures.
- Maintenance of records relating to facility design and construction, facility design changes, site conditions before and after construction, onsite waste disposal and contamination, and results of radiological surveys. Maintenance of such records will be beneficial during decommissioning.
- Maintenance of a conceptual site model based on site characterization and facility design and construction.
- Evaluation of the final site configuration after construction to assist in preventing the migration of radionuclides offsite via unmonitored pathways.
- Implementation of an onsite contamination monitoring program along the potential pathways from the release sources to the receptor points.

The staff finds that these objectives agree with the objectives listed in RG 4.21 and are therefore acceptable and meet the requirements of 10 CFR 20.1406.

Section 12.3.1.5.1 of the COL FSAR lists the radwaste effluent discharge pipeline as one of the three piping systems contain segments that will have to be run underground at North Anna 3. All three of these piping systems are required to have features to minimize contamination or to have monitoring to ensure that the potential for unmonitored, uncontrolled releases of radioactivity to the environment is minimized. Subsection 12.3.1.5.1 of the ESBWR DCD, Tier 2, Revision 10, states that these lines will be kept as short and direct as possible, and they will be designed to preclude inadvertent or unidentified leakage into the environment.

The NAPS SUP 11.2-2, in COL FSAR Section 11.2.3.2, provides a description of the features associated with the radwaste effluent discharge pipeline that will ensure that the potential for unmonitored, uncontrolled releases of radioactivity to the environment from this pipeline will be minimized, in accordance with the guidance in RG 4.21 and the requirements of 10 CFR 20.1406. The radwaste effluent discharge pipeline is used to route liquid radioactive waste generated as a result of plant operations from the RWB to the North Anna 3 discharge structure, where it then flows into the discharge canal. Dilution flow is provided by the North Anna Units 1 and 2 circulating water system which also discharges into the discharge canal. The mixed stream flows through the discharge canal into the WHTF and then out into the Lake Anna Reservoir. At the point where the mixed stream enters the WHTF, the mixture meets the release limits of 10 CFR Part 20, Appendix B Table II, Column 2.

The applicant states that the piping associated with the radwaste effluent discharge pipeline is designed to preclude inadvertent or unidentified leakage to the environment. The buried portion of the piping is enclosed within a guard pipe and monitored for leakage and the other portion of the piping is accessible for visual inspection via a tunnel. This piping incorporates several features to reduce the potential for unmonitored and uncontrolled releases to the environment, in accordance with the guidance provided in RG 4.21. Threaded and flanged pipe connections are kept to a minimum. Other joints, depending on piping material, are welded or otherwise permanently bonded. Fittings are kept to a minimum and no in-line components, such as valves, are incorporated into this line outside of the power block.

In order to obtain additional information regarding the routing of the radwaste effluent discharge pipeline and design features incorporated to preclude inadvertent or unidentified leakage from this pipe into the environment, the staff issued RAI 12.03-55. The applicant provided an initial response to this this RAI on January 8, 2015 (ADAMS Accession No. ML15009A235), and a supplemental response on June 30, 2015 (ADAMS Accession No. ML15187A050). In response to this RAI, the applicant provided a drawing and description of the radwaste effluent discharge pipeline. This pipeline will run from the RWB to the North Anna 3 discharge structure, where it then flows into the discharge canal. The portion of the pipeline that is located in the RWB and the Turbine Building (approximately 76.2 meters (m) (250 feet (ft)) is a single walled pipe which is accessible for inspection. The remainder of the pipeline (approximately 649.2 m (2130 ft)), which runs from the Turbine Building to the discharge structure, is a double walled pipe which has leak detection of the inner pipe. The portion of this pipeline between the Turbine Building and an existing tunnel is buried. The remainder of the pipeline is routed through a buried tunnel that provides access to the inner pipe leak detection as well as visual inspection of the outer guard pipe. The above ground portions of the pipeline are stainless steel while HDPE (high density polyethylene) is used (for both the inner pipe and guard pipe) for the underground portions. NAPS SUP 11.2-2 states that no in-line components (e.g., valves) are incorporated into the radwaste effluent discharge pipeline outside of the power block. In the applicant's response to RAI 12.03-55, the applicant clarified NAPS SUP 11.2-2 by stating that the portion of the radwaste effluent discharge pipeline outside of the power block will not include in-line components such as vacuum breakers or vent valves. The use of these in-line components on the radwaste effluent discharge pipeline could increase the probability of inadvertent or unidentified leakage to the environment. On the basis of the additional information that the applicant provided in response to RAI 12.03-55, on the design of the radwaste effluent discharge pipeline, the staff finds the applicant's response to this RAI acceptable. Therefore, the staff considers RAI 12.03-55, resolved and closed. The staff verified that the North Anna 3 FSAR Revision 9 incorporated the appropriate changes described in the applicant's response to RAI 12.03-55. Therefore Confirmatory Item 12.3.4-01 from the staff advanced SER for North Anna 3 is resolved and closed.

The NEI 08-08A, referenced above, provides a description of the operational and programmatic elements and controls that minimize contamination of the facility, site, and the environment in order to meet the requirements of 10 CFR 20.1406. NEI 08-08A also states that the COL applicant should establish an on-site groundwater monitoring program to ensure timely detection of inadvertent radiological releases to the groundwater.

Supplemental Information

- NAPS SUP 12.3-2 North Anna 3 Groundwater Monitoring

In response to discussions held with the staff, the applicant supplemented the North Anna 3 FSAR to add a more detailed description of the North Anna 3 groundwater monitoring program. The North Anna 3 groundwater monitoring program, which is included in the North Anna site Groundwater Protection Program, is implemented to meet the guidelines established in NEI 08-08A. The Groundwater Monitoring Program is part of the applicant's Radiological Environmental Monitoring Program. The North Anna 3 Groundwater Monitoring Program will include a network of wells to ensure timely detection of inadvertent radiological releases to the ground water, in accordance with the guidance of RG 4.21. Some of these wells are placed downgradient from North Anna 3, based on hydrogeological studies. Other wells are placed close to structures, systems, and components (SSCs) judged to have greater potential for inadvertent radiological releases. In addition, the applicant utilizes groundwater monitoring wells for Units 1 and 2, where feasible, for North Anna 3 groundwater monitoring. NAPS SUP 12.3-2 includes a listing of areas of the North Anna 3 site considered for groundwater monitoring. The applicant monitors potential radiation exposure pathways for groundwater contamination as part of the site REMP. Units 1 and 2 station procedures for the ODCM establish the requirements for the REMP, per the guidance in NEI 07-09A, Attachment 9, “Radiological Environmental Monitoring Program.”

As discussed above, the applicant will implement the groundwater monitoring program consistent with the guidelines established in NEI 08-08A to meet the objectives of RG 4.21. Therefore, the staff finds the information contained in NAPS SUP 12.3-1 to be acceptable.

- NAPS SUP 12.3-1 Radwaste Building

In FSAR Subsection 12.3.1.4.5, “Radwaste Building,” the applicant adds the following design features to minimize occupational exposures in the RWB:

- Provision for control of fluids exiting high activity rooms, including provision to isolate floor drains, and remote operation of control valves from the radwaste control room.
- Piping from high activity rooms (process and drain piping) are arranged to minimize exposure to normally occupied areas, and are designed to maintain radiation levels in the RWB process system area, as shown in Figure 12.3-19R through Figure 12.3-22R.

The first supplemental provision provides an isolation capability (both local and remote) to prevent the spread of contamination to undesired areas. Remote isolation capability minimizes occupational exposure in the event that such isolation is necessary. The second supplemental provision minimizes occupational exposures from radioactive fluids in the piping in the RWB. RG 8.8 contains guidelines related to facility and equipment design, including pipe routing and shielding, to minimize occupational exposures. The staff finds that these two supplemental provisions to FSAR Subsection 12.3.1.4.5 incorporate the guidance of RG 8.8 for preventing the spread of contamination and minimizing OREs. Therefore the staff finds the information contained in NAPS SUP 12.3-1 to be acceptable.

Operational Program

- Operational Program Item Number 22 Lifecycle Minimization of Contamination

In Operational Program Item Number 22 of North Anna 3 FSAR Table 13.4-201, “Operational Programs Required by NRC Regulations,” the applicant committed to develop an operational program for the lifecycle minimization of contamination, before fuel loading, in compliance with 10 CFR 20.1406. This operational program will be a license condition. This license condition states:

> Prior to initial fuel load, the licensee shall implement an operational program for lifecycle minimization of contamination.

Operational Program Item Number 22 in Table 13.4-201 is composed of a number of elements and considerations that are described in NEI 08–08A. Because the operational program incorporates by reference NEI 08–08A into FSAR Subsection 12.3.1.5.2, the staff finds this program milestone acceptable.

12.3.5 Post Combined License Activities

For the reasons discussed in the technical evaluation section above, the staff identifies the following license condition:

- License Condition - Prior to initial fuel load, the licensee shall implement an operational program for lifecycle minimization of contamination.

12.3.6 Conclusion

The staff's findings related to information incorporated by reference are documented in NUREG–1966. The staff reviewed the application and checked the referenced DCD. The staff's review confirms that the applicant has addressed the required information relating to the radiation protection design features, and there is no outstanding information expected to be addressed in the North Anna 3 COL FSAR related to this section. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to the radiation protection design features that were incorporated by reference are resolved.
In addition, the staff compared the information in the COLA to the relevant NRC regulations, the guidance in SRP Section 12.3-12.4, and other NRC RGs. The staff's review also finds that the applicant has adequately addressed the following:

- STD COL 12.3-2-A, which addresses the operational considerations for airborne radiation monitoring, such as the procedures for operations and calibration of the monitors, as well as the placement of the portable monitors, is acceptable because the applicant has incorporated the approved reference NEI 07-03A into the NAPS COL FSAR and meets the applicable regulatory requirements and guidance specified in Sections 12.3.3 and 12.3.4 of this SER.

- CWR COL 12.3-4-A, which address the programs and procedures implemented to minimize contamination in order to facilitate decommissioning, consistent with NEI 08-08A and the requirements of 10 CFR 20.1406, is acceptable because it meets the applicable regulatory requirements and guidance specified in Sections 12.3.3 and 12.3.4 of this SER.

Section 12.3 of the North Anna 3 COL FSAR also includes a discussion of NAPS DEP 11.4-1, the applicant's proposed departure to reconfigure the North Anna RWB waste storage space to accommodate approximately 10 years of Class B and C waste generated during plant operation. On the basis of the staff's review of this departure, the staff finds the RWB reconfiguration departure to be reasonable and in accordance with 10 CFR 52.63(b)(2).

The staff concludes that the information pertaining to North Anna COL FSAR Section 12.3 is within the scope of the DC and adequately incorporates by reference Section 12.3 of the ESBWR DCD. The information is thus acceptable.

12.4 <u>Dose Assessment</u>

12.4.1 Introduction

Section 12.4 addresses the issues related to estimating the annual personal doses associated with operation, normal maintenance, radwaste handling, refueling, ISI, and special maintenance (e.g., maintenance that goes beyond routine scheduled maintenance, modification of equipment to upgrade the plant, and repairs to failed components).

12.4.2 Summary of Application

Section 12.4 of the North Anna 3 COL FSAR, Revision 8, incorporates by reference Section 12.4 of the certified ESBWR DCD, Revision 10, referenced in 10 CFR Part 52, Appendix E.

In addition, in FSAR Section 12.4, the applicant provides the following:
<u>Supplemental Information</u>

- NAPS SUP 12.4-1 Annual Doses to Construction Workers

This site-specific supplemental information addresses the potential dose to construction workers from radiation sources associated with the routine operation of the existing Units 1 and 2 at the nearby site.

12.4.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is in NUREG–1966. In addition, the relevant requirements of the Commission regulations for the dose assessment, and the associated acceptance criteria, are in SRP Section 12.3-12.4.

The staff followed the guidance in RG 1.206 to evaluate North Anna 3 FSAR Section 12.4 for compliance with NRC regulations.

In particular, the regulatory basis for the acceptance of the supplemental information is in the applicable requirements of 10 CFR Part 20 and the guidance in RG 1.206 and in Section 4.5, “Radiation Exposure to Construction Workers,” of NUREG–1555, “Standard Review Plans for Environmental Reviews for Nuclear Power Plants: Environment Standard Review Plan.”

12.4.4 Technical Evaluation

As documented in NUREG–1966, the staff reviewed and approved Section 12.4 of the certified ESBWR DCD. The staff reviewed Section 12.4 of the North Anna 3 COL FSAR and checked the referenced ESBWR DCD to ensure that the combination of the information in the COL FSAR and the information in the ESBWR DCD appropriately represents the complete scope of information relating to this review topic.[1] The staff’s review confirmed that the information in the application and the information incorporated by reference address the required information related to “Dose Assessment.”

In addition, the staff reviewed the supplemental information under Section 12.4 of the North Anna 3 COL FSAR. The staff used the applicable sections of the SRP and RG 1.206 as guidance.

Section 1.2.3 of this SER discusses the NRC's strategy for performing one technical review for each standard issue outside the scope of the DC and to use this review to evaluate the subsequent COL applications. To ensure that the staff's findings on the standard content that were documented in the SER for the Fermi 3 application are equally applicable to the North Anna 3 COLA, the staff undertook the following reviews:

- The staff compared the Fermi 3 COL FSAR, Revision 8, to the North Anna 3 COL FSAR, Revision 8. In this comparison, the staff considered changes to the North Anna 3 COL FSAR (and other parts of the COLA, as applicable) resulting from RAIs identified in the Fermi SER.

- The staff confirmed that the applicant has endorsed all responses to the RAIs in the corresponding standard content (the Fermi SER) evaluation.

- The staff verified that the site-specific differences are not relevant to this section.

The staff completed the review and finds the evaluation of the Fermi standard content to be directly applicable to the North Anna 3 COLA.
The staff reviewed the information in the North Anna 3 COL FSAR as follows:

Supplemental Information

- NAPS SUP 12.4-1 Annual Doses to Construction Workers

This supplemental information discusses the potential sources of radiation exposure to construction workers and provides the basis for the applicant's annual and collective dose estimates to construction workers. The sources of radiation exposures to site preparation and construction workers include direct radiation and gaseous and liquid radioactive effluents from North Anna 1 and 2 operations.

A. Direct Radiation Dose

The applicant states that the principal radiation sources from Units 1 and 2 (which are located to the east of the North Anna 3 construction site) that contribute to direct radiation exposure at the North Anna 3 construction site are the boron recovery tanks and the low-level contaminated storage area. Another source of direct radiation is the ISFSI, which is located south of the construction area.
The applicant used Thermo-luminescent dosimeter (TLD) measurements taken at a location near operating Units 1 and 2 and at locations in the vicinity of the ISFSI to determine the direct dose contributions to the construction work force. The staff issued RAI 12.03-52 (ADAMS Accession No. ML14329B372) dated November 25, 2014, in order to determine the locations of the TLDs used and the quarterly dose measurements recorded at each of these TLD locations. In the response to RAI 12.03-52, dated January 23, 2015 (ADAMS Accession No. ML15028A184), the applicant provided a site map showing the location of the requested TLDs. For each of these TLDs, the applicant also provided tables showing the quarterly TLD readings measured at each of these locations over a several year period. On the basis of the information provided, the staff finds the applicant's response to RAI 12.03-52 acceptable. Therefore, the staff considers RAI 12.03-52 resolved and closed. The staff verified that the North Anna 3 FSAR Revision 9 incorporated the appropriate changes described in the applicant's response to

RAI 12.03-52. Therefore Confirmatory Item 12.3.4-02 from the staff advanced SER for North Anna 3 is resolved and closed.

The TLD readings at the west protected area fence of Units 1 and 2 indicate an average annual dose of 7.2E-1 millisievert (mSv) (72 millirem (mrem)). This equates to a continuous dose rate of 8.22E-5 mSv/hr (8.22E-3 mrem/hr) along the eastern edge of the North Anna 3 construction area. The ISFSI is located on the southern edge of the North Anna 3 construction area and there are two TLDs located along the ISFSI perimeter fence, one on the northern perimeter fence closest to the North Anna 3 construction area and one on the southern perimeter fence further from the North Anna 3 construction area. The licensee conservatively used the higher TLD reading from the southern perimeter fence as the estimated dose from the north side of the ISFSI closest to the North Anna 3 construction area. This maximum quarterly dose reading of 1.92 mSv (192 mrem) was taken when there were a total of 40 casks on the two pads of the ISFSI. The applicant stated that the planned capacity of the two fully loaded ISFSI pads is 68 casks. Therefore, to be conservative, the applicant assumed that the quarterly dose rate at the ISFSI perimeter fence from a fully loaded ISFSI would be double the measured quarterly dose, or 3.84 mSv (384 mrem). This equates to a continuous dose rate of 1.76E-3 mSv/hr (0.176 mrem/hr) at the ISFSI fence.

Since the ISFSI perimeter fence is nearly 300 feet (ft) from the southern portion of the construction area boundary, the applicant calculated that the dose rate at the construction area boundary nearest a fully loaded ISFSI would be approximately 3.04E-4 mSv/hr (3.04E-2 mrem/hr). The estimated construction worker dose at the center of the construction area (approximately 486 m (1600 ft from the ISFSI)) is 5.98E-6 mSv (5.98E-4 mrem/hr) from a fully loaded ISFSI. The staff reviewed the applicant's method of calculating these estimated dose rates and finds this method to be acceptable.

B. Gaseous Effluent Sources

The sources of gaseous effluent releases at Units 1 and 2 include the waste decay tanks, boron recovery and high-level waste tanks, containment purge system, auxiliary building vent, main condenser air ejector vents, auxiliary steam drain receiver, Turbine Building ventilation exhaust, and gland seal ejector vent. On the basis of information contained in the applicant's annual radioactive effluent release reports for the years 2001 to 2011, the average annual gaseous releases from Units 1 and 2 are 1.776e+12Bq **(**48 curies (Ci)) of fission and activation gases and 2.04E+12 Bq (55 Ci) of tritium. The resulting average doses (calculated in accordance with the ODCM for Units 1 and 2) to the maximally exposed member of the public from these gaseous releases are 1.01E-4 mSv/yr (1.01E-2 mrem/yr) for the whole body and 1.29E-3 mSv/yr (1.29E-1 mrem/yr) for the critical organ. The maximally exposed member of the public who would receive these doses is located at or beyond the site boundary. Since the North Anna 3 construction area is closer to the effluent release point than is the site boundary, the applicant increased the estimated average dose estimates from gaseous effluents to a construction worker by a factor of ten (the ratio of the χ/Q values for these two areas) to get 1.01E-3 mSv/yr (0.101 mrem/yr) for the whole body and 1.29E-2 mSv/yr (1.29 mrem/yr) for the critical organ.

C. Liquid Effluent Sources

Effluents from the liquid waste disposal system of Units 1 and 2 are the source of small amounts of radioactivity in the North Anna Reservoir and the WHTF. The applicant's annual radioactive effluent release reports for the years 2001 to 2011 indicate average annual liquid releases of

7.4E+9 Bq (0.2 Ci) of fission and activation products and 3.6E+13 Bq (966 Ci) of tritium. The resulting average doses (calculated in accordance with the ODCM for Units 1 and 2) to the maximally exposed member of the public from these liquid releases are 3.57E-3 mSv/yr (0.357 mrem/yr) for the whole body and 4.35E-3 mSv/yr (0..435 mrem/yr) for the critical organ.

D. Annual Construction Worker Dose

The applicant estimated that the peak loading during the construction of North Anna 3 will be 4,088 construction workers per year and each worker will work 2,500 hours per year. The North Anna 3 construction workers may be exposed to direct radiation and gaseous and liquid radioactive effluents from North Anna 1 and 2 operations. As discussed above, the North Anna 3 construction workers will be exposed to a both a direct dose rate contribution of 8.22E-5 mSv/hr (8.22E-3 mrem/hr) from Units 1 and 2 along the eastern edge of the North Anna 3 construction area and a larger direct dose rate contribution of approximately 3.04E-4 mSv/hr (3.04E-2 mrem/hr) from the ISFSI along the southern edge of the construction area. Even though these two locations are separated by more than 1,000 ft, the applicant conservatively added these two direct radiation dose rates to get a total dose rate of 3.86E-4 mSv/hr (3.86E-2 mrem/hr). Adjusting for the construction worker residence time of 2,500 hours per year, a North Anna 3 construction worker would receive a maximum annual dose of 9.64E-1 mSv (96.4 mrem) from direct radiation.

Although the southern portion of the North Anna 3 construction area near the ISFSI has the highest direct dose rate, the applicant states that the center of the construction area is representative of the location of the average member of the construction workforce over the course of a year. Adding the dose rate from Units 1 and 2 along the eastern edge of the North Anna 3 construction area to the calculated ISFSI dose rate at the center of the construction area yields a total dose rate of 8.82E-5 mSv/hr (8.82E-3 mrem/hr). Adjusting for the construction worker residence time of 2,500 hours per year, the applicant stated that a North Anna 3 construction worker would receive an annual dose of 2.2E-1 mSv (22.0 mrem) from direct radiation at this location.

As stated above, the applicant calculated that the estimated average dose rates in the construction area from gaseous effluents from Units 1 and 2 would be 1.01E-3 mSv/yr (0.101 mrem/yr) for the whole body and 1.29E-2 mSv/yr (1.29 mrem/yr) for the critical organ. For an expected occupancy time of 2,500 hours per year, a construction worker would be expected to receive an annual dose of 2.89E-4 mSv (2.89E-2 mrem) to the whole body and 3.68E-3 mSv (0.368 mrem) to the critical organ from gaseous effluents. Converting these doses into the total effective dose equivalent (TEDE) (by applying a weighting factor of 0.3 to the critical organ dose and adding the product to the whole body dose) yields an annual construction worker dose of 1.39E-3 mSv (0.139 mrem) TEDE from gaseous effluents.

The applicant calculated that the estimated average dose rates from liquid effluents from Units 1 and 2 would be 3.57E-3 mSv/yr (0.357 mrem/yr) for the whole body and 4.35E-3 mSv/yr (0.435 mrem/yr) for the critical organ. These estimated average dose rates are what the maximally exposed member of the public would receive due to the release of liquid effluents from Units 1 and 2. Although construction workers are not expected to be exposed to liquid effluents from Units 1 and 2, the applicant assumed that construction workers are exposed to the same dose rates as the maximally exposed member of the public. For an expected occupancy time of 2,500 hours per year, a construction worker would receive an annual dose of 1.02E-3 mSv (0.102 mrem) to the whole body and 1.24E-3 mSv (0.124 mrem) to the critical organ. This is equivalent to an annual dose of 1.39E-3 mSv (0.139 mrem) TEDE for liquid effluents.

The applicant considers construction workers working at the North Anna 3 construction area to be members of the general public. 10 CFR 20.1301, "Dose limits for individual members of the public," states that the total effective dose equivalent for members of the public from licensed operations not exceed 1 mSv (100 mrem) in a year and 2E-2 mSv (2 mrem in any 1 hour). The applicant states that the total annual dose to the maximally exposed construction worker will not exceed 9.7E-1 mSv (97 mrem) TEDE (sum of the construction worker dose from direct radiation (9.64E-1 mSv/yr (96.4 mrem/yr) TEDE), from gaseous effluents (1.39E-3 mSv (0.139 mrem) TEDE), and from liquid effluents (1.39E-3 mSv (0.139 mrem) TEDE)). The maximum dose rate in the construction area is less than 4E-4 mSv (4E-2 mrem) in any 1 hour. Since these calculated doses meet the public dose limits of 10 CFR 20.1301, the construction workers would not need to be classified as radiation workers, in accordance with the requirements of 10 CFR 19.12.

The total annual dose to an average member of the construction workforce is based on the dose to a worker who would spend most of the time working near the center of the construction area. The total annual dose to an average member of the construction workforce is 2.2E-1 mSv (22.0 mrem) TEDE. With a peak loading of 4,088 construction workers per year, the estimated construction worker collective dose would be 9.1E-1 person-sieverts (91 person-rem).

Since the applicant's estimate of 9.7E-1 mSv (97 mrem) TEDE to the maximally exposed construction worker is very close to the 10 CFR 20.1301 limit of 1.0 mSv (100 mrem) to a member of the public, the staff requested RAI 12.03-58) (ADAMS Accession No. ML14329B372) that the applicant provide a description of dose reduction measures identified or taken as a result of the dose assessment process to ensure that worker doses are maintained as low as is reasonably achievable and do not exceed the applicable dose limits. In the applicant's January 8, 2015 (ADAMS Accession No. ML14329B372), response to RAI 12.03-58, the applicant provided a number of conservative assumptions that they made in their construction worker dose assessment.

- In calculating the direct dose to a construction worker working in the southern part of the construction area closest to the ISFSI, the applicant added the full direct dose component of 2.05E-1 mSv (20.5 mrem) from Units 1 and 2 (measured at the eastern edge of the construction area) to the ISFSI direct dose component, without adjusting the dose from Units 1 and 2 based on the distance from the ISFSI. Since the eastern and southern edges of the construction area are separated by more than 1,000 feet, the component of the dose from Units 1 and 2 at the southern edge of the construction area would be negligible compared to the ISFSI dose of 7.59E-1 mSv (75.9 mrem). By making this distance adjustment to the direct dose contribution from Units 1 and 2 at the ISFSI, the estimated construction worker direct dose component would have been reduced by 27 percent.

- The applicant based the direct dose component to the construction workers from the ISFSI on a loading of 80 spent fuel casks, when the current plan is to load a maximum of 68 spent fuel casks into the ISFSI. If the dose assumption had been based on the lower number of casks, the estimated direct dose would have been reduced by 18 percent.

- Although the North Anna 3 construction area is on the north side of the ISFSI, the applicant conservatively used the higher dose reading from the TLD located on the south side of the ISFSI to determine the construction worker dose from the ISFSI.

- The applicant assumed that the construction worker spends the entire 2,500 hours per year working on the southern perimeter of the construction area near the ISFSI, where the dose rate is maximized. Realistically, a construction worker would work in different areas with varying dose rates throughout the construction area, resulting in an exposure to a lower average dose rate for the year.

In evaluating the applicant's calculations to determine the estimated dose to North Anna 3 construction workers from the ISFSI and from operating Units 1 and 2, the staff reviewed the dose conservatisms used by the applicant and described in the applicant's response to RAI 12.03-58. On the basis of these conservatisms, the staff agrees that the applicant's estimated maximum annual construction worker dose of 9.64E-1 mSv (96.4 mrem) from direct radiation is conservative and the actual measured doses to the North Anna 3 construction workers could be lower than the applicant's dose estimates. In the applicant's response to RAI 12.03-58, the applicant also stated that the construction area will be continually monitored during the construction period and that the applicant will take appropriate actions, as necessary, to ensure that doses to the construction workers will be maintained ALARA. The staff agrees that the applicant's construction worker dose estimates are conservative and that the applicant is committed to ensuring that doses to construction workers during the construction of North Anna 3 will be maintained ALARA. Therefore, the staff finds the applicant's response to RAI 12.03-58 to be acceptable and considers RAI 12.03-58 resolved and closed.

On the basis of the above evaluation, the staff finds that the applicant's estimates of doses to construction workers during the construction of North Anna 3 are within the applicable limits of 10 CFR 20.1301; and 10 CFR Part 50, Appendix I (for gaseous effluents) and are, therefore, acceptable.

12.4.5 Post Combined License Activities

There are no post COL activities related to this section.

12.4.6 Conclusion

The staff's findings related to information incorporated by reference are documented in NUREG–1966. The staff reviewed the application and checked the referenced DCD. The staff's review confirms that the applicant has addressed the required information relating to dose assessment, and there is no outstanding information expected to be addressed in the North Anna 3 COL FSAR related to this section. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to dose assessments that were incorporated by reference are resolved.

In addition, the staff compared the information in the COLA to the relevant NRC regulations, the guidance in SRP Section 12.3-12.4, and other NRC RGs. The staff's review also finds that the applicant has adequately addressed the following:

- NAPS SUP 12.4-1, which provides site-specific supplemental information to address dose to construction workers, is acceptable because the applicant has demonstrated compliance with the applicable requirements of 10 CFR 20.1101, 20 CFR 20.1301, and 10 CFR 20.1302. The applicant has also demonstrated compliance with the acceptance criteria in Section 4.5, "Radiation Exposure to Construction Workers," of NUREG–1555 and the applicable acceptance criteria provided SRP Section 12.3-12.4.

12.5 Operational Radiation Protection Program

12.5.1 Introduction

Section 12.5 addresses the operational RPP, which is designed to maintain occupational and public doses below regulatory limits and ALARA. The operational RPP is designed with the following objectives:

- Providing the capability for administrative control of the activities of plant personnel to limit personnel exposures to radiation and radioactive materials ALARA and within the guidelines in 10 CFR Part 20.

12.5.2 Summary of Application

Section 12.5 of the North Anna 3 COL FSAR, Revision 8, incorporates by reference Section 12.5 of the certified ESBWR DCD Revision 10, referenced in 10 CFR Part 52, Appendix E.

In addition, in FSAR Section 12.5, the applicant provides the following:

COL Items

- STD COL12.5-1-A — Equipment, Instrumentation, and Facilities

This DCD COL item requires the applicant to describe radiation protection equipment, instrumentation, and facilities. The applicant references Appendix 12BB, which in turn adopts NEI 07–03A to address the needs of this standard COL item.

- STD COL 12.5-2-A — Compliance with Paragraph 50.34(f)(2)(xxvii) of 10 CFR Part 50 and NUREG–0737, Item III.D.3.3

This DCD COL item requires the applicant to describe portable instruments for measuring radioiodine concentrations under accident conditions and the training and procedures on the use of these instruments, in compliance with the requirements of 10 CFR 50.34(f)(2)(xxvii) and the guidance of NUREG–0737, Item III.D.3.3. The applicant references Appendix 12BB, which in turn adopts NEI 07–03A to address the needs of this standard COL item.

- STD COL12.5-3-A — Radiation Protection Program

This DCD COL item requires the applicant to provide a description of the Operational RPP and to include descriptions of access controls to “Very High Radiation Areas.” The applicant references Appendix 12BB, which in turn adopts NEI 07–03A to address the needs of this standard COL item.

Operational Program

- Operational Program Item Number 10 Radiation Protection Program

The DCD Tier 2, Section 13.4 directs the COL applicant to develop and implement the required operational programs. The applicant provides Operational Program Item Number 10, "Radiation Protection Program," in FSAR Table 13.4-201, which identifies the program milestones.

12.5.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is in NUREG–1966. In addition, the relevant requirements of the Commission regulations for the Operational RPP, and the associated acceptance criteria, are in SRP Section 12.5.

The staff followed the guidance in RG 1.206 to evaluate North Anna 3 FSAR Section 12.5 for compliance with NRC regulations.

In particular, the regulatory basis for the acceptance of the COL items is established in the following requirements and guidance documents:

- Management and organization are established in RG 1.8, Revision 3, RG 8.2, Revision 1, RG 8.8, Revision 3, and RG 8.10, Revision 1-R; as required by 10 CFR 20.1101; and 10 CFR 20.2102, "Records of radiation protection program."

- Adequate facilities are established in RG 1.97, Revision 4, RG 8.8, Revision 3, RG 8.9, Revision 1, RG 8.15, Revision 1, RG 8.20, Revision 1, "Applications of Bioassay for I-125 and I-131," and RG 8.28; as required by 10 CFR 20.1801, "Security of stored material"; 10 CFR 20.1802, "Control of material not in storage"; and 10 CFR 20.1906, "Procedures for receiving and opening packages."

- Instrumentation and equipment are established in 10 CFR 20.1501, "General"; 10 CFR 20.1502, "Conditions requiring individual monitoring of external and internal occupational dose"; 10 CFR 50.34(f)(2)(xxvii); and the criteria in Item III.D.3.3 of NUREG–0737.

- Training and procedures are established in RG 1.8, Revision 3, RG 1.33, Revision 2, "Quality Assurance Program Requirements (Operation)," RG 8.2, Revision 1, RG 8.7 Revision 2, RG 8.8, Revision 3, and RG 8.10, Revision 1-R; as required by 10 CFR 19.11, "Posting of notices to workers"; 10 CFR 19.12, "Instruction to workers"; and the applicable requirements in 10 CFR Part 20, Part 50, Part 70, and Part 71.

The regulatory basis for acceptance of the resolution to Operational Program Number 10 in Table 13.4-201, which addresses the RPP, is satisfied based on meeting the requirements of 10 CFR 20.1101.

12.5.4 Technical Evaluation

As documented in NUREG–1966, the staff reviewed and approved Section 12.5 of the certified ESBWR DCD. The staff reviewed Section 12.5 of the North Anna 3 COL FSAR and checked the referenced ESBWR DCD to ensure that the combination of the information in the COL FSAR and the information in the ESBWR DCD appropriately represents the complete scope of information relating to this review topic.[1] The staff's review confirmed that the information in the application and the information incorporated by reference address the required information related to the "Operational Radiation Protection Program."

In addition, the staff reviewed the applicant's proposed resolution to the COL items and the description of the Operational RPP included under Section 12.5 of the North Anna 3 COL FSAR. The staff used the applicable sections of the SRP and RG 1.206 as guidance.

Section 1.2.3 of this SER discusses the NRC's strategy for performing one technical review for each standard issue outside the scope of the DC and to use this review to evaluate the subsequent COL applications. To ensure that the staff's findings on the standard content that were documented in the SER for the Fermi 3 application are equally applicable to the North Anna 3 COLA, the staff undertook the following reviews:

- The staff compared the Fermi 3 COL FSAR, Revision 8, to the North Anna 3 COL FSAR, Revision 8. In this comparison, the staff considered changes to the North Anna 3 COL FSAR (and other parts of the COLA, as applicable) resulting from RAIs identified in the Fermi SER.

- The staff confirmed that the applicant has endorsed all responses to the RAIs in the corresponding standard content (the Fermi 3 SER) evaluation.

- The staff verified that the site-specific differences are not relevant to this section.

The staff completed the review and finds the evaluation of the Fermi standard content to be directly applicable to the North Anna 3 COLA.

The staff reviewed the information in the North Anna 3 COL FSAR as follows:

<u>COL Items</u>

- STD COL12.5-1-A Equipment, Instrumentation, and Facilities

The applicant provided additional information in STD COL 12.5-1-A to address the resolution of DCD COL Item 12.5-1-A, which states:

> The COL applicant will provide a description of plant health physics equipment, instrumentation, and facilities.

The FSAR states that this COL information item is addressed in NEI 07-03A, which is referenced in Appendix 12BB of the FSAR. The staff has reviewed and accepted NEI Template 07-03A for addressing this COL item. NEI 07-03A thoroughly describes radiation protection facilities and monitoring instrumentation and equipment.

The radiation protection facilities described in NEI 07-03A include a radiochemistry laboratory, personnel and equipment decontamination facilities, an access control facility, radiation protection offices, portable instrument calibration and respirator facilities, storage and issue areas for contaminated tools and equipment, a machine shop for activated/contaminated components and equipment, radioactive materials storage area, facilities for dosimetry processing and bioassay, and a laundry facility. The ESBWR DCD provides additional information for the personnel decontamination area, radiation protection offices, and a portable instrument calibration facility that is consistent with NEI 07-03A. Equipment to be used for radiation protection purposes includes portable radiation survey instruments, personnel monitoring equipment, fixed and portable area and airborne radioactivity monitors, laboratory equipment, air samplers, respiratory protective equipment, and protective clothing.

The staff finds that the applicant has adequately described the plant health physics equipment, instrumentation, and facilities addressed by DCD COL Item 12.5-1-A and this information is sufficient to resolve DCD COL Item 12.5-1-A.

- STD COL 12.5-2-A — Compliance with Paragraph 50.34(f)(2)(xxvii) of 10 CFR Part 50 and NUREG–0737, Item III.D.3.3

The applicant provided additional information in STD COL 12.5-2-A to address the resolution of DCD COL Item 12.5-2-A, which states:

> The COL applicant will provide a description of the portable instruments that accurately measure radio-iodine concentrations in plant areas under accident conditions and of the training and procedures on the use of these instruments.

The FSAR states that this COL information item is addressed in NEI 07-03A, which is referenced in Appendix 12BB of the FSAR. The licensee must show compliance with 10 CFR 50.34(f)(2)(xxvii) and Item III.D.3.3 of NUREG–0737 in order to resolve this COL action item. 10 CFR 50.34(f)(2)(xxvii) (as supplemented by the criteria in Item III.D.3.3 of NUREG–0737) requires the licensee to provide equipment and associated training and procedures for accurately determining the airborne iodine concentration in areas within the facility where plant personnel may be present during an accident. NEI 07-03A discusses procedures to be used to collect and analyze samples to detect and measure radioiodine. This template states that radiation protection technicians will be trained and qualified under a program established in accordance with 10 CFR 50.120. This training, along with the procedures on radiological surveillance described in NEI 07-03A, will ensure that the radiation protection technicians will have the capability of determining the airborne iodine concentrations in areas within the facility where personnel may be present during an accident and for a broad range of routine conditions. Milestone 1.c. of NEI 07-03A ensures that an adequate number of instruments are available to provide for appropriate detection capabilities to conduct radiation surveys in accordance with 10 CFR 20.1501 and 20.1502, including the capability to determine the airborne iodine concentration in areas within the facility where plant personnel may be present during an accident.

The staff finds that the applicant has provided an adequate description of the portable instruments that accurately measure radio-iodine concentrations in plant areas under accident conditions and of the training and procedures provided on the use of these instruments. Therefore, the staff finds that the applicant has provided sufficient information in the FSAR to resolve DCD COL Item 12.5-2-A.

- STD COL 12.5-3-A — Radiation Protection Program

The applicant provided additional information in STD COL 12.5-3-A to address the resolution of DCD COL Item 12.5-3-A, which states:

> The COL applicant will provide a description of the operational Radiation Protection Program.

The FSAR states that this COL information item is addressed in NEI 07-03A, which is referenced in Appendix 12BB of the FSAR. NEI 07-03A provides a detailed description of the RPP.

Access to very high radiation areas is discussed in Section 12.5 of the North Anna 3 FSAR as part of the operational program for radiation protection. In Section 12.5.3 of the North Anna 3 COL FSAR, the applicant states that the operational program for radiation protection is addressed in Appendix 12BB. Appendix 12BB references NEI 07-03A as the generic FSAR template guidance for the description of North Anna's RPP.

Section 12.5.4.4 of NEI 07-03A (specifically the bracketed "Note" portion of Section 12.5.4.4) states that each COL applicant should provide additional plant-specific information in the FSAR to describe each Very High Radiation Area (VHRA) and to refer to each location on the plant layout diagrams in FSAR Section 12.3. The description of additional administrative controls for restricted access to each VHRA is required by 10 CFR 20.1602. Section 12.5.4.4 of NEI 07-03A also states that applicant's should provide detailed drawings of each VHRA and indicate physical access controls for each of these areas. Appendix 12BB of the North Anna 3 FSAR includes a table which lists all the accessible VHRAs in the plant (those VHRAs which are normally submerged are identified in the DCD Section 12.3 layout drawings), along with their cubicle numbers and a reference to the DCD plant layout drawings which depict each of these areas. The accessible VHRAs are located in the upper and lower drywells, in the Inclined Fuel Transfer Tube Room, and in other areas adjacent to the Inclined Fuel Transfer tube. In addition, Appendix 12BB includes a description of administrative controls which the licensee will implement to control entrance into VHRAs. The applicant states that, in the unlikely event that access to a VHRA is required, entry into will be controlled in accordance with the requirements of a specific (Special) radiation work permit. The applicant also described, in Appendix 12BB, the physical barriers and controls which are in place to preclude inadvertent access to each of the identified VHRAs. These include postings, barricades, physical barriers, and the use of locks that are keyed so only keys designated as VHRA can open the locks. The existence of the barriers, interlocks, and alarms used to control access to areas immediately adjacent to the Inclined Fuel Transfer System is verified via Inspections, Tests, Analyses, and Acceptance Criteria (ITAAC) which are identified in DCD Tier 1, Table 2.5.10-1.

By incorporating the guidance of NEI 07-03A, the staff finds that the applicant has provided an adequate description of the operational RPP. Therefore, the staff finds that the applicant has provided sufficient information in the FSAR to resolve DCD COL Item 12.5-3-A.

Operational Program

- Operational Program Item 10 Radiation Protection Program

The applicant provided implementation schedules and milestones to address Operational Program Number 10, which is associated with the RPP, as required by 10 CFR Part 20.1101. In Table 13.4-201 of the North Anna 3 FSAR, the applicant lists four milestones for the RPP implementation. The four listed milestones are:

1. Prior to initial receipt of byproduct, source, or special nuclear materials (excluding Exempt Quantities as described in 10 CFR 30.18) for those elements of RPP necessary to support such receipt.

2. Prior to fuel receipt for those elements of RPP necessary to support receipt and storage of fuel onsite.

3. Prior to fuel load for those elements of RPP necessary to support fuel load and plant operation.

4. Prior to the first shipment of radioactive waste for those elements of the RPP necessary to support shipment of radioactive waste.

The RPP is composed of a number of elements that are described in NEI 07-03A. Since the applicant incorporates by reference NEI 07–03A into FSAR Appendix 12BB, the staff finds these program milestones acceptable.

For operational program readiness in Section 3.6 of Part 10 of the COLA, the applicant provides a general implementation plan for operational programs that are listed in Table 13.4-201. This implementation plan states that:

> The licensee shall submit to the Director of NRO, a schedule, no later than 12 months after issuance of the COL, for implementation of the operational programs listed in FSAR Table 13.4-201. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until the operational programs in the FSAR table have been fully implemented.

The staff finds the applicant's general implementation plan for operational programs in Table 13.4-201 to be consistent with the guidance in SECY-05-197, "Review of Operational Programs in a Combined License Application and Generic Emergency Planning Inspections, Tests, Analyses, and Acceptance Criteria." In addition, in FSAR Appendix 12BB, the applicant incorporates by reference NEI 07–03A (which provides the RPP milestones). Therefore, the staff finds that the applicant adequately addresses Operational Program Item Number 10.

12.5.5 Post Combined License Activities

For the reasons discussed in the technical evaluation section above, the staff identifies the following two license conditions:

- License Condition – The licensee shall implement the RPP (including the ALARA principle) or applicable portions thereof, on or before the associated milestones identified below:

  a. Receipt of Materials – Prior to initial receipt of byproduct, source, or special nuclear materials onsite (excluding exempt quantities as described in 10 CFR 30.18, "Exempt quantities.")

  b. Fuel Receipt – Prior to initial receipt and storage of fuel onsite

  c. Fuel Loading – Prior to initial fuel load

  d. Waste Shipment – Prior to first radioactive waste shipment

- License Condition – No later than 12 months after issuance of the COL, the licensee shall submit to the Director, NRO a schedule that supports planning for and conduct of NRC inspections of the operational program (Radiation Protection Program). The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until this operational program has been fully implemented.

12.5.6 Conclusion

The staff's finding related to information incorporated by reference is in NUREG–1966. The staff reviewed the application and checked the referenced DCD. The staff's review confirms that the applicant has addressed the relevant information relating to the operational RPP, and no outstanding information is expected to be addressed in the North Anna 3 COL FSAR related to this section. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to the operational RPP that were incorporated by reference are resolved.

In addition, the staff compared the additional information in the COLA to the relevant NRC regulations, the guidance in SRP Section 12.5, and other pertinent NRC RGs. The staff's review concludes that the applicant has adequately addressed the following:

- STD COL 12.5-1-A requires the applicant to describe radiation protection equipment, instrumentation, and facilities. The FSAR states that this COL information item is addressed in NEI Template 07-03A which is referenced in Appendix 12BB of the FSAR. The staff has reviewed and accepted NEI 07-03A for addressing this COL item. This template thoroughly describes radiation protection facilities and monitoring instrumentation and equipment. The staff finds that the applicant has adequately described the plant health physics equipment, instrumentation, and facilities addressed by DCD COL Item 12.5-1-A and this information is sufficient to resolve DCD COL Item 12.5-1-A.

- STD COL 12.5-2-A requires the applicant to describe portable instruments for measuring radioiodine concentrations under accident conditions and the training and procedures on the use of these instruments, in compliance with the requirements of 10 CFR 50.34(f)(2)(xxvii) and the guidance of NUREG–0737 Item III.D.3.3. The applicant references FSAR Appendix 12BB, which in turn adopts NEI 07–03A to address the needs of this standard COL item. The staff has reviewed and accepted NEI Template 07-03A for addressing this COL item. This template discusses the procedures to be used to collect and analyze samples to detect and measure radioiodine. It also states that radiation protection technicians will have sufficient training (in accordance with the requirements of 10 CFR 50.120) to ensure that they will have the capability of determining the airborne iodine concentrations in areas within the facility where personnel may be present during an accident and for a broad range of routine conditions. The staff finds that the applicant has adequately described the portable instruments for measuring radioiodine concentrations under accident conditions and the training and procedures on the use of these instruments addressed by DCD COL Item 12.5-2-A and this information is sufficient to resolve DCD COL Item 12.5-2-A.

- STD COL 12.5-3-A requires the applicant to provide a description of the operational RPP and to include the locations of the VHRA in the plant and as well as descriptions of the access controls for each of these areas. FSAR Section 13.5 includes a description of the plant procedures that comprise the operational RPP. The applicant references FSAR Appendix 12BB, which in turn adopts NEI 07–03A to address the needs of this standard

COL item. NEI 07-03A describes a RPP that is sufficient to ensure compliance with the requirements of 10 CFR 19.12, 10 CFR 19.13, 10 CFR Part 20, and the applicable parts of 10 CFR 50, 52 and 71. The RPP described in NEI 07-03A is also consistent with the guidance in RGs 1.8, 8.2, 8.4, 8.6, 8.7, 8.8, 8.9, 8.10, 8.13, 8.15, 8.27, 8.28, 8.29, 8.34, 8.35, 8.36, and 8.38 and with the applicable portions in NUREG–1736. In addition to describing each VHRA in the plant, FSAR Appendix 12BB includes a description of additional administrative controls for restricted access to each VHRA, as required by 10 CFR 20.1602. The staff finds that this information is acceptable to resolve DCD COL Item 12.5-3-A.

The applicant also lists Operational Program Item Number 10, which pertains to the RPP and its implementation milestones, in FSAR Table 13.4-201. As stated above, the overall description of the applicant's operational program for radiation protection is in FSAR Appendix 12BB, which references NEI 07–03A. On the basis of the staff's review of the applicant's operational RPP described above, the staff finds the applicant's operational RPP and the associated milestones to be acceptable.

13.0 CONDUCT OF OPERATIONS

13.0 CONDUCT OF OPERATIONS

This chapter of the U.S. Nuclear Regulatory Commission's (NRC's) safety evaluation report (SER) provides the NRC staff evaluation of the North Anna 3 programs relating to the preparations and plans for the design, construction, and operation of a nuclear plant. The purpose of this chapter is to provide reasonable assurance that the Combined License (COL) applicant will establish and maintain a staff of adequate size and technical competence to ensure that the operating plans the licensee will follow are adequate to protect public health and safety.

13.1 <u>Organizational Structure of Applicant</u>

13.1.1 Introduction

The organizational structure of the applicant, as described in the North Anna 3 COL Final Safety Analysis Report (FSAR), Revision 8, includes the design, construction, preoperational, and operational responsibilities. The management and technical support organization includes a description of the Dominion Virginia Power (Dominion) corporate or home office organization, its functions and responsibilities, and the number and the qualifications of personnel. Its activities include facility design, design review, design approval, construction management, testing, and operation of the plant. The descriptions of the design, construction and preoperational responsibilities include the following:

- How these responsibilities are assigned by the headquarters staff and implemented within the organizational units,
- The responsible working- or performance-level organizational unit,
- The estimated number of persons to be assigned to the unit with responsibility for the project,
- The general educational and experience requirements for identified positions or classes of positions, and
- Early plans for providing technical support for the operation of the facility.

The operating organization includes a description of the structure, functions, and responsibilities of the onsite organizations established to operate and maintain the plant. The applicant renumbered Section 13.1.1 and added other Sections in FSAR Section 13.1. Several of these Sections are new and differ from the structure in Section 13.1 of Regulatory Guide (RG) 1.206, "Combined License Applications for Nuclear Power Plants (LWR Edition)."

13.1.2 Summary of Application

Section 13.1, "Organization Structure of Applicant," of the North Anna 3 COL FSAR, Revision 8, incorporates by reference Section 13.1, "Organization Structure of Applicant," of Revision 10 of the Design Control Document (DCD) for the Economic Simplified Boiling Water Reactor (ESBWR), referenced in Appendix E to Title 10 of the *Code of Federal Regulations* (10 CFR) Part 52, "Licenses, Certifications, and Approvals for Nuclear Power Plants." In addition, in

FSAR Section 13.1, the applicant provided the following supplemental items:

COL Items

- NAPS COL 13.1-1-A Management and Technical Support Organization

NAPS COL 13.1-1-A provides site-specific information to resolve DCD COL 13.1-1-A, which requires the COL applicant to describe the organizational structure. EF3 COL 13.1-1-A describes organizational positions at the nuclear power station and in the owner/applicant corporations, in addition to the associated functions and responsibilities.

- NAPS COL 9.5.1-10-A Fire Brigade

NAPS COL 9.5.1-10-A is the North Anna 3 response to DCD COL 9.5.1-10-A, which requires the COL applicant to provide a milestone for implementing in all plant areas manual firefighting capability provisions.

13.1.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG–1966,“Final Safety Evaluation Report Related to the Certification of the Economic Simplified Boiling-Water Reactor Standard Design,” (the Final Safety Evaluation Report (FSER) related to the ESBWR DCD). In addition, the relevant requirements of the Commission regulations for the applicant’s organizational structure, and the associated acceptance criteria, are in SRP Sections 13.1.1 and 13.1.2-13.1.3 of NUREG–0800, “Standard Review Plan for the Review of Safety Analysis Reports for Nuclear Power Plants (LWR Edition),” the Standard Review Plan (SRP).

The regulatory guidance for the acceptance of the organizational structure of the applicant is as follows:

- American National Standards Institute/American Nuclear Society (ANSI/ANS) -3.1-1993, as endorsed and amended by RG 1.8, Revision 3, “Qualification and Training of Personnel for Nuclear Power Plants.”

The regulations and regulatory guidance for the acceptance of the management, technical support, and operating organizations of the applicant are as follows:

- Title 10 of the *Code of Federal Regulations* (10 CFR) 50.40(b), “Common standards”
- 10 CFR 50.54, “Conditions of licenses” items (i) through (m)
- RG 1.33, Revision 2, “Quality Assurance Program Requirements (Operation)”

13.1.4 Technical Evaluation

As documented in NUREG–1966, the staff reviewed and approved Section 13.1 of the certified ESBWR DCD, Revision 10. The staff reviewed Section 13.1 of the North Anna 3 COL FSAR, Revision 8, and checked the referenced DCD to ensure that the combination of the DCD and the COL application represent the complete scope of information related to this review topic[1]. The staff's review confirmed that the information contained in the application and incorporated by reference addresses the required information relating to the management, technical support, and operating organizations.

COL Items

- NAPS COL 13.1-1-A Management and Technical Support Organization

NAPS COL 13.1-1-A is related to the organizational structure of the COL applicant. This COL item describes organizational positions and associated functions and responsibilities at a nuclear power plant and in the corporations of the owner/applicant.

The applicant provided the following additional North Anna 3 site-specific COL information to resolve COL Item 13.1-1-A. DCD COL Item 13.1-1-A states:

> The COL Applicant referencing the ESBWR will submit documentation that demonstrates that their organizational structure is consistent with the ESBWR Human Factors Engineering (HFE) design requirements and complies with the requirements of 10 CFR 50.54 (i) through (m).

The applicant provided additional information as part of the North Anna 3 COL FSAR to describe the organizational positions at the nuclear power station, in owner/applicant corporations, and associated functions and responsibilities. The applicant stated that Table 13.1-201, "Generic Position/Site Specific Position Cross Reference" provides the estimated number of positions required for each function. In addition, Table 13.1-201 provides a cross-reference to identify site-specific position titles.

The applicant added new Sections and information related to the site-specific organizational structure in Section 13.1 beyond the structure given in RG 1.206. The new Section titles are:

13.1.4	"COL Information"
13.1.5	"References"
Table 13.1-201,	"Generic Position/Site-Specific Position Cross-Reference"
Table 13.1-202,	"Minimum Shift Staffing Unit 3"
Figure 13.1-201,	"Construction Organization"
Figure 13.1-202,	"Nominal Plant Staff Hiring and Training Schedule"
Figure 13.1-203,	"Shift Operation"
Figure 13.1-204,	"Operating Organization"
Figure 13.1-205,	"Corporate Organization"

[1] See *"Finality of Referenced NRC Approvals"* in SER Section 1.2.2 for a discussion on the staff's review related to verification of the scope of information to be included in a COL application that references a design certification.

In addition, the applicant added an appendix to Chapter 13, for future designation as historical information, titled “Appendix 13AA Design and Construction Responsibilities.” Appendix 13AA describes the applicant’s construction experience and the implementation and/or delegation of design and construction responsibilities.

The staff has reviewed North Anna 3 COL 13.1-1-A and concludes that the management, technical support, and operating organizations, as described, are acceptable and meet the requirements of the ESBWR HFE design requirements and complies with the requirements of 10 CFR 50.54 (i) through (m), 10 CFR 50.40(b), and 10 CFR 50.80, “Transfer of licenses,” as applicable. This conclusion is based on the following:

The applicant described its organization for the management of, and its means of providing technical support for the plant staff for the design, construction, and operation of the facility. The applicant has described its plans for managing the project and utilizing the nuclear steam system supplier (NSSS) vendor and architect-engineer (AE). These plans provide reasonable assurance that the applicant will establish an acceptable organization and that sufficient resources are available to provide offsite technical support and to satisfy the applicant’s commitments for the design, construction, and operation of the facility.

The applicant described the assignment of plant operating responsibilities; the reporting chain up through the President and Chief Nuclear Officer; the functions and responsibilities of each major plant staff group; the proposed shift crew complement for operation; the qualification requirements for members of its plant staff; and the qualifications of the technical support organization.

In Table 1.9-203, “Conformance with the FSAR Content Guidance in RG 1.206,” of the North Anna 3 COL FSAR, the applicant noted exceptions to the guidance of RG 1.206:

- Section C.III.I.13.1.2(1) and Section C.III.I.13.1.2(2) state the guidelines of RG 1.33 are met through equivalent administrative controls described in Chapter 17,

- Section C.III.I.13.1.3.2 states that resumes will not be included in the application, but will be available for inspection at corporate headquarters upon request.

The staff finds these exceptions to the guidance of RG 1.206 acceptable because organization charts and a description of the relationship of the nuclear-oriented portion of the organization to the rest of the corporate organization are contained in the Quality Assurance Program Description and resumes for management and principal supervisory and technical positions will be available for review after position vacancies are filled.

The applicant described the Dominion corporate organization, its functions and responsibilities, and the number and qualifications of personnel. The applicant directs attention to activities that include facility design, design review, design approval, construction management, testing, and operation of the plant.

The applicant described the Dominion management, engineering, and technical support organizations. The description includes organizational charts for the current corporate structure and operating organization and any planned modifications and additions to those organizations that reflect the added functional responsibilities associated with the design, construction, and operation of a nuclear power plant.

The applicant described how the added functional responsibilities associated with the addition of the nuclear power plant to the applicant's power generation capacity are delegated and assigned. The description includes organization charts reflecting the current corporate structure and the organization of units that provide technical support for the operation of the facility.

The applicant provided a description of the management, engineering, technical support, fire protection, and operating organizations; the plans for managing the construction of North Anna 3, the NSSS vendor and AE. The applicant provided a description of the assignment of plant operating responsibilities, the reporting chain up through the chief nuclear officer, the functions and responsibilities of each major plant staff group, and the proposed shift crew complement for operation.

The applicant provided a description of Dominion's experience in the design, construction, and operation of nuclear generating plants and responsibilities associated with six nuclear units at three sites in Virginia and Connecticut.

The applicant provided a description of the general qualification requirements in terms of educational background and experience for positions depicted in the organization charts.

The applicant provided a description of the qualification requirements in terms of experience and a description of the education, training, and experience requirements established for management, operating, technical, fire protection, and maintenance positions for the operating organization.

The applicant provided Table 13.1-201, "Generic Position/Site Specific Position Cross Reference" and Table 13.1-202, "Minimum Shift Staffing for North Anna 3," that describe the operating organization at North Anna 3 and the associated functions and responsibilities. Table 13.1-201 provides the estimated number of personnel required for each position during the operational phase of North Anna 3, the site-specific Nuclear Plant Position titles, and the associated ANSI/ANS-3.1-1993, "Selection, Qualification, and Training of Personnel for Nuclear Power Plants," Table 13.1-202 describes the minimum composition of the operating shift crew for all modes of operation. The applicant also states that minimum shift staffing for the various modes of operation are implemented using plant administrative procedures, work-hour limitations, and shift staffing requirements defined by TMI Action Plan Item I.A.1.3.

In addition, the applicant's operating organization can be characterized as follows:

1. The applicant is technically qualified, as specified in 10 CFR 50.40(b) and 10 CFR 50.80, as applicable.

2. An adequate number of licensed operators will be available at all required times to satisfy the minimum staffing requirements of 10 CFR 50.54(i) – (m).

3. On-shift personnel are able to provide initial facility response in the event of an emergency.

4. Organizational requirements for the plant manager and radiation protection manager have been satisfied.

5. Qualification requirements and qualifications of plant personnel conform to the guidance of RG 1.8.

6. Organizational requirements conform to the guidance of RG 1.33.

7. The applicant has satisfied the requirements that a designated organization be responsible for the testing program and for plans to utilize the plant operating and technical staff to develop and conduct the testing program and to review the test results.

FSAR Table 1.9-201, "Conformance with Standard Review Plan," identifies an exception to SRP Section 13.1.1, Acceptance Criterion 1.C, as follows:

> The experience requirements of corporate staff are set by corporate policy and not provided in detail; however, the experience level of Dominion, as discussed in Section 13.1 and Appendix 13AA, in the area of nuclear plant development, construction, and management establishes that Dominion has the necessary capability and staff to ensure that design and construction of the facility will be performed in an acceptable manner.

As part of the SRP guidance, Areas of Review Item 1.B.vii in Section 13.1.1 states that the submittal should describe the general education and experience required for identified positions or classes of positions and for management and supervisory positions. The staff found that Dominion has addressed the corporate staff guidance for education and experience as recommended in SRP, Section 13.1.1 Areas of Review Item 1.B.vii. The applicant also includes in FSAR Section 13.1.1.4, qualifications for managers and supervisors in the technical support organization to meet the requirements of education and experience needed to meet requirements in ANSI/ANS-3.1–1993 and RG 1.8.

The FSAR Section 13.1.3.1 states that the qualifications for managers, supervisors, operators, and technicians in the operating organization meet the requirements for education and experience as described in ANSI/ANS-3.1-1993 and endorsed and amended in RG 1.8. For reactor operators (RO) and senior reactor operators (SRO), Section 13.2 of the COL FSAR modifies those requirements. In addition, for initial appointees to appropriate management and supervisory positions, Section 13.1.3.2 states that résumés and other documentation of qualifications and experience will be available for review after vacant positions are filled. In FSAR Table 13.1-202, "Minimum Shift Staffing for North Anna 3," the applicant describes the minimum composition of the operating shift crew for unit shutdown and operating modes. Position titles, license requirements, and minimum shift staffing for the various modes of operation are in technical specifications and administrative procedures.

The staff finds that the applicant's organizational structure as defined above complies with the requirements of 10 CFR 50.40(b). That is, the applicant is technically qualified to engage in design, construction activities and operation of a nuclear power plant; the applicant will have the necessary managerial and technical resources to support the plant staff in the event of an emergency; and the applicant identifies the organizational positions responsible for fire protection matters and delegates to these positions the authority to implement fire protection requirements.

- NAPS COL 9.5.1-10-A Fire Brigade

NAPS COL 9.5.1-10-A is related to onsite fire operations training and the schedule for implementation of the fire protection program. Based on the information provided in Table 13.4-201, "Operational Programs Required by NRC Regulations," the staff finds that the applicant's schedule for implementing the fire protection plan meets the guidance of the SRP and is therefore acceptable. The technical review for the North Anna 3 COL 9.5.1-10-A, as it relates to the fire protection programmatic requirements, is in Section 9.5 of this SER.

13.1.5 Post-Combined License Activities

There are no post-COL activities related to this Section.

13.1.6 Conclusions

The staff's finding related to information incorporated by reference is in NUREG–1966. The staff reviewed the application and checked the referenced DCD. The staff's review confirms that the applicant has addressed the required information, and no outstanding information is expected to be addressed in the COL FSAR related to this Section. Pursuant to 10 CFR 52.63(a) (5) and 10 CFR Part 52, Appendix E, "Design Certification Rule for the ESBWR Design," Section VI.B.1, all nuclear safety issues relating to this Section that were incorporated by reference have been resolved.

In addition, the staff compared the additional information in the COL application to the relevant NRC regulations, the guidance in SRP Section 13.1, and other NRC RGs. The staff's review concludes that the applicant has provided sufficient information to satisfy the requirements of NRC regulations. The staff determined that the applicant has adequately addressed North Anna 3 COL Item 13.1-1-A involving the management, technical support, and operating organizations; and North Anna 3 COL 9.5.1-10-A as it relates to the implementation of the Fire Protection Program, including the Fire Brigade. In conclusion, the staff determined that the applicant has provided sufficient information to satisfy the requirements of 10 CFR 50.40(b), 10 CFR 50.54(i–m), and 10 CFR 50.80; and no outstanding information is expected to be addressed in the COL FSAR related to this Section.

13.2 <u>Training</u>

13.2.1 Introduction

Section 13.2 of the North Anna 3 FSAR, Revision 8 includes a description of and schedule for the program to train ROs and SROs (i.e., licensed operators). The discussion addresses the scope of the licensing examinations as well as training requirements. The licensed operator training program also incorporates the requalification programs required in 10 CFR 50.54(i)(i-1) and 10 CFR 55.59, "Requalification."

In addition, this section provides a description of and schedule for the program to train non-licensed plant staff.

13.2.2 Summary of Application

Section 13.2 of North Anna 3 COL FSAR, Revision 8 incorporates by reference Section 13.2 of the certified ESBWR DCD, Revision 10. In addition, in FSAR Section 13.2, the applicant provides the following:

<u>COL Items</u>

- STD COL 13.2-1-A Reactor Operator Training

In FSAR Section 13.2.1, "Reactor Operator Training," the applicant states:

> Descriptions of the training program and licensed operator requalification program for reactor operators and senior reactor operators are addressed in Appendix 13BB. A schedule showing approximate timing of initial licensed operator training relative to fuel loading is addressed in Section 13.1. Requalification training is implemented in accordance with Section 13.4.

- STD COL13.2-2-A Training for Non-Licensed Plant Staff

In FSAR Section 13.2.2, "Training for Non-Licensed Plant Staff," the applicant states:

> A description of the training program for non-licensed plant staff is addressed in Appendix 13BB. A schedule showing approximate timing of initial training for non-licensed plant staff relative to fuel load is addressed in Section 13.1.

<u>Supplemental Information</u>

- STD SUP 13.2-1 Training

In FSAR Section 13.2 the applicant states:

> Training programs are discussed in Appendix 13BB. Implementation milestones are discussed in COL FSAR Section 13.4.

13.2.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is in NUREG–1966. In addition, the relevant requirements of the Commission regulations for training, and the associated acceptance criteria, are in SRP Section 13.2.

In particular, the regulatory basis for accepting the applicant's information in Section 13.2 is in 10 CFR Part 19, "Notices, Instructions and Reports to Workers: Inspection and Investigation"; Part 26, "Fitness for Duty Programs"; Part 50, "Domestic Licensing of Production and Utilization Facilities"; Part 52, "Licenses, Certifications, and Approvals for Nuclear Power Plants"; and Part 55, "Operator's Licenses"; Appendix E, "Emergency Planning and Preparedness for Production and Utilization Facilities," of 10 CFR Part 50. Related guidance is found in RG 1.8 and RG 1.149, Revision 3, "Nuclear Power Plant Simulation Facilities for Use in Operator Training and License Examinations"; NUREG–1021, "Operator Licensing Examination Standards for Power Reactors"; and NUREG–1220, "Training Review Criteria and Procedures." The COL and supplemental information items are reviewed using the guidance in SRP, Section 13.2.1, "Reactor Operator Requalification Program; Reactor Operator Training," and Section 13.2.2, "Non-Licensed Plant Staff Training."

Regulations related to the Operational Program for the Non-Licensed Plant Staff Training Program are in 10 CFR 50.120, "Training and qualification of nuclear power plant personnel," and 10 CFR 52.79(a)(33).

Regulations related to the Operational Program for the Reactor Operator Training Program are in 10 CFR 55.13, "General exemption"; 10 CFR 55.31, "How to apply"; 10 CFR 55.41, "Written examinations: Operators"; 10 CFR 55.43, "Written examinations: Senior operators"; and 10 CFR 55.45, "Operating tests."

Regulations related to the Operational Program for the Reactor Operator Requalification Program are in10 CFR 52.79(a)(34), 10 CFR 50.54(i), and 10 CFR 55.59.

The relevant criteria for reviewing COL items which relate to the incorporation of operating experience are based on meeting the provisions of Three Mile Island Action Item I.C.5, Appendix 1A, "Feedback of Operating Experience"; and the guidance of SRP, Section 13.2, "Training."

13.2.4 Technical Evaluation

As documented in NUREG–1966, the staff reviewed and approved Section 13.2 of the certified ESBWR DCD, Revision 10. The staff reviewed Section 13.2 of North Anna 3 COL FSAR, Revision 8, and checked the referenced ESBWR DCD to ensure that the combination of the information in the COL FSAR and the information in the ESBWR DCD appropriately represents the complete scope of information relating to this review topic.[1] The staff's review confirmed that the information contained in the application and the information incorporated by reference address the relevant information related to this Section.

The staff reviewed the information in the North Anna 3 COL FSAR as follows:

COL Items

- STD COL 13.2-1-A Reactor Operator Training

The applicant provides additional information in STD COL Item 13.2.1-A, which states:

> Descriptions of the training program and licensed operator requalification program for ROs and SROs are addressed in Appendix 13BB. A schedule showing approximate timing of initial licensed operator training relative to fuel loading is addressed in Section 13.1. Requalification training is implemented in accordance with Section 13.4.

In SRP, Section 13.2.1 states that the application should contain a description of the training program for ROs and SROs. In FSAR Appendix 13BB, the applicant incorporates by reference Nuclear Energy Institute (NEI) 06-13A, "Technical Report on a Template for an Industry Training Program Description," Revision 1. The staff determined that NEI 06-13A, Revision 1, endorsed by the staff on September 5, 2007, provides an acceptable template for describing licensed operator and non-licensed plant staff training programs because it meets the criteria of SRP, Section 13.2.1.

SRP Section 13.2.1 states that the application should describe the schedule for the RO and SRO training program. NEI 06-13A, Revision 1, addresses training program schedules in Section 1, "Training Program Description." In FSAR Section 13.1, "Organizational Structure of Applicant," the applicant includes a schedule showing the approximate timing of initial licensed operator training relative to fuel loading, in conformance with NEI-06-13A, Revision 1. The staff concluded that the applicant's licensed operator training program schedule contains sufficient information to satisfy the guidance of SRP, Section 13.2.1 and is therefore acceptable.

SRP Section 13.2.1 states that the application should describe the requalification program for ROs and SROs. NEI 06-13A, Revision 1, Section 1 addresses the requalification program descriptions. In FSAR Section 13.4, "Operational Program Implementation," the applicant describes the licensed operator requalification program in conformance with NEI 06-13A, Revision 1. The staff concluded that the applicant's description of the licensed operator requalification program meets the criteria in SRP, Section 13.2.1 and is therefore acceptable.

- STD COL 13.2-2-A Training for Non-Licensed Plant Staff

The applicant provides additional information to address STD COL 13.2-2-A, which states:

> A description of the training program for non-licensed plant staff is addressed in Appendix 13BB. A schedule showing approximate timing of initial training for non-licensed plant staff relative to fuel load is addressed in Section 13.1.

In SRP, Section 13.2.2 states that the applicant's training program should meet the guidelines of RG 1.8 for non-licensed personnel. In FSAR Table 13.4-201, the applicant provides a schedule for a milestone of at least 18 months before fuel loading for the requirements of non-licensed plant staff, in accordance with the requirements of 10 CFR 50.120(b). In addition, the applicant will provide a schedule for conducting formal onsite training and on-the-job training, so that the entire plant staff will be qualified before initial fuel loading. In FSAR Table 13.4-201, Operational Program Items 11 through 13 provides additional details on the commitments and applicable requirements to be met. The staff determined that the applicant's approach is acceptable because it will include those subjects that are required by regulations for the training programs and will base the training programs on the systems approach to training (SAT), as required by regulations and in accordance with the guidance of NEI 06-13A, Revision 1. The staff concluded that the applicant has provided sufficient information to satisfy the guidance of SRP, Section 13.2.2 and is therefore acceptable.

Supplemental Information

- STD SUP 13.2-1 Training

The applicant added the following sentence in Section 13.2, "Training," to supplement the DCD; this text is also identified by the applicant as STD SUP 13.2-1:

> Training programs are addressed in Appendix 13BB. Implementation milestones are addressed in Section 13.4.

The applicant provided the following text to supplement Section 13.2, "Training," Appendix 13BB, "Training Program," to address cold license training program procedures.

> NEI 06-13A (Reference 13BB-201), Technical Report on a Template for an Industry Training Program Description, is incorporated by reference.

NEI 06–13A is a generic training program description. Revision 0 of this template, which was incorporated by reference in North Anna 3 FSAR Revision 0, did not address a cold license training plan. Revision 1 of NEI 06-13A included additional information that addresses cold license testing, and the staff has endorsed this revision. Therefore, the staff issued Request for Additional Information (RAI) 13.02.01-1, requesting Dominion to address the cold licensing process. In a letter dated September 11, 2008, Dominion stated that NEI 06-13A, Revision 1, will be incorporated by reference in Appendix 13BB. The staff verified that NEI 06-13A, Revision 1, is incorporated by reference in Appendix 13BB in COL FSAR Revision 1. North Anna FSAR table 1.6-201 lists topical reports not included in DCD Section 1.6 that are incorporated in whole or in part by reference. Because the applicant's reference to NEI 06-13A, Revision 1 has been updated to the staff-endorsed revision that addresses cold licensing, the staff determined that the change made to Appendix 13BB is acceptable and meets the guidance of SRP, Chapter 13.2.1.

SRP Section 13.2.1 states that the description of the training program should address the subject matter, duration, organization, position titles, and schedules. Section 1 of NEI 06-13A, Revision 1, includes information on subject matter, duration, organization, position titles, and schedules. The staff concluded that the description of the NEI 06-13A, Revision 1, training program provides sufficient information to satisfy the criteria in SRP Section 13.2.1 and is therefore acceptable.

SRP Section 13.2.1 states that the training program for licensed operators should include (1) the subjects in 10 CFR 55.31, 10 CFR 55.41, 10 CFR 55.43, 10 CFR 55.45, and RG 1.8; and (2) provisions for upgrading licenses. In addition, this program should use the SAT as defined in 10 CFR 55.4, "Definitions." NEI 06-13A, Revision 1, Section 1.1 states that the training program for licensed operators is in accordance with and includes the subjects in 10 CFR Part 55, specifically 10 CFR 55.41, 10 CFR 55.43, 10 CFR 55.45, and RG 1.8. NEI 06-13A, Revision 1, Section 1 states that training programs are developed, established, implemented, and maintained using the SAT, as defined by 10 CFR 55.4. The staff determined that this program is acceptable and meets the guidance of SRP, Section 13.2.1, because the applicant will include in the training programs those subjects that are required by regulations and will base the training programs on the SAT, as required by regulations and in accordance with the guidance in the staff-endorsed template in NEI 06-13A, Revision 1.

SRP, Section 13.2.1, states that the applicant should describe the requalification program for ROs and SROs. In FSAR Appendix 13BB, the applicant stated that NEI 06-13A, Revision 1, is incorporated by reference. NEI 06-13A, Revision 1, addressed the requalification program descriptions in Section 1, "Training Program Description." In FSAR Section 13.4, "Operational Program Implementation," the applicant described the licensed operator requalification program. The staff determined that this program is acceptable because it follows the staff-endorsed template in NEI 06-13A and therefore meets the criteria of SRP, Section 13.2.1.

SRP Section 13.2.1 also states that the licensed operator requalification program should include the content described in 10 CFR 55.59 or should be based on the use of the SAT, as defined in 10 CFR 55.4. Section 1.1 of NEI 06-13A, Revision 1, states that the licensed operator training program content and schedule should comply with 10 CFR 55.59. This Section also states that training programs are developed, established, implemented, and maintained using the SAT, as defined by 10 CFR 55.4. The staff found this information acceptable because the applicant will include in the training programs those subjects that are required by regulations and will base the training programs on the SAT, as required by regulations and in accordance with the guidance in NEI 06-13A, Revision 1. The staff concluded that the applicant has provided sufficient information to satisfy SRP, Section 13.2.1.

In addition, SRP Section 13.2.1 states that the program for providing the simulator capability should meet the requirements described in 10 CFR 55.31, 10 CFR 55.45, 10 CFR 55.46, "Simulation facilities," and 10 CFR 50.34(f)(2)(i); in addition to the guidance in RG 1.149. NEI 06-13A, Revision 1, Section 1.1, states that licensed operators will receive plant simulator training to demonstrate an understanding of and the ability to perform the actions listed in 10 CFR 55.45, NEI 06-13A, Revision 1, Section 1.1, also states that a simulator will be used for training licensed operators which includes the items listed in 10 CFR 55.31and for the administration of operating tests, in accordance with 10 CFR 55.46. 10 CFR 50.34(f)(2)(i), requires simulators to include the capability of simulating small-break, loss-of-coolant accidents. In North Anna 3 FSAR Table 1.9-202, "Conformance with Regulatory Guides," the applicant states that the North Anna 3 conforms to the guidance of RG 1.149, Revision 3 which includes loss of coolant accidents. The staff determined that this information is acceptable because the applicant will provide the simulator capability required by the regulation. The staff concluded that the applicant has provided sufficient information to satisfy SRP, Section 13.2.1.

SRP Section 13.2.1 states that the training program should include the means for evaluating the effectiveness of the training program in accordance with the SAT. NEI 06-13A, Revision 1, Section 1.5 includes a program to evaluate training effectiveness. It also states that training programs are to be developed, established, implemented, and maintained using the SAT as defined by 10 CFR 55.4. The staff determined that this information is acceptable and sufficient to satisfy SRP, Section 13.2.1, because the applicant will apply the SAT process in the evaluation of the training programs.

SRP Section 13.2.1 states that applicants are to provide implementation milestones for the RO training program. NEI 06-13A, Revision 1, includes implementation milestones. The staff determined that this information is acceptable because the applicant has provided implementation milestones as recommended by SRP, Section 13.2.1.

13.2.5 Post Combined License Activities

There are no post COL activities related to this Section.

13.2.6 Conclusion

The staff's finding related to information incorporated by reference is in NUREG–1966. The staff reviewed the application and checked the referenced DCD. The staff's review confirms that the applicant has addressed the required information, and no outstanding information is expected to be addressed in the COL FSAR related to this Section. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to this Section that were incorporated by reference have been resolved.

In addition, the staff compared the additional COL and supplemental information in the application to the relevant NRC regulations; the guidance in SRP Section 13.2 and other NRC RGs. The staff's review concludes that the applicant has adequately addressed COL Items STD COL 13.2-1-A and 13.2-2-A and Supplemental Information STD SUP 13.2-1 relating to training, in accordance with NRC regulations. These items are thus acceptable.

13.3 Emergency Planning

13.3.1 Introduction

This Section addresses the plans, design features, facilities, functions, and equipment necessary for radiological emergency planning (EP) that must be considered in a COL application (hereinafter referred to as "COLA" or "application"). This includes both the applicant's onsite emergency plan and State and local (offsite) emergency plans, which the NRC and the Federal Emergency Management Agency (FEMA) evaluated to determine whether the plans are adequate, and that there is reasonable assurance that they can be implemented. The emergency plans are an expression of the overall concept of operation and describe the essential elements of advance planning that have been considered, as well as the provisions that have been made to cope with radiological emergency situations.

Virginia Electric and Power Company, doing business as Dominion Virginia Power is the applicant for the COL (hereinafter referred to as “Dominion” or “applicant”). Dominion submitted its initial COLA on November 26, 2007 (Agencywide Documents and Access Management System (ADAMS) Accession No. ML073320913), for one new nuclear reactor, consisting of the General Electric-Hitachi Nuclear Energy (GEH) ESBWR, which will be located on the North Anna Power Station site (North Anna site) located in Louisa County, Virginia. The new reactor is designated as North Anna 3. The NRC docketed the application on January 28, 2008 (Docket No. 52-017) (ADAMS Accession No. ML080240154). On June 28, 2010, Dominion revised its COLA to change the designation of the choice of reactor technology from the ESBWR to the Mitsubishi Heavy Industries, Ltd. US-APWR (ADAMS Accession No. ML101820627). Dominion changed the reactor technology designation back to the ESBWR on July 31, 2013 (ADAMS Accession No. ML13221A504), and updated the application on December 18, 2013, and June 24, 2014 (ADAMS Accession Nos. ML14007A541 and ML14199A360, respectively). On September 23, 2015, Dominion submitted a request for a one-time exemption from 10 CFR 50.71I(3)(iii), to postpone submission of the next FSAR annual update to no later than June 30, 2016.

On August 24, 2005, GEH submitted its ESBWR standard design certification application to the NRC, and the NRC docketed the application on December 1, 2005 (Docket No. 52-010). On December 11, 2013, GEH submitted Revision 10 of the ESBWR DCD to the NRC (ADAMS Accession No. ML14010A278), followed by an updated version of Revision 10 on April 1, 2014 (ADAMS Accession No. ML14101A028). Dominion supplemented its application in a letter dated February 10, 2014 (ADAMS Accession No. ML14043A035), which provided COLA markups that reflect the December 11, 2013, ESBWR DCD, Revision 10 changes. Dominion supplemented its application for a second time in a letter dated April 17, 2014 (ADAMS Accession No. ML14108A345), which provided additional COLA markups to reflect the April 1, 2014, updated version of ESBWR DCD, Revision 10, and to align with the February 14, 2014, Enrico Fermi Unit 3 COLA update (ADAMS Accession No. ML14055A463). On October 15, 2014, the NRC issued the ESBWR final rule (10 CFR Part 52, Appendix E) in the *Federal Register* (79 FR 61944).

Two existing nuclear reactors (i.e., North Anna Units 1 and 2) and an Independent Spent Fuel Storage Installation (ISFSI) are currently located on the North Anna site. Dominion is the licensed operator of the existing facilities, with control of the North Anna site and existing facilities. North Anna 3 will be located adjacent to and generally west of the existing reactor units. Figure 2.0-205, “Unit 3 Power Block Building Locations Within the ESP Proposed Facility Boundary,” in COLA Part 2, “Final Safety Analysis Report” (FSAR) (hereinafter referred to as “Part 2” or “FSAR”), shows that the proposed North Anna 3 footprint is located within the early site permit (ESP) plant parameter envelope. The North Anna 3 boundary is entirely within the existing North Anna site exclusion area boundary, so that for purposes of EP, little distinction exists between the North Anna site (for Units 1 and 2) and the ESP site (for North Anna 3). The COLA takes advantage of the EP resources, capabilities, and organization that currently exist at the North Anna site for Units 1 and 2.

The application includes a complete and integrated emergency plan for North Anna 3, which consists of the onsite North Anna 3 Emergency Plan in COL application Part 5, “Emergency Plan” (hereinafter referred to as “COL Plan”), and supplemental information that includes the offsite radiological emergency response plans (RERP) for the State of Maryland and

Commonwealth of Virginia (including the affected counties), and an evacuation time estimate (ETE) report for the North Anna site (hereinafter referred to as “ETE Report”). The ETE Report is discussed below in SER Section 13.3.4.17. The application also includes a listing of emergency planning inspections, tests, analyses, and acceptance criteria (ITAAC) in Table 2.3-1, “ITAAC For Emergency Planning,” of COLA Part 10, “Tier 1/ITAAC/Proposed License Conditions,” that will be completed before fuel load. Finally, the COLA incorporates by reference ESP No. ESP-003 for the North Anna ESP site and the ESBWR standard plant design.

As described below, in consultation with FEMA, the staff reviewed the COLA, the applicant’s responses to RAIs and generally available reference materials in accordance with the guidance provided in the SRP, Section 13.3, “Emergency Planning,” and SRP Section 14.3.10, “Emergency Planning – Inspections, Tests, Analyses, and Acceptance Criteria.” FEMA reviewed the offsite RERPs for the State of Maryland and Commonwealth of Virginia, and local government plans for Caroline, Hanover, Louisa, Orange, and Spotsylvania Counties in Virginia (i.e., risk jurisdictions).

In an August 22, 2008, letter to NRC, FEMA provided its Interim Findings Report for the North Anna COLA (ADAMS Accession No. ML082470307), and on December 23, 2008, its Interim Findings Report for Open Items (ADAMS Accession No. ML090070398). These reports reflected the current status of FEMA’s evaluation, including FEMA’s RAIs, associated with the offsite emergency response plans for North Anna 3. By letter dated October 24, 2008 (ADAMS Accession No. ML083080127), Dominion provided responses to FEMA’s RAIs, which had been prepared by the Commonwealth of Virginia Department of Emergency Management (VDEM) on October 22, 2008. In a March 4, 2009, letter to NRC (ADAMS Accession No. ML090790498), FEMA stated that there remained 37 open items that require resolution before it could make its finding of reasonable assurance for the offsite plans. FEMA continued to work directly with Dominion and the governmental agencies until all of the open items were resolved. In a December 7, 2009, letter to NRC (ADAMS Accession No. ML093441405), FEMA provided its Interim Finding Report for Reasonable Assurance, dated December 1, 2009 (ADAMS Accession No. ML093441481), which found that all planning standards associated with their review were adequate. The “planning standards” referred to here and below consist of the 16 planning standards (i.e., A through P) of NUREG–0654/FEMA-REP-1, Revision 1, “Criteria for Preparation and Evaluation of Radiological Emergency Response Plans and Preparedness in Support of Nuclear Power Plants” (hereinafter referred to as “NUREG–0654”).

FEMA further stated in the December 1, 2009, report that the adequacy of the COLA emergency plan review for offsite response organizations is also dependent on satisfactory demonstration of plan implementation during a joint exercise with the licensee (Dominion) and State and local governments, utilizing the North Anna 3 facilities. Exercises and drills are discussed below in SER Section 13.3.4.14, and offsite exercise objectives are addressed in SER Table 13.3-1, “NAPS Unit 3 ITAAC,” acceptance criterion 8.1.3. The staff reviewed the FEMA findings in the December 1, 2009, report, and the overall FEMA conclusions are reflected below in SER Sections 13.3.4 and 13.3.6. The applicant’s reactor technology change from the ESBWR to the US-APWR, and subsequent change back to the ESBWR, did not affect the offsite emergency plans; and therefore, FEMA’s December 1, 2009, findings remain valid.

13.3.2 Summary of Application

The COLA Part 2 (FSAR) Section 1.1.1.9, "Referencing of [ESP application] ESPA Information," incorporates by reference Revision 9 of the North Anna ESP application Site Safety Analysis Report (SSAR), as required by 10 CFR 52.79(b)(1). Dominion submitted the ESP application to the NRC on September 25, 2003 (ADAMS Accession No. ML032731511), which was docketed on October 23, 2003 (Docket No. 52-008). The NRC issued ESP-003 on November 27, 2007 (ADAMS Accession Nos. ML073180427 and ML073180440). In addition, as required by 10 CFR 52.79(d)(1), FSAR Section 1.1.1.7, "Incorporation by Reference," incorporates by reference Revision 10 of the ESBWR DCD.

FSAR Section 13.3, "Emergency Planning," incorporates by reference Section 13.3 of the ESBWR DCD, Revision 10, and Section 13.3 of the ESP SSAR. COLA Part 7, "Departures Report," includes information on departures, variances, and exemptions. With regard to EP, there are no departures from the ESBWR DCD, variances from the ESP SSAR, or requests for exemptions from NRC regulations. In addition, there are no ESP COL action items or permit conditions associated with EP.

COL Items

As reflected in ESBWR DCD Tier 2 Table 1.10-1, "Summary of COL Items," and the table's referenced Tier 2 DCD Sections, the applicant identified COL items relating to EP in COLA Part 2 (FSAR) Table 1.10-201, "Summary of FSAR Sections Where DCD COL Items Are Addressed," and FSAR Table 1C-202, "Operating Experience Review Results Summary – IE Bulletins." In FSAR Section 13.3, the applicant identified the following three Standard COL Items from the ESBWR DCD:

- STD COL 13.3-1-A: The COL applicant is responsible for identifying the operational support center (OSC) and the communication interfaces for inclusion in the detailed design of the control room and technical support center (TSC).

- STD COL 13.3-2-A: The COL applicant is responsible for the design of the communication system located in the emergency operations facility (EOF) in accordance with NUREG–0696.

- STD COL 13.3-3-A: The COL applicant will provide supplies at the site for decontamination of onsite individuals in the service building adjacent to the main change rooms.

The applicant also identified (in the respective FSAR Sections) the following three Standard COL Items from the ESBWR DCD (including ESBWR DCD Tier 2 Appendix 1C, "Industry Operating Experience," and DCD Tier 2, Table 1C-2, "Operating Experience Review Results Summary – IE Bulletins"), which relate to EP:

- STD COL 13.4-2-A: The COL applicant will provide implementation milestones for operational programs that are required by NRC regulation.

- STD COL 14.3-1-A: The COL applicant shall provide emergency planning ITAAC, based on industry guidance.

- STD COL 1C.1-2-A: COL applicant will address requirements of IE Bulletin 2005-02[2] regarding emergency preparedness and response actions for security-based events.

The staff's evaluation of the applicant's resolution of these six Standard COL Items is addressed below in SER Section 13.3.4.18.

In FSAR Section 9.5.2, "Communications System," the applicant identified four additional (ESBWR DCD) Plant-Specific COL Items associated with emergency communication systems (i.e., NAPS COL 9.5.2.5-1-A, NAPS COL 9.5.2.5-3-A, NAPS COL 9.5.2.5-4-A, and NAPS COL 9.5.2.5-5-A). Communication systems are described in ESBWR DCD Tier 2, Section 9.5.2, "Communications System," FSAR Section 9.5.2.2, COL Plan Sections II.E and II.F, ESP SSAR Sections 13.3.2.2.2.e and 13.3.2.2.2.f, and NUREG–1835[3], Sections 13.3.3.6 and 13.3.3.7; and are addressed below in SER Sections 13.3.4.5 and 13.3.4.6. Resolution of these four Plant-Specific COL Items is addressed in SER Section 9.5.2, "Communication System."

Supplemental Information

In FSAR Section 13.5.2.2.2, "Emergency Preparedness Procedures," the applicant identified the following Standard Supplemental Information to DCD Tier 2, Section 13.5.2, "Operating and Maintenance Procedures," relating to E:

- STD SUP 13.5-28: A discussion of emergency preparedness procedures can be found in the emergency plan, and that a list of implementing procedures is maintained in the emergency plan.

The staff's evaluation of the applicant's resolution of this Standard Supplemental Information item is addressed below in Section 13.3.4.18 of this report.

Onsite Emergency Plan

Emergency planning for North Anna 3 is addressed throughout COLA Part 2 (FSAR), with the North Anna 3 Emergency Plan (COL Plan) provided in COLA Part 5. The COL Plan consists of a basic plan and eight appendices (listed below), which provide additional detailed information on specific aspects of the EP, and incorporates by reference various information from Section 13.3, "Emergency Planning," of the ESP SSAR. In addition, the COLA includes the ETE Report as supplemental information to the COL Plan. COL Plan Appendix 4, below, consists of the Executive Summary from the full ETE Report.

[3] NUREG–1835, "Safety Evaluation Report for an Early Site Permit (ESP) at the North Anna ESP Site," September 2005 (ADAMS Accession No. ML052710305).

- Appendix 1: Reserved
- Appendix 2: Assessment and Monitoring for Actual or Potential Offsite Consequences of a Radiological Emergency
- Appendix 3: Public Alert and Notification System
- Appendix 4: Evacuation Time Estimates (summary)
- Appendix 5: Implementing Procedures – Topical List
- Appendix 6: Emergency Equipment and Supplies
- Appendix 7: Certification Letter
- Appendix 8: Cross-Reference to Regulations, Guidance, and State and Local Plans

Offsite Emergency Plans

The COLA includes supplemental information consisting of the offsite RERPs for the State of Maryland, the Commonwealth of Virginia, and the risk jurisdictions of Louisa, Spotsylvania, Orange, Caroline, and Hanover Counties in Virginia.

License Conditions

COLA Part 10 Section 3, “North Anna 3 Proposed License Conditions,” includes the following proposed license conditions related to EP actions (which are addressed below in SER Sections 13.3.4 and 13.3.6):

- License Condition 3.1 (Letters of Agreement) (See SER Section 13.3.4.16).

  Prior to loading fuel, the licensee shall update its Units 1 and 2 Letters of Agreement with the following entities or their successors:

  a. Commonwealth of Virginia Department of Emergency Management
  b. Commonwealth of Virginia Department of Health
  c. Commonwealth of Virginia Department of State Police
  d. Commonwealth of Virginia Department of Game and Inland Fisheries
  e. Virginia Commonwealth University Medical Center
  f. Louisa County Administrator
  g. Louisa County Sheriff
  h. Louisa County Department of Fire and Emergency Medical Services
  i. Spotsylvania County Sheriff
  j. Spotsylvania Department of Fire, Rescue, and Emergency Management
  k. Orange County Administrator
  l. Orange County Sheriff
  m. Caroline County Sheriff
  n. Caroline County Department of Fire, Rescue, and Emergency Management

o. Hanover County Administrator
p. Hanover County Sheriff

These updated letters of agreement will identify the specific nature of arrangements in support of emergency preparedness for the North Anna site, including North Anna 3. The emergency plan shall be revised to include these update letters of agreement after they have been executed.

- License Condition 3.7.1 (Emergency Action Levels (EAL)) (See SER Section 13.3.4.4).

  No later than 180 days prior to initial fuel load, the licensee shall submit to the Director of NRO [NRC Office of New Reactors], or the Director's designee, a fully developed set of site-specific EALs in accordance with [Nuclear Energy Institute] NEI 07-01, Revision 0, with no deviations. The EALs shall have been discussed and agreed upon with state and local officials.

- License Condition 3.7.2 (On-Shift Staffing) (See SER Section 13.3.4.2).

  The licensee shall perform a detailed analysis of on-shift staffing, in accordance with NEI 10-05, "Assessment of On-Shift Emergency Response Organization Staffing and Capabilities," Revision 0, and the licensee shall incorporate any changes to the emergency plan (EP) needed to bring staff to the required levels, prior to or concurrent with the completion of EP ITAAC 2.0 of Table 2.3-1, and no less than 180 days prior to initial fuel load.

- License Condition 3.8.1 (Fukushima Near-Term Task Force (NTTF) Recommendations) (See SER Sections 13.3.4.2 and 13.3.4.6).

  At least two years prior to scheduled initial fuel load, the licensee shall have performed an assessment of the onsite and augmented staffing capability to satisfy the regulatory requirements for response to a multi-unit event. The staffing assessment will be performed in accordance with NEI 12-01, "Guideline for Assessing Beyond Design Basis Accident Response Staffing and Communications Capabilities," Revision 0.

  At least 180 days prior to scheduled initial fuel load, the licensee shall revise the EP to include the following:

  - Incorporation of corrective actions identified in the staffing assessment described above

  - Identification of how the augmented staff will be notified given degraded communications capabilities

  At least two years prior to scheduled initial fuel load, the licensee shall have performed an assessment of on-site and off-site communications systems and equipment required during an emergency event to ensure communications capabilities can be maintained during prolonged station blackout conditions. The communications capability assessment will be performed in accordance with NEI 12-01, "Guidance [*sic*] for

Assessing Beyond Design Basis Accident Response Staffing and Communications Capabilities," Revision 0.

At least 180 days prior to scheduled initial fuel load, the licensee shall complete implementation of corrective actions identified in the communications capability assessment described above, including any related emergency plan and implementing procedure changes and associated training.

ITAAC

The COLA Part 10 Section 2.3, "Emergency planning ITAAC," includes the proposed emergency planning ITAAC (EP ITAAC) in Table 2.3-1. The application does not include EP ITAAC from either the referenced North Anna 3 ESP SSAR or ESBWR DCD, as there are none (see STD COL 14.3-1-A in SER Section 13.3.4.18, below, with regard to the ESBWR DCD). The complete set of EP ITAAC for North Anna 3 is provided below in SER Table 13.3-1.

13.3.3 Regulatory Basis

The regulatory basis of the North Anna 3 ESP SSAR information incorporated by reference is addressed in NUREG–1835. The regulatory basis of the ESBWR DCD information incorporated by reference is addressed in NUREG–1966, April 2014 (which reflects DCD Revision 9), and in Supplement 1 to NUREG–1966, September 2014 (which reflects DCD Revision 10). The applicable regulatory requirements and guidance for EP information submitted in a COLA are as follows:

- 10 CFR 52.79(a)(21) requires that the FSAR include emergency plans that comply with the requirements of 10 CFR 50.47, "Emergency plans," and 10 CFR Part 50, Appendix E. In addition, 10 CFR 52.79(a)(22)(i) requires certifications from State and local governmental agencies with EP responsibilities. The staff also considered the applicable requirements in 10 CFR 50.33(g), 10 CFR 50.72, "Immediate notification requirements for operating nuclear power reactors," 10 CFR 52.79(b)(4), 10 CFR 52.80, "Contents of applications; additional technical information," 10 CFR 52.83, "Finality of referenced NRC approvals; partial initial decision on site suitability," and 10 CFR 100.21, "Non-seismic siting criteria."

- SRP identifies NUREG–0654 and other related guidance that the staff should considered during its review. The related acceptance criteria are identified in Section II, "Acceptance Criteria," SRP, Section 13.3, and the applicable regulatory guidance for reviewing emergency preparedness as an operational program is established in SRP, Section 13.4, "Operational Programs." In addition, the staff considered NUREG/CR-7002, "Criteria for Development of Evacuation Time Estimate Studies," November 2011, NUREG/CR-6863, "Development of Evacuation Time Estimate Studies for Nuclear Power Plants," January 2005; and (NRC Office of Nuclear Security and Incident Response/Division of Preparedness and Response (NSIR/DPR) Interim Staff Guidance (ISG) NSIR/DPR-ISG-01, Revision 0, "Emergency Planning for Nuclear Power Plants," November 2011 (ADAMS Accession No. ML113010523). NSIR/DPR-ISG-01 provides updated guidance based on changes to EP regulations in 10 CFR 50.47 and

10 CFR Part 50, Appendix E, which were published as a Final Rule in the *Federal Register* on November 23, 2011 (76 FR 72560)).

- 44 CFR Part 350, “Review and Approval of State and Local Radiological Emergency Plans and Preparedness,” and 44 CFR Part 352, “Commercial Nuclear Power Plants: Emergency Preparedness Planning,” provide procedures for the review and evaluation of the adequacy of offsite radiological emergency planning and preparedness. In addition, FEMA considered NUREG–0654 (FEMA-REP-1), the Radiological Emergency Preparedness (REP) Program Manual, current FEMA guidance documents, and established industry practices. Pursuant to 44 CFR Part 353, “Fee for Services in Support, Review, and Approval of State and Local Government or Licensee Radiological Emergency Plans and Preparedness,” Appendix A, “Memorandum of Understanding Between NRC and FEMA Relating to Radiological Emergency Planning and Preparedness” (58 FR 47996, September 14, 1993), FEMA provided its findings and determinations on offsite planning and preparedness to the NRC for its use in the licensing process.

13.3.4 Technical Evaluation

As documented in NUREG–1966, the staff reviewed and approved Section 13.3 of the certified ESBWR DCD, Revision 10. The staff reviewed Section 13.3 of the North Anna 3 COL FSAR, Revision 8, and checked the referenced ESBWR DCD to ensure that the combination of the information in the COL FSAR and the information in the ESBWR DCD appropriately represents the complete scope of information relating to this review topic.[1] The staff's review confirms that the information contained in the application and the information incorporated by reference address the relevant information related to this Section. The staff reviewed the information in the North Anna 3 COLA, including FSAR, Revision 8, Section 13.3, “Emergency Planning,” and the certified ESBWR DCD, Revision 10 and the North Anna 3 ESP SSAR, for conformance with the applicable standards and requirements identified in SRP, Sections 13.3 and 14.3.10, and confirmed that the COLA addresses the required information relating to emergency planning.

The staff reviewed general and administrative information in COLA Part 1, COLA Part 2 (FSAR), the North Anna 3 Emergency Plan (COL Plan) in COLA Part 5, the Departure Report in COLA Part 7, and EP ITAAC and proposed license conditions in COLA Part 10. The complete set of EP ITAAC for North Anna 3 is provided below in SER Table 13.3-1, and various EP ITAAC are discussed throughout this SER Section. EP ITAAC are also addressed below in SER Section 13.3.4.18, which includes resolution of STD COL 14.3-1-A.

In addition, the staff reviewed selected portions of the RERPs for the State of Maryland and the Commonwealth of Virginia, including the Virginia counties of Caroline, Hanover, Louisa, Orange, and Spotsylvania, for understanding and content, in relation to consistency with various Sections of the COL Plan that address offsite support and resources (e.g., see SER Section 13.3.4.3). The staff also conducted three site area visits to the North Anna 3 on December 8, 2003, August 16, 2006, and April 16, 2008, consisting of a review of existing onsite emergency response facilities (ERF) and the various areas within and beyond the 16-km (10-mi) plume exposure pathway emergency planning zone (EPZ).

In COLA Part 1, the applicant referenced ESP-003, and in FSAR Section 1.1.1.9, incorporated Revision 9 of the SSAR from the North Anna ESP application. SSAR Section 13.3, "Emergency Planning," describes the "major features" of the emergency plan for the proposed North Anna 3 (hereinafter referred to as the "ESP Plan"), submitted by the ESP applicant (Dominion Nuclear North Anna, LLC) for the North Anna ESP site pursuant to 10 CFR 52.17(b)(2)(i). The NRC issued ESP-003 to the ESP applicant on November 27, 2007, pursuant to 10 CFR 52.24, "Issuance of Early Site Permit." The emergency planning information in the COLA supplements what was submitted in the ESP application. Consistent with 10 CFR 52.83, the staff's review of the COLA was limited by the scope and nature of the matters resolved in the staff's previous evaluation of the North Anna 3 ESP application. Without re-evaluating the matters resolved during the ESP review, the staff's review of the COLA considered Section 13.3 of the ESP SSAR and the associated NRC findings in NUREG–1835.

The staff's and FEMA's previous technical review of the ESP Plan, together with the review of the COL Plan, addressed all of the relevant evaluation criteria in the 16 planning standards of NUREG–0654 in a way consistent with SRP, Section 13.3, which cites the applicable regulations. As stated above, the proposed North Anna 3 boundary is entirely within the existing North Anna site exclusion area boundary, so that for purposes of EP, little distinction exists between the North Anna site (for the existing reactor units) and the proposed new North Anna 3. The COLA takes advantage of the EP resources, capabilities, and organization that currently exist at the North Anna site. SRP, Section 13.3, Section I, "Areas of Review," provides, in part, this guidance to the staff regarding the appropriate level of review:

> In general, if an application is for an additional reactor at an operating reactor site, and the application proposes to incorporate and extend elements of the existing emergency planning program to the new reactor (including by reference), those existing elements should be considered acceptable and adequate. The reviewer will generally focus the review on the extension of the existing program to the new reactor, and will determine whether the incorporated emergency planning program information from the existing reactor site (1) is applicable to the proposed reactor, (2) is up-to-date when the application is submitted, and (3) reflects use of the site for construction of a new reactor (or reactors) and appropriately incorporates the new reactor(s) into the existing plan.

To be consistent with this guidance, the staff focused its review on the extension of the existing North Anna site emergency preparedness program to the new unit, and considered those elements of the existing program that are unchanged in their applicability to the new unit, as acceptable and adequate.

The FSAR Section 1.1.1.7 incorporates by reference Revision 10 of the ESBWR DCD, and FSAR Section 13.3 references ESBWR DCD, Section 13.3, "Emergency Planning." COLA Part 5 provides the North Anna 3 onsite emergency plan (COL Plan), which consists of a basic plan and eight appendices (see SER Section 13.3.2, above). The basic plan follows the format of NUREG–0654, and provides detailed information about each of the 16 planning standards and associated evaluation criteria in NUREG–0654. In addition, COL Plan Section I.C, "Planning Basis and Emergency Planning Zones," states that the EPZs for the new unit are based on the guidance in NUREG–0654. As shown in COL Plan Figure I-1, the North Anna site plume exposure pathway EPZ for the North Anna site is an area surrounding the plant within a radius of approximately 16 km (10 mi). COL Plan Figure I-2 shows the North Anna site ingestion exposure pathway EPZ, which is an area surrounding the North Anna site within a radius of approximately 80 km (50 mi). The existing 16-km and 80-km (10-mi and 50-mi) EPZs for the North Anna site are used for the new unit, and the descriptions of the EPZs in ESP SSAR Section 13.3.2.2.1, “Emergency Planning Zones,” are incorporated by reference into the COLA, and are addressed in Section 13.3.3.1, “Emergency Planning Zones,” of NUREG–1835.

The SER Sections 13.3.4.1 through 13.3.4.19 describe the staff’s technical evaluation of the information provided in the COL Plan, and the review and findings in this SER apply only to the proposed new unit. Any changes to the operating North Anna Units 1 and 2 Emergency Plan would be addressed as separate licensing actions, in accordance with 10 CFR 50.54(q). The section designations of the COL Plan generally correspond to the 16 planning standard designations in NUREG–0654, Section II; specifically, COL Plan Sections II.A through II.P address NUREG–0654, “Planning Standards and Evaluation Criteria,” A through P, respectively. The format of the staff’s review of the COL Plan is patterned after these 16 planning standards, which reflect the requirements (“standards”) in 10 CFR 50.47(b)(1) through 10 CFR 50.47(b)(16). 10 CFR Part 50, Appendix E provides additional requirements that duplicate and supplement the evaluation criteria associated with the planning standards. The staff’s evaluation of the various aspects of 10 CFR Part 50, Appendix E is included within the associated NUREG–0654 planning standards review.

13.3.4.1 Assignment of Responsibility (Organization Control)

As stated in NUREG–0654, Section II, Planning Standard A, “Assignment of Responsibility (Organization Control),” 10 CFR 50.47(b)(1) requires that primary responsibilities for emergency response by the nuclear facility licensee and by State and local organizations within the EPZs have been assigned, the emergency responsibilities of the various supporting organizations have been specifically established, and each principal response organization has staff to respond and to augment its initial response on a continuous basis. In addition, 10 CFR Part 50, Appendix E, Section III requires that the emergency plans incorporate information about the emergency response roles of supporting organizations and offsite agencies, and that the incorporated information shall be sufficient to provide assurance of coordination among the supporting groups and with the licensee. 10 CFR Part 50, Appendix E, Section IV.A requires a description of the local offsite services to be provided in support of the licensee’s emergency organization; identification of, and a description of the assistance expected from, appropriate local, State, and Federal agencies with responsibilities for coping with emergencies, including hostile action at the site; and identification of the State and/or local officials responsible for planning for, ordering, and controlling appropriate protective actions, including evacuations when necessary. In addition, 10 CFR 52.79(a)(22)(i) requires the COL applicant to obtain emergency plan certifications from the State and local governmental agencies with EP responsibilities, which state that (1) the proposed emergency plans are practicable; (2) these agencies are committed to participating in any further development of the plans, including any required field demonstrations; and (3) these agencies are committed to executing their responsibilities under the plans in the event of an emergency.

In COL Plan Section II.A, “Assignment of Responsibility (Organization Control),” the applicant described the responsibilities of the applicant and of various local, State, and Federal agencies, as well as private sector organizations, that are part of the emergency response organization

(ERO) for the North Anna site and may be required to respond to an emergency at the North Anna site. The staff reviewed this Section, as well as other relevant portions of the application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff's primary focus was to evaluate the emergency plan against NUREG–0654, Planning Standard A, which provides the detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(1).

In COL Plan Section II.A, the applicant incorporated by reference Sections 13.3.2.2.2.a and 13.3.2.2.2.b.1 of the ESP Plan, with regard to the description of participating organizations, and the interfaces between and among the onsite and offsite functional areas of emergency response. ESP Plan Section 13.3.2.2.2.a.6 references letters of agreement with various offsite agencies and supporting organizations that are in Appendix 10.1, "Letters of Agreement," of the (Units 1 and 2) North Anna Emergency Plan (hereinafter referred to as "NAEP"), Revision 28, July 1, 2003 (not publicly available). Dominion also provided copies of these letters of agreement in support of the ESP application, which include an acknowledgement by each agency that its existing arrangements would apply to prospective additional reactors at the North Anna site. In Sections 13.3.2 and 13.3.3.2 of NUREG–1835, the staff found that this information was acceptable.

COL Plan Section II.A.3, "Written Agreements," it states that Appendix 7 (in the North Anna 3 COLA Part 5) provides a copy of the certification letter established between Dominion and the Commonwealth of Virginia and risk jurisdiction government agencies and private sector organizations committed to supporting further development and implementation of the COL Plan. The applicant also stated that no certification letters are required for many Federal agencies because their responsibilities are established in the U.S. Department of Homeland Security, "National Response Framework" (January 2008). The staff reviewed the certification letter, dated June 11, 2010, and finds it acceptable because it adequately addresses the requirements in 10 CFR 52.79(a)(22)(i), described above, in support of a new reactor at the North Anna site. Further, the 16 agencies and organizations represented in the certification letter are the same agencies and organizations represented in the letters of agreement provided by Dominion in support of the ESP application. The certification letter and letters of agreement are discussed further in SER Sections 13.3.4.3 and 13.3.4.16.

Dominion provided additional information in COL Plan Section II.A that addresses the concept of operations for the onsite organization and ERFs; the relationships with local, State, and Federal agencies; and coordination of emergency response actions taken at North Anna 3 with Units 1 and 2. The Emergency Coordinator is responsible for making notifications and subsequent communications with Units 1 and 2 staff, in order to provide for coordination of activities between onsite ERFs. Figure II-1, "Emergency Response Organization Interrelationships," provides a block diagram that illustrates the interrelationships among the station and offsite EROs. Emergency response support from offsite organizations and agencies, including expected assistance associated with hostile action at the North Anna site, is further described in COL Plan Section II.C, and addressed below in SER Sections 13.3.4.3 and 13.3.4.16.

The COL Plan Section II.A also addresses the coordination of North Anna 3 emergency response actions with other reactor sites serviced by the Central EOF (discussed below in SER

Section 13.3.4.8). In the unlikely event that the Central EOF is activated for emergencies that are declared at North Anna 3 simultaneously with another reactor site it services, the EOF Director is responsible for discharging the duties described in the COL Plan, as well as in the other affected site's emergency plan. Section II.A.1.b lists the following actions that Dominion is responsible for taking during an emergency condition:

- Assess plant conditions
- Classify emergency conditions
- Notify affected agencies of emergency conditions
- Provide technical expertise to affected agencies
- Provide support for offsite assessment and protective activities
- Make protective action recommendations (PARs)
- Mitigate the consequences of adverse plant conditions by monitoring and controlling plant parameters
- Request assistance from off-site agencies, as needed
- Provide support to affected agencies for communications with the affected public
- Terminate emergency conditions

In COL Plan Section II.A.1, Dominion stated that normal operations at North Anna 3 are conducted under the authority of the Shift Manager and directed from the North Anna 3 Control Room. Using approved operating procedures, including the EALs provided in implementing procedures, the Shift Manager determines if an emergency condition exists and, if so, the proper emergency classification. (EALs are discussed below in SER Section 13.3.4.4.) Based on this classification and plant conditions, the Shift Manager (or Unit Supervisor) assumes the role of the Emergency Coordinator, makes or directs initial notifications to affected plant staff and Commonwealth of Virginia, risk jurisdiction, and Federal authorities, and determines if activation of the Dominion ERFs is desirable or required. The OSC, which provides an operational center to provide support to the TSC and Control Room, dispatches assessment and repair teams as directed by the Emergency Coordinator, and provides operational information, radiological assessment, and manpower for in-plant functions. Table II-1, "Responsibility for Emergency Response Functions," summarizes the responsibilities and activities of the ERFs under the four emergency classifications (i.e., notification of unusual event, alert, site area emergency, and general emergency). ERFs are discussed below in SER Section 13.3.4.8.

Upon declaration of an emergency, the Emergency Coordinator is in charge of the emergency response for the facility, including directing the activities of the plant staff in performing initial assessment, corrective, and protective functions. If required by the emergency classification, or deemed appropriate by the Emergency Coordinator, emergency response personnel are notified and instructed to report to their emergency response locations. (Notification methods and procedures are discussed below in SER Section 13.3.4.5.) Following activation of the ERFs and receipt of an adequate turnover, the Site Vice President, or other designated member of the station management staff, relieves the Shift Manager of Emergency Coordinator responsibilities and directs the activities of the onsite ERO from the TSC.

If the EOF is activated, it is staffed by Dominion personnel, including the EOF Director, who directs the activities of this facility and assumes responsibility for the licensee's offsite emergency response efforts, coordinates the availability and utilization of corporate and external resources, and manages recovery efforts. The EOF may be activated concurrently with the TSC, and is always activated upon declaration of a Site Area Emergency or General Emergency. The senior Dominion representative is responsible for ensuring the EOF communicates emergency status to the Commonwealth of Virginia and risk jurisdiction governments, directs the efforts of the offsite monitoring teams, makes radiological assessments, recommends offsite protective measures to the Commonwealth of Virginia, and arranges through the company for the dispatch of any special assistance or services requested by the station. The Director Nuclear Protection Services and Emergency Preparedness reports to Dominion's senior nuclear executive, who is responsible for the total execution of the radiological emergency response effort at Dominion's fleet of nuclear power plants.

The COL Plan Sections II.A.1.e and II.A.4 state that Dominion maintains the capability for a 24-hour response, including staffing of communication links, and for continuous operations through training of multiple responders for key emergency response positions, consistent with the staffing requirements of COL Plan Section II.B.5, "Plant Emergency Response Staff," and the training requirements of Section II.O, "Radiological Emergency Response Training." The Emergency Coordinator bears responsibility for ensuring continuity of technical, administrative, and material resources during emergency operations.

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and the associated evaluation criteria in NUREG–0654.

The staff finds that the applicant has adequately assigned primary responsibilities for emergency response, and the applicant has the staff to respond to and to augment its initial response on a continuous basis. The applicant is capable of providing 24-hour-per-day emergency response and staffing of communications links, including continuous (24-hour) operations for a protracted period. In addition, the applicant identified the appropriate organizations that are intended to be part of the overall response organization, and has established the emergency responsibilities of the various supporting organizations, including providing adequate written agreements. The applicant has specified the concept of operations and its relationship to the total effort, illustrated the interrelationships in a block diagram, and has identified the individuals in charge of the emergency response and for ensuring continuity of resources.

In addition, the staff finds that the applicant has incorporated information about the emergency response roles of supporting organizations and offsite agencies, and that information is sufficient to provide assurance of coordination among the supporting groups and with the licensee. Further, the applicant has described the local offsite services to be provided in support of the licensee's emergency organization, and has identified the assistance expected from appropriate local, State, and Federal agencies, including State and/or local officials responsible for planning for, ordering, and controlling appropriate protective actions.

Conclusion

The staff concludes that the information provided in the COLA is consistent with the guidelines in NUREG–0654, Planning Standard A. Therefore, the staff finds that the information is acceptable and meets the relevant requirements of 10 CFR 50.47(b)(1), 10 CFR Part 50, Appendix E, Sections III and IV.A, and 10 CFR 52.79(a)(22)(i), insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.2 Onsite Emergency Organization

As stated in NUREG–0654, Section II, Planning Standard B, "Onsite Emergency Organization," 10 CFR 50.47(b)(2) requires that on-shift facility licensee responsibilities for emergency response are unambiguously defined, adequate staffing to provide initial facility accident response in key functional areas is maintained at all times, timely augmentation of response capabilities is available, and interfaces among various onsite response activities and offsite support and response activities are specified. In addition, 10 CFR Part 50, Appendix E, Section IV.A requires a description of the organization for coping with radiological emergencies, including definition of authorities, responsibilities, and duties of individuals assigned to the licensee's emergency organization, and the means for notification of such individuals in the event of an emergency. This shall include a description of the normal plant operating organization, onsite ERO, headquarters personnel who will augment the onsite emergency organization, and local offsite services to be provided in support of the licensee's emergency organization. The emergency plan shall identify persons within the licensee organization who will be responsible for making offsite dose projections, and other employees with special qualifications for coping with emergency conditions that may arise. Other persons with special qualifications, who are not licensee employees and who may be called upon for assistance, shall also be identified, including a description of their special qualifications. 10 CFR Part 50, Appendix E, Section IV.A.9 requires a detailed analysis demonstrating that on-shift personnel assigned emergency plan implementation functions are not assigned responsibilities that would prevent the timely performance of their assigned functions, as specified in the emergency plan.

In COL Plan Section II.B, "Onsite Emergency Organization," the applicant described the organizational structure that would be available to respond to an emergency at the North Anna site. The staff reviewed this section, as well as other relevant portions of the application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff's primary focus was to evaluate the emergency plan against NUREG–0654, Planning Standard B, which provides the detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(2).

In COL Plan Section II.B, the applicant incorporated by reference Section 13.3.2.2.2.b of the ESP Plan, with regard to interfaces among various onsite response activities, and the identification of offsite support and response activities. In Section 13.3.3 of NUREG–1835, the staff found this information was acceptable. In addition, COL Plan Section II.B states that Figure II-2, "North Anna 3 Emergency Response Organization On-Site," illustrates the onsite ERO and that upon the declaration of an emergency, designated members of the normal staff complement fulfill corresponding roles within the ERO. Station administrative procedures provide the details of the normal station organization, including reporting relationships, and emergency plan implementing procedures (EPIP) provide details regarding ERO position functions. The minimum staff required to conduct routine and immediate emergency operations is maintained at the station, consistent with 10 CFR 50.54(m) and the emergency plan. Staffing is further described in FSAR Section 13.1, "Organizational Structure of Applicant."

The Shift Manager/Unit Supervisor position is continuously staffed, consistent with 10 CFR 50.54(m). Upon recognition of an emergency condition, the individual filling this position assumes the duties of the Emergency Coordinator until relieved by a qualified member of the management staff or until termination of the emergency condition, whichever comes first. The Emergency Coordinator has the responsibility and authority to initiate emergency actions necessary to protect the life, health, and safety of the plant staff, and to initiate any required emergency response actions, including notification of affected Federal, Commonwealth of Virginia, and risk jurisdiction authorities and provision of PARs to offsite authorities. The non-delegable responsibilities of the Emergency Coordinator are listed in COL Plan Section II.B.4, and include classifying the emergency, authorizing offsite notifications, recommending protective measures, and authorizing emergency exposure limits. With the staffing of the ERO, the EOF Director relieves the Emergency Coordinator of responsibility for notifying and coordinating with offsite authorities.

If the Shift Manager is rendered unable to fulfill the duties and responsibilities of the Emergency Coordinator position, the Unit Supervisor or an on-shift Reactor Operator assumes the Emergency Coordinator position until relieved by a qualified member of the management staff. Figure II-1 illustrates the interfaces between and among the onsite functional areas of emergency response activity, Dominion EOF support, the affected Commonwealth of Virginia and risk jurisdiction government response organizations, the NRC, and other offsite organizations.

The staff finds that the applicant has adequately designated an individual as the Emergency Coordinator who has the authority and responsibility to initiate emergency actions, including recommending protective actions to the authorities responsible for implementing offsite emergency measures. The staff also finds that the applicant clearly specified which responsibilities may not be delegated to other elements of the emergency organization, and has identified an adequate line of succession for the Emergency Coordinator position.

In COL Plan Section II.B.5, "Plant Emergency Response Staff," the applicant stated that Dominion will establish minimum emergency response staffing consistent with Table II-2, "Plant Staff Emergency Functions," which has been based on the guidance in Table B-1, "Minimum Staffing Requirements for NRC Licensees for Nuclear Power Plant Emergencies," of NUREG–0654. Figure II-2 illustrates the plant staff emergency organization. Upon declaration of an emergency, members of the plant staff assume positions in the ERO consistent with their training and management assignments, and provide for the key functions of accident assessment, radiological monitoring and analysis, security, fire-fighting, first aid and rescue, and communications. Figure II-3, "North Anna 3 Augmented Emergency Response Organization," illustrates the augmented plant staff ERO. The ERO, when fully activated, includes the positions described in Table II-2. Additional personnel may be designated as emergency responders providing special expertise deemed beneficial, but not mandatory, to the planned response. The individuals assigned as responders for the emergency positions are designated based on the technical requirements of the position. COL Plan Appendix 5 lists an EPIP entitled "Activation of the Emergency Response Organization." The staff reviewed Table II.2, as well as the comparable North Anna Units 1 and 2 Table 5.1, "Minimum Staffing Requirements for Emergencies," of the NAEP, Revision 40, December 10, 2013 (not publicly available), and finds that the required minimum on-shift and augmentation staffing in support of North Anna 3 is acceptable because it is consistent with Table B-1 of NUREG–0654.

The COL Plan Section II.B.7, "Corporate Support for the Plant Staff," states that upon declaration of an Alert, Site Area Emergency, or General Emergency, the Emergency Coordinator directs the activation and notification of the onsite and offsite ERFs. Dominion management, technical, and administrative personnel staff the EOF and provide (or coordinate) augmented support for the plant staff. The Dominion corporate staff provides management, technical, and administrative support as needed to support the plant staff and to relieve the plant staff of external coordination responsibilities, including notification of and coordination with offsite authorities and release of information to the media. In addition to the activities identified in Table II-2, Dominion corporate staff provides logistical support for plant personnel; technical support for planning and recovery/re-entry operations; management-level interface with governmental authorities; and coordination with, and the release of information to, the news media.

ERO augmentation is also addressed in BL 2005-02, which requested in part that all holders of operating licenses provide information regarding ERO augmentation for security-based events. DCD COL Item 1C.1-2-A requires the COL applicant to address the security-related requirements of BL 2005-02, and is addressed below in SER Section 13.3.4.18. As discussed below in SER Section 13.3.4.8, COL Plan Section II.H.4 states in part that in the event the site is under threat of, or experiencing hostile action, the Louisa Fire Training Center functions as a staging area for augmentation of emergency response staff. Specific aspects of BL 2005-02 are also addressed below in SER Sections 13.3.4.4, 13.3.4.5, 13.3.4.10, and 13.3.4.14.

The Institute of Nuclear Power Operations (INPO), when notified of an emergency situation, will serve as a clearinghouse for industry wide support and provide requested emergency response technical assistance, including emergency manpower and equipment. Dominion may request that the reactor vendor, GEH, provide technical support for emergency response activities. GEH will operate primarily from its corporate offices, with a small contingent at the plant if requested. If required at the time of the event, additional resources can be obtained through purchase agreements with the supporting institutions. These agreements would be negotiated on an as-needed basis. In addition, Dominion has established and will maintain agreements for risk jurisdiction emergency response support services, including firefighting, rescue squad, and medical and hospital services. COL Plan Section II.L describes the arrangements for medical support services, including hospital and ambulance support, and is addressed below in SER Section 13.3.4.12. COL Plan Appendix 7 provides the certification letter for organizations providing these services. (Emergency response support and resources are further described below in SER Section 13.3.4.3.)

Fukushima Dai-ichi – NTTF Recommendation 9.3

On March 12, 2012, the NRC requested additional information from all power reactor licensees and holders of construction permits, associated with the NRC NTTF review of the accident at the Fukushima Dai-ichi nuclear facility (ADAMS Accession No. ML12053A340). In Recommendation 9.3, the NTTF addressed staffing and communications provisions for enhancing emergency preparedness. On January 23, 2013, the NRC issued a follow-up letter (ADAMS Accession No. ML13010A162), which identified generic technical issues that need to be addressed as part of the Recommendation 9.3 communications capability assessment.

With regard to staffing, the accident at Fukushima highlighted the need to determine and implement the required staff to fill all necessary positions responding to a multi-unit event. Specifically, NTTF Recommendation 9.3 requests that all power reactor licensees and holders of construction permits (in active or deferred status) assess their current staffing levels and determine the appropriate staff to fill all necessary positions for responding to a multi-unit event during a beyond design basis natural event, and determine if any enhancements are appropriate. Single unit sites should provide the requested information, as it pertains to an extended loss of all alternating current (AC) power and impeded access to the site. (Emergency communications are addressed in Section 13.3.4.6 of this report.)

In COLA Part 10 the applicant proposed License Condition 3.8.1 (Fukushima Near-Term Task Force (NTTF) Recommendations), which addresses both the staffing and communications areas addressed in NTTF Recommendation 9.3. The staff reviewed License Condition 3.8.1, and, with the exception of the timeframes for completion and submission of the staffing and communications capability assessments, finds that it is acceptable because it is consistent with NTTF Recommendation 9.3 and reflects the use of NEI technical report NEI 12-01, which the NRC has endorsed as an acceptable method for licensees to employ when addressing NTTF Recommendation 9.3.[4]

The staff proposes a similar timeframe for completion of the assessments, which is based on the latest date set forth in the schedule for completing the inspections, tests, and analyses in the ITAAC submitted in accordance with 10 CFR 52.99(a). In addition, the staff proposes a similar timeframe for submission of the assessments to the NRC, which is based on the date scheduled for initial fuel load set forth in the notification submitted in accordance with 10 CFR 52.103(a). Therefore, consistent with the applicant's proposed License Condition 3.8.1, the staff identified the following License Conditions 1 and 2, which address enhanced staffing and communications capabilities, respectively, and include the staff's proposed timeframes for completion of the assessments and their submission to the NRC.

---

[4] See (1) NRC May 15, 2012, letter, 'U.S. Nuclear Regulatory Commission Review of NEI 12-01, "Guideline for Assessing Beyond Design Basis Accident Response Staffing and Communications Capabilities," Revision 0, dated May 2012' (ADAMS Accession No. ML12131A043); (2) NEI May 3, 2012, letter, 'Transmittal of NEI 12-01, "Guideline for Assessing Beyond Design Basis Accident Response Staffing and Communications Capabilities," Revision 0, dated May 2012' (ADAMS Accession No. ML12125A411); and (3) NEI Report No. 12-01, Revision 0, "Guideline for Assessing Beyond Design Basis Accident Response Staffing and Communications Capabilities," May 2012 (ADAMS Accession No. ML12125A412).

License Conditions 1 and 2

1. No later than 2 years before the latest date set forth in the schedule submitted in accordance with 10 CFR 52.99(a) for completing the inspections, tests, and analyses in the ITAAC, the licensee shall have performed an assessment of on-site and augmented staffing capability for responding to a multi-unit event. The staffing assessment shall be performed in accordance with NEI 12-01, "Guidance for Assessing Beyond Design Basis Accident Response Staffing and Communications Capabilities." At least one hundred eighty (180) days before the date scheduled for initial fuel loading, as set forth in the notification submitted in accordance with 10 CFR 52.103(a), the licensee shall complete implementation of corrective actions identified in the staffing assessment described above, and identify how the augmented staff will be notified given degraded communications capabilities, including any related emergency plan and implementing procedure changes and associated training.

2. No later than 2 years before the latest date set forth in the schedule submitted in accordance with 10 CFR 52.99(a) for completing the inspections, tests, and analyses in the ITAAC, the licensee shall have performed an assessment of on-site and off-site communications systems and equipment relied upon during an emergency event to ensure communications capabilities can be maintained during an extended loss of ac power. The communication capability assessment shall be performed in accordance with NEI 12-01, "Guidance for Assessing Beyond Design Basis Accident Response Staffing and Communications Capabilities." At least one hundred eighty (180) days before the date scheduled for initial fuel loading, as set forth in the notification submitted in accordance with 10 CFR 52.103(a), the licensee shall complete implementation of corrective actions identified in the communications capability assessment described above, including any related emergency plan and implementing procedure changes and associated training.

Enhancements to Emergency Preparedness Regulations

In addition to appropriate staffing levels associated with multi-unit events (discussed above), on November 23, 2011, the NRC published a Final Rule, "Enhancements to Emergency Preparedness Regulations" (hereinafter referred to as "Final Rule"), which included a new requirement in 10 CFR Part 50, Appendix E, Section IV.A associated with on-shift ERO personnel. Specifically, 10 CFR Part 50, Appendix E, Section IV.A.9 requires that for nuclear power reactor licensees, by December 24, 2012, a detailed analysis must be performed to demonstrate that on-shift personnel assigned emergency plan implementation functions are not assigned responsibilities that would prevent the timely performance of their assigned functions, as specified in the emergency plan.

As part of the issuance of the Final Rule, NRC issued associated guidance in Interim Staff Guidance NSIR/DPR-ISG-01. In Section IV.C, "On-Shift Staffing Analysis," of NSIR/DPR-ISG-01, NRC endorsed NEI technical report NEI 10-05, Revision 0, dated June 2011 (ADAMS Accession No. ML111751698) stating in part that NEI 10-05 establishes a standard methodology for a licensee to perform the required staffing analysis (in 10 CFR Part 50, Appendix E, Section IV.A.9), and that the NRC has reviewed NEI 10-05 and found it to be an acceptable methodology for this purpose.

In COLA Part 10, the applicant proposed License Condition 3.7.2, “On-Shift Staffing,” which addresses the requirements in 10 CFR Part 50, Appendix E, Section IV.A.9 for a detailed on-shift staffing analysis associated with the emergency plan. The staff reviewed License Condition 3.7.2, and, with the exception of the timeframe for submission of the on-shift staffing analysis and changes to the emergency plan, finds that it is acceptable because it is consistent with the Final Rule and NSIR/DPR-ISG-01. The NRC endorsed guidance included in NEI 10-05 is addressed in NSIR/DPR-ISG-01, Section IV.C, “On-Shift Staffing Analysis,” which states, in part, that NEI 10-05 establishes a standard methodology for a licensee to perform the required staffing analysis, and that the NRC has reviewed NEI 10-05 and finds it an acceptable methodology for this purpose.

The staff proposes 2-year timeframe for completion of the on-shift staffing analysis, which is similar to that proposed for completion of the on-site and augmented staffing capability assessment addressed in proposed License Condition 1, above. The staff also proposes a similar timeframe for submission of the on-shift staffing analysis to the NRC, which is based on the date scheduled for initial fuel load set forth in the notification submitted in accordance with 10 CFR 52.103(a). In addition, the staff has eliminated the applicant’s proposed link between ITAAC 2.0 and incorporation of any needed changes to the emergency plan, because it is unnecessary. Therefore, consistent with the applicant’s proposed License Condition 3.7.2, the staff identified the following License Condition 3, which addresses an analysis of on-shift personnel assigned emergency plan implementation functions, and includes the staff’s proposed timeframes for completion of the on-shift staffing analysis, and submission to the NRC.

License Condition 3

3. No later than 2 years before the latest date set forth in the schedule submitted in accordance with 10 CFR 52.99(a) for completing the inspections, tests, and analyses in the ITAAC, the licensee shall have performed an assessment of on-shift staffing in accordance with NEI 10-05, “Assessment of On-Shift Emergency Response Organization Staffing and Capabilities.” At least one hundred eighty (180) days before the date scheduled for initial fuel loading, as set forth in the notification submitted in accordance with 10 CFR 52.103(a), the licensee shall incorporate any changes to the emergency plan needed to bring staffing to the required levels.

Subject to License Conditions 1, 2, and 3, the staff finds that the applicant sufficiently defined its responsibilities for emergency response, has adequate staffing to provide and maintain at all times initial facility accident response in key functional areas, and is capable of timely augmentation of the response capabilities. In addition, the applicant adequately specified the interfaces among various onsite and offsite support and response activities. In addition, the applicant described the organization for coping with radiological emergencies, including the authorities, responsibilities, and duties of individuals assigned to the licensee’s emergency organization and the means for their notification in the event of an emergency. The applicant also described the normal plant operating organization, the onsite ERO, and the headquarters and local offsite personnel and services that will augment and support the onsite organization. Further, licensee employees who are responsible for making offsite dose projections, and licensee and other persons with special qualifications for coping with emergency conditions, are also identified.

Conclusion

Subject to License Conditions 1, 2, and 3, the staff concludes that the information provided in the COLA is consistent with the guidelines in NUREG–0654, Planning Standard B and NSIR/DPR-ISG-01, Section IV.C. Therefore, the staff finds that the information is acceptable and meets the relevant requirements of 10 CFR 50.47(b)(2) and 10 CFR Part 50, Appendix E, Section IV.A, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.3 Emergency Response Support and Resources

As stated in NUREG–0654, Planning Standard C, "Emergency Response Support and Resources," 10 CFR 50.47(b)(3) requires that arrangements for requesting and effectively using assistance resources have been made, arrangements to accommodate State and local staff at the licensee EOF have been made, and other organizations capable of augmenting the planned response have been identified. In addition, 10 CFR Part 50, Appendix E, Section III requires that the emergency plans incorporate information about the emergency response roles of supporting organizations and offsite agencies, and that that information shall be sufficient to provide assurance of coordination among the supporting groups and with the licensee. 10 CFR Part 50, Appendix E, Section IV.A.7 requires identification of, and a description of the assistance expected from, appropriate local, State, and Federal agencies with responsibilities for coping with emergencies, including hostile action at the site.

In COL Plan Section II.C, "Emergency Response Support and Resources," the applicant addressed the responsibilities and concepts of operations for the various organizations that would support the North Anna site, including North Anna 3, in an emergency. The staff reviewed this section, as well as other relevant portions of the application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff's primary focus was to evaluate the emergency plan against NUREG–0654, Planning Standard C, which provides the detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(3).

In COL Plan Section II.C, the applicant incorporated by reference Section 13.3.2.2.2.c of the ESP Plan, with regard to arrangements for emergency response support and resources. In Section 13.3.3.4 of NUREG–1835, the staff found this information was acceptable. The applicant provided additional information in COL Plan Section II.C, including identifying the Emergency Coordinator/EOF Director as the person who may request Federal Radiological Monitoring and Assessment Center (FRMAC) assistance through the NRC. Dominion estimates that a FRMAC Advance Party could be expected at the site within 6 to 14 hours following the order to deploy, based on the availability of airports near the North Anna site,[5] and expects NRC

[5] U.S. Department of Energy (DOE) Radiation Emergency Assistance Center/Training Site (REAC/TS) staff is available 24 hours a day, 7 days a week, to deploy and provide emergency medical consultation for incidents involving radiation anywhere in the world. REAC/TS provides direct support for the National Nuclear Security

assistance from NRC's offices in Atlanta, Georgia will arrive in the (North Anna) site vicinity within 7 to 8 hours following notification. (The DOE FRMAC Operations Plan is addressed below in SER Section 13.3.4.16.) Dominion provides facilities and resources needed to support the Federal response at the TSC and EOF. Dominion does not expect risk jurisdiction representatives to be present at the EOF. A VDEM State On-Scene Coordinator serves as the Commonwealth's representative to provide interface between the utility and the Commonwealth of Virginia and risk jurisdiction governments.

The North Anna maintains fixed laboratory equipment to support sampling analysis and monitoring. The equipment includes multichannel analyzers, proportional counters, a tritium analyzer, and whole body counters; arrangements are maintained for reading thermoluminescent dosimeters. These resources are supplemented by offsite radiological laboratory facilities, listed in COL Plan Section II.C.3, "Radiological Laboratories," and ESP SSAR Section 13.3.2.2.2.c.2, which are available to support emergency response activities on a 24-hour per day basis. In addition, COL Plan Section II.C.4, "Other Supporting Organizations," states that Dominion has made arrangements to obtain additional emergency response support from the INPO Fixed Nuclear Facility Voluntary Assistance Agreement signatories and the REAC/TS.

The scope of expected support from additional agencies and organizations that can be relied upon in an emergency to provide assistance is outlined in the certification letter in COL Plan Appendix 7, and reflected in the letters of agreement that were provided in support of the ESP application. As described in SER Sections 13.3.4.1 and 13.3.4.16, the staff reviewed these letters of agreement and determined that they were broadly written; such that they could cover an expanded North Anna site use to include North Anna 3. In addition, while not specifically addressed, they could also include expected assistance associated with hostile action at the site. In order to clarify that the expected assistance from offsite agencies includes hostile action at the site, consistent with 10 CFR Part 50, Appendix E, Section IV.A.7, the staff has included this requirement in proposed License Condition 5 (addressed below in SER Section 13.3.4.16). In addition, License Condition 5 addresses updating the Units 1 and 2 letters of agreement to reflect North Anna 3.

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and the associated evaluation criteria in NUREG–0654.

Subject to License Condition 5, the staff finds that the applicant has made arrangements for requesting and effectively using assistance resources, including arrangements to accommodate State and local staff at the EOF, and has identified other organizations capable of augmenting the planned response. In addition, the applicant has made adequate provisions for incorporating the Federal response capability into its operation plan, and has identified radiological laboratories and other organizations that can be relied on in an emergency to provide assistance. The staff also finds that the emergency plans incorporate information about the emergency response roles of supporting organizations and offsite agencies, and that the information is sufficient to provide assurance of coordination among the supporting groups and

---

Administration's Office of Emergency Response and the FRMAC (source: http://orise.orau.gov/reacts/, visited March 27, 2014).

the licensee. Finally, the applicant has identified appropriate local, State, and Federal agencies with responsibilities for coping with emergencies (including hostile action at the North Anna 3 site), as well as the expected assistance from each.

Conclusion

Subject to License Condition 5, the staff concludes that the information provided in the COLA is consistent with the guidelines in NUREG–0654, Planning Standard C. Therefore, the staff finds that the information is acceptable and meets the relevant requirements of 10 CFR 50.47(b)(3) and 10 CFR Part 50, Appendix E, Sections III and IV.A.7, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.4 Emergency Classification System

As stated in NUREG–0654, Planning Standard D, "Emergency Classification System," 10 CFR 50.47(b)(4) requires that a standard emergency classification and action level scheme, the bases of which include facility system and effluent parameters, is in use by the nuclear facility licensee, and that State and local response plans call for reliance on information provided by facility licensees for determinations of minimum initial offsite response measures. In addition, 10 CFR Part 50, Appendix E, Section IV.B requires a description of the means to be used for determining the magnitude, and for continually assessing the impact, of the release of radioactive materials, including EALs that are to be used as criteria for determining the need for offsite agency notifications and participation, and when and what types of protective measures should be considered. The EALs must include hostile actions that might adversely affect the nuclear power plant. The initial EALs shall be discussed and agreed on by the applicant or licensee and State and local governmental authorities, and approved by the NRC. Thereafter, EALs shall be reviewed with State and local governmental authorities on an annual basis. 10 CFR Part 50, Appendix E, Section IV.C requires a description of EALs and emergency conditions that involve alerting or activating the total emergency organization, including communication steps to be taken under each emergency class. The emergency classes defined shall include (1) notification of unusual event, (2) alert, (3) site area emergency, and (4) general emergency. 10 CFR Part 50, Appendix E, Section IV.C.2 requires the capability to assess, classify, and declare an emergency condition within 15 minutes after the availability of indications to plant operators that an EAL has been exceeded, and to promptly declare the emergency conditions as soon as possible after the identification of the appropriate emergency classification level.

In COL Plan Section II.D, "Emergency Classification System," the applicant described the emergency classification and action level scheme used to determine the minimum response to an abnormal event at the plant. The staff reviewed this section, as well as other relevant portions of the application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff's primary focus was to evaluate the emergency plan against NUREG–0654, Planning Standard D, which provides detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(4).

In COL Plan Section II.D, the applicant incorporated by reference Section 13.3.2.2.2.d of the ESP Plan, with regard to the description of the emergency classification system. In Section 13.3.2.2.2.d, Dominion described the four emergency classes (identified above), and stated that Dominion would propose site-specific EALs in the COL application. Further, the EALs would be discussed and agreed on with the Commonwealth of Virginia and local governmental authorities, and submitted to the NRC for approval. Thereafter, they would be reviewed with the Commonwealth of Virginia and local governmental authorities on an annual basis. After initial approval, changes to these EALs and initiating criteria would be made without NRC approval only if the changes do not decrease the effectiveness of the [emergency] plans, and the revised plans continue to meet the standards of 10 CFR 50.47(b)(4) and the requirements of 10 CFR Part 50, Appendix E. In Section 13.3.3.5 of NUREG–1835, the staff found this information acceptable.

At the COL application stage, the requisite EAL information is limited and consists of four critical elements: (1) An overview of the EAL scheme, including a definition of the four emergency classification levels and general list of licensee actions; (2) a commitment to develop the remainder of the EAL scheme using a specified NRC-endorsed guidance document; (3) a proposed license condition that addresses EAL completion, agreement with State and local officials (as appropriate), and submission of the fully developed EALs to the NRC; and (4) maintaining the EALs in a document controlled by 10 CFR 50.54(q). The information associated with these critical elements provides a sufficient level of applicable detail to support the staff's reasonable assurance evaluation.

In COLA Plan Section II.D, the applicant stated that Dominion uses a standard emergency classification scheme, based on system and effluent parameters, which allows affected Commonwealth of Virginia and risk jurisdiction response organizations to determine initial offsite response measures. Section II.D also contains an overview of the EAL scheme, which includes a definition of the four emergency classes (identified above) and a general list of licensee actions for each. The description of EALs in ESP Plan Section 13.3.2.2.2.d is supplemented by Section II.D, which states that implementing procedures provide the parameter values and equipment status that are indicative of each emergency class. Once indications are available to plant operators that an EAL has been exceeded, the event is promptly assessed and classified, and the corresponding emergency classification level is declared. This declaration occurs as soon as possible, and within 15 minutes of when these indications become available. COL Plan Appendix 5 lists an EPIP entitled "Emergency Classification." In addition, the applicant proposed License Condition 3.7.1, which includes a commitment to develop an EAL scheme with fully developed site-specific EALs, in accordance with NRC-endorsed guidance document NEI 07-01, Revision 0.

The staff finds the description of the EAL scheme is acceptable because it is consistent with 10 CFR Part 50, Appendix E, Section IV.C, and addresses critical element (1). The applicant's incorporation of the fully developed site-specific EAL scheme into implementing procedures is acceptable because it ensures that the EALs are maintained in a document controlled by 10 CFR 50.54(q) (i.e., EPIPs), and therefore addresses critical element (4). With regard to critical elements (2) and (3), in COLA Part 10, the applicant proposed License Condition 3.7.1 (Emergency Action Levels (EALs)), which includes a commitment to develop an EAL scheme with fully developed site-specific EALs in accordance with NRC-endorsed guidance document NEI 07-01, Revision 0. In addition, License Condition 3.7.1 requires a discussion and agreement with State and local officials, and submission of the fully developed EALs to the NRC. The EAL scheme is also addressed in BL 2005-02, which requested in part that all holders of operating licenses provide information regarding the identification of emergency classification levels and EALs for security-based events. In NEI 07-01, Revision 0, the emergency classification scheme for security events, including hostile actions, is addressed in Section 5.9, "Hazards or Other Conditions Affecting Plant Safety EALs."

The staff reviewed License Condition 3.7.1, and with the exception of the timeframe for submission of the EALs, finds that it is acceptable because it is consistent with NEI 07-01, Revision 0. The staff proposes a similar timeframe for submission of the EALs to the NRC, which is based on the date scheduled for initial fuel load set forth in the notification submitted in accordance with 10 CFR 52.103(a). Therefore, consistent with the applicant's proposed License Condition 3.7.1, the staff identified the following License Condition 4, which includes the staff's proposed timeframe for submission of the EALs to the NRC.

License Condition 4

4. No later than one hundred eighty (180) days before the date scheduled for initial fuel load set forth in the notification submitted in accordance with 10 CFR § 52.103(a), the licensee shall submit to the Director of NRO, or the Director's designee, in writing, a fully developed set of plant-specific emergency action levels (EALs) for North Anna 3, in accordance with NEI 07-01, "Methodology for Development of Emergency Action Levels. Advanced Passive Light Water Reactors," Revision 0, with no deviations. The EALs shall have been discussed and agreed upon with State and local officials.

For the reasons discussed above, the staff finds that the applicant adequately addressed the four critical elements (identified above) that comprise the required EAL information in the COL application. EALs are also addressed in the various ITAAC in COL Plan Attachment 10 and reflected in Table 13.3-1 of this report. These include ITAAC 1.1.1, which states that the specific parameters identified in the EAL thresholds listed in the EPIPs have been retrieved and displayed in the control room, TSC, and EOF. ITAAC 1.1.2 states that the ranges available in the control room, TSC, and EOF encompass the values for the specific parameters identified in the EAL thresholds listed in the EPIPs. Finally, full-participation exercise ITAAC 8.1.1.A states that the licensee will demonstrate the ability to identify initiating conditions, determine EAL parameters, and correctly classify the emergency throughout the exercise.

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and the associated evaluation criteria in NUREG–0654.

Subject to License Condition 4, the staff finds that the applicant established a standard emergency classification and action level scheme, the bases of which include facility system and effluent parameters, which includes the four emergency classes identified above. The applicant described EALs and emergency conditions that involve ERO activation, including steps to be taken under each emergency class. The applicant also described the means to determine the magnitude of, and for continually assessing the impact of, the release of radioactive materials, and EALs (including those pertaining to hostile actions) that are used to determine the need for offsite notifications and protective measures. In addition, the applicant has the capability to assess, classify, and declare an emergency condition within 15 minutes after the availability of indications to plant operators that an EAL has been exceeded, and to promptly declare the emergency condition.

Conclusion

Subject to License Condition 4, the staff concludes that the information provided in the COLA is consistent with the guidelines in NUREG–0654, Planning Standard D. Therefore, the staff finds that the information is acceptable and meets the relevant requirements of 10 CFR 50.47(b)(4) and 10 CFR Part 50, Appendix E, Sections IV.B and IV.C, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.5 Notification Methods and Procedures

As stated in NUREG–0654, Planning Standard E, "Notification Methods and Procedures," 10 CFR 50.47(b)(5) requires that procedures have been established for notification, by the licensee, of State and local response organizations and for notification of emergency personnel by all organizations; the content of initial and follow-up messages to response organizations and the public has been established; and that the means to provide early notification and clear instruction to the populace within the 16-km (10-mi) plume exposure pathway EPZ have been established. In addition, 10 CFR Part 50, Appendix E, Section IV.A.4 requires a description of how offsite dose projections will be made and the results transmitted to State and local authorities, NRC, and other appropriate governmental entities. 10 CFR Part 50, Appendix E, Section IV.C requires a description of EALs and emergency conditions that involve alerting or activating the emergency organization, including communication steps to be taken under each class of emergency, and the existence of a message-authentication scheme. 10 CFR Part 50, Appendix E, Section IV.D.1 requires a description of administrative and physical means for notifying local, State, and Federal officials and agencies and agreements reached with these officials and agencies for the prompt notification of the public and for public evacuation or other protective measures. The description shall include identification of the appropriate officials, by title and agency, of the State and local government agencies within the EPZs. 10 CFR Part 50, Appendix E, Section IV.D.3 requires the licensee to have the capability to notify responsible State and local governmental agencies within 15 minutes after declaring an emergency. The licensee shall demonstrate that appropriate governmental authorities have the capability to make a public alerting and notification decision promptly on being informed by the licensee of an emergency condition, and that administrative and physical means have been established for alerting and providing prompt instructions to the public within the plume exposure pathway EPZ. The alerting and notification capability shall include a backup method. Finally, 10 CFR 50.72(a)(3) requires NRC notification no later than 1 hour after declaring an emergency.

In COL Plan Section II.E, "Notification Methods and Procedures," the applicant described the specific methods and sequencing of notifications that will be covered in the appropriate implementing procedures for North Anna 3 in an emergency. The staff reviewed this section, as well as other relevant portions of the application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff's primary focus was to evaluate the emergency plan against NUREG–0654, Planning Standard E, which provides the detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(5).

In COL Plan Section II.E, the applicant incorporated by reference Sections 13.3.2.2.2.e and 13.3.2.2.2.g of the ESP Plan, with regard to the descriptions of notification methods and procedures, including the processes used for providing written messages to the public. In Sections 13.3.3.6 and 13.3.3.8 of NUREG–1835, respectively, the staff found this information acceptable. (Public education and information is discussed further in SER Section 13.3.4.7, below.) The applicant provided additional information in COL Plan Section II.E, which states that Dominion maintains procedures for notifying Commonwealth of Virginia and risk jurisdiction response organizations and licensee emergency responders. These procedures include, or make reference to, the pre-planned content of messages to Commonwealth of Virginia and risk jurisdiction organizations. Dominion also makes arrangements to provide prompt notification to members of the public within the plume exposure pathway EPZ. COL Plan Appendix 5 lists an EPIP entitled “Notifications Associated with Emergency Conditions.” ITAAC 2.3 states that a means exists to notify and provide instructions to the public in accordance with the emergency plan requirements.

In COL Plan Section II.E.1, “Notification of Commonwealth and Risk Jurisdiction Authorities,” the applicant stated that Dominion maintains systems and procedures needed to provide prompt notification of affected Commonwealth of Virginia, risk jurisdiction, and Federal authorities following the declaration of any emergency condition, consistent with the emergency classification and action level scheme described in implementing procedures. The emergency classification system is discussed above in SER Section 13.3.4.4. ITAAC 2.1 states that a means to notify responsible organizations, within 15 minutes after the licensee declares an emergency, has been established via the Operational Hot Line among the control room, the Commonwealth of Virginia, and the five risk jurisdictions. The 15-minute notification capability is also addressed in ITAAC 8.1.1.B.2.a.

The Emergency Coordinator initiates notification of affected Commonwealth of Virginia and risk jurisdiction authorities (within 15 minutes after declaration of an emergency), including the escalation or de-escalation of any emergency condition. The primary notification method is the Insta-phone system, which is accessible from the control room, TSC, and EOF. Back-up notification capability is maintained through the use of commercial telephone systems. Message content and verification methods are established in the implementing procedures. Implementing procedures are addressed in ITAAC 9.1, which states that each of the detailed implementing procedures for the North Anna 3 Emergency Plan, as defined in Appendix 5 of the emergency plan, are submitted to the NRC no less than 180 days prior to fuel load. The submission of implementing procedures is also included as an implementation milestone, which is addressed below in SER Section 13.3.4.19. The adequacy of the procedures will be demonstrated through a review of their use during an exercise pursuant to ITAAC 8.1.1 and ITAAC 8.1.2. Exercises and drills are addressed below in SER Section 13.3.4.14.

Dominion maintains the systems and procedures needed to provide prompt notification of the NRC Operations Center following the declaration of any emergency condition. The NRC will be notified as soon as practical following notification of the Commonwealth of Virginia and risk jurisdiction authorities, and within 1 hour of the emergency declaration, including the escalation or de-escalation of any emergency declaration. The primary notification method is the

Emergency Notification System, with back-up notification capability maintained through the use of commercial telephone systems. Emergency notification and communication systems are discussed further in SER Section 9.5.2.

NRC notifications are further addressed in BL 2005-02, which requested in part that all holders of operating licenses provide information regarding the implementation of an NRC notification time period of approximately 15 minutes from discovery of a security-based event. DCD COL Item 1C.1-2-A requires the COL applicant to address the security-related requirements of BL 2005-02, and is addressed below in SER Section 13.3.4.18. With regard to NRC notifications, in RAI 13.03-2.16 dated July 18, 2008 (ADAMS Accession No. ML082000593), the staff asked the applicant to discuss how the North Anna 3 Emergency Plan addresses the latest applicable requirements associated with notifications and responses that are related to an imminent or actual safeguard threat against the facility (or other safeguards event). In an October 6, 2008, response to RAI 13.03-2.16 (ADAMS Accession No. ML082830168), the applicant stated that Dominion plans to include immediate notification of the NRC in the Operations Abnormal Procedures, similar to Units 1 and 2. In addition, for North Anna 3, security-related events are addressed in COLA Part 8, Security Plan, Appendix C, Responsibility Matrix. COLA Part 8, Security Plan was submitted to the NRC under separate letter (Dominion Serial No. NA3-07-002). Demonstration of facility response capabilities in response to hostile actions will be integrated into Force-on-Force and emergency exercises when required. Emergency exercises are addressed below in SER Section 13.3.4.14.

As described by Dominion, the Emergency Coordinator directs the notification and mobilization of the licensee ERO following the declaration of an alert or higher level emergency. The Emergency Coordinator has the discretion to mobilize all or part of the ERO at the notification of unusual event level. ITAAC 2.2 states that a means exists to notify the North Anna 3 ERO. When staffing of the ERO is required, or desired by the Emergency Coordinator, affected personnel may be notified by a multifaceted process, including alarms, announcements, pagers, telephones, on-line messages, etc. Notification and mobilization of the ERO is initiated in accordance with implementing procedures.

The content of initial emergency notification messages from the plant to affected Commonwealth of Virginia and risk jurisdiction authorities includes information addressing the class of the emergency, status of any radioactive releases, locations of any potentially-affected populations, and recommendations regarding protective public actions. Follow-up messages from the plant to affected Commonwealth of Virginia and risk jurisdiction authorities include various detailed information, to the extent that the information is available and appropriate, as mutually agreed upon between Dominion and VDEM.

Dominion further stated that the primary method of alerting the public is by sounding the Alert and Notification System sirens. Other alerting methods may include telephone communications, television and radio communications via the Emergency Alert System (EAS) stations, public address systems, bull horns from patrol cars, and personal contact. The Commonwealth of Virginia and risk jurisdiction governments have ultimate responsibility for warning the public in accordance with their respective RERPs. Affected Commonwealth of Virginia and risk jurisdiction officials bear responsibility for providing emergency messages intended for the public, including instructions regarding specific protective actions. Dominion supports development of these messages by providing supporting information.

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and the associated evaluation criteria in NUREG–0654.

The staff finds that procedures for notification of State and local response organizations and emergency personnel by all organizations have been established, and the licensee has the capability to notify offsite officials and agencies, including State and local governmental agencies within 15 minutes, and NRC no later than 1 hour, after declaring an emergency. The appropriate officials of the State and local government agencies within the EPZs have been identified. The licensee has described the entire spectrum of emergency conditions that involve alerting or activating the emergency organization, including EALs for offsite agency notification and communication steps to be taken under each class of emergency. Message authentication is described in the State and local emergency plans. The applicant has also described how appropriate governmental authorities have the capability to make a public alerting and notification decision promptly following notification of an emergency by the licensee, and administrative and physical means have been established for alerting and providing prompt instruction to the public within the plume exposure pathway EPZ (including a backup method to alert populations), and for public evacuation and other protective measures. In addition, the applicant has described how offsite dose projections will be made and the results transmitted to State and local authorities, the NRC, and other appropriate governmental entities.

Conclusion

The staff concludes that the information provided in the COLA is consistent with the guidelines in NUREG–0654, Planning Standard E. Therefore, the staff finds that the information is acceptable and meets the relevant requirements of 10 CFR 50.47(b)(5), 10 CFR 50.72(a)(3), and 10 CFR Part 50, Appendix E, Sections IV.A.4, IV.C, IV.D.1, and IV.D.3, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.6 Emergency Communications

As stated in NUREG–0654, Planning Standard F, “Emergency Communications,” 10 CFR 50.47(b)(6) requires that provisions exist for prompt communications among principal response organizations, to emergency personnel, and to the public. In addition, 10 CFR Part 50, Appendix E, Section IV.E.9 requires onsite and offsite communication systems with backup power sources, including provisions for communications with State and local governments within the plume exposure EPZ, and Federal emergency response organizations and the NRC. Also required are provisions for communications among the Control Room, TSC, EOF, principal State, and local emergency operations centers (EOC), and field assessment teams. Communication systems shall be tested at designated frequencies.

In COL Plan Section II.F, “Emergency Communications,” the applicant described the communication capabilities between the North Anna site and the Commonwealth of Virginia and risk jurisdiction governments. The staff reviewed this section, as well as other relevant portions of the application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff’s primary focus was to evaluate the emergency plan against NUREG–0654, Planning Standard F, which provides the detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(6).

In COL Plan Section II.F, the applicant incorporated by reference Section 13.3.2.2.2.f of the ESP Plan, with regard to the description of the provisions for prompt communications among principal response organizations to emergency personnel and to the public. In Section 13.3.3.7 of NUREG–1835, the staff found this information acceptable. The applicant provided additional information in Section II.F, which states that Dominion maintains systems and procedures that provide prompt communications between its ERFs and between the site and offsite ERFs. COL Plan Appendix 5 lists an EPIP entitled “Emergency Communications.” ERF communication capabilities are further described below in SER Section 13.3.4.8.

In COL Plan Section II.F.1, “Description of Communication Links,” the applicant stated that Dominion maintains reliable communications links both within the plant and between the plant and external EROs. In addition, Dominion maintains capabilities for 24-hour-per-day emergency notification to the Commonwealth of Virginia and risk jurisdiction emergency response network. Commonwealth of Virginia and risk jurisdiction warning points are staffed 24 hours per day. This communications link consists of an Insta-phone loop, which can be activated from the control room, TSC, or EOF, with links to the Commonwealth of Virginia and risk jurisdictions. The Insta-phone loop has been installed to permit simultaneous telephone-speaker communications for the station to the risk jurisdictions and the Virginia EOC on a 24-hour per day basis. If the Insta-phone is out of service, regular commercial telephone will be used to make the notifications. The offsite agencies have a system to call back to the power station and verify the notification message. Dominion also provides communications capabilities between the control room or TSC and radiological field personnel. Communications systems are described further in DCD Tier 2 Section 9.5.2 and FSAR Section 9.5.2, and addressed in SER Section 9.5.2.

Procedures for notifying, alerting, and activating emergency response personnel in the TSC, OSC, and EOF are described in Section II.E.2, and are discussed in SER Section 13.3.4.5. ITAAC 3.1 and ITAAC 3.2 address the establishment of various communications capabilities. The staff reviewed other application sections that deal with the availability of 24-hour emergency communications and response, and discusses those reviews in SER Sections 13.3.4.1, 13.3.4.2, 13.3.4.5, 13.3.4.8, and 13.3.4.12.

Dominion provides for communications between the control room/TSC/EOF and the NRC Operations Center via dedicated telephone lines. In addition to the ENS, Health Physics Network, Reactor Safety Counterpart Link, and Protective Measures Counterpart Link, separate dedicated telephone lines for communications with the NRC include the Management Counterpart Link (MCL) and Local Area Network (LAN). The MCL lines are located in the TSC and EOF and provide for internal discussions between the NRC Executive Team and the NRC Director of Site Operations or licensee management. The LAN has jacks in the TSC and EOF, and provides access to the NRC LAN. Finally, Dominion will activate the Emergency Response Data System (ERDS) within 1 hour of the declaration of an alert or higher emergency classification in accordance with the applicable facility procedure(s). ITAAC 3.2 states that an access port for ERDS is provided. SER Section 13.3.4.3 discusses the assistance available from Federal agencies, including coordination and communications among those agencies with the North Anna site and State and local agencies.

In COL Plan Sections II.F.2 and II.F.3, the applicant stated that Dominion maintains communications systems that allow for communications between the North Anna site and fixed and mobile medical support facilities. The communications systems include both commercial telephone communications with fixed facilities and radio communications to the ambulance. Communications associated with transporting personnel from the site to the hospital is addressed below in SER Section 13.3.4.12. Dominion conducts tests of its emergency communications system consisting of monthly testing of communications with the facility, EOF, and Commonwealth of Virginia and risk jurisdiction warning points. Dominion also conducts annual testing of communications between the Virginia/risk jurisdiction EOCs and field assessment teams. COL Plan Appendix 5 lists a supporting procedure entitled "Testing of Emergency Communications Systems."

Fukushima Dai-ichi – NTTF Recommendation 9.3

As discussed above in SER Section 13.3.4.2, on March 12, 2012, the NRC requested additional information from all power reactor licensees and holders of construction permits, associated with the NRC NTTF review of the accident at the Fukushima Dai-ichi nuclear facility. In Recommendation 9.3, the NTTF addressed staffing and communications provisions for enhancing emergency preparedness. With regard to communications, the accident at Fukushima highlighted the need to ensure that the communications equipment relied upon to coordinate the event response during a prolonged station blackout can be powered. Specifically, NTTF Recommendation 9.3 requests that all power reactor licensees and holders of construction permits (in active or deferred status) assess their current communications systems and equipment used during an emergency event, including consideration of any enhancements that may be appropriate for the emergency plan with respect to communications requirements of 10 CFR 50.47, Appendix E to 10 CFR Part 50, and NUREG–0696, "Functional Criteria for Emergency Response Facilities." In addition, the means necessary to power the new and existing communications equipment during a prolonged station blackout should be considered. (Onsite emergency organization and staffing is addressed above in SER Section 13.3.4.2.)

In COLA Part 10, the applicant proposed License Condition 3.8.1, which addresses both enhanced staffing and communications capabilities. The resolution of NTTF Recommendation 9.3, including the staff's identified License Condition 2, associated with emergency communications, is addressed above in Section 13.3.4.2 of this report.

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and the associated evaluation criteria in NUREG–0654.

Subject to License Condition 2, the staff finds that provisions exist for prompt communications among principal response organizations, to emergency personnel, and to the public. Specifically, the applicant established a reliable primary and backup means of communications for alerting and activating the response organizations and personnel, including 24-hour manning of communications links. Provisions also exist for communications among the Control Room, TSC, EOF, State, and local governments within the EPZs, and field assessment teams. In addition, the applicant provided a coordinated communication link for fixed and mobile medical support facilities. Onsite and offsite communication systems have backup power sources and are tested at designated frequencies.

Conclusion

Subject to License Condition 2, the staff concludes that the information provided in the COLA is consistent with the guidelines in NUREG–0654, Planning Standard F. Therefore, the staff finds that the information is acceptable and meets the relevant requirements of 10 CFR 50.47(b)(6) and 10 CFR Part 50, Appendix E, Section IV.E.9, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.7 Public Education and Information

As stated in NUREG–0654, Planning Standard G, "Public Education and Information," 10 CFR 50.47(b)(7) requires that information be made available periodically to the public concerning notification methods and initial actions the public should take in an emergency (e.g., listening to a local broadcast station and remaining indoors), the principal points of contact with the news media for dissemination of information during an emergency (including the physical location or locations) be established in advance, and procedures for coordinating dissemination of information to the public be established. In addition, 10 CFR Part 50, Appendix E, Section IV.D.2 requires a description of provisions for yearly dissemination to the public within the plume exposure EPZ of basic emergency planning information, such as methods for public notifications and protective actions planned if an accident occurs, general information as to the nature and effects of radiation, and a listing of local broadcast stations that will be used for dissemination of information during an emergency. Signs or other measures shall also be used to disseminate information to any transient population within the plume exposure pathway (16-km (10-mi)) EPZ.

In COL Plan Section II.G, "Public Education and Information," the applicant described the public education and information program for the North Anna site, including the process for keeping the public in the 16-km (10-mi) EPZ informed in the event of an emergency. The staff reviewed this section, as well as other relevant portions of the application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff's primary focus was to evaluate the emergency plan against NUREG–0654, Planning Standard G, which provides the detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(7).

In COL Plan Section II.G, the applicant incorporated by reference Section 13.3.2.2.2.g of the ESP Plan, with regard to the description of the emergency information program for the public and the news media. In Section 13.3.3.8 of NUREG–1835, the staff found this information acceptable. The applicant provided additional information in Section II.G, which addresses the dissemination of information to the public and the news media, and states that Dominion maintains a coordinated program to educate affected members of the public regarding emergency notification methods and actions.

In COL Plan Section II.G.1, “Public Information Program,” the applicant stated that Dominion coordinates with affected Commonwealth of Virginia and risk jurisdiction authorities to disseminate pertinent emergency response information to members of the public in the plume exposure pathway EPZ on a yearly basis. Information may be provided via a number of methods, including providing informational publications such as brochures or calendars through mailings to individual households in the plume exposure pathway EPZ. Emergency public information may also be distributed in telephone directories and utility bills, through public information postings, and via local media outlets. Distributed information includes educational information on radiation, notification methods and immediate actions, protective measures, special needs of the handicapped, and point of contact for additional information. In addition, COL Plan Section II.G.2, “Distribution and Maintenance of Public Information,” states that information intended for transients (i.e., individuals on vacation in, camping in, or traveling through the plume exposure pathway EPZ) may include public postings, publications provided to hotels, motels, and campgrounds, and information published in telephone directories. These sources of information provide transients with sources for local emergency information, such as local radio and television stations.

The COL Plan Section II.G.3, “News Media Coordination,” states that the outlet for emergency information is the Joint Information Center (JIC), which is an element of the Corporate Emergency Response Center that is located at Dominion’s Innsbrook Technical Center in Glen Allen, Virginia. Members of the news media respond to the JIC. Dominion’s Chief Technical Spokesperson serves in the JIC as the primary licensee spokesperson and news media contact, gathers information from the ERO for dissemination to the news media, and updates the news media on a periodic basis throughout any emergency situation. COL Plan Appendix 5 lists an EPIP entitled “Emergency Media Relations.” COL Plan Section II.G.5, “News Media Training,” states that news media training is accomplished through briefings for the news media offered on a yearly basis. These annual briefings acquaint members of the media organizations with emergency plans, information about radiation hazards, and points of contact for the release of public information during an emergency. COL Plan Appendix 5 lists a supporting procedure entitled “Emergency Plan Training.”

The COL Plan Section II.G.4, “Information Exchange,” states that the Dominion public affairs liaison has access to required public information, primarily through communications with the Chief Technical Spokesperson and designated members of the EOF staff. The Dominion public affairs liaison coordinates continuity and consistency of information with designated members of the Commonwealth of Virginia and risk jurisdiction EROs on a periodic basis. Rumor control is accomplished through ongoing contact with the Chief Technical Spokesperson and by the activities of a Dominion public affairs liaison in the JIC, who monitors communications, identifies rumors, and makes appropriate contacts to obtain and disseminate accurate information through the representatives in the JIC. The rumor control telephone number is announced by the VDEM Public Affairs Office at media briefings and in press releases.

The staff reviewed the various emergency information communication publications, including the brochure entitled “North Anna Power Station Emergency Public Information for Residents and Visitors in the Communities of: [Louisa, Spotsylvania, Orange, Caroline, and Hanover Counties],” Revision September 2007 (ADAMS Accession No. ML081210740), and the

NAPS 2008 Nuclear Emergency Planning Information Calendar (ADAMS Accession No. ML081210741).

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and the associated evaluation criteria in NUREG–0654.

The staff finds that the applicant has provided for a coordinated and periodic dissemination of information to the public, including the permanent and transient adult population within the plume exposure (16-km (10-mi)) EPZ, regarding how they will be notified and what their actions should be in an emergency. The applicant has also established the principal points of contact with the news media for dissemination of information during an emergency, and procedures for coordinated dissemination of information to the public. In addition, the applicant has described the provisions for yearly dissemination to the public within the plume exposure EPZ of basic emergency planning information, including the use of signs or other measures to disseminate information to any transient population within the plume exposure EPZ.

Conclusion

The staff concludes that the information provided in the COLA is consistent with the guidelines in NUREG–0654, Planning Standard G. Therefore, the staff finds that the information is acceptable and meets the relevant requirements of 10 CFR 50.47(b)(7) and 10 CFR Part 50, Appendix E, Section IV.D.2, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.8 Emergency Facilities and Equipment

As stated in NUREG–0654, Planning Standard H, “Emergency Facilities and Equipment,” 10 CFR 50.47(b)(8) requires that adequate emergency facilities and equipment to support the emergency response be provided and maintained. In addition, 10 CFR Part 50, Appendix E, Section IV.E.8 requires that adequate provision be made and described for emergency facilities and equipment, including a licensee’s onsite OSC and TSC, as well as an EOF from which effective direction can be given and effective control can be exercised during an emergency. 10 CFR Part 50, Appendix E, Section IV.E.8.b addresses various requirements associated with EOF locations and required provisions, which are not applicable to an existing EOF pursuant to 10 CFR Part 50, Appendix E, Section IV.E.8.e. 10 CFR Part 50, Appendix E, Section IV.E.8.c requires various EOF capabilities, which include supporting response to multiple reactors/sites and simultaneous events, as applicable. 10 CFR Part 50, Appendix E, Section IV.E.8.d requires an alternative facility (for use when onsite emergency facilities cannot be safely accessed during hostile actions) that would be accessible and could function as a staging area for augmentation of emergency response staff. 10 CFR Part 50, Appendix E, Section IV.G requires a description of provisions to be employed to ensure that the emergency plan, its implementing procedures, and emergency equipment and supplies are maintained up to date. 10 CFR Part 50, Appendix E, Section VI.1 requires an ERDS data link between the licensee’s onsite computer system and the NRC Operations Center, through which a limited data set of selected parameters can be automatically transmitted.

In COL Plan Section II.H, “Emergency Facilities and Equipment,” the applicant described the ERFs and the equipment that will be used to assess an accident and monitor functions following the declaration of an emergency. The staff reviewed this section, as well as other relevant portions of the application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff’s primary focus was to evaluate the emergency plan against NUREG–0654, Planning Standard H, which provides the detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(8).

In COL Plan Section II.H, the applicant incorporated by reference Section 13.3.2.2.2.h of the ESP Plan, with regard to the descriptions of ERFs. As described in Section 13.3.3.9 of NUREG–1835, on March 3, 2005, the ESP applicant withdrew its request for the NRC to evaluate major feature H, “Emergency Facilities and Equipment,” as part of the North Anna ESP application. Since the ESP applicant withdrew its request that major feature H (of the ESP SSAR) be evaluated, the staff reached no conclusion regarding the acceptability of ESP major feature H. As part of its COLA review, the staff reviewed the description of the emergency facilities and equipment in Section II.H, which includes the information in Section 13.3.2.2.2.h of the ESP plan.

In COL Plan Section II.H, the applicant stated that the TSC and OSC are provided to support emergency operations consistent with the guidance in Supplement 1 to NUREG–0737, “Clarification of [Three Mile Island] TMI Action Plan Requirements – Requirements for Emergency Response Capability (Generic Letter No. 82-33).” Consistent with SRP Section 13.3, the staff determined compliance with the applicable regulations using the guidance in NUREG–0654, and through it NUREG–0696. Supplement 1 to NUREG–0737 provides additional related guidance that primarily summarizes and supplements the information in NUREG–0696.

Dominion staffs and activates the designated ERFs (i.e., TSC, OSC, and EOF), consistent with the emergency classification and in accordance with EPIPs. ERFs and ERO augmentation is also addressed in BL 2005-02, which states in part that all holders of operating licenses provide information regarding how alternative locations for onsite ERFs support EP functions during a security-based event. In COL Plan Section II.H.4, “Activation and Staffing of Emergency Response Facilities,” the applicant stated that in the event the site is under threat of, or experiencing hostile action, the Louisa Fire Training Center functions as a staging area for augmentation of emergency response staff. This location has the capability to communicate with the EOF, control room, and plant security. The descriptions of ERF notification and staffing are provided in ESP Plan Sections 13.3.2.2.2.e.2 and 13.3.2.2.2.f.4. See also, COL Plan Sections II.E and II.F, which are addressed in SER Sections 13.3.4.5 and 13.3.4.6, respectively. The Commonwealth of Virginia and risk jurisdiction emergency response personnel also staff their ERFs consistent with the provisions in their respective plans.

Emergency Systems and Equipment

Dominion maintains and operates onsite monitoring systems needed to provide data that is essential for initiating emergency measures and for performing accident assessments. This includes monitoring systems for geophysical phenomena, radiological conditions, plant processes, and fire hazards. Dominion also provides offsite radiological monitoring equipment, suitable for assessing the offsite radiological consequences of facility incidents, for use by its offsite monitoring field teams.

Offsite environmental radiological monitoring equipment includes a series of continuous air samplers and environmental monitoring dosimeters surrounding the facility. The facility's Offsite Dose Calculation Manual (ODCM) describes the monitoring systems. In addition to the monitoring systems, equipment, and radiological laboratory facilities provided at the plant, Dominion maintains arrangements to obtain back-up radiological monitoring and analysis support from offsite organizations. COL Plan Section II.C.3 describes the available laboratory facilities, which are discussed above in SER Section 13.3.4.3, and COL Plan Appendix 7 provides a certification letter from these offsite organizations.

Dominion acquires meteorological data from the National Weather Service during periods when the primary system is unavailable. Back-up seismic data are available from the U.S. Geological Survey (National Earthquake Information Center) and the Virginia Polytechnic Institute and State University (Virginia Tech) Seismological Observatory. Streamflow data is available from the U.S. Geological Survey. Flooding data is available from the National Oceanographic and Atmospheric Administration's Hydro-Meteorological Reports. Other data sources, such as commercial media outlets, may also be used.

The station's Meteorological Monitoring System can provide data that is used to predict atmospheric effluent transport and diffusion. The system consists of a primary and a back-up tower, the locations of which were chosen so as to be representative of regional conditions. The North Anna 3 primary meteorological monitoring site consists of a 48.4 meters (m) (159 feet (ft)) tower located approximately 579 m (1900 ft) east of the Unit 1 reactor containment building. The primary meteorological tower records wind speed, wind direction, horizontal wind direction fluctuation, ambient temperature, and dew point temperature. The North Anna 3 back-up meteorological monitoring site consists of instrumentation on a freestanding 10 m (33 ft) tower located approximately 396 m (1300 ft) northeast of the Unit 1 containment building. The tower serves as the back-up meteorological monitoring site. A sensor at the top of the mast monitors wind speed, wind direction, and horizontal wind direction fluctuation. The Meteorological Monitoring System is described further in COL Plan Appendix 2, and addressed below in SER Section 13.3.4.9. In addition, ESP application SSAR Section 2.3, "Meteorology," provides a detailed description of the Meteorological Monitoring System, which is addressed in Section 2.3.3, "Onsite Meteorological Measurements Program," of NUREG–1835.

Dominion performs inspection, inventory, and appropriate operational tests of dedicated emergency equipment and instruments on a quarterly basis, consistent with COL Plan Section II.P. The responsibility for maintaining facilities and equipment is described in COL Plan Section II.P, and addressed below in SER Section 13.3.4.16. Plant procedures establish requirements for performing inventories and operational tests. COL Plan Appendix 5 lists a supporting procedure entitled "Emergency Equipment Inventory and Operational Tests." Dominion maintains sufficient reserves of equipment and instruments to replace any items that are removed from the emergency kits for calibration or repair. COL Plan Appendix 6 describes the emergency equipment and supplies that are typically used by emergency response personnel, including field teams.

The staff finds that the applicant has adequately identified onsite monitoring systems that will be used to initiate emergency measures in addition to the provisions for acquiring data from, or gaining emergency access to, offsite monitoring and analysis equipment. The staff finds that the applicant has provided for adequate offsite meteorological instrumentation and radiological monitoring equipment in the vicinity of the nuclear facility, including sufficient reserves of instruments and equipment to replace those that are removed for calibration or repair. In addition, the applicant has identified emergency kits by general category (e.g., protective equipment, communications equipment, radiological monitoring equipment, and emergency supplies).

Technical Support Center

In COL Plan Section II.H.1, "On-Site Emergency Response Facilities," the applicant stated that the function of the TSC is to provide an area and resources for use by personnel providing plant management and technical support to the plant operating staff during emergency evolutions. The TSC relieves the reactor operators of peripheral duties and communications not directly related to reactor system manipulations and prevents congestion in the control room.

The TSC is located in the electrical building and its size is sufficient to support a staff of 25 people. The TSC is environmentally controlled to provide room air temperature, humidity, and cleanliness appropriate for personnel and equipment. The room is provided with radiological protection and monitoring equipment necessary to monitor personnel radiation exposure and to maintain personnel doses less the 0.05 Sv (5 rem) total effective dose equivalent (TEDE), as defined in 10 CFR 50.2, for the duration of the accident. The level of protection is similar to the main control room. In the event that offsite and onsite AC power are unavailable, the TSC could be evacuated and the TSC management function transferred to a location unaffected by the radiation release. ITAAC 5.1 addresses various TSC features, including location, size, habitability, back-up power, and information and communications capabilities.

The TSC is provided with reliable voice and data communication with the main control room and EOF, and reliable voice communications with the OSC, NRC Operations Center, and Virginia and risk jurisdiction EOCs. COL Part Section II.F describes the communications capabilities provided in the TSC, which is addressed above in SER Section 13.3.4.6. The TSC is also provided control room communication of ERDS data with the NRC Operations Center, Safety Parameter Display System (SPDS) parameters, and key reference materials via LAN connection from the Nuclear Electronic Document Library. Information systems associated with the ERFs and the accident monitoring and display systems are discussed in ESBWR DCD Tier 2, Section 7.5, "Safety-Related and Nonsafety-Related Information Systems," and NUREG–1966, Section 7.5, "Information Systems Important to Safety," and addressed in SER Section 7.5, "Safety-Related Display Information."

Emergency Operations Facility

In COL Plan Section II.H.2, "Emergency Operations Facility," the applicant stated that the function of the EOF is to provide a location for Dominion management to direct and coordinate emergency response activities, with an emphasis on providing support to the plant staff and coordinating emergency response activities with offsite response agencies. Health physics personnel located in the EOF are designated as the point of contact for the receipt of offsite monitoring data results and sample media analysis results collected by Dominion personnel.

Dominion provides both a Local EOF and Central EOF to support the North Anna site. The Local EOF is the primary EOF used to support emergency response activities at the North Anna site. The Central EOF may be activated in lieu of the Local EOF to support emergency response activities for emergencies, such as severe storms, that affect both the North Anna and Surry sites. The Central EOF may also be activated if the Local EOF is unavailable. Except for the radiation protection functions of the Local EOF (discussed below), the minimum capacities, capabilities, and plant parameter displays of the Local EOF and Central EOF are similar.

The Local EOF and Central EOF are the same as those used for North Anna Units 1 and 2. The Local EOF is located within the owner controlled area, adjacent to the NAPS Units 1 and 2 Training Facility, and the Central EOF is located at Dominion's Innsbrook Technical Center in Glen Allen, Virginia, approximately 30 miles from North Anna 3. COL Plan Section II.H.2 further states that the size of the EOF is sufficient to support 35 people. ITAAC 5.2.1 states that the EOF has at least 243 square meters (2625 square feet). Provisions are made for staffing of the EOF by Dominion, Commonwealth of Virginia, and NRC personnel. Dominion also makes provisions for accommodating a limited number of media personnel in the EOF. Contact with the news media in the JIC is described in COL Plan Section II.G, and addressed above in SER Section 13.3.4.7. The Local EOF was designed to provide a specified protection factor from gamma radiation, and has a specially designed ventilation system to limit the exposure of its occupants and further assure its availability during an emergency. Provisions exist for dedicated radiation monitoring equipment to measure airborne particulate and direct radiation. The location of the Central EOF precludes the necessity of providing radiation monitoring systems.

The Local EOF and Central EOF draw power from commercial power sources, and there is electrical generator backup power to the Central EOF. A loss of commercial power should not impact any of the voice or data communications equipment located in the Central EOF. Common Dominion telecommunications infrastructure that supports EOF functions include fiber optic transmission equipment, telephone switching equipment, and data network routers. The telecommunication infrastructure is configured to operate from at least one, and usually multiple, backup power sources in the event of a loss of commercial power. These backup sources include generator, direct current battery, and uninterruptible power supply (UPS) systems. Emergency communications capabilities are described in COL Plan Section II.F, and addressed above in SER Section 13.3.4.6. ITAAC 5.2.2 states that voice transmission and reception have been accomplished between the EOF and TSC. ITAAC 5.2.3 addresses the establishment of EOF communications via the Operational Hot Line. In addition, ITAAC 5.2.4 addresses the availability of various data in the EOF that is pertinent to determine offsite protective measures.

Display capability of the technical data system in the EOF includes a workstation that is capable of displaying the parameters that are required of an SPDS. The SPDS function, as well as human-system interface design for the EOF and TSC, is described in ESBWR DCD Tier 2 Chapter 18, "Human Factors Engineering," and addressed in SER Section 18.8, "Human-System Interface Design." Key reference materials will be available to the EOF staff via LAN connection from the Nuclear Electronic Document Library.

Operational Support Center

In COL Plan Section II.H.9, "Operational Support Center," the applicant stated that the function of the OSC is to provide a common area and the necessary supporting resources for the assembly of designated operations support personnel during emergency conditions. Designated plant support personnel, as indicated in COL Plan Section II.B, assemble in the OSC to provide support to both the control room and the TSC. Personnel reporting to the OSC can be assigned duties in support of emergency operations. Assessment, corrective action, and rescue personnel are dispatched by the OSC to locations in the plant, as directed by the TSC and control room. The OSC is not designed to remain habitable under all projected emergency conditions; however, implementing procedures make provisions for relocating the OSC as needed, based on ongoing assessments of plant conditions and facility habitability.

The OSC is located within the protected area in the service building. ITAAC 5.1.6 states that the OSC is in a location separate from the control room. The OSC provides dedicated telephone extensions for communicating with the control room and TSC, which permits personnel reporting to the OSC to be assigned to duties in support of emergency operations. The OSC is also equipped with a separate telephone line to provide for communications with onsite and offsite locations, as needed. COL Plan Section II.F describes the communications capabilities provided in the OSC (see also, SER Section 13.3.4.6). ITAAC 5.1.7 lists the various communications equipment that is provided in the OSC.

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and the associated evaluation criteria in NUREG–0654.

The staff finds that the applicant has described, provided, and maintains adequate emergency facilities and equipment to support the emergency response, including a licensee onsite OSC and TSC, and an EOF from which effective direction can be given and effective control can be exercised during an emergency. This includes onsite and offsite radiological and meteorological monitoring systems. The applicant also described provisions to be employed to ensure that the emergency plan, its implementing procedures, and emergency equipment and supplies are kept up-to-date. In addition, the applicant provided for an ERDS data link between the onsite computer system and the NRC Operations Center.

Conclusion

The staff concludes that the information provided in the COLA is consistent with the guidelines in NUREG–0654, Planning Standard H. Therefore, staff finds that the information is acceptable and meets the relevant requirements of 10 CFR 50.47(b)(8) and 10 CFR Part 50, Appendix E, Sections IV.E.8, IV.G, and VI.1, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.9 Accident Assessment

As stated in NUREG–0654, Planning Standard I, "Accident Assessment," 10 CFR 50.47(b)(9) requires the use of adequate methods, systems, and equipment for assessing and monitoring the actual or potential offsite consequences of a radiological emergency condition. In addition, 10 CFR Part 50, Appendix E, Section IV.A.4 requires the identification of persons within the licensee organization who will be responsible for making offsite dose projections, and a description of how these projections will be made and the results transmitted to State and local authorities, the NRC, and other appropriate governmental entities. 10 CFR Part 50, Appendix E, Section IV.B requires a description of the means to be used for determining the magnitude of, and for continually assessing the impact of, the release of radioactive materials. 10 CFR Part 50, Appendix E, Section IV.E.2 requires that adequate provisions shall be made and described for emergency facilities and equipment, including equipment for determining the magnitude of, and for continuously assessing the impact of, the release of radioactive materials to the environment.

In COL Plan Section II.I, "Accident Assessment," the applicant described the methods, systems, and equipment available for assessing and monitoring actual or potential consequences of a radiological emergency. The staff reviewed this section, as well as other relevant portions of the application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff's primary focus was to evaluate the emergency plan against NUREG–0654, Planning Standard I, which provides the detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(9).

In COL Plan Section II.I, the applicant incorporated by reference Section 13.3.2.2.2.i of the ESP Plan, with regard to the description of provisions for accident assessment. In Section 13.3.3.10 of NUREG–1835, the staff found this information acceptable. The applicant provided additional information in Section II.I. In COL Plan Section II.I.1, "Parameters Indicative of Emergency Conditions," the applicant stated that implementing procedures describe plant system and effluent parameter values that are indicative of off-normal conditions and the various indications that correspond to the emergency initiating conditions. Plant procedures specify the types and capabilities of the instruments used to indicate emergency conditions.

Tier 2, Section 7.5.1, "Post-Accident Monitoring Instrumentation," of the ESBWR DCD describes the post-accident monitoring systems, and is incorporated into the emergency plan by reference. Tier 2, Section 7.5.2, "Containment Monitoring System," of the ESBWR DCD describes instrumentation parameters that are monitored during both normal reactor operations and post-accident conditions to evaluate the integrity and safe condition of the containment. In addition, FSAR Section 9.3.2, "Process Sampling System," incorporates by reference DCD Tier 2, Section 9.3.2, "Process Sampling System," which describes the post-accident monitoring systems and program. Systems for post-accident sampling, including associated provisions and procedures, are addressed in SER Section 9.3, "Process Auxiliaries."

The COL Plan Section II.I.3, "Determination of Source Term and Radiological Conditions," states that COL Plan Appendix 2 and plant procedures provide the means for relating various measured parameters, including containment radiation monitor readings, to the source term available for release within plant systems, and effluent monitor readings to the magnitude of the release of radioactive materials. COL Plan Appendix 5 lists EPIPs entitled "Core Damage Assessment" and "Obtaining and Analyzing High Activity Samples Under Emergency Conditions." ITAAC 6.1 states that an exercise or drill has been accomplished, including use of selected monitoring parameters identified in the EAL thresholds listed in the EPIPs, to assess simulated degraded plant conditions and initiate protective actions in accordance with the various listed criteria relating to accident assessment and classification, and radiological assessment and control. (The emergency classification and EAL scheme are discussed above in SER Section 13.3.4.4) ITAAC 6.2 states that the EPIPs and ODCM correctly calculate source terms and magnitudes of postulated releases.

In addition, COL Plan Section II.I states that dose assessment procedures include the relationship between effluent monitoring readings and onsite and offsite exposures and contamination for various meteorological conditions. Plant procedures establish processes for estimating release rates and projected doses if the associated instrumentation is inoperable or off-scale, and consider estimated releases based on field monitoring data and surrogate instrumentation and methods to estimate the extent of fuel damage. COL Plan Appendix 2 provides a description of the emergency dose assessment program used at North Anna 3. Information includes dose and dose rate determinations based on plant effluent monitors, and contamination estimates based on deposition assumptions and meteorological conditions. ITAAC 6.3 states that the EPIPs and ODCM calculate the relationship between effluent monitor readings and offsite exposure and contamination for various meteorological conditions.

In COL Plan Section II.H.8, Appendix 2, and ESP SSAR Section 2.3.3, “Onsite Meteorological Measurements Program,” the applicant provided a description of the meteorological monitoring systems that are used to provide initial values and continuing assessments of meteorological conditions under emergency conditions. ITAAC 6.4 states that various meteorological data (i.e., wind speed, wind direction, and ambient and differential air temperature) is available in the control room, TSC, and EOF. Additional details about meteorological instrumentation and methods are discussed in NUREG–1835, Section 2.3.3, “Onsite Meteorological Measurements Program,” and SER Section 2.3.3, “Onsite Meteorological Measurement Programs.”

The COL Plan Section II.I.7, “Field Monitoring Capability,” states that Dominion provides emergency response field teams composed of one or more radiation protection technicians trained in accordance with the emergency preparedness training requirements established in COL Plan Section II.O. The field teams perform a sampling of offsite media as needed to assess the actual or potential magnitude and locations of radiological hazards. ITAAC 6.5 addresses demonstration of the capability for making rapid assessment of the actual or potential magnitude and locations of any radiological hazards through liquid or gaseous release pathways. Dominion notifies and activates field team personnel consistent with COL Plan Section II.E. Mobilization times are consistent with COL Plan Section II.B. (COL Plan Sections II.O, II.E, and II.B are addressed in SER Sections 13.3.4.15, 13.3.4.5, and 13.3.4.2, respectively.)

The COL Plan Appendix 6 provides a description of instrumentation that is available for performance of field monitoring in the plume exposure pathway EPZ. Dominion equips field teams with portable air samplers, appropriate filters or other sampling media (e.g., silver zeolite or other media capable of collecting airborne radioiodine samples), and analysis equipment capable of detecting radioiodine concentrations at or below 10^{-7} µCi/ml (microcuries per milliliter) under field conditions, taking into consideration potential interference from noble gas activity and background radiation. ITAAC 6.6 states that instrumentation used for monitoring I-131 to detect airborne concentrations as low as 1E-07 microcuries per cubic centimeter (µCi/cc) has been provided.

In addition to the required field monitoring instrumentation, Dominion provides protective equipment (including respiratory protection and radioprotective drugs), communications equipment, and supplies to facilitate the performance of radiation, surface contamination, and airborne radioactivity monitoring. Implementing procedures provide guidance for field monitoring teams' performance of monitoring activities. COL Plan Appendix 5 lists an EPIP entitled "Plume Tracking and Assessment of Offsite Radiological Conditions." Field monitoring teams act under the direction of health physics personnel in the TSC prior to activation of the EOF. Following activation of the EOF, the teams act under the direction of EOF health physics personnel.

The COL Plan Section II.I.10, "Relating Measured Parameters to Dose Rates," states that plant implementing procedures establish the means for relating measured parameters, such as surface, airborne, or waterborne activity levels to dose rates for those key isotopes listed in NUREG–0654, Section I, Table 3, "Radionuclides with Significant Contribution to Dominant Exposure Modes." Implementing procedures also establish provisions for estimating the projected dose based on projected and actual dose rates. ITAAC 6.7 states that a methodology has been established for relating contamination levels and airborne radioactivity levels to dose rates and gross radioactivity measurements for the various listed isotopes, and for comparing the dose estimates with the Environmental Protection Agency (EPA) protective action guides (PAG).

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and the associated evaluation criteria in NUREG–0654.

The staff finds that the applicant has described and provided adequate facilities, systems, equipment, and means for assessing and monitoring the actual or potential offsite consequences of a radiological emergency condition, including determining the magnitude of, and continually assessing the impact of, the release of radioactive materials. The applicant also described the capability and resources for field monitoring within the 16-km (10-mi) plume exposure pathway EPZ, and has the methods, equipment, and expertise to rapidly assess actual or potential radiological hazards. This includes the capability to detect and measure radioiodine airborne concentrations within the plume exposure pathway EPZ as low as 1×10^{7} µCi/cc under field conditions, and to relate the various measured parameters to dose rates for key isotopes and gross radioactivity measurements. In addition, the applicant identified, by position and function to be performed, persons within the licensee organization who will be responsible for making offsite dose projections, and has described how these projections will be made and the results transmitted to State and local authorities, the NRC, and other appropriate governmental entities.

Conclusion

The staff concludes that the information provided in the COLA is consistent with the guidelines in NUREG–0654, Planning Standard I. Therefore, the staff finds that the information is acceptable and meets the relevant requirements of 10 CFR 50.47(b)(9) and 10 CFR Part 50, Appendix E, Sections IV.A.4, IV.B, and IV.E.2, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.10 Protective Response

As stated in NUREG–0654, Planning Standard J, "Protective Response," 10 CFR 50.47(b)(10) requires that a range of protective actions have been developed for the plume exposure pathway EPZ for emergency workers and the public. In developing this range of actions, consideration has been given to evacuation, sheltering, and as a supplement to these, the prophylactic use of potassium iodide (KI). ETEs have been developed by applicants and licensees, and licensees shall update the ETEs on a periodic basis. Guidelines for the choice of protective actions during an emergency are developed and in place, and protective actions for the ingestion exposure pathway EPZ appropriate to the locale have been developed. In addition, 10 CFR 50.47(c)(2) and 10 CFR Part 50, Appendix E, Section I require that the size and configuration of the EPZs be determined in relation to local emergency response needs and capabilities, as they are affected by such conditions as demography, topography, land characteristics, access routes, and jurisdictional boundaries. 10 CFR Part 50, Appendix E, Section IV.I requires the development of a range of protective actions to protect onsite personnel during hostile action to ensure the continued ability of the licensee to safely shut down the reactor and perform the functions of the emergency plan.

In COL Plan Section II.J, "Protective Response," the applicant described the protective response measures that have been developed to limit radiation exposure of plant personnel and the public following an accident at the North Anna 3 site. The staff reviewed this section, as well as other relevant portions of the application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff's primary focus was to evaluate the emergency plan against NUREG–0654, Planning Standard J, which provides the detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(10).

In COL Plan Section II.J, the applicant incorporated by reference Section 13.3.2.2.2.j of the ESP Plan, with regard to the description of protective response measures associated with the plume exposure pathway (10-mi) EPZ and the ingestion exposure pathway (50-mi) EPZ. The two EPZ were also addressed in ESP SSAR Section 13.3.2.2.1, "Emergency Planning Zones," which consist of the same EPZs that currently support North Anna Units 1 and 2. Consistent with 10 CFR 50.47(c)(2), the EPZs meet the required size and were determined in relation to local emergency response needs and capabilities, as they are affected by such conditions as demography, topography, land characteristics, access routes, and jurisdictional boundaries. In Section 13.3.3.1 of NUREG–1835, the staff found this information acceptable. In addition, as discussed above, the staff conducted three site visits, which included driving the roads within and beyond the 10-mi EPZ.

The applicant provided additional information in Section II.J, stating that Dominion establishes and implements methods to inform personnel within the protected area (within the Security fence) and exclusion area (within 5,000 ft of the North Anna 3 containment) of an emergency condition requiring individual action. Dominion maintains the ability to notify individuals within the protected area within about 15 minutes of the declaration of an emergency requiring individual response actions, such as accountability or evacuation, and to account for individuals within the protected area and identify any missing individuals within 30 minutes following initiation of assembly and accountability measures. Dominion also provides a capability to account for individuals within the protected area continuously after the initial accountability. Dominion maintains these capabilities consistent with the requirements of the facility Security Plan. The notification methods include plant public announcement system and audible warning systems. In high noise areas or other areas where these systems may not be audible, other measures, such as visible warning signals or personal notifications, may be used.

Dominion informs individuals located within the exclusion area, but outside of the protected area, via audible warnings provided by warning systems and the activities of the Security force (e.g., vehicle-mounted public address systems) and activities of the Virginia Department of Game and Inland Fisheries. Dominion provides information regarding the meaning of the various warning systems, and the appropriate response actions, via plant training programs, visitor orientation, escort instructions, posted instructions, or within the content of the audible messages. COL Plan Appendix 5 lists an EPIP entitled “Site Assembly, Accountability, and Evacuation.” ITAAC 7.1.1 states that during a drill or exercise, notification and instructions were provided to onsite workers and visitors, within the protected area, over the plant public announcement system. ITAAC 7.1.2 states that during a drill or exercise, audible warnings were provided to individuals outside the protected area, but within the owner controlled area.

Dominion has established evacuation routes to primary and secondary assembly areas, which are shown in Figure II-4, “Map to North Anna Remote Assembly Areas.” Affected individuals evacuate the site via personal vehicles and will be directed to a designated assembly area. The assembly areas provide a location for contamination monitoring of personnel, vehicles, and personal property. If the evacuation routes are rendered impassable or inadvisable due to adverse conditions (e.g., weather-related, radiological, or traffic density conditions), Dominion will direct affected individuals to a safe onsite area for accountability and, if necessary, contamination monitoring and decontamination. Appropriate equipment and supplies are provided from the facility to the assembly areas to facilitate contamination monitoring. Monitoring and decontamination are further discussed below in SER Section 13.3.4.11.

The COL Plan Section II.J.6, “Protective Measures,” states that Dominion provides equipment and supplies to provide adequate protection for individuals remaining or arriving onsite during an emergency. The equipment and supplies include respiratory protection equipment, protective clothing, and radioprotective drugs. COL Plan Appendix 5 lists an EPIP entitled “Respiratory Protection and Distribution of Radioprotective Drugs.” Onsite supplies of protective clothing and respiratory protection equipment may be augmented by that provided by offsite responders, such as firefighters responding to the site. Dominion maintains inventories of emergency equipment and supplies, described in COLA Plan Appendix 6, for use by emergency response personnel in the ERFs and by Dominion’s offsite field monitoring teams. COL Plan Figure II-5, “Radiological Monitoring Locations,” indicates the offsite radiological monitoring locations associated with the plume exposure pathway EPZ.

In the event of a hostile action against the site, conditions may dictate the initiation of protective measures other than personnel assembly, accountability, and evacuation. The Emergency Coordinator makes decisions regarding appropriate protective measures based on the evaluation of site conditions, including input from the Security force. If the Emergency Coordinator feels that personnel assembly, accountability, and evacuation may result in undue hazards to site personnel, the Emergency Coordinator may direct other protective measures, including:

- Evacuation of personnel from areas and buildings perceived as high-value targets
- Site evacuation by opening, while continuing to defend, security gates
- Dispersal of key personnel
- On-site sheltering
- Staging of ERO personnel in alternate locations pending restoration of safe conditions
- Implementation of accountability measures following restoration of safe conditions

Onsite protective measures for security-based events is also addressed in BL 2005-02, which requested in part that all holders of operating licenses provide information regarding onsite protective actions that may be appropriate for a terrorist attack, particularly an aircraft attack. The staff reviewed the description of onsite protective measures identified in BL 2005-02, and find that it is consistent with the applicant's description above of protective measures that may be initiated for hostile actions against the North Anna 3 site. As stated in the applicant's response to RAI 13.03-2.16, demonstration of facility response capabilities in response to hostile actions will be integrated into Force-on-Force and emergency exercises when required. Emergency exercises are addressed below in SER Section 13.3.4.14.

COL Plan Section II.J.7, "Protective Action Recommendations and Bases," states that public PARs are based on plant conditions, estimated offsite doses, or some combination of both. EALs correspond to the projected dose to the population at risk, and are determined consistent with the methodology described in implementing procedures. (EALs are addressed above in SER Section 13.3.4.4). If the Emergency Coordinator declares a general emergency, then Dominion will communicate to the Virginia EOC a PAR to evacuate at least a 2-mile radius around the facility, unless impediments to evacuation exist. The PAR may call for other areas within the plume exposure pathway EPZ to evacuate, shelter-in-place, or monitor and prepare to take protective actions as directed. Notification methods and procedures are described in COL Plan Section II.E, and discussed above in SER Section 13.3.4.5.

In addition to the EAL-based PAR, Dominion provides PARs based on offsite dose projections. The Health Physics staff is responsible for conducting offsite dose projections periodically throughout any emergency during which there is an actual or potential release of an amount of radioactive material that is likely to result in offsite consequences. Implementing procedures will establish requirements for performing calculations and projections. Projected doses are compared to the PAGs shown in COL Plan Table II-3, "Protective Action Guides" (as derived from EPA 400-R-92-001, "Manual of Protective Action Guides and Protective Actions for Nuclear Incidents," dated May 1992[6]), and PARs are developed based on the results of these comparisons, as discussed in COLA Plan Section II.J.10.m. Consideration will be given to evacuation, sheltering, and as a supplement to these, the prophylactic use of KI, as appropriate. An implementing procedure includes specific PARs, which are based on NUREG–0654, Supplement 3, "Criteria for Protective Action Recommendations for Severe Accidents," and plant and meteorological conditions. COL Plan Appendix 5 lists an EPIP entitled "Protective Action Recommendations." Prior to activation of the EOF, the Emergency Coordinator is responsible for determining PARs and communicating them to the Virginia EOC, which is

---

[6] In March 2013, the EPA updated EPA 400-R-92-001 with "PAG Manual – Protective Action Guides and Planning Guidance for Radiological Incidents," Draft for Interim Use and Public Comment.

responsible for implementing the protective actions. Following activation of the EOF, the EOF Director assumes these responsibilities, and the Emergency Coordinator or EOF Director provides PARs to the Virginia EOC.

The COL Plan Section II.J.8, “Evacuation Time Estimates,” states that Dominion conducted an ETE that updated the ETE information provided in ESP SSAR Section 13.3.2.1, “Identification of Physical Characteristics,” and which is consistent with the guidance in Appendix 4 of NUREG–0654, NUREG/CR-6863, and NUREG/CR-7002. The ETE Report is included in the COLA as supplemental information to the COL Plan, and the updated population distribution and ETEs are summarized in COL Plan Appendix 4, which includes the updated ETE’s Executive Summary. ETEs are a factor considered in the development of off-site PARs, and are provided to Commonwealth and local governmental authorities for use in developing off-site protective action strategies. The ETE Report provides maps of the plume exposure pathway EPZ, which illustrate the population distribution around the North Anna 3, evacuation areas and routes, and locations of assembly areas. A summary of the staff’s detailed review of the ETE Report is included below in SER Section 13.3.4.17.

The COL Plan Section II.J.10, “Protective Measures Implementation,” states that warnings to the public within the plume exposure pathway EPZ are the responsibility of Commonwealth of Virginia and risk jurisdiction officials, and the primary method of warning the public is by the use of the Early Warning System sirens. Other warning methods may include telephone communications, television and radio EAS stations, public address systems, bull horns from patrol cars and personal contact. There are currently no hospitals, prisons, or nursing homes within the plume exposure pathway EPZ. Offsite notifications and communications are discussed in COL Plan Sections II.E and II.F, and are addressed above in SER Sections 13.3.4.5 and 13.3.4.6, respectively.

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and the associated evaluation criteria in NUREG–0654.

The staff finds that the applicant developed a range of protective actions for the (16-km (10-mi)) plume exposure pathway EPZ for emergency workers and the public, including consideration of evacuation, sheltering, and the prophylactic use of KI. The staff finds that the applicant has developed guidelines for the choice of protective actions during an emergency that are consistent with Federal guidance, including protective actions for the (80-km (50-mi)) ingestion exposure pathway EPZ that are appropriate to the locale. The size and configuration of the EPZs have been determined in relation to local emergency response needs and capabilities, as they are affected by such conditions as demography, topography, land characteristics, access routes, and jurisdictional boundaries. In addition, the staff finds that the applicant has developed a range of protective actions to protect onsite personnel during hostile action. Development of ETEs is addressed in Section 13.3.4.17 of this report.

Conclusion

The staff concludes that the information provided in the COLA is consistent with the guidelines in NUREG–0654, Planning Standard J. Therefore, the staff finds that the information is acceptable and meets the relevant requirements of 10 CFR 50.47(b)(10), 10 CFR 50.47(c)(2), and 10 CFR Part 50, Appendix E, Sections I and IV.I, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.11 Radiological Exposure Control

As stated in NUREG–0654, Planning Standard K, "Radiological Exposure Control," 10 CFR 50.47(b)(11) requires that the means for controlling radiological exposures in an emergency be established for emergency workers. The means for controlling radiological exposures shall include exposure guidelines consistent with EPA 400-R-92-001, May 1992. In addition, 10 CFR Part 50, Appendix E, Section IV.E.3 requires that adequate provisions shall be made and described for emergency facilities and equipment, including facilities and supplies at the site for decontamination of onsite individuals.

In COL Plan Section II.K, "Radiological Exposure Control," the applicant described the emergency exposure limits for emergency workers, including decisions and efforts made to minimize exposures. The staff reviewed this section, as well as other relevant portions of the application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff's primary focus was to evaluate the emergency plan against NUREG–0654, Planning Standard K, which provides the detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(11).

In COL Plan Section II.K, the applicant incorporated by reference Section 13.3.2.2.2.k of the ESP Plan, with regard to the description of radiological exposure control measures. In Section 13.3.3.12 of NUREG–1835, the staff found this information acceptable. The applicant provided additional information in Section II.K. In COL Plan Section II.K.1, "On-Site Exposure Guidelines and Authorizations," the applicant stated that Dominion implements onsite exposure guidelines for emergency response consist with EPA 400-R-92-001, Table 2-2, "Guidance on Dose Limits for Workers Performing Emergency Services," which are reflected in COL Plan Table II-4, "Emergency Worker Exposure Guidelines."

Prior to EOF activation, the Emergency Coordinator, in consultation with facility health physics personnel, is responsible for authorizing any emergency exposure exceeding 10 CFR Part 20 limits. Following EOF activation, the EOF Director, in consultation with health physics personnel and the Emergency Coordinator, has this responsibility. If exposures in excess of 10 CFR Part 20 limits are required, these exposures will be limited to individuals who are properly trained and knowledgeable of the tasks to be completed and the risks associated with the exposures. Selection criteria for volunteer emergency workers include consideration of those who are in good physical health, are familiar with the consequences of emergency exposure, and are not a declared pregnant worker. It is preferable, though not mandatory, that volunteers be older than 45 years of age and not be a female capable of reproduction. Efforts are made to maintain personnel doses as low as reasonably achievable (ALARA).

Dominion further stated that Chapter 12, "Radiation Protection," of the FSAR (i.e., COLA Part 2) describes a radiation protection program (RPP) that is consistent with the requirements of 10 CFR Part 20. The RPP, in concert with the EPIPs, includes provisions for implementing emergency exposure guidelines. Implementing procedures establish procedures for allowing onsite volunteers to receive radiation doses in the course of carrying out life-saving and other emergency response activities, including provisions for expeditious decision-making and consideration of the relative risks. COL Plan Appendix 5 lists EPIPs entitled “Radiation Protection Under Emergency Conditions,” and “Personnel Monitoring.” The radiation protection and health physics programs are further described in SER Section 12.0, “Radiation Protection.”

COLA Plan Section II.K.3, “Dosimetry and Dose Assessment,” states that Dominion maintains a site personnel radiation dosimetry program that includes the capability to determine both external and internal doses consistent with the requirements of 10 CFR Part 20. The external dosimetry program includes provisions and requirements for use of both permanent record and self-reading dosimeters (e.g., pocket or electronic dosimeters). Dosimeter ranges are sufficient to measure both planned routine and foreseeable accident photon doses. Plant procedures establish requirements for distributing dosimeters to emergency responders, including those individuals responding to the site from offsite locations. Internal doses are typically estimated through the use of whole body counting and/or in-vitro sampling and analysis routines. Dominion maintains individual Dose records in accordance with the requirements of 10 CFR Part 20 and the RPP and its supporting procedures.

Dominion implements requirements for personnel and area decontamination, including decontamination actions levels and criteria for returning areas and items to normal use, in procedures supporting the RPP. Procedures also address decontamination of onsite personnel wounds, supplies, instruments and equipment, and for waste disposal. COL Plan Appendix 5 lists an EPIP entitled “Decontamination.” COL Plan Appendix 6 describes the emergency equipment and supplies, including decontamination supplies with emergency kits. In addition, Dominion makes provisions for protective clothing, contamination monitoring, and decontamination (including decontamination for radioiodine contamination on the skin) at the offsite assembly area or other location as directed.

In COL Plan Section II.K.6, “Contamination Control Measures,” the applicant stated that the FSAR and Security Plan establish requirements for site access control from offsite locations. Following a site evacuation, law enforcement agencies control access to the owner controlled area, consistent with the requirements of the supporting Commonwealth of Virginia and risk jurisdiction plans. The site Security Force controls entry to the restricted area by individuals, including emergency responders, who must enter the site during an emergency. The RPP and its supporting procedures establish requirements for limiting access to areas having significant radiological hazards, consistent with the requirements of 10 CFR Part 20 and FSAR Chapter 12.

Should the potential exist for contamination of onsite food or drinking water supplies that renders these supplies non-consumable, arrangements will be made for transport of non-contaminated offsite supplies to the North Anna site. Dominion permits areas and items to be returned to normal (i.e., non-contaminated) use following surveys and verification that contamination levels meet the criteria provided in the RPP or its supporting procedures.

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and the associated evaluation criteria in NUREG–0654.

The staff finds that the applicant has established the means to control radiological exposures for emergency workers in a way consistent with the exposure guidelines in EPA 400-R-92-001. In addition, the applicant made and described adequate provisions for emergency facilities and equipment, including facilities and supplies for monitoring and decontamination of onsite and relocated personnel, vehicles, and other affected materials, and has established appropriate contamination control measures.

Conclusion

The staff concludes that the information provided in the COLA is consistent with the guidelines in NUREG–0654, Planning Standard K. Therefore, the staff finds that the information is acceptable and meets the relevant requirements of 10 CFR 50.47(b)(11) and 10 CFR Part 50, Appendix E, Section IV.E.3, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.12 Medical and Public Health Support

As stated in NUREG–0654, Planning Standard L, "Medical and Public Health Support," 10 CFR 50.47(b)(12) requires that arrangements be made for medical services for contaminated injured individuals. In addition, 10 CFR Part 50, Appendix E, Section IV.E requires facilities and medical supplies at the site for appropriate emergency first aid treatment, and arrangements for medical service providers qualified to handle radiation emergencies onsite. Arrangements are also required for transportation of contaminated injured individuals from the site to specifically identified treatment facilities outside the site boundary.

In COL Plan Section II.L, "Medical and Public Health Support," the applicant described the arrangements for medical services for contaminated injured personnel at the North Anna site. The staff reviewed this section, as well as other relevant portions of the application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff's primary focus was to evaluate the emergency plan against NUREG–0654, Planning Standard L, which provides the detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(12).

In COL Plan Section II.L, the applicant incorporated by reference Section 13.3.2.2.2.l of the ESP Plan, with regard to descriptions of plans for medical and public health support. These descriptions included contacts and arrangements for medical services for contaminated injured individuals and were supported by a letter of agreement with the Medical College of Virginia Hospitals (MCVH) in Richmond, Virginia, which describes arrangements that have been made to provide emergency services to North Anna. These arrangements would apply to the ESP site. In Section 13.3.3.13 of NUREG–1835, the staff found this information acceptable.

The applicant provided additional information in COL Plan Section II.L, including a certification letter in COL Plan Appendix 7 that is signed by the Chief Executive Officer of MCVH, which addresses the facility's continued availability in support of a new unit at the North Anna site. COL Plan Section II.L refers to MCVH as the Virginia Commonwealth University Medical Center (VCUMC). (The certification letter in support of North Anna 3 is also discussed above in SER Section 13.3.4.1.) In addition, Section II.L.1 states that the hospital has established and maintains the capability to evaluate the radiation exposure and/or uptake of accident victims and to handle contaminated victims. These capabilities are established and maintained through training courses that are consistent with COL Plan Section II.O, periodic drills and exercises that are consistent with COL Plan Section II.N, and services provided that are consistent with agreements between Dominion and the medical support providers. In the event that a contaminated injured person is transported from North Anna 3 to an offsite medical facility, Dominion may provide to the facility one or more technicians qualified to perform radiological monitoring if requested by the facility to support the radiological aspects of the medical treatment and post-treatment efforts.

Dominion maintains a trained first aid team at the site to provide 24-hour-per-day first aid support consistent with COL Plan Section II.B, and maintains first aid team readiness through training consistent with COL Plan Section II.O and drills and exercises consistent with COL Plan Section II.N. In addition, Dominion has made arrangements with local volunteer rescue squads to transport injured contaminated personnel to the hospital, and response team members have received training concerning transportation of contaminated injured individuals. A health physics technician, with appropriate instrumentation, would normally accompany the person to the hospital. Contaminated injured personnel will be suitably clothed or prepared to prevent the spread of contamination in the transporting vehicle, if practical, considering the medical condition of the injured person. The station can communicate with VCUMC and the site ambulance (if used), and the ambulance can communicate with VCUMC. COL Plan Appendix 5 lists an EPIP entitled “Notifications Associated with Emergency Conditions.”

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and the associated evaluation criteria in NUREG–0654.

The staff reviewed the certification letter for the medical service providers described above and the additional information provided in COL Plan Section II.L. The staff finds that the applicant has made arrangements for hospital and medical service providers that have the capability to evaluate radiation exposure and uptake, and persons providing these services are adequately prepared to handle contaminated individuals. In addition, the applicant provided for appropriate emergency first aid treatment at the site, including qualified medical personnel to handle radiation emergencies, and arrangements for transporting victims of radiological accidents (i.e., contaminated injured individuals) to offsite medical support facilities.

Conclusion

The staff concludes that the information provided in the COLA is consistent with the guidelines in NUREG–0654, Planning Standard L. Therefore, the staff finds that the information is acceptable and meets the relevant requirements of 10 CFR 50.47(b)(12) and 10 CFR Part 50, Appendix E, Section IV.E, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.13 Recovery and Reentry Planning and Post-Accident Operations

As stated in NUREG–0654, Planning Standard M, “Recovery and Reentry Planning and Post-Accident Operations,” 10 CFR 50.47(b)(13) requires that general plans for recovery and reentry be developed. In addition, 10 CFR Part 50, Appendix E, Section IV.H requires a description of criteria to be used to determine when, following an accident, reentry of the facility would be appropriate or when operation could be resumed.

In COL Plan Section II.M, “Recovery and Re-Entry,” the applicant described the steps that it will take, once the emergency situation has ended, to mitigate the consequences of the event and to minimize any effects on the health and safety of the public and emergency workers. The staff reviewed this section, as well as other relevant portions, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff’s primary focus was to evaluate the emergency plan against NUREG–0654, Planning Standard M, which provides the detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(13).

In COL Plan Section II.M.1, “Recovery Plans and Procedures,” the applicant stated that Dominion implements recovery plans and procedures that provide guidance for a range of recovery and re-entry activities, including organization, decision making, informing members of the ERO that recovery operations are to be initiated, and estimating the total population exposure. The recovery process is further outlined in the EPIP specifically designed for administration of the recovery program. COL Plan Appendix 5 lists an EPIP entitled “Recovery and Reentry.”

In COL Plan Section II.M.2, “Recovery Organization,” states that prior to entering the recovery/re-entry phase of operations following an emergency Dominion establishes a recovery organization that is consistent with the existing conditions and continuing organizational needs. The EOF Director assumes control and direction of the recovery operation, with the authority and responsibilities set forth in the EPIPs. Depending on plant conditions and the scope of activities, the recovery organization may discharge its activities from one or more designated ERFs or from other locations specified by the recovery organization managers.

COL Plan Section II.M further states that the recovery process is implemented when the facility’s ERO managers, with concurrence of Commonwealth of Virginia and Federal agencies, have determined the station to be in a stable and controlled condition. Upon the determination, Dominion notifies the NRC Operations Center, Virginia EOC, and risk jurisdiction EOCs that the emergency has been terminated and any required recovery has commenced. The recovery organization develops plans and procedures that are designed to address both immediate and long-term actions. Specific recovery procedures may need to be written to address special requirements. The necessity to maintain protective measures implemented during the emergency will be evaluated and, if deemed appropriate, the recovery organization will recommend the relaxation of existing protective measures. Total population doses are periodically estimated in the affected areas utilizing population distribution data. Health Physics personnel determine the TEDE and the thyroid committed dose equivalent (CDE) using a methodology that is consistent with EPA 400-R-92-001.

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and the associated evaluation criteria in NUREG–0654.

The staff finds that the applicant has developed general plans for recovery and reentry, including describing criteria to be used to determine when, following an accident, reentry of the facility is appropriate or operation can be resumed. In addition, the applicant designated the individuals who will fill key positions in the facility recovery organization. The staff finds that the plans adequately specify the means for informing members of the response organizations that a recovery operation is to be initiated, describe how decisions to relax protective measures are made, and include a method for periodically estimating total population exposure.

Conclusion

The staff concludes that the information provided in the COLA is consistent with the guidelines in NUREG–0654, Planning Standard M. Therefore, the staff finds that the information is acceptable and meets the relevant requirements of 10 CFR 50.47(b)(13) and 10 CFR Part 50, Appendix E, Section IV.H, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.14 Exercises and Drills

As stated in NUREG–0654, Planning Standard N, “Exercises and Drills,” 10 CFR 50.47(b)(14) requires that periodic exercises be conducted to evaluate major portions of emergency response capabilities, periodic drills be conducted to develop and maintain key skills, and deficiencies identified as a result of exercises or drills be corrected. In addition, 10 CFR Part 50, Appendix E, Section IV.F requires a description of the program that provides for training of employees, exercising by periodic drills, and participation by other assisting persons. The exercises – including hostile action exercises of the onsite and offsite emergency plans – shall test the adequacy of timing and content of implementing procedures and methods, test emergency equipment and communications networks, test the public alert and notification system, and ensure that emergency organization personnel are familiar with their duties. 10 CFR Part 50, Appendix E, Section IV.F further describes the full participation exercise (including timing), participation by each offsite authority having a role under the radiological response plan, deficiencies identified during the exercise, remedial exercises, exercise scenarios, and 8-year exercise cycle.

In COL Plan Section II.N, “Exercises and Drills,” the applicant described the conduct and frequency of emergency exercises and drills, including coordination between the North Anna 3 site and offsite EROs. The staff reviewed this section, as well as other relevant portions of the application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff’s primary focus was to evaluate the emergency plan against NUREG–0654, Planning Standard N, which provides the detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(14).

The COL Plan Section II.N states that Dominion implements a program of periodic drills and exercises to test and evaluate major portions of emergency response capabilities, including emergency plans, procedures and organizations, and to develop and maintain key emergency response skills. Exercises allow demonstration of the key skills specific to emergency response duties in the control room, TSC, OSC, EOF, and JIC. The exercises test the adequacy of timing and content of implementing procedures and methods, emergency equipment and communications networks, the public notification system, and the familiarity of emergency organization personnel with their duties. COL Plan Appendix 5 lists supporting procedures entitled “Conduct of Emergency Drills and Exercises,” and “Testing of Emergency Communications Systems.” Exercise scenarios are varied so major elements of the plans and preparedness organizations are tested, including, at least once during the 8-year exercise cycle, the following:

- Hostile action directed at the plant site.
- No radiological release or an unplanned minimal radiological release that does not require public protective actions.
- An initial classification of, or rapid escalation to, a site area emergency or general emergency.
- Implementation of strategies, procedures, and guidance developed under §50.54(hh)(2) (i.e., for loss of large areas of the plant due to explosion or fire).
- Integration of offsite resources with onsite response.

The drill and exercise program is also addressed in BL 2005-02, which requested in part that all holders of operating licenses provide information regarding how current emergency preparedness drill and exercise programs prepare or evaluate responders for security-based events commensurate with established emergency preparedness standards. DCD COL Item1C.1-2-A requires the COL applicant to address the security-related requirements of BL 2005-02, and is addressed below in SER Section 13.3.4.18. With regard to the drill and exercise program, the applicant stated in response to RAI 13.03-2-16 that demonstration of facility response capabilities in response to hostile actions will be integrated into Force-on-Force and emergency exercises when required.

Dominion conducts an exercise of its onsite emergency plan every 2 years, which may be included in the biennial full participation exercise. Dominion also conducts exercises involving full participation by offsite authorities at least biennially, and at least once every 8-year exercise cycle provisions will be made to start a drill or exercise during off-hours. Unannounced exercises will also be conducted on a periodic basis. Dominion will conduct a full participation exercise within 2 years before initiation of scheduled initial fuel loading, which will include participation by the Commonwealth of Virginia, State of Maryland, and affected local governments within the plume exposure pathway EPZ and the ingestion exposure pathway EPZ. If the full participation exercise is conducted more than 1 year before the scheduled date for initial fuel loading, Dominion will conduct an exercise that tests the onsite emergency plans within 1 year before the scheduled date for initial fuel loading.

The ITAAC 8.1.1 states that the exercise is completed within the specified time periods of 10 CFR Part 50, Appendix E, and the listed onsite exercise objectives have been met with no uncorrected onsite exercise deficiencies. (SER Section 13.3.4.19 addresses implementation milestones associated with this exercise.) In addition, ITAAC 8.1.2 addresses successful performance of assigned responsibilities by onsite emergency response personnel.

ITAAC 8.1.3 addresses offsite exercise objectives and the absence of uncorrected offsite exercise deficiencies prior to reactor operation above 5 percent of rated power.

The COLA Plan Section II.N.2, “Drills,” states that Dominion maintains adequate emergency response capabilities between biennial exercises by conducting drills, including at least one drill involving a combination of some of the principal functional areas of onsite emergency response capabilities. Upon request, Dominion allows affected Commonwealth of Virginia and risk jurisdiction governments to participate in the drills. A response to an actual declared emergency may be used to satisfy emergency drill requirements if the response demonstrates adequate execution of the specified activities. The drill program includes the following (at the indicated frequencies):

Communication Drills:

Dominion conducts monthly tests of communications with Commonwealth of Virginia and risk jurisdiction governments. In addition, Dominion conducts quarterly tests of communications with Federal emergency response organizations, and annual tests of communications between the facility, the Virginia and risk jurisdiction EOCs, and field assessment teams. Communication drills evaluate both the operability of the communications systems and the ability of the participants to understand message content.

Fire Drills:

Dominion conducts fire drills as required by Section 9.5.1 [“Fire Protection System”] of the North Anna 3 FSAR.

Medical Emergency Drills:

Dominion conducts yearly medical emergency drills that include a simulated contaminated injured individual and participation by the local support services agencies (i.e., medical transportation and offsite medical treatment facility).

Radiological Monitoring Drills:

Dominion conducts yearly radiological monitoring drills involving both onsite and offsite radiological monitoring activities, which include collection and analysis of sample media, communications with monitoring teams, and recordkeeping activities. Dominion may coordinate radiological monitoring drills with those drills conducted by Commonwealth of Virginia and risk jurisdiction government entities, or may conduct these drills independently.

Health Physics Drills:

On a semi-annual basis, Dominion conducts onsite health physics drills that include a response to, and analysis of, simulated elevated airborne and liquid samples, direct radiation measurements in the environment, and an analysis of in-plant liquid samples with simulated or actual elevated radiation levels.

Dominion develops drill and exercise scenarios and related materials that establish basic objectives and evaluation criteria; date, time period, location, and participating organizations; simulated events; a narrative summary describing the conduct of the exercise or drill; and arrangements for official observers. One or more qualified instructors/evaluators supervise and evaluate drills and exercises. A qualified instructor/evaluator is an individual whose knowledge, skills, and abilities have been evaluated and determined to be sufficient for observing and evaluating the planned activities against the established criteria. Exercises may be critiqued by Federal and Commonwealth of Virginia observers/evaluators.

Dominion conducts a critique following conduct of the exercise. Participants may include selected Dominion, NRC, Commonwealth of Virginia, risk jurisdiction, and other participants and observers/evaluators. Input from the critique is evaluated to determine the need for changes to the plan, procedures, equipment, facilities, and other components of the emergency preparedness and response program. Dominion identifies deficiencies and tracks corrective actions to completion using the facility's corrective action program.

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and the associated evaluation criteria in NUREG–0654. In addition, FEMA stated that the adequacy of the North Anna 3 COLA Emergency Plan review is also dependent on satisfactory demonstration of plan implementation during a joint exercise with the licensee and State and local governments, and utilizing North Anna 3 facilities. ITAAC 8.1.3 addresses offsite exercise objectives and the absence of uncorrected offsite exercise deficiencies prior to (reactor) operation above 5 percent of rated thermal power.

The staff finds that the applicant has described provisions for conducting periodic exercises and drills to evaluate major portions of emergency response capabilities and to develop and maintain key skills. The exercises will test the adequacy of implementing procedures, emergency equipment and communications networks, and the public notification system, and will ensure that the ERO personnel are familiar with their duties. In addition, the applicant described the full participation exercise, participation by offsite authorities, and how exercise and drill deficiencies will be identified and corrected.

Conclusion

The staff concludes that the information provided in the COLA is consistent with the guidelines in NUREG–0654, Planning Standard N. Therefore, the staff finds that the information is acceptable and meets the relevant requirements of 10 CFR 50.47(b)(14) and 10 CFR Part 50, Appendix E, Section IV.F, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.15 Radiological Emergency Response Training

As stated in NUREG–0654, Planning Standard O, "Radiological Emergency Response Training," 10 CFR 50.47(b)(15) requires that radiological emergency response training be provided to those who may be called on to assist in an emergency. In addition, 10 CFR Part 50,

Appendix E, Section IV.F.1 requires a description of the program that provides for training of employees, exercising by periodic drills, and participation by other assisting persons.

In COL Plan Section II.O, “Radiological Emergency Response Training,” the applicant described the training that will be conducted for both onsite and offsite response organizations in support of an emergency at the North Anna site. The staff reviewed this Section, as well as other relevant portions of the application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff’s primary focus was to evaluate the emergency plan against NUREG–0654, Planning Standard O, which provides the detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(15).

In COL Plan Section II.O, the applicant incorporated by reference Section 13.3.2.2.2.o of the ESP Plan, with regard to the description of the emergency preparedness training program. In Section 13.3.3.14 of NUREG–1835, the staff found that this information was acceptable. The applicant provided additional information in Section II.O, which states that Dominion implements a training program that provides for initial training and retraining for individuals who have been assigned emergency response duties, including both onsite staff and offsite individuals who may be called on to provide assistance in the event of an emergency. This includes emergency responders employed by agencies identified in COL Plan Section II.A. Dominion offers training for affected hospital, ambulance/rescue, police, and firefighting personnel. For these and any other offsite emergency responders who may be required to enter the site under emergency conditions, Dominion offers training that addresses site access procedures and identifies (by position) the individual who will control their activities onsite.

In COL Plan Section II.O.2, “Onsite Emergency Response Training,” the applicant stated that the training program includes practical drills (consistent with COL Plan Section II.N) for on-site Dominion personnel who may be called upon to respond to an emergency, during which individuals demonstrate the ability to discharge the assigned emergency response function. The instructor/evaluator corrects any erroneous performance noted during these practical drills and, as appropriate, demonstrates proper performance that is consistent with approved procedures and accepted standards. COL Plan Appendix 5 lists a supporting procedure entitled “Emergency Plan Training,” which supports the ongoing maintenance of emergency preparedness.

COL Plan Section II.O further states that Dominion conducts a program for instructing and qualifying personnel who implement the emergency plan. Individuals complete the required training prior to assignment to a position in the ERO. The training program establishes the scope, nature, and frequency of the required training and qualification measures (e.g., individuals assigned to render treatment during an emergency receive first aid training equivalent to the Red Cross Multi-Media Training). Dominion implements a program to provide position-specific emergency response training for designated members of the ERO, which includes annual retraining. The content of the training program is appropriate for the duties and responsibilities of the assigned position. Failure of Dominion ERO members to successfully complete this training in a timely manner, as specified in plant training program requirements, results in the individual’s removal from the ERO pending completion of the required training.

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and the associated evaluation criteria in NUREG–0654.

The staff finds that the applicant has provided for radiological emergency response training to those who may be called on to assist in an emergency. In addition, the applicant described the program that trains employees to ensure they are familiar with their specific emergency response duties, including exercising with periodic drills. The applicant also described the participation in training and drills by other persons whose assistance might be needed, including specialized initial training and periodic retraining.

Conclusion

The staff concludes that the information provided in the COLA is consistent with the guidelines in NUREG–0654, Planning Standard O. Therefore, the staff finds that the information is acceptable and meets the relevant requirements of 10 CFR 50.47(b)(15) and 10 CFR Part 50, Appendix E, Section IV.F.1, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.16 Responsibility for the Planning Effort – Development, Periodic Review, and Distribution of Emergency Plans

As stated in NUREG–0654, Planning Standard P, “Responsibility for the Planning Effort: Development, Periodic Review and Distribution of Emergency Plans,” 10 CFR 50.47(b)(16) requires that responsibilities for plan development and review and for distribution of emergency plans are established and that planners are properly trained. In addition, 10 CFR Part 50, Appendix E, Section IV.G requires a description of provisions to be employed to ensure that the emergency plan, its implementing procedures, and emergency equipment and supplies are maintained up to date.

In COL Plan Section II.P, “Responsibility for the Planning Effort,” the applicant described the responsibilities and authorities associated with developing and maintaining emergency preparedness for the North Anna site. The staff reviewed this Section, as well as other relevant portions of the application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff’s primary focus was to evaluate the emergency plan compared to NUREG–0654, Planning Standard P, which provides the detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(16).

In COL Plan Section II.P, the applicant incorporated by reference Section 13.3.2.2.2.p of the ESP Plan, with regard to the description of plans for maintaining emergency preparedness. In Section 13.3.3.15 of NUREG–1835, the staff found this information acceptable. The applicant provided additional information in Section II.P, which states that Dominion implements an organizational structure and processes to periodically review, update, distribute, and control the emergency plan (i.e., COL Plan), consistent with facility quality assurance and document control requirements. The facility’s document control organization distributes the updated emergency plan to organizations and individuals with responsibility for implementing the plans. Dominion also implements a program to provide training to personnel responsible for the emergency planning effort appropriate to their duties and responsibilities.

The COL Plan Section II.P further states that the Site Vice President holds the overall authority and responsibility for ensuring that an adequate level of emergency preparedness is maintained. In addition, Dominion establishes a Manager Emergency Preparedness position, which is responsible for developing and updating site emergency plans (including the ETE and emergency personnel notification list), coordinating these plans with other response organizations, and conducting or coordinating an annual review of the emergency plan to verify the plan and its supporting agreements are current. The Manager Emergency Preparedness also reviews and updates the plan and agreements, as needed, to verify they remain current. Dominion develops and implements a process to provide training to the Manager Emergency Preparedness and support staff, which may include formal education, professional seminars, plant-specific training, industry meetings, and other activities and forums that provide for an exchange of pertinent information.

In COLA Part 10, the applicant proposed License Condition 3.1 (Letters of Agreement), which states that prior to loading fuel, the licensee shall update its Units 1 and 2 letters of agreement with the 16 listed entities (i.e., State and county agencies and organizations) or their successors. These updated letters of agreement will identify the specific nature of arrangements in support of emergency preparedness for the North Anna site, including North Anna 3. (Arrangements for support from the various offsite agencies and organizations are discussed above in SER Section 13.3.4.3.) In addition, the emergency plan shall be revised to include these updated letters of agreement after they have been executed. The complete License Condition 3.1 is included above in SER Section 13.3.2 and reflected below, with some staff revisions, as staff-proposed License Condition 5.

In ESP Plan Section 13.3.2, "Major Features Emergency Plan," the applicant stated that "[t]he Major Features Emergency Plan [i.e., ESP Plan] takes advantage of the emergency planning resources, capabilities, and organization that Virginia Power has already established and currently maintains at the NAPS site." In addition, ESP Plan Section 13.3.2.2.2.a.6, "Contacts and Arrangements," states that the existing licensed facilities (i.e., Units 1 and 2) maintain within the NAEP letters of agreement with the listed State and county agencies and organizations. The staff's evaluation of these NAEP letters of agreement is reflected in NUREG–1835, Section 13.3.2, "Contacts and Arrangements with Local, State, and Federal Agencies," and Section 13.3.3.4, "Emergency Response Support and Resources (Supplement 2, Major Feature C)," where the staff found that the letters of agreement were acceptable.

In COL Plan Appendix 7, the applicant provided a June 11, 2010, certification letter, which provided up-to-date information associated with submission of the COLA, and is signed by the 16 agencies and organizations that will support the proposed new nuclear unit (i.e., North Anna 3). When initially submitted to the NRC, as part of the June 28, 2010, revised COLA, the certification letter provided up-to-date information because it reflected recent agreement by the signatories (i.e., all parties signed the certification letter between June 11 and June 16, 2010). The applicant did not update the certification letter in subsequent COLA revisions because there is no requirement to do so. The agencies and organizations represented in the certification letter are the same agencies and organizations represented in the Units 1 and 2 letters of agreement listed in the applicant's proposed License Condition 3.1. (The certification letter and letters of agreement are discussed further in SER Sections 13.3.4.1 and 13.3.4.3.) The staff reviewed the certification letter, and finds it acceptable because it meets the requirements in 10 CFR 52.79(a)(22)(i), and guidance in SRP Acceptance Criterion II.18.

The applicant's proposed License Condition 3.1 would require the COL licensee to update the Units 1 and 2 letters of agreement to reflect North Anna 3 prior to loading fuel, and revise the emergency plan to include these updated letters of agreement after they have been executed. There is no requirement or guidance that precludes Dominion, as a new 10 CFR Part 52 licensee on the existing North Anna site, from waiting to update the emergency plan and letters of agreement until prior to initial North Anna 3 fuel load.

As required by 10 CFR Part 50, Appendix E, Section IV.G, Dominion has maintained the Units 1 and 2 letters of agreement up-to-date following, and independent of, their submission in the ESP application. Since all three reactor units are located on a common site (i.e., the North Anna site), the nature of offsite support reflected in the existing Units 1 and 2 letters of agreement would be generally applicable to North Anna 3 after the COL is issued, during construction, and up to fuel load.

As required by 10 CFR Part 50, Appendix E, Section IV.G, Dominion must maintain the Units 1 and 2 letters of agreement up-to-date.

In addition, as discussed above in SER Section 13.3.4.3, the general nature of the existing letters of agreement is such that the scope of expected support could include expected assistance associated with hostile action at the site, which is required by 10 CFR Part 50, Appendix E, Section IV.A.7 to be identified and described in the COL Plan. However, this requirement is not effective until June 23, 2014, which occurred after COLA submission. The Units 1 and 2 letters of agreement supporting the COLA did not specifically address hostile actions, and were not required to, when the COLA was initially submitted on November 26, 2007. In order to clarify that the expected assistance from offsite agencies includes hostile action, the staff has included in License Condition 5 (below) the requirement for the updated letters of agreement to reflect expected assistance associated with hostile actions at the North Anna site, as required by 10 CFR Part 50, Appendix E, Section IV.A.7.

For the reasons discussed above, the staff finds that delaying the updating of the letters of agreement, and revising the North Anna 3 Emergency Plan to include them after they are executed, until prior to North Anna 3 fuel load is consistent with the requirements in 10 CFR Part 50, Appendix E, Section IV.G, and guidance in NUREG–0654 Evaluation Criterion II.P.4. The staff reviewed License Condition 3.1, and with the exception of the timeframe for submission of the updated letters of agreement, finds that it is acceptable for the reasons discussed above. The staff proposes a timeframe for updating the letters of agreement, which is based on the date scheduled for initial fuel load set forth in the notification submitted in accordance with 10 CFR 52.103(a). In addition, the license condition provides the staff with the necessary control over post-licensing updates to the letters of agreement, and ensures that they will be in effect prior to fuel load. Therefore, consistent with the applicant's proposed License Condition 3.1, the staff identified the following License Condition 5.

License Condition 5

5. No later than one hundred eighty (180) days before the date schedule for initial fuel load set forth in the notification submitted in accordance with 10 CFR § 52.103(a), the licensee shall update its North Anna Units 1 and 2 Letters of Agreement with the following entities, or their successors, and revise the North Anna 3 Emergency Plan to include these updated Letters of Agreement after they have been executed. These updated Letters of Agreement shall identify the specific nature of arrangements in support of emergency preparedness for the North Anna site, including North Anna 3, and reflect expected assistance associated with hostile action at the North Anna site, as defined in 10 CFR Part 50, Appendix E, Section IV.A.7.

    a. Commonwealth of Virginia Department of Emergency Management
    b. Commonwealth of Virginia Department of Health
    c. Commonwealth of Virginia Department of State Police
    d. Commonwealth of Virginia Department of Game and Inland Fisheries
    e. Virginia Commonwealth University Medical Center
    f. Louisa County Administrator
    g. Louisa County Sheriff
    h. Louisa County Department of Fire and Emergency Medical Services
    i. Spotsylvania County Sheriff
    j. Spotsylvania Department of Fire, Rescue, and Emergency Management
    k. Orange County Administrator
    l. Orange County Sheriff
    m. Caroline County Sheriff
    n. Caroline County Department of Fire, Rescue, and Emergency Management
    o. Hanover County Administrator
    p. Hanover County Sheriff

In COL Plan Section II.P.9, "Emergency Plan Reviews," the applicant stated that Dominion's independent assessment organization performs, or oversees the performance of, periodic independent reviews of the emergency preparedness program, consistent with the requirements of 10 CFR 50.54(t). The reviews include, at a minimum, the following:

- Emergency plan
- EPIPs and practices
- Emergency preparedness training program
- Readiness testing (e.g., drills and exercises)
- ERFs, equipment, and supplies
- Interfaces with Commonwealth of Virginia and risk jurisdiction government agencies

Dominion's independent assessment organization documents review results and improvement recommendations and reports these results to Dominion management. Review findings are subject to management controls, consistent with the facility's corrective action program. Dominion makes those portions of the reviews that address the adequacy of interfaces with Commonwealth of Virginia and risk jurisdiction governments available to the affected governments. Dominion retains review records for a period of at least 5 years, in accordance with facility document control requirements. COL Plan Section II.P.6, “Supporting Plans,” identifies the following supporting plans and their sources:

- Commonwealth of Virginia Plan (Virginia Emergency Operations Plan, Radiological Emergency Response Basis Plan)

- RERPs for the Counties of Louisa, Spotsylvania, Orange, Caroline, and Hanover

- VCUMC Radiation Emergency Plan

- DOE FRMAC Operations Plan

The FRMAC assistance is discussed above in SER Section 13.3.4.3. COL Plan Appendix 5 lists supporting procedures entitled “Emergency Plan Training” and “Maintaining Emergency Preparedness.” The format for the COL Plan directly follows the format of NUREG–0654, as outlined in the Table of Contents, and Appendix 8 provides a cross-reference of the plan to the evaluation criteria in NUREG–0654.

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and the associated evaluation criteria in NUREG–0654.

Subject to License Condition 5, the staff finds that the applicant has established the responsibilities for plan development and review, including distribution of the emergency plans to all appropriate organizations. In addition, the applicant established provisions to properly train the planners (i.e., the individuals responsible for the emergency planning effort) and described the provisions to be employed to ensure that the emergency plan, its implementing procedures, and emergency equipment and supplies are maintained up-to-date.

Conclusion

Subject to License Condition 5, the staff concludes that the information provided in the COLA is consistent with the guidelines in NUREG–0654, Planning Standard P. Therefore, the staff finds that the information is acceptable and meets the relevant requirements of 10 CFR 50.47(b)(16) and 10 CFR Part 50, Appendix E, Section IV.G, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.17 Evacuation Time Estimate Analysis

The 10 CFR 50.47(b)(10) requires, in part, that ETEs have been developed by applicants and licensees, and that licensees shall update the ETEs on a periodic basis. In addition, 10 CFR Part 50, Appendix E, Section IV requires that the applicant provide an analysis of the time required to evacuate various sectors and distances within the plume exposure pathway EPZ for transient and permanent populations, using the most recent U.S. Census Bureau data as of the application submission date. NUREG–0654, Appendix 4, “Evacuation Time Estimates within the Plume Exposure Pathway Emergency Planning Zone,” contains the detailed guidance to be used by the staff to determine whether the ETE Report meets the applicable regulatory requirements in 10 CFR Part 50, Appendix E. Additional guidance is contained in NUREG/CR-6863 and NUREG/CR-7002. ETEs are part of the required EP basis and provide Dominion and State and local governments with site-specific information needed for protective action decision making.

The North Anna site is located approximately 64 km (40 mi) northwest of Richmond, Virginia. The North Anna site plume exposure pathway EPZ and the surrounding communities, along with major highways and geographic features, are shown on mapping in the ETE. The protective action zones (PAZ) are illustrated in Figure 6-1, “NAPS EPZ PAZ,” and the physical boundaries of each PAZ are described in Appendix L, “Protective Action Zone (PAZ) Boundaries.” These areas are typically bounded by local roadways and Lake Anna. Evacuation time estimates were determined for 41 evacuation regions (i.e., Regions R01 through R41), which encompass the entire area within the plume exposure pathway EPZ. The evacuation regions are listed in Tables 6-1 and H-1, and are shown in Figures H-1 through H-41.

COL Plan Section J.8 states that an ETE was conducted consistent with the guidance provided in Appendix 4 of NUREG–0654, NUREG/CR-6863, and NUREG/CR-7002. The population distribution and ETEs are summarized in Appendix 4 of COL Plan Part 5 (i.e., the COL Plan), which contains the Executive Summary of the full ETE Report. The North Anna 3 COLA includes, as supplemental information to the COL Plan, ETE Final Report (KLD TR-503), Revision 1, November 2012 (i.e., ETE Report), entitled, “North Anna Power Station – Development of Evacuation Time Estimates” (ADAMS Accession No. ML13221A389), which was prepared by KLD Engineering, P.C., in coordination with Dominion personnel and emergency management personnel representing State and local governments.

The ETE study (i.e., ETE Report) is based on local information, a telephone survey, and 2010 U.S. Census Bureau data, which was the most recent census data available when the ETE Report was revised in November 2012, and submitted to the NRC as part of the December 18, 2013, COLA update. The ETE Report provides a complete review of the evacuation road network, and the PAZ areas were used to define evacuation regions, which approximated keyhole sections within the plume exposure pathway EPZ. The ETE Report consists of these 13 sections and includes detailed supporting information in Appendices A-H and J-N.

Section 1 – Introduction (basic description of the analysis process)

Section 2 – Study Estimates and Assumptions (methodology used)

Section 3 – Demand Estimation (population and vehicles)

Section 4 – Estimation of Highway Capacity (ability of road network to service demand)

Section 5 – Estimation of Trip Generation Time (activity/event time distributions)

Section 6 – Demand Estimation for Evacuation Scenarios (region and scenario evacuation cases)

Section 7	–	General Population Evacuation Time Estimates (ETE) (results of computer analyses)
Section 8	–	Transit-Dependent and Special Facility Evacuation Time Estimates (analyses applied and results obtained)
Section 9	–	Traffic Management Strategy (traffic control designed to expedite movement of evacuating traffic)
Section 10	–	Evacuation Routes (major evacuation routes for the five counties within the plume exposure pathway EPZ)
Section 11	–	Surveillance of Evacuation Operations (concurrent surveillance procedures)
Section 12	–	Confirmation Time (suggested approach of stratified random sample and telephone survey to confirm that the evacuation process is effective)
Section 13	–	Recommendations (suggestions to improve/facilitate the evacuation process)

The Executive Summary of the ETE Report includes a summary of the conclusions reached in the report. Specifically, general population (i.e., permanent residents and transients) ETEs were computed for 574 unique cases, consisting of a combination of 41 unique evacuation regions and 14 unique evacuation scenarios. The 14 scenarios address different times of day, days of the week, weather conditions, a special event (i.e., Triathlon at Lake Anna State Park), and roadway impact. For each scenario, an analysis was included of the scenario applicable population segments including permanent residents and transient populations, transit-dependent permanent residents, special facility residents, and schools. In addition, the ETEs considered a shadow evacuation in each analysis to reflect evacuation of residents from outside of the official evacuation area; the estimated shadow population is presented in Figure 3-4.

The ETEs for the general population range from 1:45 (hr: min) to 3:45 for the 90th percentile. The maximum ETE for the 100th percentile is 6:40. The ETE statistics provide the elapsed times for 90 percent and 100 percent of the population to evacuate from within the impacted region. The 90th percentile ETEs have been identified as the values that should be considered when making protective action decision. This is because the 100th percentile ETEs are prolonged by those relatively few people who take longer to mobilize; referred to as the "evacuation tail." There is very little congestion experienced during evacuation of the EPZ. The ETEs are most influenced by the trip generation time, which is the time residents take to prepare to evacuate. Section M of the ETE study shows the ETEs are sensitive to the trip generation time.

Separate ETEs were computed for schools, the medical facility, transit-dependent persons, and homebound special needs persons. The average single-wave ETEs are comparable to the general population ETEs at the 90th percentile for these population segments, except for the transit-dependent where the average ETE was comparable to the general population ETEs at the 100th percentile. The ETE for the full EPZ (Region R03) is insensitive to changes in population growth and increased shadow evacuation.

The one special event, identified as the Kinetic Triathlon at Lake Anna State Park, and roadway impact scenarios have no material effect on the 100th percentile ETEs. The computation of ETEs considers staged evacuation, wherein people within the 2-mile region from the plant evacuate immediately, and those beyond 2 mi (i.e., downwind to the EPZ boundary) initially shelter-in-place and then evacuate. Federal guidance in Appendix 4 to NUREG–0654 suggests evacuation of the 0-2 mi regions and sectors downwind to 5 mi, and Federal guidance in Supplement 3 to NUREG–0654 and NUREG/CR-7002 suggests staged evacuation be considered where the 0-2 mi area evacuates while the 2-5 mi area shelters. The results of the study show there is no benefit in applying a staged evacuation approach for this EPZ. The current county traffic management plans for the North Anna site EPZ are sufficient, and the ETE study has not identified any necessary changes to the plans.

The staff evaluated the ETE Report against the criteria set forth in Appendix 4 to NUREG–0654, NUREG/CR-6863, and NUREG/CR-7002. The evaluation included checking the ETE Report for internal consistency, consistency with other parts of the emergency plan, and consistency with other parts of the COLA, including the FSAR. Citations in the ETE Report were verified by comparison to the cited document text. General descriptions of the North Anna site region, population, and highways were verified using internet searches, aerial photographs, and field survey observations. Demographic information was gathered, a field survey of the EPZ performed, trip generation times estimated, evacuation regions defined, the procedures specified in the 2010 Highway Capacity Manual applied, the site was modeled using the DYNEV II System traffic simulation model,[7] and ETEs were generated.

Section 3.3 of the ETE study describes a total of 2,298 transients and 899 vehicles assigned to campgrounds in the EPZ. These values correspond to values in Table E-5, "Campgrounds within the EPZ," which show 2,000 transients and 800 vehicles for the Christopher Run Campground and 298 transients and 99 vehicles for the Lake Anna State Park. Section 3.3 further states that data gathered from Lake Anna State Park include 1,920 transients and 480 vehicles, which correspond to values in Table E-6, "State Parks within the EPZ." In RAI Letter No. 118, May 5, 2014 (email, ADAMS Accession No. ML14125A460), the staff requested additional information from the applicant in RAI 13.03-9, regarding why there are two separate (and different) sets of transient data for Lake Anna State Park.

In a May 19, 2014, response to RAI 13.03-9 (ADAMS Accession No. ML14141A016), the applicant stated that the number of transients and vehicles was calculated separately for the campground/cabin facilities and for the day use facilities. Table E-5 presents the number of transients and vehicles for the Lake Anna State Park campground/cabin facilities. Table E-6 presents the number of transients and vehicles for the Lake Anna State Park day use facilities. The number of transients and vehicles presented in Tables E-5 and E-6 for Lake Anna State Park are exclusive of each other (i.e., the number of transients and vehicles are not double-counted). This clarification does not impact the calculated evacuation time estimates. The staff

---

[7] The DYNEV traffic simulation model is a macroscopic model that describes the operations of traffic flow in terms of aggregate variables: vehicles, flow rate, mean speed, volume, density, queue length, on each link, for each turn movement, during each Time Interval (i.e., simulation time step).

finds this response acceptable because the applicant's clarification that the values identified in the ETE study represent two different types of transient visitors to Lake Anna State Park (i.e., those that stay for the day, and those that stay overnight) demonstrates that all transients for this facility were included in the analysis. Therefore RAI 13.03-9 is resolved and closed.

In ETE Table 1-1, "Stakeholder Interaction," the applicant identified various interactions among the State and local government agencies, and stated that final review meetings had been conducted.

The staff finds that the applicant has developed adequate ETEs for the plume exposure pathway EPZ for transient and permanent populations using the most recent U.S. Census Bureau data as of the application (update) submission date. In addition, the ETEs are consistent with Appendix 4 to NUREG–0654, NUREG/CR-6863, and NUREG/CR-7002. (SER Section 13.3.4.10 addresses the ETE Report, with regard to protective action decision making for the plume exposure pathway EPZ).

Conclusion

The staff concludes that Revision 1 of the ETE Final Report (KLD TR-503, November 2012) is consistent with the guidelines in Appendix 4 to NUREG–0654, NUREG/CR-6863, and NUREG/CR-7002. Therefore, the staff finds that the information is acceptable and meets the relevant requirements of 10 CFR 50.47(b)(10) and 10 CFR Part 50, Appendix E, Section IV, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.18 COL Items, Supplemental Information, and ITAAC

As addressed above in SER Section 13.3.2, FSAR Section 13.3 identifies three emergency planning Standard COL Items from the ESBWR DCD (i.e., STD COL Items 13.3-1-A, 13.3-2-A, and 13.3-3-A). Three additional Standard COL Items from the ESBWR DCD, relating to EP, are identified in FSAR Section 13.4, "Operational Program Implementation," FSAR Section 14.3, and FSAR Appendix 1C "Industry Operating Experience," (i.e., STD COL Items 13.4-2-A, 14.3-1-A, and 1C.1-2-A, respectively). FSAR Table 1.10-201 lists the FSAR location(s) where the individual COL items from the DCD are addressed. In addition, FSAR Section 13.5.2.2 identifies one Standard Supplemental Information item (i.e., STD SUP 13.5-28). The following addresses the applicant's resolution of the six Standard COL Items and the Standard Supplemental Information item.

- STD COL 13.3-1-A

DCD COL Item 13.3-1-A states that the COL applicant is responsible for identifying the OSC and the communication interfaces for inclusion in the detailed design of the control room and TSC. In FSAR Section 13.3, the applicant identified this as STD COL 13.3-1-A, and stated that this COL item is addressed in COL Plan Sections II.F and II.H. The staff reviewed Sections II.F and II.H, and determined that the applicant identified the OSC and described the communication interfaces with the main control room and TSC. The staff's evaluation of the descriptions of OSC and communication interfaces is addressed above in SER Sections 13.3.4.6 and 13.3.4.8.

Therefore, the staff finds that the COL applicant has adequately addressed DCD COL Item 13.3-1-A.

- STD COL 13.3-2-A

DCD COL Item 13.3-2-A states that the COL applicant is responsible for the design of the communication system(s) located in the EOF, in accordance with NUREG–0696. In FSAR Section 13.3, the applicant identified this as STD COL 13.3-2-A, and stated that this COL item is addressed in COL Plan Sections II.F and II.H. The staff reviewed Sections II.F and II.H, and determined that the applicant described the EOF communication systems, in accordance with NUREG–0696. In addition, the applicant addressed EOF communication systems in COL Plan Section II.E and FSAR Section 9.5.2. The staff's evaluation of the EOF and its communication systems is addressed above in SER Sections 13.3.4.5, 13.3.4.6, and 13.3.4.8, and in SER Section 9.5.2. Therefore, the staff finds that the COL applicant has adequately addressed DCD COL Item 13.3-2-A.

- STD COL 13.3-3-A

DCD COL Item 13.3-3-A states that the COL applicant will provide supplies at the site for decontamination of onsite individuals in the service building, adjacent to the main change rooms. In FSAR Section 13.3, the applicant identified this as STD COL 13.3-3-A, and stated that this COL item is addressed in COL Plan Section II.J. The staff reviewed Section II.J, and determined that the applicant described supplies at the site for decontamination of onsite individuals in the service building, adjacent to the main change rooms. The staff's evaluation of decontamination of onsite individuals is addressed above in SER Section 13.3.4.10. Therefore, the staff finds that the COL applicant has adequately addressed DCD COL Item 13.3-3-A.

- STD COL 13.4-2-A

DCD COL Item 13.4-2-A states that the COL applicant will provide implementation milestones for operational programs that are required by NRC regulation. In FSAR Section 13.4, the applicant identified this as STD COL 13.4-2-A, and stated that FSAR Table 13.4-201, "Operational Programs Required by NRC Regulations," lists each operational program, the regulatory source for the program, the associated implementation milestone(s), and the Section of the FSAR in which the operational program is fully described. Table 13.4-201 lists the Emergency Planning program (Item) No. 14, and includes the associated implementation milestones. The staff reviewed FSAR Section 13.4 and Table 13.4-201, and determined that the applicant provided implementation milestones for the EP operational program that are required by NRC regulation. The staff's evaluation of these implementation milestones is addressed below in SER Section 13.3.4.19, and in SER Section 13.4, "Operational Programs." Therefore, the staff finds that the COL applicant has adequately addressed DCD COL Item 13.4-2-A.

- STD COL 14.3-1-A

DCD COL Item 14.3-1-A states that the COL applicant shall provide EP ITAAC based on industry guidance. In FSAR Section 14.3, the applicant identified this as STD COL 14.3-1-A, and stated that the set of generic EP ITAAC in SECY-05-0197, "Review of Operational

Programs in a Combined License Application and Generic Emergency Planning Inspections, Tests, Analyses, and Acceptance Criteria," October 28, 2005 (ADAMS Accession No. ML052770225), was considered in the development of the plant-specific EP ITAAC, which are tailored to the ESBWR design, and included in a separate part of the COLA (i.e., Part 10, Table 2.3-1, which is reflected below in SER Table 13.3-1). The ESBWR DCD does not include any EP ITAAC. The staff reviewed the EP ITAAC in Table 2.3-1 against the generic EP ITAAC in Table 14.3.10-1 of SRP, Section 14.3.10, and determined that the applicant provided EP ITAAC based on guidance in the SRP, because the EP ITAAC in SECY-05-0197 is a subset of, and consistent with, the EP ITAAC in Table 14.3.10-1. The staff's evaluations of individual EP ITAAC in Table 2.3-1 are addressed above in SER Section 13.3.4, as they relate to the various planning standards. Therefore, the staff finds that the COL applicant has adequately addressed DCD COL Item 14.3-1-A.

- STD COL 1C.1-2-A

DCD COL Item 1C.1-2-A states that the COL applicant will address the requirements of IE BL 2005-02 regarding emergency preparedness and response actions for security-based events. In FSAR Appendix 1C, the applicant identified this as STD COL 1C.1-2-A. Part 2 Table 1C-202 identifies COLA Part 5, Emergency Plan (i.e., COL Plan), as the location where BL 2005-02 is discussed. BL 2005-02 addresses five areas associated with emergency preparedness and response actions for security-based events. These areas, including the COL Plan Section(s) where each is addressed, are as follows:

(1) Emergency classification scheme for security events (COL Plan Section II.D)

(2) NRC notifications (COL Plan Section II.E)

(3) Onsite protective measures (COL Plan Sections II.H and II.J)

(4) ERO augmentation, including alternative emergency response facilities (COL Plan Sections II.B, II.H, and II.J)

(5) Security-related drill and exercise program (COL Plan Section II.N)

The staff reviewed the COLA against BL 2005-02 to identify actions taken or planned to be taken for areas (1) through (5), identified above, and determined that the applicant addressed all of the requirements of BL 2005-02, with regard to emergency preparedness and response actions for security-based events. The staff's evaluation, associated with the applicable areas (1) through (5) of BL 2005-02, is addressed above in SER Sections 13.3.4.2 (4), 13.3.4.4 (1), 13.3.4.5 (2), 13.3.4.8 (3) and (4), 13.3.4.10 (3) and (4), and 13.3.4.14 (5). Therefore, the staff finds that the COL applicant has adequately addressed DCD COL Item 1C.1-2-A.

- STD SUP 13.5-28

STD SUP 13.5-28 states that a discussion of emergency preparedness procedures can be found in the emergency plan, and a list of implementing procedures is maintained in the emergency plan. COL Plan Appendix 5 lists the EPIPs by topic, and states that EPIPs address a range of actions needed to implement the contents of the emergency plan. Specific topical

EPIPs are identified above in SER Section 13.3.4, in relation to their applicability to the various planning standards that are addressed in the emergency plan. Submission of EPIPs to the NRC is discussed below in SER Section 13.3.4.19, and addressed in ITAAC 9.1 of SER Table 13.3-1. Administrative, plant operating, and emergency procedures are addressed in DCD Tier 2, Section 13.5, "Plant Procedures," and discussed in SER Section 13.5, "Plant Procedures."

13.3.4.19 Implementation Milestones

Activities that the COL licensee shall perform after the COL is issued, that are applicable to EP, include the implementation milestones and license conditions listed below. In Table 13.4-201 of FSAR Section 13.4, the applicant listed operational programs required by NRC regulations. The EP program is identified as operational program (Item) No. 14, and includes the associated implementation milestones. The staff reviewed Table 13.4-201, and finds that the proposed implementation milestones associated with the EP program are acceptable because they are consistent with the relevant guidance and acceptance criteria in the SRP, and therefore meet the requirements in Appendix E of 10 CFR Part 50. The implementation milestone associated with EALs is subject to the staff-identified changes reflected in proposed License Condition 4 (see SER Sections 13.3.4.4 and 13.3.5). See also, STD SUP 13.5-28 in SER Section 13.3.4.18, ITAAC 9.1 in SER Table 13.3-1, and SER Sections 13.4 and 13.5, with regard to EPIPs.

Implementation Milestones

- Full participation exercise conducted within 2 years prior to scheduled date for initial loading of fuel, as required by 10 CFR Part 50, Appendix E, Section IV.F.2(a)(ii).

- Onsite exercise conducted within 1 year prior to the scheduled date for initial loading of fuel, as required by 10 CFR Part 50, Appendix E, Section IV.F.2(a)(ii).

- Licensee's detailed implementing procedures for its emergency plan submitted at least 180 days prior to the scheduled date for initial loading of fuel, as required by 10 CFR Part 50, Appendix E, Section V.

- The licensee shall submit a fully developed set of site-specific EAL to the NRC in accordance with the NRC-endorsed version of NEI 07-01, Revision. 0, with no deviations. The fully developed site-specific EAL scheme shall be submitted to the NRC for confirmation at least 180 days prior to initial fuel load.

13.3.5 Post-Combined License Activities

For the reasons discussed in the technical evaluation Section above, the staff proposes to include the following license conditions:

License Conditions 1 through 5

1. No later than 2 years before the latest date set forth in the schedule submitted in accordance with 10 CFR 52.99(a) for completing the inspections, tests, and analyses in

the ITAAC, the licensee shall have performed an assessment of on-site and augmented staffing capability for responding to a multi-unit event. The staffing assessment shall be performed in accordance with NEI 12-01, “Guidance for Assessing Beyond Design Basis Accident Response Staffing and Communications Capabilities.” At least one hundred eighty (180) days before the date scheduled for initial fuel loading, as set forth in the notification submitted in accordance with 10 CFR 52.103(a), the licensee shall complete implementation of corrective actions identified in the staffing assessment described above, and identify how the augmented staff will be notified given degraded communications capabilities, including any related emergency plan and implementing procedure changes and associated training. [See Section 13.3.4.2 of this report.]

2. No later than 2 years before the latest date set forth in the schedule submitted in accordance with 10 CFR 52.99(a) for completing the inspections, tests, and analyses in the ITAAC, the licensee shall have performed an assessment of on-site and off-site communications systems and equipment relied upon during an emergency event to ensure communications capabilities can be maintained during an extended loss of ac power. The communication capability assessment shall be performed in accordance with NEI 12-01, “Guidance for Assessing Beyond Design Basis Accident Response Staffing and Communications Capabilities.” At least one hundred eighty (180) days before the date scheduled for initial fuel loading, as set forth in the notification submitted in accordance with 10 CFR 52.103(a), the licensee shall complete implementation of corrective actions identified in the communications capability assessment described above, including any related emergency plan and implementing procedure changes and associated training. [See Sections 13.3.4.2 and 13.3.4.6 of this report.]

3. No later than 2 years before the latest date set forth in the schedule submitted in accordance with 10 CFR 52.99(a) for completing the inspections, tests, and analyses in the ITAAC, the licensee shall have performed an assessment of on-shift staffing in accordance with NEI 10-05, “Assessment of On-Shift Emergency Response Organization Staffing and Capabilities.” At least one hundred eighty (180) days before the date scheduled for initial fuel loading, as set forth in the notification submitted in accordance with 10 CFR 52.103(a), the licensee shall incorporate any changes to the emergency plan needed to bring staffing to the required levels. [See Section 13.3.4.2 of this report.]

4. No later than one hundred eighty (180) days before the date scheduled for initial fuel load set forth in the notification submitted in accordance with 10 CFR § 52.103(a), the licensee shall submit to the Director of NRO, or the Director’s designee, in writing, a fully developed set of plant-specific emergency action levels (EALs) for North Anna 3, in accordance with NEI 07-01, “Methodology for Development of Emergency Action Levels – Advanced Passive Light Water Reactors,” Revision 0, with no deviations. The EALs shall have been discussed and agreed upon with State and local officials. [See Section 13.3.4.4 of this staff FSER.]

5. No later than one hundred eighty (180) days before the date schedule for initial fuel load set forth in the notification submitted in accordance with 10 CFR § 52.103(a), the licensee shall update North Anna Units 1 and 2 Letters of Agreement with the following entities, or their successors, and revise the Unit 3 Emergency Plan to include these

updated Letters of Agreement after they have been executed. These updated Letters of Agreement shall identify the specific nature of arrangements in support of emergency preparedness for the North Anna site, including North Anna 3, and reflect expected assistance associated with hostile action at the North Anna site, as defined in 10 CFR Part 50, Appendix E, Section IV.A.7.

a. Commonwealth of Virginia Department of Emergency Management
b. Commonwealth of Virginia Department of Health
c. Commonwealth of Virginia Department of State Police
d. Commonwealth of Virginia Department of Game and Inland Fisheries
e. Virginia Commonwealth University Medical Center
f. Louisa County Administrator
g. Louisa County Sheriff
h. Louisa County Department of Fire and Emergency Medical Services
i. Spotsylvania County Sheriff
j. Spotsylvania Department of Fire, Rescue, and Emergency Management
k. Orange County Administrator
l. Orange County Sheriff
m. Caroline County Sheriff
n. Caroline County Department of Fire, Rescue, and Emergency Management
o. Hanover County Administrator
p. Hanover County Sheriff

[See Section 13.3.4.16 of this report.]

For the reasons discussed in the technical evaluation Section above, the staff proposes to include the following EP ITAAC:

- The licensee shall perform and satisfy the acceptance criteria of the EP ITAAC set forth in SER Table 13.3-1.

13.3.6 Conclusions

The staff reviewed the application, including applicable portions of the referenced North Anna site ESP SSAR and ESBWR DCD. The staff confirmed that the applicant addressed the required information relating to EP, and that there is no additional information needed to support the North Anna 3 COL application. The results of the staff's technical evaluation of the information incorporated by reference in the application are documented in NUREG–1835 for the ESP, and NUREG–1966 for the ESBWR standard design.

The EP ITAAC that are applicable to North Anna 3 are provided below in SER Table 13.3-1. The staff concludes that, pursuant to 10 CFR 52.80(a), the applicant included in the North Anna 3 COL application the proposed inspections, tests, and analyses that the licensee shall perform, and the acceptance criteria that are necessary and sufficient to provide reasonable assurance that, if the inspections, tests, and analyses are performed and the acceptance criteria met, the facility has been constructed and will operate in conformity with the license, the provisions of the Atomic Energy Act, and the NRC's rules and regulations.

The FEMA provided its findings and determinations concerning the adequacy of offsite EP and preparedness, which are based on its review of State and local emergency plans. FEMA concluded that the offsite State and local emergency plans are adequate to cope with an incident at the North Anna site, and there is reasonable assurance that these plans can be implemented. On the basis of its review of these FEMA findings and determinations, the staff concludes that the State and local emergency plans are adequate, and there is reasonable assurance that they can be implemented.

Based on its evaluation, the staff concludes that the onsite emergency plan establishes an adequate planning basis for an acceptable state of onsite emergency preparedness, and there is reasonable assurance that the plan can be implemented.

Base on FEMA's conclusions and the staff's evaluation, the staff concludes that the emergency plans provide an adequate expression of the overall concept of operation and describe the essential elements of advanced planning and the provisions made to cope with emergency situations. Therefore, the staff concludes that the overall state of onsite and offsite emergency preparedness, when fully implemented, will meet the requirements of 10 CFR 50.33(g), 10 CFR 50.47, Appendix E to 10 CFR Part 50, 10 CFR 52.77, 10 CFR 52.79(a)(21), 10 CFR 52.79(a)(22)(i), 10 CFR 52.79(b)(4), 10 CFR 52.80, 10 CFR 52.83, and 10 CFR 100.21.

Further, in accordance with 10 CFR 50.47(a), the staff concludes that, subject to the required conditions and limitations of the full-power license, including the license conditions listed in Section 13.3.5 of this SER, there is reasonable assurance that adequate protective measures can and will be taken in the event of a radiological emergency at the North Anna site, and that emergency preparedness at North Anna 3 is adequate to support full-power operations.

Table 13.3-1 North Anna 3 ITAAC

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
1.0 Emergency Classification System			
10 CFR 50.47(b)(4) – A standard emergency classification and action level scheme, the bases of which include facility system and effluent parameters, is in use by the nuclear facility licensee, and State and local response plans call for reliance on information provided by facility licensees for determinations of minimum initial offsite response measures.	1.1 A standard emergency classification and emergency action level (EAL) scheme exists, and identifies facility system and effluent parameters constituting the bases for the classification scheme. [D.1**] [**D.1 corresponds to NUREG-0654/FEMA-REP-1 evaluation criteria.] ITAAC element addressed in: Combined license (COL) Emergency Plan (EP) II.D.1	1.1 An inspection of the control room, technical support center (TSC), and emergency operations facility (EOF) will be performed to verify that they have displays for retrieving facility system and effluent parameters that constitute the bases for the classification scheme identified in the Emergency Plan Implementing Procedures (EPIPs).	1.1.1 The specific parameters identified in the EAL thresholds listed in the EPIPs have been retrieved and displayed in the control room, TSC, and EOF. 1.1.2 The ranges available in the control room, TSC, and EOF encompass the values for the specific parameters identified in the EAL thresholds listed in the EPIPs.
2.0 Notification Methods and Procedures			
10 CFR 50.47(b)(5) – Procedures have been established for notification, by the licensee, of State and local response organizations and for notification of emergency personnel by all organizations; the content of initial and follow-up messages to response organizations and the public has been established; and means to provide early notification and clear instruction to the populace within the plume exposure pathway Emergency Planning Zone (EPZ) have been established.	2.1 The means exist to notify responsible State and local organizations within 15 minutes after the licensee declares an emergency. [E.1] ITAAC element addressed in: COL EP II.E.1	2.1 A test will be performed of the capabilities.	2.1 A means to notify responsible organizations, within 15 minutes after the licensee declares an emergency, has been established via the Operational Hot Line among the control room, the Commonwealth of Virginia, Caroline County, Hanover County, Louisa County, Orange County, and Spotsylvania County.

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
	2.2 The means exist to notify emergency response personnel. [E.2] ITAAC element addressed in: COL EP II.E.2	2.2 A test will be performed of the capabilities.	2.2 A means exists to notify the North Anna 3 emergency response organization.
	2.3 The means exist to notify and provide instructions to the populace within the plume exposure EPZ. [E.6] ITAAC element addressed in: COL EP II.E.6	2.3 The full test of notification capabilities will be conducted.	2.3 A means exists to notify and provide instructions to the public in accordance with the emergency plan requirements.
3.0 Emergency Communications			
10 CFR 50.47(b)(6) – Provisions exist for prompt communications among principal response organizations to emergency personnel and to the public.	3.1 The means exist for communications among the control room, TSC, EOF, principal State and local emergency operations centers (EOCs), and radiological field assessment teams. [F.1.d] ITAAC element addressed in: COL EP II.F.1.d	3.1 A test will be performed of the capabilities.	3.1.1 Communications have been established between the control room and TSC. 3.1.2 Communications have been established among the control room, TSC, and EOF. 3.1.3 Communications via the Operational Hot Line have been established among the TSC and EOCs, which include the Commonwealth of Virginia, Caroline County, Hanover County, Louisa County, Orange County, and Spotsylvania County. 3.1.4 Communications have been established between the TSC and radiological monitoring teams. 3.1.5 Communications have been established between the EOF and radiological monitoring teams.

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
	3.2 The means exist for communications from the control room, TSC, and EOF to the Nuclear Regulatory Commission (NRC) headquarters and regional office EOCs (including establishment of the Emergency Response Data System (ERDS) between the onsite computer system and the NRC Operations Center). [F.1.f] ITAAC element addressed in: COL EP II.F.1.f	3.2 A test will be performed of the capabilities.	3.2 Communications have been established from the control room, TSC, and EOF to the NRC headquarters and Region II EOCs and an access port for ERDS is provided.
4.0 Public Education and Information			
[Deleted]	[Deleted]	[Deleted]	[Deleted]
5.0 Emergency Facilities and Equipment			
10 CFR 50.47(b)(8) – Adequate emergency facilities and equipment to support the emergency response are provided and maintained.	5.1 The licensee has established a TSC and onsite operational support center (OSC). [H.1] ITAAC element addressed in: COL EP II.H.1	5.1 An inspection of the as-built TSC and OSC will be performed.	5.1.1 The TSC has at least 1950 square feet of floor space. 5.1.2 The following communications equipment have been provided in the TSC and voice transmission and reception have been accomplished: a. NRC systems: Emergency Notification System (ENS), Health Physics Network (HPN), Reactor Safety Counterpart Link (RSCL), Protective Measures Counterpart Link (PMCL),

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			Management Counterpart Link (MCL) b. Dedicated telephone to EOF c. Dedicated telephone to control room d. Dedicated telephone to OSC 5.1.3 The TSC has been located in the Electrical Building. 5.1.4 The TSC includes radiation monitors and a ventilation system with a high efficiency particulate air (HEPA) and charcoal filter. 5.1.5 A back-up electrical power supply is available for the TSC.
			5.1.6 The OSC is in a location separate from the control room. 5.1.7 The following communications equipment have been provided in the OSC and voice transmission and reception have been accomplished: a. Dedicated telephone to control room b. Dedicated telephone to TSC c. Plant page system (voice transmission only)
	5.2 The licensee has established an EOF. [H.2] ITAAC element addressed in: COL EP II.H.2	5.2 An inspection of the EOF will be performed.	5.2.1 A report exists that confirms the EOF has at least 243 square meters (2625 square feet). 5.2.2 Voice transmission and reception have been accomplished between the EOF and TSC. 5.2.3 A report exists that confirms voice transmission and reception have been accomplished via the Operational Hot Line among the EOF,

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			Commonwealth of Virginia, Caroline County, Hanover County, Louisa County, Orange County, and Spotsylvania County. 5.2.4 The EOF has the means to acquire, display and evaluate radiological, meteorological, and plant system data pertinent to determining offsite protective measures.
6.0 Accident Assessment			
10 CFR 50.47(b)(9) – Adequate methods, systems, and equipment for assessing and monitoring actual or potential offsite consequences of a radiological emergency condition are in use.	6.1 The means exist to provide initial and continuing radiological assessment throughout the course of an accident. [I.2] ITAAC element addressed in: COL EP II.I.2, Appendix 2	6.1 A test of the emergency plan will be conducted by performing an exercise or drill to verify the capability to perform accident assessment.	6.1 An exercise or drill has been accomplished, including use of selected monitoring parameters identified in the EAL thresholds listed in the EPIPs, to assess simulated degraded plant conditions and initiate protective actions in accordance with the following criteria: A. *Accident Assessment and Classification* 1. Initiating conditions identified, EAL parameters determined, and the emergency correctly classified throughout the drill. 2. Protective action recommendations developed and communicated to appropriate authorities. B. *Radiological Assessment and Control* 1. Onsite radiological surveys performed and samples collected. 2. Radiation exposure of emergency workers monitored and controlled. 3. Field monitoring teams assembled and deployed.

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			4. Field team data collected and disseminated. 5. Dose projections developed. 6. The decision whether to issue radioprotective drugs to NAPS emergency workers made.
	6.2 The means exist to determine the source term of releases of radioactive material within plant systems, and the magnitude of the release of radioactive materials based on plant system parameters and effluent monitors. [I.3] ITAAC element addressed in: COL EP II.I.3, Appendix 2	6.2 An analysis of EPIPs and the Offsite Dose Calculation Manual (ODCM) will be completed to verify the ability to determine the source term and magnitude of release.	6.2 The EPIPs and ODCM correctly calculate source terms and magnitudes of postulated releases.
	6.3 The means exist to continuously assess the impact of the release of radioactive materials to the environment, accounting for the relationship between effluent monitor readings, and onsite and offsite exposures and contamination for various meteorological conditions. [I.4] ITAAC element addressed in: COL EP II.I.4, Appendix 2	6.3 An analysis of EPIPs and the ODCM will be completed to verify the relationship between effluent monitor readings and offsite exposures and contamination for various meteorological conditions has been established.	6.3 The EPIPs and ODCM calculate the relationship between effluent monitor readings and offsite exposures and contamination for various meteorological conditions.
	6.4 The means exist to acquire and evaluate meteorological information. [I.5]	6.4 An inspection of the control room, TSC, and EOF will be performed to verify the availability of the	6.4 The following meteorological data is available in the control room, TSC, and EOF:

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
	ITAAC element addressed in: COL EP II.I.5	following meteorological data: • Wind speed (at 10 meters (m) and 48.4 m) • Wind direction (at 10 m and 48.4 m) • Ambient air temperature (at 10 m) • Differential air temperature (between 10 m and 48.4 m)	• Wind speed (at 10 m and 48.4 m) • Wind direction (at 10 m and 48.4 m) • Ambient air temperature (at 10 m) • Differential air temperature (between 10 m and 48.4 m)
	6.5 The means exist to make rapid assessments of actual or potential magnitude and locations of any radiological hazards through liquid or gaseous release pathways, including activation, notification means, field team composition, transportation, communication, monitoring equipment, and estimated deployment times. [I.8] ITAAC element addressed in: COL EP II.I.8	6.5 A test will be performed of the capabilities.	6.5 Demonstrate the capability for making rapid assessment of the actual or potential magnitude and locations of any radiological hazards through liquid or gaseous release pathways.
	6.6 The capability exists to detect and measure radioiodine concentrations in air in the plume exposure EPZ, as low as 10^{-7} µCi/cc (microcuries per cubic centimeter) under field conditions. [I.9] ITAAC element addressed in: COL EP II.I.9	6.6 A test of NAPS field survey instrumentation will be performed to verify the capability to detect airborne concentrations as low as 1E-07 µCi/cc.	6.6 Instrumentation used for monitoring I-131 to detect airborne concentrations as low as 1E-07 µCi/cc has been provided.

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
	6.7 The means exist to estimate integrated dose from the projected and actual dose rates, and for comparing these estimates with the Environmental Protection Agency (EPA) protective action guides (PAGs). [I.10] ITAAC element addressed in: COL EP II.I.10, Appendix 2	6.7 An analysis of EPIPs will be performed to verify that a methodology is provided to establish means for relating contamination levels and airborne radioactivity levels to dose rates and gross radioactivity measurements for the following isotopes: Kr-88, Ru-106, I-131, I-132, I-133, I-134, I-135, Te-132, Xe-133, Xe-135, Cs-134, Cs-137, Ce-144	6.7 A report exists and concludes a methodology has been established for relating contamination levels and airborne radioactivity levels to dose rates and gross radioactivity measurements for the specified isotopes (Kr-88, Ru-106, I-131, I-132, I-133, I-134, I-135, Te-132, Xe-133, Xe-135, Cs-134, Cs-137, Ce-144), and for comparing the dose estimates with the EPA PAGs.
7.0 Protective Response			
10 CFR 50.47(b)(10) – A range of protective actions has been developed for the plume exposure EPZ for emergency workers and the public. In developing this range of actions, consideration has been given to evacuation, sheltering, and, as a supplement to these, the prophylactic use of potassium iodide (KI), as appropriate. Guidelines for the choice of protective actions during an emergency, consistent with Federal guidance, are developed and in place, and protective actions for the ingestion exposure EPZ appropriate to the locale have been developed.	7.1 The means exist to warn and advise onsite individuals of an emergency, including those in areas controlled by the operator, including: [J.1] a. employees not having emergency assignments; b. visitors; c. contractor and construction personnel; and d. other persons who may be in the public access areas, on or passing through the site, or within the owner controlled area. ITAAC element addressed in: COL EP II.J.1	7.1 A test of the onsite warning and communications capability will be performed during a drill or exercise.	7.1.1 During a drill or exercise, notification and instructions were provided to onsite workers and visitors, within the Protected Area, over the plant public announcement system. 7.1.2 During a drill or exercise, audible warnings were provided to individuals outside the Protected Area, but within the Owner Controlled Area.
8.0 Exercises and Drills			

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
10 CFR 50.47(b)(14) – Periodic exercises are (will be) conducted to evaluate major portions of emergency response capabilities, periodic drills are (will be) conducted to develop and maintain key skills, and deficiencies identified as a result of exercises or drills are (will be) corrected.	8.1 Licensee conducts a full-participation exercise to evaluate major portions of emergency response capabilities, which includes participation by each State and local agency within the plume exposure EPZ, and each State within the ingestion control EPZ. [N.1] ITAAC element addressed in: COL EP II.N.1	8.1 A full-participation exercise (test) will be conducted within the specified time periods of Appendix E to 10 CFR Part 50.	8.1.1 The exercise is completed within the specified time periods of 10 CFR Part 50, Appendix E, and a report exists that confirms onsite exercise objectives listed below have been met and there are no uncorrected onsite exercise deficiencies. A. *Accident Assessment and Classification* 1. Demonstrate the ability to identify initiating conditions, determine EAL parameters, and correctly classify the emergency throughout the exercise. Standard Criteria: a. Determine the correct highest emergency classification level based on events which were in progress, considering past events and their impact on the current conditions, within 15 minutes from the time the initiating condition(s) or EAL(s) is (are) identified. B. *Notifications* 1. Demonstrate the ability to alert, notify, and mobilize site emergency response personnel. Standard Criteria: a. Initiate activation of the emergency recall system following initial event classification for an Alert or higher. 2. Demonstrate the ability to notify responsible State and local government agencies within 15 minutes and the NRC within 60 minutes after declaring an emergency.

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			a. Initiate transmittal of initial information to the Commonwealth of Virginia and risk jurisdictions using the designated EPIP within 15 minutes of event classification. b. Initiate transmittal of follow-up information to the Commonwealth of Virginia and risk jurisdictions using the designated EPIP within appropriate interval. c. Initiate transmittal of initial information to the NRC using the designated EPIP within 60 minutes of event classification. 3. Demonstrate the ability to warn or advise onsite individuals of emergency conditions. Standard Criteria: a. Initiate notification of onsite individuals (via plant page or telephone), using the designated EPIP within 15 minutes of notification. 4. Demonstrate the capability of the Alert and Notification System (ANS) sirens to operate properly when required. Standard Criteria: a. 90 percent of the sirens operate properly. C. *Emergency Response* 1. Demonstrate the capability to direct and control emergency operations. Standard Criteria: a. Command and control is demonstrated by the control room in the early phase of the emergency

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			and the TSC, after its activation. 2. Demonstrate the ability to transfer emergency direction from the control room (simulator) to the TSC. Standard Criteria: a. Briefings were conducted prior to turnover responsibility. Personnel document transfer of duties. 3. Demonstrate the ability to prepare for around-the-clock staffing requirements. Standard Criteria: a. Complete 24-hour staff assignments. 4. Demonstrate the ability to perform assembly and accountability for all onsite individuals during an emergency requiring Protected Area assembly and accountability. Standard Criteria: a. Protected Area personnel assembly and accountability completed within 30 minutes following initiation of assembly and accountability measures. D. *Emergency Response Facilities* 1. Demonstrate activation of the OSC, and full functional operation of the TSC and EOF. Standard Criteria: a. The TSC, OSC, and EOF are activated within about 60 minutes of the initial notification. 2. Demonstrate the adequacy of equipment, security provisions, and habitability precautions for the TSC, OSC, EOF, and

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			Joint Information Center (JIC), as appropriate. Standard Criteria: a. Demonstrate the adequacy of the emergency equipment in the emergency response facilities. b. The Security Team Leader implements and follows applicable EPIPs. c. The Health Physics (HP) personnel implement the designated EPIP provisions if an onsite or offsite release has occurred. 3. Demonstrate the adequacy of communications for all emergency support resources. Standard Criteria: a. Emergency response facility personnel are able to operate all specified communication systems. b. Clear primary or backup communications links are established and maintained for the duration of the exercise. E. *Radiological Assessment and Control* 1. Demonstrate the ability to obtain onsite radiological surveys and samples. Standard Criteria: a. HP personnel demonstrate the ability to obtain appropriate instruments (range and type) and take surveys. b. Airborne samples are taken when the conditions indicate the need for the information. 2. Demonstrate the ability to continuously monitor

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			and control radiation exposure to emergency workers. Standard Criteria: a. Emergency workers are issued self-reading dosimeters when radiation levels require, and exposures are controlled to 10 CFR Part 20 occupational dose limits (unless the Emergency Coordinator/EOF Director authorizes emergency limits). b. Exposure records are available. c. Emergency workers include Security and personnel within all emergency facilities. 3. Demonstrate the ability to assemble and deploy field monitoring teams. Standard Criteria: a. One field monitoring team is ready to be deployed within 60 minutes of being requested, and no later than 90 minutes from the declaration of an Alert or higher emergency. 4. Demonstrate the ability to satisfactorily collect and disseminate field team data. Standard Criteria: a. Field team data to be collected is dose rate or counts per minute (cpm) from the plume, both open and closed window, and air sample (gross/net cpm) for particulate and iodine, if applicable. b. Satisfactory data dissemination is from the field team to HP (Plume

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			Tracking/Dose Assessment) personnel. 5. Demonstrate the ability to develop dose projections. Standard Criteria: a. Timely and accurate dose projections are performed in accordance with EPIPs. 6. Demonstrate the ability to make the decision whether to issue radioprotective drugs to emergency workers. Standard Criteria: a. Radioprotective drugs are taken (simulated) if the estimated dose to the thyroid will exceed 25 rem committed dose equivalent (CDE). 7. Demonstrate the ability to develop appropriate protective action recommendation(s) (PAR(s)) and notify appropriate authorities within 15 minutes of development. Standard Criteria: a. Total effective dose equivalent (TEDE) and CDE dose projections from the dose assessment computer code are compared to criteria in EPIPs. b. PAR(s) is (are) developed within 15 minutes of data availability, as appropriate. c. PAR(s) is (are) transmitted to responsible State and local government agencies within 15 minutes of development. F. *Public Information*

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			1. Demonstrate the capability to develop and disseminate clear, accurate, and timely information to the news media. Standard Criteria: a. Media information (e.g., press releases, press briefings, electronic media) is made available following notification of Dominion External Affairs personnel. 2. Demonstrate the capability to establish and effectively operate rumor control in a coordinated fashion. Standard Criteria: a. Calls are answered in a timely manner with the correct information. b. Rumors are identified and addressed. G. *Evaluation* 1. Demonstrate the ability to conduct a post-exercise critique, to determine areas requiring improvement and corrective action. Standard Criteria: a. An exercise time-line is developed, followed by an evaluation of the objectives. b. Significant problems in achieving the objectives are discussed to ensure understanding of why objectives were not fully achieved. c. Recommendations for improvement in non-objective areas are discussed.

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			8.1.2 Onsite emergency response personnel are mobilized in sufficient number to fill the emergency positions identified in COL EP II.B, Onsite Emergency Organization, and a report exists that confirms they successfully perform their assigned responsibilities as outlined in Acceptance Criterion 8.1.1.D, Emergency Response Facilities.
			8.1.3 The exercise is completed within the specified time periods of 10 CFR Part 50, Appendix E, a report exists that confirms offsite exercise objectives have been met and there are no uncorrected offsite deficiencies, or a license condition requires offsite deficiencies to be corrected prior to operation above 5 percent of rated power.
9.0 Implementing Procedures			
10 CFR Part 50, Appendix E.V – No less than 180 days prior to the scheduled issuance of an operating license for a nuclear power reactor or a license to possess nuclear material, the applicant's detailed implementing procedures for its emergency plan shall be submitted to the Commission.	9.1 The licensee has submitted detailed implementing procedures for its emergency plan no less than 180 days prior to fuel load.	9.1 An inspection will be performed to confirm that the detailed implementing procedures for the North Anna 3 Emergency Plan were submitted to the NRC.	9.1 Each of the detailed implementing procedures for the North Anna 3 Emergency Plan, as defined in Appendix 5 of the Emergency Plan, are submitted to the NRC no less than 180 day prior to fuel load.

13.4 <u>Operational Program Implementation</u>

13.4.1 Introduction

This Section of the FSAR addresses the operational programs described in NRC guidance SECY-05-0197. The Section includes a description of the programs and the proposed implementation milestones for each program.

This Section describes the proposed implementation milestones for each operational program in compliance with the guidance of RG 1.206, Regulatory Position C.I.13.4. The applicant provides this information in FSAR Table 13.4-201 "Operational Programs Required by NRC Regulations," which lists each operational program, the regulatory requirement for the program, the associated implementation milestone(s), and the Section of the FSAR that describes the operational program.

13.4.2 Summary of Application

Section 13.4.1 of North Anna 3 COL FSAR, Revision 8, incorporates by reference Section 13.4.1 of the certified ESBWR DCD, Revision 10. In addition, in FSAR Section 13.4.1, Revision 8, the applicant provides the following:

<u>COL Items</u>

- STD COL 13.4-1-A Operational Programs

Table 13.4-201 lists each operational program, the regulatory source for the program, the associated implementation milestone(s), and the Section of the FSAR that fully describes the operational program, as required by RG 1.206.

- STD COL 13.4-2-A Implementation Milestones

The applicant provided the information in FSAR Table 13.4-201, which lists each operational program, the regulatory requirement for each program, the associated implementation milestone(s), and the Section of the FSAR that fully describes the operational program consistent with the guidance in RG 1.206.

13.4.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is in NUREG–1966. In addition, in the Staff Requirements Memorandum on SECY-05-0197, the Commission provided the following directions regarding operational programs:

- Include license conditions for operational programs in the COL, where implementation requirements are not specified in the regulations.

- Identify the list of operational programs required to be included in a COL application.

- Use the proposed generic EP-ITAAC as a model for EP-ITAAC to be included in COL applications.

- The SRP Section 13.4.1 provides guidance for staff review. For a COL application, the staff reviews the applicable table in FSAR Section 13.4.1, Revision 8, to ensure that all required operational programs are included. The staff's review of the operational program description and the proposed implementation milestones is performed within the identified SRP Section reviews.

13.4.4 Technical Evaluation

As documented in NUREG–1966, the staff reviewed and approved Section 13.4 of the certified ESBWR DCD, Revision 10. The staff reviewed Section 13.4 of North Anna 3 COL FSAR, Revision 8, and checked the referenced ESBWR DCD to ensure that the combination of the information in the COL FSAR and the information in the ESBWR DCD appropriately represents the complete scope of information relating to this review topic.[1] The staff's review confirmed that the information in the application and the information incorporated by reference address the relevant information related to this Section.

The staff reviewed the information in North Anna 3 COL FSAR as follows:

COL Items

- STD COL 13.4-1-A Operational Programs
- STD COL 13.4-2-A Implementation Milestones

The staff reviewed FSAR Table 13.4-201 and determined that the applicant had identified the operational programs required by NRC regulations and had provided a description of the proposed implementation milestones for each program in North Anna 3 COL Part 10, "Tier 1/ITAAC/Proposed License Conditions." The technical evaluation of the operational programs to ensure that the applicant has fully described the programs and their associated implementation milestones is provided in the respective Section of this SER.

Operational Program Implementation Schedule License Condition:

> No later than 12 months after issuance of the COL, Dominion shall submit to the Director of NRO, or the Director's designee, a schedule for implementation of the operational programs listed in FSAR Table 13.4-201, including the associated estimated date for initial loading of fuel.
>
> The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until all the operational programs listed in FSAR Table 13.4-201 have been fully implemented.

13.4.5 Post Combined License Activities

License Condition Section 3.6 of North Anna COLA Part 10 references North Anna 3 FSAR Table 13.4-201, for the implementation milestones for each operational program. These implementation milestones, the schedule for which is required to be submitted and updated in accordance with the license condition described above, specify activities to be completed following issuance of the COL. Implementation of each operational program will be evaluated by the staff according to the respective implementation milestone.

13.4.6 Conclusion

The staff's finding related to information incorporated by reference is in NUREG–1966. The staff reviewed the COL application and checked the referenced DCD. The staff's review confirms that the applicant has addressed the required information, and no outstanding information is expected to be addressed in the COL FSAR related to this Section. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to this Section that were incorporated by reference have been resolved.

In addition, the staff compared the additional COL information in the application to the relevant NRC regulations, the guidance in SRP Section 13.4.1, and other NRC RGs. The staff's review concludes that the applicant has presented adequate information on COL Items STD COL 13.4-1-A and 13.4-2-A in Table 13.4-201 of the COL FSAR.

13.5 <u>Plant Procedures</u>

This Section of the FSAR addresses the administrative and operating procedures that the operating organization (plant staff) uses to ensure that routine operating, off-normal, and emergency activities are conducted in a safe manner. This Section is divided into two Sections that are described below—Administrative Procedures and Operating and Emergency Operating Procedures. The inspection of the procedures will occur as part of the construction inspection program.

13.5.1 Administrative Procedures

13.5.1.1 Introduction

The administrative procedures the applicant uses to ensure that routine operating, off-normal, and emergency activities are conducted in a safe manner are provided. In plant procedures, the applicant provides a brief description of the nature and content of the procedures and a schedule for the preparation of appropriate written administrative and operating procedures. The applicant delineates in the description of the procedures the functional position for procedural revisions and approval before implementation.

13.5.1.2 Summary of Application

Section 13.5.1 of North Anna 3 COL FSAR, Revision 8, incorporates by reference Section 13.5.1 of the certified ESBWR DCD Revision 10. In addition, in FSAR Section 13.5.1, the applicant provides the following information:

COL Item

- STD COL 13.5-1-A Administrative Procedures

Industry guidance for the appropriate format, content, and typical activities delineated in written procedures is implemented, as appropriate. Guidance is based on ASME NQA-1, "Quality Assurance Requirements for Nuclear Facility Applications."

Administrative procedures are developed in accordance with the nominal schedule presented in Table 13.5-202.

Supplemental Information

- STD SUP 13.5-1

In FSAR Section 13.5, the applicant states that this Section describes the administrative and operating procedures that the operating organization (plant staff) uses to conduct routine operating, abnormal, and emergency activities in a safe manner.

- STD SUP 13.5-2

The quality assurance program description (QAPD) describes procedural document control, record retention, adherence, assignment of responsibilities, and changes.

- STD SUP 13.5-3

Procedures are identified in this section by topic, type, or classification in lieu of the specific title and represent general areas of procedural coverage.

- STD SUP 13.5-4

The applicant states that procedures are developed before fuel loading to allow sufficient time for plant staff familiarization and to allow staff adequate time to review the procedures and to develop operator licensing examinations.

- CWR COL 13.5-4-A

Industry guidance for the appropriate format, content, and typical activities delineated in written procedures is implemented, as appropriate. Guidance is based on ASME NQA-1, "Quality Assurance Requirements for Nuclear Facility Applications" (Reference 13.5-02).

- STD SUP 13.5-5

The format and content of procedures are controlled by administrative procedure(s). Procedures are organized to include the following components, as necessary:

    - Title Page
    - Table of Contents
    - Scope and Applicability

- Responsibilities
- Prerequisites
- Precautions and Limitations
- Main Body
- Acceptance Criteria
- Check-off Lists
- References
- Attachments and Data Sheets

- STD SUP 13.5-6

Each procedure is sufficiently detailed for an individual to perform the required function without direct supervision but does not provide a complete description of the system or plant process. The level of detail in the procedure is commensurate with the qualifications of the individual normally performing the function.

- STD SUP 13.5-7

Procedures are developed to be consistent with the guidance described in DCD Section 18.9, "Procedure Development," and with input from the human factors engineering (HFE) process and evaluations.

The bases for procedure development include:

- Plant design bases

- System-based technical requirements and specifications

- Task analyses results

- Risk-important human actions identified in the human reliability analysis (HRA)/probabilistic risk assessment (PRA)

- Initiating events considered in the Emergency Operating Procedures (EOPs), including those events in the design bases

- Generic Technical Guidelines (GTG) for EOPs

Procedure verification and validation (V&V) includes the following activities, as appropriate:

- A review to verify they are correct and can be carried out.

- A final validation in a simulation of the integrated system as part of the V&V activities as described in DCD Section 18.11, "Human Factors Verification and Validation."

- A verification of modified procedures for adequate content, format, and integration.

- The procedures are assessed through validation if a modification substantially changes personnel tasks that are significant to plant safety. The validation verifies that the procedures correctly reflect the characteristics of the modified plant and can be performed effectively to restore the plant.

- STD SUP 13.5-8

Procedures for shutdown management are developed to be consistent with the guidance in NUMARC 91-06, “Guidelines for Industry Actions to Assess Shutdown Management,” to reduce the potential for the loss of reactor coolant system boundary and inventory during shutdown conditions. (Reference 13.5-203)

- STD SUP 13.5-9

This Section describes administrative procedures that provide administrative controls over activities that are important to safety for the operation of the facility.

- CWR SUP 13.5-10

Procedures outline the essential elements of the administrative programs and controls as described in ASME NQA-1 and Section 17.5. These procedures are organized such that the program elements are prescribed in documents normally referred to as administrative procedures. Administrative procedures contain adequate programmatic controls to provide effective interface between organizational elements. This includes contractor and owner organizations providing support to the station operating organization.

- CWR SUP 13.5-11

Procedure control is discussed in the QAPD. Type and content of procedures are discussed throughout Section 13.5.

- STD SUP 13.5-12

The applicant defines the procedure writer’s guide.

- STD SUP 13.5-13

The applicant states that updates to maintenance and control procedures are performed according to the QAPD.

- STD SUP 13.5-14

The applicant states that the administrative programs and associated procedures developed in the pre-COL phase are described in Table 13.5-201.

- STD SUP 13.5-15

This Section describes those procedures that provide administrative controls with respect to procedures, including those that define and provide controls for operational activities of the plant staff.

- STD SUP 13.5-16

The applicant provides a list of plant administrative procedures.

13.5.1.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is in NUREG–1966. In addition, the relevant requirements of the Commission regulations for the administrative and plant procedures, and the associated acceptance criteria, are in Section 13.5.1 and SRP Section 13.5.2.1.

In particular, the relevant provisions for reviewing plant procedures are based on (1) meeting the methods and criteria described in 10 CFR 52.79(a)(14), (26), (29)(i), (29)(ii), (33), and (34), and in TMI Action Plan Items I.C.1 and I.C.9; and (2) meeting the guidance of SRP, Sections 13.5.1.1 and 13.5.2.1. The review of FSAR information related to the development of emergency procedures is based on meeting the requirements of 10 CFR 52.79(a)(14), (26), (29)(i), (29)(ii), (33), and (34); and the guidance of SRP, Section 13.5.2.1.

The provisions for reviewing COL Item STD COL 13.5-1-A related to the implementation of the plan are based on the following:

- Meeting the requirements of 10 CFR 52.79(a)(14), (26), (29)(i), (29)(ii), (33), and (34).
- Meeting the TMI Action Plan requirements described in NUREG–0737 and Supplement 1 to NUREG–0737.
- The plant procedures in accordance with the provisions of TMI Action Plan Item I.C.5.
- The guidance of SRP, Sections 13.5.1.1 and 13.5.2.1.

The relevant provisions for reviewing FSAR information related to the procedures included in the scope of the plan are based on (1) meeting the requirements of the procedures in Sections A3, A5, and A10 of ANSI/ANS-3.2; and (2) meeting the guidance of SRP, Sections 13.5.1.1 and 13.5.2.1.

13.5.1.4 Technical Evaluation

As documented in NUREG–1966, the staff reviewed and approved Section 13.5.1 of the certified ESBWR DCD, Revision 10. The staff reviewed Section 13.5.1 of North Anna 3 COL FSAR, Revision 8 and checked the referenced ESBWR DCD, Revision 10 to ensure that the combination of the information in the COL FSAR and the information in the ESBWR DCD appropriately represents the complete scope of information relating to this review topic.[1] The staff's review confirmed that the information in the application and the information incorporated by reference address the required information relating to administrative procedures.

The staff reviewed the information in the North Anna 3 COL FSAR as follows:

COL Item

- STD COL 13.5-1-A

The applicant states that industry guidance ASME NQA-1 for the appropriate format, content, and typical activities delineated in written procedures is implemented, as appropriate. Administrative procedures are developed in accordance with the nominal schedule presented in Table 13.5-202.

The ESBWR DCD Tier 2, Section 13.5.1 states that the applicant shall develop the administrative procedures, therefore in North Anna 3 COL FSAR, the applicant in Section 13.5.1 states, "This section describes administrative procedures that provide administrative control over activities that are important to safety for the operation of the facility."

The staff reviewed FSAR Section 13.5.1 and Table 13.5-202 and determined that they address the development of the administrative procedures within the timeline specified in SRP, Section 13.5.1.1. The staff concluded that the new paragraph meets the criteria in SRP, Section 13.5.1.1.

Supplemental Information

In addition to the supplemental items listed in Sections 13.5.1 and 13.5.2 of the FSAR, STD SUP Items 13.5.3 through13.5.9 described in FSAR Section 13.5 provide additional detail of the applicant's process for developing all of North Anna 3 procedures.

- STD SUP 13.5-1

The staff reviewed STD SUP 13.5-1, which describes the administrative and operating procedures used to conduct routine operating, abnormal, and emergency operating activities. The staff determined that this Section of the applicant's FSAR meets the criteria in SRP, Section 13.5.1.1 and is therefore acceptable.

- STD SUP 13.5-2

The QAPD describes procedural document control, record retention, adherence, assignment of responsibilities, and changes. The QAPD is evaluated in Chapter 17, "Quality Assurance," of this SER.

The staff reviewed STD SUP 13.5-2, which describes procedural document control, record retention, adherence, assignment of responsibilities, and changes. The staff determined that this Section of the applicant's FSAR meets the criteria in SRP, Section 13.5.1.1, combined with evaluation of the QAPD in Chapter 17 and is therefore acceptable.

- STD SUP 13.5-3

This Section identifies procedures by topic, type, or classification in lieu of the specific title, and represents general areas of procedural coverage.

The staff reviewed STD SUP 13.5-3, which states that plant procedures are identified by topic, type, or classification. The staff determined that this Section of the applicant's FSAR meets the criteria in SRP, Section 13.5.1.1 and is therefore acceptable.

- STD SUP 13.5-4

The applicant states that:

> Procedures are developed prior to fuel load to allow sufficient time for plant staff familiarization and to allow staff adequate time to review the procedures and to develop operator licensing examinations.

The staff reviewed STD SUP 13.5-4 to develop plant procedures before initial fuel loading. The staff determined that this Section of the applicant's FSAR meets the criteria in SRP, Section 13.5.1.1 and is therefore acceptable.

- CWR COL 13.5-4-A

The staff reviewed CWR COL 13.5-4-A, which states that industry guidance based on ASME NQA-1 is implemented as appropriate for the format, content, and activities delineated in written procedures. The staff determined that this Section of the applicant's FSAR meets the criteria in SRP, Section 13.5.1.1 and is therefore acceptable.

- STD SUP 13.5-5

Administrative procedures control the format and content of procedures, which are organized to include the following components, as necessary:

- Title Page
- Table of Contents
- Scope and Applicability
- Responsibilities
- Prerequisites
- Precautions and Limitations
- Main Body
- Acceptance Criteria
- Check-Off Lists
- References
- Attachments and Data Sheets

The staff reviewed STD SUP 13.5-5, which states that the format and content of plant procedures used to conduct routine operating, abnormal, and emergency operating activities. The staff determined that this Section of the applicant's FSAR meets the criteria in SRP, Section 13.5.1.1 and is therefore acceptable.

- STD SUP 13.5-6

The staff reviewed STD SUP 13.5-6, which states that the plant procedures used to conduct routine operations, abnormal, and emergency operating activities should have the level of detail commensurate with the qualifications of the individual performing the required functions. The staff determined that this Section of the applicant's FSAR meets the criteria in SRP, Section 13.5.1.1 and is therefore acceptable.

- STD SUP 13.5-7

Procedures should be developed consistent with the guidance described in DCD Tier 2, Section 18.9, and with input from the HFE process and evaluations.

The bases for procedural development include:

- Plant design bases;
- System-based technical requirements and specifications;
- Task analyses results;
- Risk-important human actions identified in the HRA/PRA;
- Initiating events considered in the EOPs, including those events in the design bases; and
- GTGs for EOPs.

Procedure V&V includes the following activities, as appropriate:

- A review to verify that they are correct and can be carried out.
- A final validation in a simulation of the integrated system as part of the V&V activities as described in DCD Tier 2, Section 18.11.
- Verification that modified procedures have adequate content, format, and integration.
- The procedures are assessed through validation if a modification substantially changes personnel tasks that are significant to plant safety. The validation verifies that the procedures correctly reflect the characteristics of the modified plant and can be performed effectively to restore the plant.

The staff reviewed STD SUP 13.5-7, which states that plant procedures used to conduct routine operation, abnormal, and emergency operating activities should be consistent with the guidance described in DCD Tier 2, Section 18.9. The staff determined that this Section of the applicant's FSAR is consistent with the guidance in DCD Tier 2, Section 18.9 and meets the criteria in SRP, Section 13.5.1.1 and is therefore acceptable.

- STD SUP 13.5-8

The staff reviewed STD SUP 13.5-08, which states that procedures for managing a shutdown should be consistent with the guidance in NUMARC 91-06. The staff determined that this Section of the applicant's FSAR is consistent with the guidance in NUMARC 91-06 and meets the criteria in SRP, Section 13.5.1.1. This information is therefore acceptable.

- STD SUP 13.5-9

The SRP, Section 13.5.1.1 states that the applicant should describe the procedures that provide administrative controls over safety-related activities for the operation of the facility. In FSAR Section 13.5.1.1, the applicant replaces the first sentence of the paragraph to supplement the DCD with the following:

> This section describes administrative procedures that provide administrative control over activities that are important to safety for the operation of the facility.

The staff concluded that the applicant-provided descriptions of plant administrative procedures meet the criteria in SRP, Section 13.5.1.1 and are therefore acceptable.

- CWR SUP 13.5-10

The applicant states that:

> Procedures outline the essential elements of the administrative programs and controls described in ASME NQA-1 and Section 17.5. These procedures are organized to prescribe the programmatic elements in documents normally referred to as administrative procedures.
>
> Administrative procedures contain adequate programmatic controls to provide an effective interface between organizational elements, including contractor and owner organizations that support the station operating organization.

The SRP, Section 13.5.1.1 states that the applicant should describe the procedures that provide administrative controls over safety-related activities for the operation of the facility, but applicants are not required to include detailed written procedures in the FSAR. In FSAR Section 13.5-1-A, the applicant lists the Category (A) Controls and Category (B) Specific Procedures described in SRP, Section 13.5.1.1. The staff determined that this information meets the criteria of SRP, Section 13.5.1.1 and is therefore acceptable.

- CWR SUP 13.5-11

The SRP, Section 13.5.1.1 states that the applicant should describe the procedures that provide for administrative controls over safety-related activities for the operation of the facility, but applicants are not required to include detailed written procedures in the FSAR. In FSAR Section 13.5-1-A, the applicant lists the Category (A) Controls and Category (B) Specific Procedures described in SRP, Section 13.5.1.1. The Supplemental Information CWR SUP 13.5-11 refers to the QAPD and FSAR Section 13.5. The staff's review of these sections concluded that the applicant has provided an adequate and acceptable description of procedural controls in North Anna 3 COL FSAR that meets the criteria in SRP, Section 13.5.1.1.

- STD SUP 13.5-12

The applicant states that:

> A procedure style (writer's) guide promotes the standardization and application of HFE principles to procedures. The writer's guide establishes the process for developing procedures that are complete, accurate, consistent, and easy to understand and follow. The guide provides objective criteria so that procedures are consistent in organization, style, and content. The writer's guide provides criteria for the content and format of procedures, including written action steps and specific acceptable acronym lists and terms to be used.

In SRP, Section 13.5.1.1, Area of Review Item 1.A, "Category (A) Controls," states that the applicant should describe the procedural review and approval process. Inherent in this discussion is the use of a procedure writer's guide. In FSAR Section 13.5.1.1, the applicant adds a new paragraph under STD SUP 13.5-12 that describes the writer's guide and promotes the standardization of procedures that include human factor applications and consistent organization, style, and content. The staff concluded that the applicant has provided acceptable general operating descriptions of procedures that meet the criteria in SRP, Section 13.5.2.1.

- STD SUP 13.5-13

The applicant states that:

> Procedure maintenance and control of procedure updates are performed in accordance with the QAPD.

The SRP, Section 13.5.1.1 states that the applicant should describe the procedures that provide administrative controls over safety-related activities for the operation of the facility, but the applicant is not required to include detailed written procedures in the FSAR. In FSAR Section 13.5.1.1, the applicant lists the Category (A) Controls and Category (B) Specific Procedures described in SRP, Section 13.5.1.1. In STD SUP 13.5-13, the applicant states that the control over the maintenance and updates of procedures is performed in accordance with the QAPD. The staff determined that this information meets the criteria of SRP, Section 13.5.1.1 and is therefore acceptable.

- STD SUP 13.5-14

The applicant states:

> The administrative programs and associated procedures developed in the pre-COL phase are described in Table 13.5-201 (for future designation as historical information).

The SRP, Section 13.5.1.1 states that the applicant should describe the procedures that provide administrative control over safety-related activities for the operation of the facility, but the applicant is not required to include detailed written procedures in the FSAR. In FSAR Section 13.5.1.1, the applicant lists the Category (A) Controls and Category (B) Specific Procedures described in SRP, Section 13.5.1.1. In FSAR Section 13.5.1, STD SUP 13.5-14 refers to Table 13.5-201. The staff's review of these Sections concluded that the applicant has provided an adequate description of procedural controls in the FSAR that meets the criteria in SRP, Section 13.5.1.1. This information is therefore acceptable.

- STD SUP 13.5-15

The applicant states:

> Section 13.5.1.1, "Administrative Procedures-General," describes those procedures that provide administrative controls with respect to procedures, including those that define and provide controls for operational activities of the plant staff.

The SRP, Section 13.5.1.1 states that the applicant should describe the procedures that provide administrative control over safety-related activities for the operation of the facility, but the applicant is not required to include detailed written procedures in the FSAR. In FSAR Section 13.5.1.1, the applicant lists the Category (A) Controls and Category (B) Specific Procedures described in SRP, Section 13.5.1.1. The staff reviewed these listed procedures, regulatory requirements, and proposed completion times per Table 13.5-202 in the COL FSAR. The staff concluded that the applicant has provided an acceptable and adequate description of procedural controls in the FSAR that meets the criteria in SRP, Section 13.5.1.1.

- STD SUP 13.5-16

The applicant states that, plant administrative procedures provide procedural instructions for the following:

- Procedures review and approval
- Procedure adherence
- Scheduling for surveillance tests and calibration
- Log entries
- Record retention

- Containment access
- Bypass of safety function and jumper control
- Communication systems
- Equipment control procedures—These procedures provide for control of equipment, as necessary, to maintain personnel and reactor safety, and to avoid the unauthorized operation of equipment
- Control of maintenance and modifications
- Fire Protection Program procedures
- Crane Operation Procedures—Crane operators who operate cranes over fuel pools are qualified and conduct themselves in accordance with ANSI/ASME B30.2 (Chapter 2-3), “Overhead and Gantry Cranes” (Reference 13.5-201).
- Temporary changes to procedures
- Temporary procedure issuance and control
- Special orders of a temporary or self-canceling nature
- Standing orders to shift personnel including the authority and responsibility of the shift manager, senior reactor operator in the control room, control room operator, and shift technical advisor
- Manipulation of controls and assignment of shift personnel to duty stations per the requirements of 10 CFR 50.54 (i), (j), (k), (l), and (m), including delineation of the space designated for the “At the Controls” area of the Control Room
- Shift relief and turnover procedures
- Fitness for duty (FFD)
- Control Room access
- Working hour limitations
- Feedback of design, construction, and applicable important industry and operating experience
- Shift Manager administrative duties

- Verification of correct performance of operational activities

- A vendor interface program that provides vendor information for safety-related components is incorporated into plant documentation

The SRP, Section 13.5.1.1 states that the applicant should describe the procedures that provide administrative controls over safety-related activities for the operation of the facility, but the applicant is not required to include detailed written procedures in the FSAR. In FSAR Section 13.5.1.1, the applicant lists the Category (A) Controls and Category (B) Specific Procedures described in SRP, Section 13.5.1.1. The staff's review of these listed procedures, regulatory requirements, and proposed completion times per COL FSAR Table 13.5-202 concluded that the applicant has provided acceptable and adequate descriptions of procedural controls in the COL FSAR that meet the criteria in SRP, Section 13.5.1.1.

13.5.1.5 Post Combined License Activities

The applicant identifies the following commitment under the Supplemental Information STD SUP 13.5-4:

> Procedures are developed prior to fuel load to allow sufficient time for plant staff familiarization and to allow staff adequate time to review the procedures and to develop operator licensing examinations.

13.5.1.6 Conclusion

The staff's finding related to information incorporated by reference is in NUREG–1966. The staff reviewed the application and checked the referenced DCD. The staff's review confirms that the applicant has addressed the required information. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to this Section that were incorporated by reference have been reviewed and are acceptable.

In addition, the staff compared the additional COL items and supplemental information in the application to the relevant NRC regulations, the guidance in SRP Section 13.5.1, SRP Sections 13.5.1.1 and 13.5.2.1; and other NRC RGs. The staff's review concludes that the applicant has presented adequate information in North Anna 3 FSAR to meet the guidance in the applicable Sections of the SRP. Thus, the applicant has adequately addressed COL Item STD COL 13.5-1-A, Supplemental Information Items STD SUP 13.5-1 through 13.5-16, and CWR COL 13.5-4-A relating Plant Operating Procedures Development, and the information in this Section is therefore acceptable.

13.5.2 Operating and Maintenance Procedures

13.5.2.1 Introduction

This Section of the FSAR provides the operating and maintenance procedures that the plant staff uses to ensure that routine operating, off-normal, and emergency activities are conducted in a safe manner. The plant procedures provide a brief description of the nature and content of the procedures and a schedule for preparing appropriate written operating and maintenance procedures. This FSAR Section also delineates in the description of operating and maintenance procedures the functional position for a procedural revision and approval process before implementation.

13.5.2.2 Summary of Application

Section 13.5.2 of North Anna 3 COL FSAR, Revision 8, incorporates by reference Section 13.5.2 of the certified ESBWR DCD, Revision 10. In addition, in COL FSAR Section 13.5.2, the applicant provides the following:

COL Items

- STD COL 13.5-2-A

Operating Procedures are developed in accordance with Section 13.5.2.1, and Maintenance Procedures are developed in accordance with Section 13.5.2.2.6.1.

- STD COL 13.5-3-A

Emergency Procedures are developed in accordance with Section 13.5.2.1.4.

- CWR COL 13.5-4-A

A Plant Operating Procedures Development Plan is established in accordance with Section 13.5.2.1.

- STD COL 13.5-5-A

The scope of procedures in the Plant Operating Procedures Development Plan is addressed in Section 13.5.2.1.

- STD COL 13.5-6-A

The applicant states that procedures for calibration, inspection, and testing are included in the Plant Operating Procedures Development Plan.

Supplemental Information

- STD SUP 13.5-18 Classification of Procedures
- STD SUP 13.5-19 System Operating Procedures
- STD SUP 13.5-20 General Operating Procedures
- STD SUP 13.5-21 Abnormal (Off-Normal) Operating Procedures
- CWR SUP 13.5-22 Emergency Operating Procedures
- STD SUP 13.5-23 Alarm Response Procedures

•	CWR SUP 13.5-24	Temporary Procedures
•	STD SUP 13.5-25	Fuel Handling Procedures
•	STD SUP 13.5-26	Maintenance and Other Operating Procedures
•	STD SUP 13.5-27	Plant Radiation Protection Procedures
•	STD SUP 13.5-28	Emergency Preparedness Procedures
•	STD SUP 13.5-29	Instrument Calibration and Test Procedures
•	STD SUP 13.5-30	Chemistry Procedures
•	STD SUP 13.5-31	Radioactive Waste Management Procedures
•	STD SUP 13.5-32	Maintenance, Inspection, Surveillance, and Modification Procedure
•	STD SUP 13.5-33	Inspection Procedures
•	STD SUP 13.5-34	Modification Procedures
•	STD SUP 13.5-35	Heavy Load Handling Procedures
•	STD SUP 13.5-36	Material Control Procedures
•	STD SUP 13.5-37	Security Procedures
•	STD SUP 13.5-38	Refueling and Outage Planning Procedures
•	STD SUP 13.5-40	Procedure related to Refueling Cavity Integrity
•	STD SUP 13.5-41	Special Nuclear Material (SNM) Material Control and Accounting Procedures

Each standard or site-specific supplement defines the procedure of interest.

13.5.2.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is in NUREG–1966. In addition, the relevant requirements of the Commission regulations for the plant operating and maintenance procedures, and the associated acceptance criteria, are in SRP Section 13.5.2.1.

In particular, the relevant provisions for reviewing plant procedures are based on (1) meeting the requirements of methods and criteria described in 10 CFR 52.79(a)(14), (26), (29)(i), (29)(ii), (33), and (34) and TMI Action Plan Items I.C.1 and I.C.9; and (2) meeting the guidance of SRP, Section 13.5.2.1. The review of FSAR information related to the development of emergency procedures is based on meeting the requirements of 10 CFR 52.79(a)(14), (26), (29)(i), (29)(ii), (33), and (34) and the guidance of SRP, Section 13.5.2.1.

13.5.2.4 Technical Evaluation

As documented in NUREG–1966, the staff reviewed and approved Section 13.5.2 of the certified ESBWR DCD, Revision 10. The staff reviewed Section 13.5.2 of North Anna 3 COL FSAR and checked the referenced ESBWR DCD to ensure that the combination of the information in the COL FSAR and the information in the ESBWR DCD appropriately represents the complete scope of information relating to this review topic.[1] The staff's review confirmed that the information in the application and the information incorporated by reference address the required information relating to operating and maintenance procedures. In addition, the staff reviewed the resolution to the following COL and supplemental information items included under Section 13.5.2 of the COL FSAR. In this review, the staff used the applicable Sections of the SRP as guidance.

<u>*COL Items*</u>

- STD COL 13.5-2-A Plant Operating Procedures Development Plan

The third paragraph of Section 13.5.2 in DCD Tier 2 is replaced with the following:

> Operating Procedures are developed in accordance with Section 13.5.2.1 and Maintenance Procedures are developed in accordance with Section 13.5.2.2.6.1.

The ESBWR DCD Tier 2, Section 13.5.2 states that the development of operating and maintenance procedures is the responsibility of the applicant. The staff reviewed Section 13.5.2.1 and determined that it addresses the development of operating procedures, which will be developed at least 6 months before fuel load. The staff reviewed Section 13.5.2.2.6.1 and determined that it addressed the development of maintenance procedures. The staff concluded that these paragraphs meet the criteria in SRP, Section 13.5.2.1.

- STD COL 13.5-3-A Emergency Procedures Development

The last sentence of Section 13.5.2 in the ESBWR DCD Tier 2 is replaced with the following:

> Emergency Procedures are developed in accordance with Section 13.5.2.1.4.

The ESBWR DCD Tier 2, Section 13.5.2 states that the applicant will develop emergency procedures. In COL FSAR Section 13.5.2, the applicant states that the new Section 13.5.2.1.4 was added to address the development of emergency procedures. The staff reviewed Section 13.5.2.1.4 and determined that it addresses the development of emergency procedures.

The SRP, Section 13.5.2.1, states that the procedures generation package (PGP) should include a description of the process used to develop plant-specific technical guidelines (P-STG) from the GTG, the identification of significant deviations from the generic guidelines, and a description of the process used for identifying operator information and control requirements; a plant-specific writer's guide; a description of the program for V&V of EOPs; and a description of the program for training operators on EOPs. In FSAR Section 13.5.2.1.4, the applicant stated that the PGP would include the identification of significant deviations from the generic guidelines, and a description of the process used for identifying operator information and control requirements; a generic writer's guide; a description of the program for V&V of EOPs; and a description of the program for training operators on EOPs. The applicant also stated that the procedure development program, as described in the PGP for EOPs, is submitted to the NRC at least 3 months prior to the planned date to begin formal operator training on the EOPs. The PGP did not include a description of the process used to develop P-STGs from the GTGs or a plant-specific writer's guide. The staff concluded that the applicant-provided added paragraph did not meet the criteria in SRP, Section 13.5.2.1. The staff issued RAI 13.05.02.01, 13.05.02.01-3 and 13.05.02.01-4 requesting Dominion to address the missing P-STG development process description and plant-specific writer's guide. The applicant responded to RAI 13.05.02.01, 13.05.02.01-3, and 13.05.02.01-4, stating that it will provide a P-SWG, P-STGs, and identify the group within the operating organization responsible for maintaining procedures. The staff determined that these responses are acceptable and has verified that the applicable standards have been incorporated into the North Anna 3 FSAR Revision 8, Section 13.5.2.1.4. The staff concluded that this new Section meets the criteria in SRP, Section 13.5.2.1.

- CWR COL 13.5-4-A Plant Operating Procedures Development Plan

The COL Item CWR COL 13.5-4-A replaces the fifth paragraph of the DCD Tier 2 with the following:

> A Plant Operating Procedures Development Plan is established in accordance with Section 13.5.2.1.

The ESBWR DCD Tier 2, Section 13.5.2 states that the applicant will develop a Plant Operating Procedures Development Plan. In the North Anna 3 COL FSAR Section 13.5.2, the applicant states that the new Section 13.5.2.1 was added to address the establishment of a Plant Operating Procedures Development Plan. The staff reviewed paragraph 13.5.2.1 and determined that it addresses the establishment of a Plant Operating Procedures Development Plan. The staff concluded that this new paragraph meets the criteria in SRP, Section 13.5.2.1.

- STD COL 13.5-5-A Procedures Included in Scope of Plan

The COL Item STD COL 13.5-5-A replaces the second paragraph of the DCD Tier 2 with the heading "Procedures Related to Refueling Cavity Integrity" with the following:

> The scope of procedures in the Plant Operating Procedures Development Plan is addressed in Section 13.5.2.1.

The ESBWR DCD Tier 2, Section 13.5.2 states that the applicant will include procedures for handling heavy loads in the scope of the Plant Operating Procedures Development Plan. In North Anna 3 COL FSAR Section 13.5.2, the applicant states that the Plant Operating Procedures Development Plan is established in accordance with Section 13.5.2.1.

The staff reviewed Section 13.5.2.1 and determined that it included procedures for handling heavy loads within the scope of the Plant Operating Procedures Development Plan. The staff concluded that this new Section meets the criteria in SRP, Section 13.5.2.1.

- STD COL 13.5-6-A Procedures for Calibration, Inspection, and Testing

STD COL 13.5-6-A replaces the second sentence of the Section "Procedures for Calibration, Inspection and Testing" to the DCD Tier 2 with the following:

> Procedures for calibration, inspection, and testing are included in the Plant Operating Procedures Development Plan.

The ESBWR DCD Tier 2, Section 13.5.2.1 states that the applicant will ensure that all portions of the safety-related logic circuitry are adequately covered in surveillance procedures described in GL 96-01, "Testing of Safety Related Logic Circuits." In North Anna 3 COL FSAR Section 13.5.2.1, the applicant has added to the procedures for calibration, inspection, and testing to the Plant Operating Procedures Development Plan to ensure they are appropriately developed and maintained. The staff of the Plant Operating Procedures Development Plan determined that procedures will be developed and maintained and the calibration, inspection, and testing procedures will adequately test all portions of safety-related logic circuitry in a manner that, is as described in GL 96-01. The staff concluded that this meets the criteria in SRP, Section 13.5.2.1.

Supplemental Information

- STD SUP 13.5-18 Classification of Procedures

North Anna 3 STD SUP 13.5-18 states the following:

> The classifications of operating procedures are:
>
> - System Operating Procedures
> - General Operating Procedures
> - Abnormal (Off-Normal) Operating Procedures
> - Emergency Operating Procedures
> - Alarm Response Procedures.

The SRP, Section 13.5.2.1 states that the applicant should identify the different classifications of procedures (e.g., system procedures, general plant procedures, abnormal procedures, emergency operating procedures, and alarm procedures) that the operators will use in the control room (CR) and locally in the plant for plant operations. In FSAR Section 13.5.2, the applicant states that the classifications of operating procedures are system operating procedures, general operating procedures, abnormal (off-normal) operating procedures, emergency operating procedures, and alarm response procedures. The staff concluded that the applicant has provided acceptable procedure classification information that meets the criteria in SRP, Section 13.5.2.1.

- STD SUP 13.5-19

System Operating Procedures in FSAR Section 13.5.2.1.1, STD SUP 13.5-19 states the following:

> Instructions for energizing, filling, venting, draining, starting up, shutting down, changing modes of operation, returning to service following testing or maintenance (if not contained in the applicable procedure), and other instructions appropriate for operation of systems are delineated in system procedures.
>
> System procedures contain check-off lists, where appropriate, which are prepared in sufficient detail to provide an adequate verification of the status of the system.

The SRP, Section 13.5.2.1 states that the applicant should describe the general format and content of the different classifications of procedures. In FSAR Section 13.5.2, Section 13.5.2.1.1 describes system operating procedures and their general format and content. The staff concluded that the applicant has provided descriptions of the system operating procedures that meet the criteria in SRP, Section 13.5.2.1.

- STD SUP 13.5-20

General Operating Procedures FSAR Section 13.5.2.1.2, STD SUP 13.5-20 states the following:

> General operating procedures provide instructions for performing integrated plant operations involving multiple systems, such as plant startup and shutdown.
>
> These procedures provide a coordinated means of integrating procedures together to change the mode of plant operation or to achieve a major plant evolution. Check-off lists are used for the purpose of confirming completion of major steps in proper sequence.
>
> Typical types of general operating procedures are described as follows:
>
> - Startup procedures provide instruction for starting the reactor from cold or hot conditions, establishing power operation, and recovering from reactor trips.
>
> - Shutdown procedures guide operations during and following controlled shutdown or reactor trips, and include instructions for establishing or maintaining hot standby and safe or cold shutdown conditions, as applicable.
>
> - Power operation and load changing procedures provide instruction for steady-state power operation and load changing.

The SRP, Section 13.5.2.1 states that the applicant should describe the different classifications of procedures (e.g., general plant procedures) and the general format and content of the different classifications of procedures. In FSAR Section 13.5.2, Section 13.5.2.1.2 describes general operating procedures and their general format and content. The staff concluded that the applicant has provided descriptions of general operating procedures that are acceptable and meet the criteria in SRP, Section 13.5.2.1.

- STD SUP 13.5-21 Abnormal Operating Procedures

In FSAR Section 13.5.2.1.3, STD SUP 13.5-21 states the following:

> Abnormal operating procedures for correcting abnormal conditions are developed for those events where system complexity might lead to operator uncertainty. Abnormal operating procedures describe actions to be taken during other than routine operations, which, if continued, could lead to either material failure, personnel harm, or other unsafe conditions.
>
> Abnormal procedures are written so that a trained operator knows in advance the expected course of events or indications that identify an abnormal situation and the immediate action to be taken.

The SRP, Section 13.5.2.1 states that the applicant should describe the different classifications of procedures (e.g., abnormal operating procedures) and the general format and content of the different classifications of procedures. In FSAR Section 13.5.2, Section 13.5.2.1.3 describes abnormal (off-normal) procedures and their general format and content. The staff concluded that the applicant has provided descriptions of abnormal procedures that are acceptable and meet the criteria in SRP, Section 13.5.2.1.

- CWR SUP 13.5-22

Emergency Operating Procedures in FSAR Section 13.5.2.1.4, CWR SUP 13.5-22 states the following:

> EOPs are procedures that direct actions necessary for the operators to mitigate the consequences of transients and accidents that cause plant parameters to exceed reactor protection system or [Engineered Safety Features] ESF actuation setpoints.
>
> Emergency operating procedures include appropriate guidance for the operation of plant post-72-hour equipment, and are developed as appropriate per the guidance of:
>
> - NUREG–0737, “Clarification of TMI Action Plan Requirements,” Items I.C.1 and I.C.9
>
> - The QAPD

The SRP, Section 13.5.2.1 states that the applicant should describe the different classifications of procedures (e.g., emergency operating procedures) and the general format and content of the different classifications of procedures. In FSAR, Section 13.5.2.1.4, the applicant added a new paragraph that described emergency operating procedures and their general format and content. The staff concluded that the applicant has provided descriptions of emergency operating procedures that meet the criteria in SRP, Section 13.5.2.1.

- STD SUP 13.5-23 Alarm Response Procedures

In FSAR Section 13.5.2.1.5, STD SUP 13.5-23 states the following:

> Procedures are provided for annunciators (alarm signals) identifying the proper operator response actions to be taken. Each of these procedures normally contains: a) the meaning of the annunciator or alarm, b) the source of the signal, c) any automatic plant responses, d) any immediate operator action, and e) the long range actions. When corrective actions are very detailed and/or lengthy, the alarm response may refer to another procedure.

The SRP, Section 13.5.2.1 states that the applicant should describe the different classifications of procedures (e.g., alarm response procedures) and the general format and content of the different classifications of procedures. In FSAR, Section 13.5.2.1.5, the applicant added a new paragraph that described alarm response procedures and their general format and content. The staff concluded that the applicant has provided descriptions of alarm response procedures that are acceptable and meet the criteria in SRP, Section 13.5.2.1.

- CWR SUP 13.5-24 Temporary Procedures

In FSAR Section 13.5.2.1.6, CWR SUP 13.5-24 states the following:

> Temporary procedures are issued during the operational phase only when permanent procedures do not exist for the following activities: to direct operations during testing, refueling, maintenance, and modifications; to provide guidance in unusual situations not within the scope of the normal procedures; and to provide orderly and uniform operations for short periods when the plant, a system, or a component of a system is performing in a manner not covered by existing detailed procedures, or has been modified or extended in such a manner that portions of existing procedures do not apply.
>
> Temporary operating procedures are developed under established administrative guidelines. They include designation of the period of time during which they may be used and adhere to the QAPD and Technical Specifications, as applicable.

The SRP, Section 13.5.2.1 states that the applicant should describe the different classifications of procedures (e.g., temporary procedures) and the general format and content of the different classifications of procedures. In FSAR, Section 13.5.2.1.6, the applicant added a new paragraph that described temporary procedures and their general format and content. The staff concluded that the applicant has provided descriptions of temporary procedures that meet the criteria in SRP, Section 13.5.2.1 and are therefore acceptable.

- STD SUP 13.5-25 Fuel Handling

Procedures in FSAR Section 13.5.2.1.7, STD SUP 13.5-25 states the following:

> Fuel handling operations, including fuel receipt, identification, movement, storage, and shipment, are performed in accordance with written procedures. Fuel handling procedures address, for example, the status of plant systems required for refueling; inspection of replacement fuel and control rods; designation of proper tools; proper conditions for spent fuel movement and storage; proper conditions to prevent inadvertent criticality; proper conditions for fuel cask loading and movement; and status of interlocks, reactor trip circuits, and mode switches. These procedures provide instructions for use of refueling equipment, actions for core alterations, monitoring core criticality status, accountability of fuel, and partial or complete refueling operations.

The SRP, Section 13.5.2.1 states that the applicant should describe the different classifications of procedures (e.g., fuel handling procedures) and the general format and content of the different classifications of procedures. In FSAR, Section 13.5.2.1.7, the applicant added a new paragraph that described fuel handling procedures and their general format and content. The staff concluded that the applicant has provided descriptions of fuel handling procedures that meet the criteria in SRP, Section 13.5.2.1 and are therefore acceptable.

- STD SUP 13.5-26 Maintenance and Other Operating Procedures

FSAR Section 13.5.2.2, STD SUP 13.5-26 states the following:

The QAPD provides guidance for procedural adherence. The technical review for elements of the QAPD for Dominion which addresses this STD SUP 13.5-26 is evaluated in Section 17.5 of this SER.

- STD SUP 13.5-27 Plant Radiation Protection

Procedures in FSAR Section 13.5.2.2.1, STD SUP 13.5-27 states the following:

> The plant radiation protection program is contained in procedures. Procedures are developed and implemented for such things as: maintaining personnel exposures, plant contamination levels, and plant effluents ALARA; monitoring both external and internal exposures of workers, considering industry-accepted techniques; performing routine radiation surveys; performing environmental monitoring in the vicinity of the plant; monitoring radiation levels during maintenance and special work activities; evaluating radiation protection implications of proposed modifications; management of radioactive wastes for offsite shipment, disposal, and treatment; and maintaining radiation exposure records of workers and others.

The SRP, Section 13.5.2.1 states that the applicant should describe the different classifications of procedures (e.g., plant radiation protection procedures) and the general format and content of the different classifications of procedures. In FSAR Section 13.5.2, the applicant adds new Section 13.5.2.2.1 that describes plant radiation protection procedures and their general format and content. The staff concluded that the applicant has provided plant radiation protection procedures that meet the criteria in SRP, Section 13.5.2.1 and are therefore acceptable.

- STD SUP 13.5-28 Emergency Preparedness

Procedures in FSAR Section 13.5.2.2.2, STD SUP 13.5-28 states the following:

> A discussion of emergency preparedness procedures can be found in the Emergency Plan. A list of implementing procedures is maintained in the Emergency Plan.

The technical review for STD SUP 13.5-28 is in Section 13.3 of this SER.

- STD SUP 13.5-29 Instrument Calibration and Test

Procedures In FSAR Section 13.5.2.2.3, STD SUP 13.5-29 states the following:

> The QAPD provides a description of procedural requirements for instrumentation calibration and testing.

The technical review for elements of the QAPD for Dominion which address this STD SUP 13.5-29 is in Section 17.5 of this SER.

- STD SUP 13.5-30 Chemistry Procedures

In FSAR Section 13.5.2.2.4, STD SUP 13.5-30 states the following:

> Procedures provided for chemical and radiochemical control activities include the nature and frequency of sampling and analyses; instructions for maintaining fluid quality within prescribed limits; the use of control and diagnostic parameters; and limitations on concentrations of agents that could cause corrosive attack, foul heat transfer surfaces or become sources of radiation hazards due to activation.
>
> Procedures are also provided for the control, treatment, and management of radioactive wastes and control of radioactive calibration sources.

The SRP, Section 13.5.2.1 states that the applicant should describe the different classifications of procedures (e.g., chemistry procedures) and the general format and content of the different classifications of procedures. In FSAR, Section 13.5.2.2.4, the applicant added a new paragraph that described chemical and radiochemical control activities procedures and their general format and content. The staff concluded that the applicant has provided chemistry procedures that meet the criteria in SRP, Section 13.5.2.1 and are therefore acceptable.

- STD SUP 13.5-31 Radioactive Waste Management

Procedures In FSAR Section 13.5.2.2.5, STD SUP 13.5-31 states the following:

> Procedures for the operation of the radwaste processing systems provide for the control, treatment, and management of onsite radioactive wastes. These procedures are addressed in Section 13.5.2.1.1, System Operating Procedures.

The SRP, Section 13.5.2.1 states that the applicant should describe the different classifications of procedures (e.g., radioactive waste management procedures) and the general format and content of the different classifications of procedures. In FSAR, Section 13.5.2.2.5, the applicant added a new paragraph that described radioactive waste management procedures and their general format and content. The staff concluded that the applicant has provided radioactive waste management procedures that meet the criteria in SRP Section 13.5.2.1 and are therefore acceptable.

- STD SUP 13.5-32 Maintenance, Inspection, Surveillance, and Modification Procedures

In FSAR Section 13.5.2.2.6.1, STD SUP 13.5-32 states the following:

> Maintenance procedures describe maintenance planning and preparation activities. Maintenance procedures are developed considering the potential impact on the safety of the plant, license limits, availability of equipment required to be operable and possible safety consequences of concurrent or sequential maintenance, testing, or operating activities.

In SRP, Section 13.5.2.1, the staff stated that the application should describe the different classifications of procedures, e.g., maintenance, inspection, surveillance, and modification procedures, and the general format and content of the different classifications of procedures should be described, though maintenance, inspection, surveillance, and modification procedures are not specifically required to be described. In FSAR, Section 13.5.2.2.6 and Section 13.5.2.2.6.1, the applicant added a new Section that described maintenance, inspection, surveillance, and modification procedures and their general format and content. The staff concluded that the applicant-provided maintenance, inspection, surveillance, and modification procedures meet the criteria found in SRP, Section 13.5.2.1. The staff determined that this is acceptable, as the requirements of SRP, Section 13.5.2.1 are met.

- STD SUP 13.5-33 Inspection Procedures

In FSAR Section 13.5.2.2.6.2, STD SUP 13.5-33 states the following:

> The QAPD provides a description of procedural requirements for inspections.

In FSAR Section 13.5.2.2.6.3, STD SUP 13.5-33 states the following:

> The QAPD provides a description of procedural requirements for surveillance testing. Surveillance testing procedures are written in a manner that adequately tests all portions of safety-related logic circuitry as described in Generic Letter 96-01, "Testing of Safety Related Logic Circuits."

The technical review for elements of the QAPD for Dominion which address this STD SUP 13.5-33 is in Section 17.5 of this SER.

- STD SUP 13.5-34 Modification Procedures

In FSAR Section 13.5.2.2.6.4, STD SUP 13.5-34 states the following:

> Plant modifications and changes to setpoints are developed in accordance with approved procedures. These procedures control necessary activities associated with the modifications such that they are carried out in a planned, controlled, and orderly manner. For each modification, design documents such as drawings, equipment and material specifications, and appropriate design analyses are developed, or the as-built design documents are utilized. Separate reviews are conducted by individuals knowledgeable in both technical and QA requirements to verify the adequacy of the design effort.
>
> Proposed modifications that involve a license amendment or a change to Technical Specifications are processed as proposed license amendment request.
>
> Plant procedures impacted by modifications are changed to reflect revised plant conditions prior to declaring the system operable and cognizant personnel who are responsible for operating and maintaining the modified equipment are adequately trained.

The SRP, Section 13.5.2.1 states that the applicant should describe the different classifications of procedures (e.g., modification procedures) and the general format and content of the different classifications of procedures. In FSAR, Section 13.5.2.2.6.4, the applicant added a new Section that described modification procedures and their general format and content. The staff concluded that the applicant has provided modification procedures that meet the criteria in SRP, Section 13.5.2.1 and are therefore acceptable.

- STD SUP 13.5-35 Heavy Load Handling Procedures

In FSAR Section 13.5.2.2.6.5, STD SUP 13.5-35 states the following:

> This topic is discussed in Section 9.1.5.8 of this SER.

The SRP, Section 13.5.2.1 states that the applicant should describe the different classifications of procedures (e.g., heavy-load handling procedures) and the general format and content of the different classifications of procedures. In FSAR Section 13.5.2, the applicant refers to the revised Section 9.1.5.8 that describes heavy-load handling procedures and their general format and content. The staff concluded that the applicant has provided heavy-load handling procedures that meet the criteria in SRP, Section 13.5.2.1 and are therefore acceptable.

- STD SUP 13.5-36 Material Control Procedures

In FSAR Section 13.5.2.2.7, STD SUP 13.5-36 states the following:

> The QAPD provides a description of procedural requirements for material control.

The technical review for elements of the QAPD for Dominion which address this STD SUP 13.5-36 is in Section 17.5 of this SER.

- STD SUP 13.5-37 Security Procedures

In FSAR Section 13.5.2.2.8, STD SUP 13.5-37 states the following:

> A discussion of security procedures is provided in the Security Plan.

The technical review for STD SUP 13.5-37 is in Section 13.6 of this SER.

- STD SUP 13.5-38 Refueling and Outage Planning Procedures

In FSAR Section 13.5.2.2.9, STD SUP 13.5-38 states the following:

> Procedures provide guidance for the development of refueling and outage plans, and as a minimum address the following elements:
>
> - An outage philosophy which includes safety as a primary consideration in outage planning and implementation.
> - Separate organizations responsible for scheduling and overseeing the outage and provisions for an independent safety review team that would be assigned to perform final review and grant approval for outage activities.
> - Control procedures, which address both the initial outage plan and safety-significant changes to schedule.
> - Provisions that activities receive adequate resources.
> - Provisions that defense-in-depth during shutdown and margins are not reduced or provisions that an alternate or backup system must be available if a safety system or a defense-in-depth system is removed from service
> - Provisions that personnel involved in outage activities are adequately trained including operator simulator training to the extent practicable, and training of other plant personnel, including temporary personnel, commensurate with the outage tasks they are to perform.

- The guidance described in NUMARC 91-06, “Guidelines for Industry Actions to Assess Shutdown Management,” to reduce the potential for loss of reactor coolant system boundary and inventory during shutdown conditions (Reference 13.5-203).

The SRP, Section 13.5.2.1 states that the applicant should describe the different classifications of procedures (e.g., refueling and outage planning procedures) and the general format and content of the different classifications of procedures. In FSAR, Section 13.5.2.2.9, the applicant added a new Section that described refueling and outage planning procedures and their general format and content. The staff concluded that the applicant has provided refueling and outage planning procedures that meet the criteria in SRP, Section 13.5.2.1 and are therefore acceptable.

- STD SUP 13.5-40 Procedure related to Refueling Cavity Integrity

In FSAR Section 13.5.2.2.10, STD SUP 13.5-40 states the following:

Procedures will be established and implemented for:

- Monitoring refueling cavity seal leakage,
- Responding to refueling cavity and buffer pool drain down events, and
- Performing periodic maintenance and inspection of the refueling cavity seal and the Main Steam and Isolation Condenser System plugs in accordance with vendor recommendations.

In SRP, Section 13.5.2.1, the staff stated that the application should describe the different classifications of procedures, e.g., refueling cavity integrity procedures, and the general format and content of the different classifications of procedures should be described, though refueling cavity integrity procedures are not specifically required to be described. In FSAR, Section 13.5.2.2.10, the applicant added a new Section that described refueling cavity integrity procedures and their general format and content. The staff concluded that the applicant-provided described refueling cavity integrity procedures meet the criteria found in SRP, Section 13.5.2.1. The staff determined that this is acceptable, as the requirements of SRP, Section 13.5.2.1 are met.

- STD SUP 13.5-41 Special Nuclear Material (SNM) Material Control and Accounting Procedures

In FSAR Section 13.5.2.2.11, STD SUP 13.5-41 states the following:

A material control and accounting system consisting of special nuclear material accounting procedures is utilized to delineate the requirements, responsibilities, and methods of special nuclear material control from the time special nuclear material is received until it is shipped from the plant. These procedures provide detailed steps for SNM shipping and receiving, inventory, accounting, and preparing records and reports.

The Special Nuclear Material (SNM) Material Control and Accounting (MC&A) Program description is provided in Appendix 13CC.

In SRP, Section 13.5.2.1, the staff stated that the application should describe the different classifications of procedures, e.g., SNM MC&A procedures, and the general format and content of the different classifications of procedures should be described, though SNM MC&A procedures are not specifically required to be described. In FSAR, Section 13.5.2.2.11, the applicant added a new Section that described SNM MC&A procedures and their general format and content. The detailed program description is provided in North Anna 3 FSAR Appendix 13CC. The staff concluded that the applicant-provided SNM material control and accounting procedures meet the criteria found in SRP, Section 13.5.2.1. The staff determined that this is acceptable, as the requirements of SRP, Section 13.5.2.1 are met.

13.5.2.5 Post Combined License Activities

The applicant identified the following post COL activities in development of plant procedures:

- Procedures are developed prior to fuel load to allow sufficient time for plant staff familiarization and to allow staff adequate time to review the procedures and to develop operator licensing examinations (STD SUP 13.5-4).

- Operating procedures are developed at least 6 months prior to fuel load to allow sufficient time for plant staff familiarization and to allow staff adequate time to review the procedures and to develop operator licensing examinations (STD COL 13.5-6-A).

- The procedure development program, as described in the PGP for EOPs, is submitted to the NRC at least 3 months prior to the planned date to begin formal operator training on the EOPs (STD COL 13.5-3-A).

13.5.2.6 Conclusion

The staff's finding related to information incorporated by reference is in NUREG–1966. The staff reviewed the application and checked the referenced DCD. The staff's review confirms that the applicant has addressed the required information, related to this Section. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to this Section that were incorporated by reference have been reviewed and are acceptable.

In addition, the staff compared the additional COL and supplemental information items in the COL application to the relevant NRC regulations, the guidance in SRP Section 13.5 and other NRC RGs. The staff's review concludes that the applicant has provided the required information to satisfy the requirements of the NRC regulations. The applicant has adequately addressed COL Items STD COL 13.5-2-A, 13.5-3-A, 13.5-5-A, and 13.5-6-A; Supplemental Items STD SUP 13.5-18, 13.5-19, 13.5-20, 13.5-21, 13.5-23, 13.5-25, 13.5-26, 13.5-27, 13.5-28, 13.5-29, 13.5-30, 13.5-31, 13.5-32, 13.5-33, 13.5-34, 13.5-35, 13.5-36, 13.5-37, 13.5-38, 13.5-40 and 13.5.41; and site-specific COL and Supplemental Items CWR COL 13.5-4-A, CWR SUP 13.5-22, and CWR SUP 13.5-24 relating to plant procedures. The staff finds the applicant has provided the required procedure information in its application and therefore it is acceptable.

13.6 Physical Security

13.6.1 Introduction

The North Anna 3 COLA describes the applicant's physical protection program, which is intended to meet the NRC regulations for protection against the design basis threat (DBT) to design safeguards systems to protect against acts of radiological sabotage as required by 10 CFR 73.1, "Purpose and Scope." The overall purpose of the applicant's physical protection program is to provide high assurance that activities involving SNM are not inimical to the common defense and security and do not constitute an unreasonable risk to the public health and safety.

The applicant chose to update the site's Part 8 of the COLA concerning the NRC-endorsed security plan template. In this update, the applicant chose to change from NEI 03-12, Revision 6 to Revision 7, in order to maintain consistency with Dominion's fleet operating security plans.

The physical protection program includes the design of a physical protection system that ensures the capabilities to detect, assess, interdict, and neutralize threats of radiological sabotage are maintained at all times. The applicant incorporates by reference the standard ESBWR design, which includes design of physical protection systems within the design of the vital area and vital systems, as described in the ESBWR DCD including topical report, NEDE-33389, "ESBWR Security Enhancements Report," NEDE-33390, "ESBWR Interim Compensatory Measures Assessment Report," and NEDE-33391, "The ESBWR Safeguards Assessment Report." Part 8 of the COL application, consisting of the North Anna Physical Security Plan (PSP), Training and Qualification Plan (T&QP), and Safeguards Contingency Plan (SCP) (collectively, security plan), is referenced in Section 13.6 of the North Anna COL FSAR to describe the physical protection program and physical protection systems that are not addressed within the scope of the standard ESBWR design for meeting NRC performance and prescriptive requirements for physical protection stated in 10 CFR Part 73, "Physical Protection of Plants and Materials." Because of information security requirements, the staff's evaluation of the physical security protection program presented in this publicly-available SER does not include the same level of detail as the safeguards information (SGI) version. Those persons with the correct access authorization and need-to-know may view the SGI version of the North Anna COLA Section 13.6 SER, which is located in the NRC's Secure LAN.

13.6.2 Summary of Application

Section 13.6, "Physical Security," of the North Anna COL FSAR, Revision 8, incorporates by reference Section 13.6 of the certified ESBWR DCD, Revision 10.

Part 8 – Safeguards/Security Plans

In a letter dated November 26, 2007, Dominion submitted a security plan to the NRC as part of the COLA for proposed North Anna 3. In a letter dated March 30, 2009, Dominion submitted Revision 1 to the North Anna security plan. In a letter dated June 28, 2010, Dominion submitted Revision 2 to the security plan. In a letter dated July 18, 2011, Dominion submitted Revision 3 to the security plan. In a letter dated July 31, 2013, Dominion submitted Revision 4 to the security plan. In a letter dated March 30, 2015, Dominion submitted Revision 5 to the security plan.

In a letter dated December 18, 2013, Dominion submitted revisions to the SGI documents in Part 8 of the North Anna 3 COLA for NRC review. Enclosure 1 provides the Evaluation of CAS/SAS Design for No Single Act, Revision 4. Enclosure 2 provides Figure North Anna 3 COL 13.6-16-A, Security Site Arrangement - Fields of Fire drawings. Enclosure 3 provides GE Hitachi Nuclear Energy licensing topical report LTR NEDC - 33844P, Bomb Blast Analysis for North Anna 3.

Additionally, in the North Anna COL FSAR Section 13.6, the applicant stated as follows:

COL Information Items

- STD COL 13.6-6-A

Site key control was addressed by the applicant through the North Anna COL FSAR, Section 13.6.1.1.5. A key control program will be developed and implemented prior to the milestone for PSP implementation (Table 13.4-201).

- STD COL 13.6-7-A

Redundancy and equivalency of the central alarm station (CAS) and secondary alarm station (SAS) was addressed by the applicant through the North Anna PSP, Section 15.4, and in the "Evaluation of CAS/SAS Design for No Single Act," Revision 3.

- NAPS COL 13.6-8-A

The no single act requirement for the CAS and SAS was addressed by the applicant through the North Anna COL FSAR, Section 13.6.2. A description of the design of the CAS and SAS and analysis of single act security events is contained in the North Anna, "Evaluation of CAS/SAS Design for No Single Act," Revision 3.

- STD COL 13.6-9-A

The requirement for operational alarm response procedures was addressed by the applicant through the North Anna COL FSAR, Section 13.6.1.1.3. Operating alarm response procedures will be developed and implemented in accordance with milestone defined in Section 13.5.2.1.

- STD COL 13.6-10-A

The requirement for operational surveillance test procedures was addressed by the applicant through the North Anna COL FSAR, Section 13.6.1.1.8. The establishment of these surveillance test procedures and frequencies will be completed in accordance with the milestone for PSP implementation (Table 13.4-201).

- STD COL 13.6-11-A

Maintenance test procedures were addressed by the applicant through the North Anna COL FSAR, Section 13.6.1.1.8. The establishment of these testing and maintenance milestones will be completed in accordance with the milestone for PSP implementation (Table 13.4-201).

- STD COL 13.6-12-A

Operational response procedures to security events were addressed by the applicant through the North Anna COL FSAR, Section 13.6.2. As part of the Security Plan, the applicant will develop an integrated response strategy to a confirmed security event that provides for manual actuation of plant systems by the operators to an evolving scenario necessitating escalating operator response. This action will be completed prior to the milestone for PSP implementation (Table 13.4-201).

- STD COL 13.6-13-A

Operational alarm response procedures were addressed by the applicant through the North Anna COL FSAR, Section 13.6.1.1.3. This action will be completed prior to the milestone for PSP implementation (Table 13.4-201).

- STD COL 13.6-14-A

Administrative controls to sensitive cabinets were addressed by the applicant through the North Anna COL FSAR, Section 13.6.1.1.5. Administrative procedures will be developed prior to the milestone for PSP implementation (Table 13.4-201) to control work being performed in cabinets containing the control circuitry for systems listed in Table 4-1 of NEDE-33391.

- STD COL 13.6-15-A

Administrative controls to sensitive equipment were addressed by the applicant through the North Anna COL FSAR, Section 13.6.1.1.5. Administrative procedures will be developed prior to the milestone for PSP implementation (Table 13.4-201) that will require two persons, each of whom are qualified to perform the intended work, to be present during the performance of any work on systems listed in Table 4-1 of NEDE-33391.

- NAPS COL 13.6-16-A

External bullet resisting enclosures (BRE) were addressed by the applicant through the North Anna COL FSAR, Section 13.6.2. The applicant provided site arrangement drawings, which show the location of the external BREs and indicate the fields of fire from these locations. The applicant also described the level of protection provided to security personnel in the BREs from the effects of the equipment available to the adversaries utilizing the DBT toolkit.

- NAPS COL 13.6-17-A

Site-specific locations of security barriers were addressed by the applicant through the North Anna COL FSAR, Section 13.6.2. The applicant provided site arrangement drawings showing the site-specific locations of security barriers that are not part of the ESBWR Certified Design, in the PSP. Additionally, prior to the milestone for PSP implementation (Table 13.4-201) the applicant will demonstrate that the security strategy described in the ESBWR Safeguards Assessment Report (NEDE-33391) remains valid.

- STD COL 13.6-18-A

Ammunition for armed responders was addressed by the applicant through the North Anna COL FSAR, Section 13.6.2. Prior to the milestone for PSP implementation (Table 13.4-201), the applicant will update the security plan with an analysis to determine if armed responders require ammunition greater than the amount normally carried to include the development of necessary procedures to assure adequate ammunition is available.

- STD COL 13.6-19-A

Site-specific update of the ESBWR Safeguards Assessment Report was addressed by the applicant through the North Anna COL FSAR, Section 13.6.2. Prior to the milestone for PSP implementation (Table 13.4-201), the applicant will analyze the ESBWR Safeguards Assessment Report to reflect site-specific location of engagement positions including fields of fire, to demonstrate that the security strategy can be implemented as described and the effectiveness of neutralization in the report can be achieved. The PSP will be updated based on this revised analysis.

- STD COL 13.6-20-A

Physical security ITAAC is covered in part by the ESBWR standard ITAAC that addresses the physical plant security systems and those features that are part of the standard design. The ESBWR standard ITAAC were addressed by the applicant through the ESBWR DCD Tier 1, which was incorporated by reference. The plant and site-specific physical security ITAAC not covered by the ESBWR standard design, are contained in the North Anna COL FSAR, Part 10, Section 2.2.1, “Site-Specific Physical Security ITAAC.”

Supplemental Information

- STD SUP 13.6-1

In Section 13.6.2 of the North Anna 3 COL FSAR, the applicant provides supplemental information addressing the security plans which are submitted as separate licensing documents to fulfill the requirements of 10 CFR 52.79(a)(35) and (36). The applicant also states that the security plan meets the requirements of 10 CFR Part 73 and will be maintained in accordance with the requirements of 10 CFR 52.98 and protected in accordance with 10 CFR 73.21, "Protection of Safeguards Information: Performance Requirements.". The security plans are categorized as security SGI. The safeguards version of the North Anna COL application Section 13.6 SER, which included the evaluation of STD SUP 13.6-1, is located in the NRC's Secure Local Area Network.

- NAPS ESP COL 13.6-1

In Section 13.6.2 of the North Anna 3 COL FSAR, the applicant provides the design requirements for protected area barriers described in the PSP. The barriers will be designed and located to support the security response strategy timelines. The specific designs for protected area barriers will be completed as part of detailed plant design before the milestone for PSP implementation (Table 13.4-201).

The North Anna 3 ESP COL 13.6-1: A COL or construction permit (CP) applicant should provide specific designs for protected area barriers. Exact locations and the design of barriers are not known at the ESP stage.

- CWR SUP-13.6-2

In Section 13.6.2 of the North Anna 3 COL FSAR, the applicant provides supplemental information addressing a commitment that has been added to administrative procedures to meet the requirements of 10 CFR 73.58 for managing the safety/security interface.

- NAPS SUP 13.6-2 13.6.5 ESP Information

North Anna 3 ESP SSAR Section 13.6 is incorporated by reference.

License Conditions

- Part 10, Section 3.6

The applicant proposed a license condition in Part 10 of the North Anna COLA, which provides milestones for implementing applicable portions of the Physical Security Program.

13.6.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is in NUREG–1966 related to the ESBWR DCD, Revision 10. In addition, the relevant requirements of the Commission regulations for the physical security, and the associated acceptance criteria, are summarized in SRP Section 13.6.

The applicable regulatory requirements for physical protection are as follows:

- The provisions of 10 CFR 52.79(a)(35)(i) and (ii) require that information submitted for a COL describe how the applicant will meet the requirements of 10 CFR Part 73 and provide a description of the implementation of the PSP. The provisions of 10 CFR 52.79(a)(36)(i) through (iv) require that the application include an SCP in accordance with the criteria set forth in Appendix C, "Nuclear Power Plant Safeguards Contingency Plans," to 10 CFR Part 73, and a T&QP in accordance with Appendix B of 10 CFR Part 73. The provisions also require that the applicant provide a description of the implementation of the SCP and the T&QP; and that the applicant protect the PSP, T&QP, SCP, and other related SGI in accordance with the requirements of 10 CFR 73.21.

- The provisions of 10 CFR Part 73 include performance-based and prescriptive regulatory requirements that, when adequately met and implemented, provide high assurance that activities involving SNM are not inimical to the common defense and security and do not constitute an unreasonable risk to the public health and safety. A COL applicant must describe how it will meet the regulatory requirements of 10 CFR Part 73 that are applicable to nuclear power plants.

- The provisions of 10 CFR 52.79(a)(41) require an evaluation of the facility against the SRP in effect 6 months before the docket date of the application. The evaluation required by this Section shall include an identification and description of all differences in design features, analytical techniques, and procedural measures proposed for a facility and those corresponding features, techniques, and measures given in the SRP acceptance criteria. Where a difference exists, the evaluation shall discuss how the proposed alternative provides an acceptable method of complying with the Commission's regulations, or portions thereof, that underlie the corresponding SRP acceptance criteria. The SRP is not a substitute for the regulations, and compliance is not a requirement.

The staff used SRP, Section 13.6.1, Revision 1, dated June 15, 2010, to complete the physical security COL review.

Regulatory guidance documents, technical reports (TR), accepted industry codes and standards that an applicant may apply to meet regulatory requirements include, but are not limited to the following:

- RG 5.7, Revision 1, "Entry/Exit Control for Protected Areas, Vital Areas, and Material Access Areas," May 1980.

- RG 5.12, "General Use of Locks in the Protection and Control of Facilities and Special Nuclear Materials," November 1973.

- RG 5.44, Revision 3, "Perimeter Intrusion Alarm Systems," October 1997.

- RG 5.62, Revision 1 "Reporting of Safeguards Events," November 1987.

- RG 5.65, “Vital Area Access Controls, Protection of Physical Protection System Equipment and Key and Lock Controls,” September 1986.

- RG 5.66, Revision 1, “Access Authorization Program for Nuclear Power Plant,” July 2009.

- RG 5.68, “Protection Against Malevolent Use of Vehicles at Nuclear Power Plants,” August 1994.

- RG 5.74, “Managing the Safety/Security Interface,” March 2009.

- RG 5.75, “Training and Qualification of Security Personnel at Nuclear Power Reactor Facilities,” June 2009.

- NRC letter dated November 10, 2011, NRC Staff Review of NEI 03-12 “Template for Security Plan, Training and Qualification, Safeguards Contingency Plan, [and Independent Spent Fuel Storage Installation Security Program],” (Revision 7) (ADAMS Accession No. ML112800379).

- SECY-05-0197.

The following documents include security-related or SGI and are not publically available:

- RG 5.69, “Guidance for the Application of Radiological Sabotage Design Basis Threat in the Design, Development, and Implementation of a Physical Security Protection Program that Meets 10 CFR 73.55 Requirements,” June 2006.

- RG 5.76, “Physical Protection Programs at Nuclear Power Reactors,” July 2009.

- NEI 03-12, Revision 7, “Template for the Security Plan, Training and Qualification Plan, Safeguards Contingency Plan, and Independent Spent Fuel Installation Security Program.”

- NUREG/CR-6190, “Update of NUREG/CR-6190 Material to Reflect Postulated Threat Requirements,” March 27, 2003.

- RG 5.77, “Insider Mitigation Program,” March 2009.

13.6.4 Technical Evaluation

As documented in NUREG–1966, the staff reviewed and approved Section 13.6 of the certified ESBWR DCD, Revision 10. The staff reviewed Section 13.6 of North Anna 3 COL FSAR, Revision 8, and checked the referenced ESBWR DCD to ensure that the combination of the information in the COL FSAR and the information in the ESBWR DCD appropriately represents the complete scope of information relating to this review topic.[1] The staff’s review confirmed that the information contained in the application and the information incorporated by reference address the relevant information related to this Section.

The staff reviewed the information in the COL application:

COL Information Items

- STD COL 13.6-9-A

Operational alarm response procedures were addressed by the applicant through the North Anna COL FSAR, Section 13.6.1.1.3.

> Operating alarm response procedures will be developed and implemented in accordance with milestone defined in Section 13.5.2.1.

The staff reviewed STD COL 13.6-9-A and determined that it adequately references that the operational alarm response procedures were addressed and will be developed and implemented in accordance with the milestone defined in Section 13.5.2.1. The site protective strategy is in the facility implementing procedures, which were not subject to staff review as part of this COLA and are, therefore, subject to future NRC inspection in accordance with 10 CFR 73.55(c)(7)(iv) and 10 CFR Part 73, Appendix C, Section II.B.5(iii).

- STD COL 13.6-10-A

Operational surveillance test procedures were addressed by the applicant through the North Anna COL FSAR, Section 13.6.1.1.8.

> The establishment of these surveillance test procedures and frequencies will be completed in accordance with the milestone for Physical Security Plan implementation (Table 13.4-201).

The staff reviewed STD COL 13.6-10-A and determined that it adequately references that the operational surveillance test procedures and frequencies were addressed and will be completed in accordance with the milestone for PSP implementation (Table 13.4-201). The site protective strategy is in the facility implementing procedures, which were not subject to staff review as part of this COLA and are, therefore, subject to future NRC inspection in accordance with 10 CFR 73.55(c)(7)(iv) and 10 CFR Part 73, Appendix C, Section II.B.5(iii).

- STD COL 13.6-11-A

Maintenance test procedures were addressed by the applicant through the North Anna COL FSAR, Section 13.6.1.1.8.

> The establishment of these testing and maintenance milestones will be completed in accordance with the milestone for Physical Security Plan implementation (Table 13.4-201).

The staff reviewed STD COL 13.6-11-A and determined that it adequately references that the maintenance test procedures were addressed and will be completed in accordance with the milestone for PSP implementation (Table 13.4-201). The site protective strategy is in the facility implementing procedures, which were not subject to staff review as part of this COLA and are, therefore, subject to future NRC inspection in accordance with 10 CFR 73.55(c)(7)(iv) and 10 CFR Part 73, Appendix C, Section II.B.5(iii).

- STD COL 13.6-12-A

Operational response procedures to security events were addressed by the applicant through the North Anna COL FSAR, Section 13.6.2.

> As part of the Security Plan, the applicant will develop an integrated response strategy to a confirmed security event that provides for manual actuation of plant systems by the operators to an evolving scenario necessitating escalating operator response. This action will be completed prior to the milestone for PSP implementation (Table 13.4-201).

The staff reviewed STD COL 13.6-12-A and determined that it adequately references that the operational response procedures to security events were addressed and will be completed in accordance with the milestone for PSP implementation (Table 13.4-201). The site protective strategy is in the facility implementing procedures, which were not subject to staff review as part of this COLA and are, therefore, subject to future NRC inspection in accordance with 10 CFR 73.55(c)(7)(iv) and 10 CFR Part 73, Appendix C, Section II.B.5(iii).

- STD COL 13.6-13-A

Operational alarm response procedures were addressed by the applicant through the North Anna COL FSAR, Section 13.6.1.1.3.

> This action will be completed prior to the milestone for Physical Security Plan implementation (Table 13.4-201).

The staff reviewed STD COL 13.6-13-A and determined that it adequately references that the alarm response procedures were addressed and will be completed in accordance with the milestone for PSP implementation (Table 13.4-201). The site protective strategy is in the facility implementing procedures, which were not subject to staff review as part of this COLA and are, therefore, subject to future NRC inspection in accordance with 10 CFR 73.55(c)(7)(iv) and 10 CFR Part 73, Appendix C, Section II.B.5(iii).

- STD COL 13.6-14-A

Administrative controls to sensitive cabinets were addressed by the applicant through the North Anna COL FSAR, Section 13.6.1.1.5.

> Administrative procedures will be developed prior to the milestone for Physical Security Plan implementation (Table 13.4-201) to control work being performed in cabinets containing the control circuitry (contact elements) for the systems listed in Table 4-1 of NEDE-33391 (DCD reference 13.6-6).

The staff reviewed STD COL 13.6-14-A and determined that it adequately references that the administrative controls to sensitive cabinets were addressed and will be completed in accordance with the milestone for PSP implementation (Table 13.4-201). The site protective strategy is in the facility implementing procedures, which were not subject to staff review as part of this COLA and are, therefore, subject to future NRC inspection in accordance with 10 CFR 73.55(c)(7)(iv) and 10 CFR Part 73, Appendix C, Section II.B.5(iii).

- STD COL 13.6-15-A

Administrative controls to sensitive equipment were addressed by the applicant through the North Anna COL FSAR, Section 13.6.1.1.5.

> Administrative procedures will be developed prior to the milestone for Physical Security Plan implementation (Table 13.4-201) that will require two persons, each of whom are qualified to perform the intended work, to be present during the performance of any work on systems listed in Table 4-1 of NEDE-33391.

The staff reviewed STD COL 13.6-15-A and determined that it adequately references that the administrative controls to sensitive equipment procedures were addressed and will be completed in accordance with the milestone for PSP implementation (Table 13.4-201). The site protective strategy is in the facility implementing procedures, which were not subject to staff review as part of this COLA and are, therefore, subject to future NRC inspection in accordance with 10 CFR 73.55(c)(7)(iv) and 10 CFR Part 73, Appendix C, Section II.B.5(iii).

- NAPS COL 13.6-16-A

External BREs were addressed by the applicant through the North Anna COL FSAR, Section 13.6.2.

> A site arrangement drawing that shows the location of the external Bullet Resisting Enclosures and indicates the fields of fire from these locations is provided in COLA Part 8: Security, drawing NA3 COL 13.6-16-A, Security Site Arrangement - Fields of Fire. A description of the level of protection provided to security personnel stationed in Bullet Resisting Enclosures (BREs) from the effects of the equipment available to the adversaries utilizing the Design Basis Threat (DBT) toolkit (defined in DCD Reference 13.6-8) is also provided in COLA Part 8: Security, drawing NA3 COL 13.6-16-A, Security Site Arrangement - Fields of Fire.

In RAI 13.06.01-63 the staff asked the applicant for additional information concerning the Site Arrangement – Fields of Fire drawing that was provided in their December 18, 2013, submittal. The NRC requested additional information to evaluate and assess the proposed defensive strategy and to compare this strategy to the information incorporated by reference from NEDE-33391, Revision 3.

In a response dated May 29, 2014 (ADAMS Accession No. ML14155A338), the applicant provided information addressing Item 1, an updated fields of fire drawing addressing Item 2, and a Table addressing Items 3 and 4 of this RAI. In RAI 13.06.01-74, the staff asked an additional follow-up question regarding the December 18, 2013 submittal concerning Enclosure number 3's topical report. Since North Anna 3 will share the protected area (PA) perimeter with North Anna 1 and 2, the response to RAI 13.06.01-74, and items regarding unresolved issues (URIs) concerning North Anna's operating site may affect the response to a portion of RAI 13.06.03-63.

In May 2015, the final disposition of the North Anna Units 1 and 2 URI, and disposition of RAIs 13.06.01-63 and 13.06.01-74 was satisfied during the operating site's triennial force-on-force exercise. The final outcome of this URI required North Anna to appropriately identify in the site security plan and implementing procedures the minimum number of armed responders and armed security officers required to implement the site protective strategy. Therefore, RAIs 13.06.01-63 and 13.06.01-74 are resolved and closed.

- NAPS COL 13.6-17-A

Site-specific locations of security barriers were addressed by the applicant through the North Anna COL FSAR, Section 13.6.2.

> A site arrangement drawing that shows the location of the Protected Area (PA) fence, the isolation zone on either side of the PA fence, the Vehicle Barrier System (VBS), any Red Zone or Delay Fences, and any buildings or structures inside the PA that are not part of the Certified Design is provided in Figure 13.6-201, Security Site Arrangement – Physical Layout.
>
> Prior to the milestone for Physical Security Plan implementation (Table 13.4-201), a demonstration that the security strategy described in the ESBWR Safeguards Assessment Report (DCD Reference 13.6-6) remains valid will be conducted.

In RAI 13.06.01-64 dated May 6, 2014 (ADAMS Accession No. ML14126A406), the staff asked the applicant if they would consider relocating the detailed North Anna 3 COL 13.6-17-A drawing, Figure 13.6-201 to the site's PSP. In its response dated May 29, 2014 (ADAMS Accession No. ML14155A338), the applicant provided a revised figure showing the site-specific locations of security barriers, which will be incorporated into Part 2 of the North Anna COL FSAR. Dominion determined that it was not necessary to provide the detailed information on the site's security plan because the information was significantly in excess of that required by the PSP, and can create an unnecessary configuration management challenge when minor changes to the site are made.

The staff finds the response to RAI 13.06.01-64, in regard to COL Information Item 13.6-17-A, acceptable as it provides a commitment to add a revised site arrangement drawing to the North Anna 3, FSAR Part 2 showing the location of the PA fence, isolation zone on either side of the fence, the VBS, any red zone or delay fences, and any buildings or structures inside the PA that are not part of the design.

In FSAR Part 2, Revision 8, dated June 2014, the applicant provided a revised site arrangement drawing that shows the location of the PA fence, isolation zone on either side of the fence, the VBS, any red zone or delay fences, and any buildings or structures inside the PA that are not part of the design. Therefore, RAI 13.06.01-64 is resolved and closed.

- STD COL 13.6-18-A

Ammunition for armed responders was addressed by the applicant through the North Anna COL FSAR Section 13.6.2.

> Prior to the milestone for Physical Security Plan implementation (Table 13.4-201), the security plan will be updated with an analysis to determine if armed responders require ammunition greater than the amount normally carried to provide reasonable assurance of successful engagement of adversaries from various engagement positions, including the development of necessary procedures to assure adequate ammunition is available.

The staff's evaluation of STD COL 13.6-18-A is contained in Section 13.6.4.1.9 of this SER. The staff reviewed STD COL 13.6-18-A and determined that it adequately references that an analysis to determine if ammunition greater than the amount that is normally carried and the development of necessary procedures will be completed in accordance with the milestone for the PSP implementation table (Table 13.4-201).

The site protective strategy is in the facility implementing procedures, which were not subject to staff review as part of this COLA and are, therefore, subject to future NRC inspection in accordance with 10 CFR 73.55(c)(7)(iv) and 10 CFR Part 73, Appendix C, Section II.B.5(iii).

- STD COL 13.6-19-A

Site-specific update of the ESBWR Safeguards Assessment Report was addressed by the applicant through the North Anna COL FSAR Section 13.6.2.

> Prior to the milestone for Physical Security Plan implementation (Table 13.4-201), the security plan will be updated with an analysis of the ESBWR Safeguards Assessment Report (DCD Reference 13.6-6) reflecting site-specific locations of engagement positions including fields of fire. This applies for the external Bullet Resisting Enclosures as well as any internal positions that have external engagement responsibilities. This will include an implementation analysis of the Security Strategy described in the report, focusing on the effectiveness of neutralization of adversaries before significant radiological sabotage can occur.

In RAI 13.06.01-35, the staff asked the applicant to describe how the specific security features identified in NEDE-33391 will be tracked, incorporated, verified, and demonstrated for the North Anna 3 physical protection program. In its response dated November 19, 2009 (ADAMS Accession No. ML093270043), the applicant stated that Revision 2 of NEDE-33391, ESBWR "Safeguards Assessment Report" will be used to develop a strategy that will be tested and implemented to protect North Anna 3 against the adversary characteristics of the DBT. The assumptions in the report will be analyzed when developing the protective strategy.

During RAI reconciliations, it was noted that significant information in the NEDE-33391, ESBWR "Safeguards Assessment Report" Revision 2 was superseded by information in NEDE-33391, Revision 3. In a letter dated October 8, 2014 (ADAMS Accession No. ML14287A288), the applicant stated that the response to RAI 13.06.01-35 would be revised to reference the latest revision [Revision 3] of the ESBWR Safeguards Assessment report. In addition, it was stated in the North Anna RAI Review letter dated August 30, 2013 (ADAMS Accession No. ML13247A394) that the response to RAI 13.06.01-35 was valid with the exception of the reference to the New Plant Physical Security Program Milestone Implementation Schedule that was proposed by NEI but later deleted.

Development of the site protective strategy is a necessary milestone in the implementation of the North Anna Security Program. The applicant stated that the milestone for the development of the site protective strategy, as well as the major changes (modifications or revisions) resulting from the development of the protective strategy will be communicated to the NRC and tracked in the 14.3-201 Operational Programs Required by NRC Regulations. The applicant stated that it will submit, within 12 months after issuance of a COL, a schedule for implementation of the North Anna Security Program that supports planning for and conduct of NRC inspections. The schedule will be updated every 6 months until 12 months before scheduled fuel load, and every month thereafter until the North Anna Security Program has been fully implemented. This is documented in the SER Section 13.6.5 as License Condition 13.6-1.

The staff found the applicant response to RAI 13.06.01-35 acceptable, as it provides in the FSAR, STD COL 13.6-19-A a commitment to update the PSP with the analysis from the ESBWR Safeguards Assessment Report and the protective strategy to include plant-specific features, as required by 10 CFR 73.55(b). Therefore, RAI 13.03.01-35 is resolved and closed.

- STD COL 13.6-20-A

Physical security ITAAC is covered in part by the ESBWR standard ITAAC that address the physical plant security systems and those features that are part of the standard design. In addition, this COL item was also addressed by the applicant through the North Anna COL FSAR Section 13.6.2.

> Features of the physical security system are covered, in part, by the standard ESBWR design, while other features are plant and site specific. Accordingly, the ESBWR standard ITAAC cover the physical plant security system and address those features that are part of the standard design. NRC guidance provides suggested ITAAC that cover both the standard design and the plant and site specific features. The plant and site-specific Physical Security ITAAC not covered by the ESBWR Tier 1, Section 2.19, are contained in Part 10, ITAAC, Section 2.2.1 Site-Specific Physical Security ITAAC.

The staff reviewed STD COL 13.6-20-A and found that between the information described in the ESBWR Design Certification and the site-specific information described in Part 10, ITAAC, Section 2.2.1, Site-Specific Physical Security ITAAC, the applicant adequately addressed the Physical Security ITAAC.

License Conditions

- Part 10, Section 3.6

In FSAR Part 10, Revision 6, dated December 2013 (ADAMS Accession No. ML14007A426), the applicant proposed a license condition in Part 10 of the North Anna COLA that provides milestones for implementing applicable portions of the Security Program. Specifically, the applicant proposed the following:

The licensee shall submit to the appropriate Director of the NRC, a schedule, no later than 12 months after issuance of the COL, that supports planning for and conduct of NRC inspections of operational programs listed in the operational program FSAR Table 13.4-201. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until the operational programs in the FSAR table have been fully implemented.

The applicant followed the recommendations of the SRM dated February 22, 2006, on SECY-05-0197, in formulating the above license condition. The Staff, however, notes that the Commission, in its 2012 decision in the *Vogtle* proceeding, approved a license containing a different condition governing the same subject

Condition 2. D.(11) of the Southern Nuclear Operating Company's Vogtle Electric Generating Plant, Unit 3, COL (ADAMS Accession No. ML112991110), which governs the Operational Program Implementation Schedule, states:

> No later than 12 months after issuance of the COL, SNC shall submit to the Director of NRO, or the Director's designee, a schedule for implementation of the operational programs listed in FSAR Table 13.4-201, including the associated estimated date for initial loading of fuel. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until all the operational programs listed in FSAR Table 13.4-201 have been fully implemented.

The staff will use Vogtle Condition 2.D.(11) as a template for the corresponding condition in a North Anna COL.

13.6.4.1 Physical Security Plan

The applicant submitted in Part 8 of the COLA the North Anna 3 PSP, T&QP and SCP, to meet the requirements of 10 CFR 52.79(a)(35) and (36). Part 2, FSAR, Chapter 13, Section 13.6 references North Anna 3 PSP, T&QP, and SCP in describing the licensing basis for establishing a physical protection program, design of a physical protection system, and security organization that will have as its objective to provide high assurance that activities involving SNM are not inimical to the common defense and security and do not constitute an unreasonable risk to the public health and safety. The PSP submitted by North Anna 3 makes references to 10 CFR 50.34(c) and (d). Since this is a COLA which includes a common PA for both operating and new reactors, the references also include 10 CFR 52.79(a)(35)(i), (36)(i) and (36)(ii). The staff evaluated the North Anna 3 Security Plans only.

Security plans must describe how the applicant will implement Commission requirements and those site-specific conditions that affect implementation as required by 10 CFR 73.55(c)(1)(i) and 10 CFR 73.55(c)(1)(ii).

The requirements are provided in 10 CFR 73.55(c) and (d) to establish, maintain, and implement a PSP to meet the requirements of 10 CFR 73.55, “Requirements for Physical Protection of Licensed Activities in Nuclear Power Reactors against Radiological Sabotage,” and 10 CFR Part 73, Appendices B and C. The applicant must show establishment and maintenance of a security organization, the use of security equipment and technology, the training and qualification of security personnel, the implementation of predetermined response plans and strategies, and the protection of digital computer and communication systems and networks. The applicant must have a management system for development, implementation, revision, and oversight of security implementing procedures. The approval process for implementing security procedures will be documented.

In the July 18, 2011 cover letter response to RAI questions 13.06-26, 13.06-15, and 13.06-16, “SRP 13.06: Response To Rai Letter 55,” the applicant provided the following statement to clarify the intent for the separation of the COL security plan and the operating site fleet security plan, and how it would be reassembled after receipt of license: “The COLA PSP was created by copying information from the operating fleet PSP applicable to North Anna Units 1 and 2 and then adding information applicable to North Anna Unit 3. The COLA PSP is submitted as part of the license application to provide assurance of physical protection of North Anna Unit 3 in accordance with applicable regulatory requirements. North Anna Units 1 and 2 will continue to operate in accordance with the operating fleet PSP. After receipt of the license, the information in the COLA PSP will be included in the operating fleet PSP, with changes provided to the next submission of the North Anna Unit 3 COLA.”

The staff has reviewed the applicant’s description in PSP Section 1, for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant’s description in the PSP is consistent with the acceptance criteria in the SRP, Section 13.6.1, the staff found that the description provided in the PSP provides reasonable assurance that the licensee will meet the requirements of 10 CFR 73.55(c) and (d), and therefore is acceptable.

13.6.4.1.1 Introduction and Physical Facility Layout

The provisions of 10 CFR 52.79(a)(35) require that the application include a PSP describing how the applicant will meet the requirements of 10 CFR Part 73 (and 10 CFR Part 11, “Criteria and Procedures for Determining Eligibility for Access to or Control over Special Nuclear Material,” if applicable, including the identification and description of jobs as required by 10 CFR 11.11(a) of this chapter, at the proposed facility). The plan must list tests, inspections, audits, and other means to be used to demonstrate compliance with the requirements of 10 CFR Parts 11 and 73, if applicable; and a description of the implementation of the PSP.

The provisions of 10 CFR 52.79(a)(36) require that the application contain: (i) a SCP in accordance with the criteria set forth in Appendix C to 10 CFR Part 73. The SCP shall include plans for dealing with threats, thefts, and radiological sabotage, as defined in 10 CFR Part 73 of this chapter, relating to the SNM and nuclear facilities licensed under this chapter and in the applicant's possession and control. Each application for this type of license shall include the information contained in the applicant's SCP. (Implementing procedures required for this plan need not be submitted for approval.)

(ii) A training and qualification plan in accordance with the criteria set forth in Appendix B to 10 CFR Part 73.

(iii) A cyber security plan in accordance with the criteria set forth in 10 CFR 73.54, “Protection of Digital Computer and Communication Systems and Networks” of this chapter;

(iv) A description of the implementation of the SCP, training and qualification plan, and cyber security plan; and

(v) Each applicant who prepares a PSP, a SCP, a training and qualification plan, or a cyber security plan, shall protect the plans and other related SGI against unauthorized disclosure in accordance with the requirements of 10 CFR 73.21 of this chapter.

The provisions of 10 CFR 52.79(a)(44) requires a description of the FFD program required by 10 CFR Part 26, “Fitness for Duty Programs,” and its implementation.

Requirements are established in 10 CFR 73.55(c)(2) to ensure protection of SGI against unauthorized disclosure in accordance with 10 CFR 73.21. The applicant’s submittal in Part 8 of the COLA (page 1) acknowledges that the PSP the T&QP, and the SCP discuss specific features of the physical security system or response procedures and are SGI.

Section 1 of the PSP describes the applicant’s commitment to satisfying 10 CFR 50.34(c) and (d) and 10 CFR Part 73 by submitting a PSP, and to controlling the PSP and its appendices as SGI according to 10 CFR 73.21.

The provisions of 10 CFR Part 73, Appendix C, Section II.B.3.b, require a description and map of the physical layout of the site.

Section 1.1 of the PSP provides descriptions of location, site layout, and facility configuration. The PSP describes the physical structures and their locations on the site, description of the PA, and a description of the site in relation to nearby towns, roads, and other environmental features important to the coordination of response operations. The plant layout includes identification of main and alternate entry routes for law enforcement assistance forces and the location of control points for marshaling and coordinating response activities.

In addition, Section 1.1 of the North Anna COLA describes general plant descriptions that include details of the 16-to 80-kilometer (10- to 50-mile) radius of the geographical area of the North Anna 3 site, a site area map, and general plant and site descriptions. North Anna COL FSAR, Chapter 2, references the ESBWR design certification for the principal design and operating characteristics for the design and construction of North Anna 3. Part 1, “General Information,” of the North Anna COLA describes the name of the applicant and principal business locations.

In RAI 13.06.01-64, Item number 3, the staff questioned the added information provided in the applicant's PSP, pointing to the FSAR and ESP SSAR for information concerning the site's layout. In its response, the applicant stated that the sentence pointing to the FSAR and ESP SSAR will be removed from PSP Section 1.1. In addition, the applicant stated, in PSP Section 1.1, SCP Section 4.2, and PSP Figure 1, information pertaining to surrounding airports will be added. In a letter dated March 30, 2015, the licensee provided a revised security plan, Revision 5, with the above information. The applicant appropriately updated PSP Section 1.1, SCP Sections 4.2, and Figure 1. Therefore, RAI 13.06.01-64, Item number 3 is resolved and closed.

The staff has reviewed the facility physical layout provided in PSP Section 1.1 and as supplemented by the North Anna COL FSAR. The staff determined that the applicant included site-specific conditions that affect the applicant's capability to satisfy the requirements of a comprehensive PSP. The applicant has adequately described the physical structures and their locations on site and the site in relation to nearby towns, roads, and other environmental features important to the effective coordination of response operations. Also in Section 1.1, the applicant described which figures in the PSP that depicts the main and alternate entry routes for law-enforcement assistance and the location of control points for marshaling and coordinating response activities. The staff concludes that the applicant's security plans have met the requirements for content of a PSP as stated above. Therefore, the staff found the "Facility Layout" described in the PSP and the North Anna COL FSAR is acceptable.

13.6.4.1.2 Performance Objectives

The provisions of 10 CFR 73.55(b)(1) require, in part, that the applicant shall establish and maintain a physical protection program with an objective to provide high assurance that activities involving SNM are not inimical to the common defense and security and do not constitute an unreasonable risk to the public health and safety. The provisions of 10 CFR 73.55(b)(2) establish, in part, the requirement to protect a nuclear power reactor against the DBT of radiological sabotage as described in 10 CFR 73.1. The provisions of 10 CFR 73.55(b)(3)(i) and 10 CFR 73.55(b)(3)(ii) require the applicant to establish a physical protection program designed to ensure the capabilities to detect, assess, interdict, and neutralize threats up to and including the DBT of radiological sabotage, as stated in 10 CFR 73.1, are maintained at all times, and to provide defense-in-depth, supporting processes, and implementing procedures that will ensure the effectiveness of the physical protection program.

Section 2 of the PSP outlines regulatory requirements for the establishment and maintenance of an onsite physical protection system, security organization, and integrated response capability. As part of the objective, the security program design incorporates supporting processes such as defense-in-depth principles, including diversity and redundancy, to ensure that no single event can disable the security response capability. The physical protection systems and programs described in the PSP are designed to protect against the DBT of radiological sabotage in accordance with the requirements of 10 CFR 73.55(a) through (r) or NRC approved equivalent measures that meet the same high assurance objectives provided by paragraph (a) through (r). The applicant proposes to use the corrective action program to track, trend, correct and prevent recurrence of failures and deficiencies in the physical protection program.

The staff has reviewed the applicant's description in PSP Section 2, for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the PSP meets the requirements of 10 CFR 73.55(b), and therefore is acceptable.

13.6.4.1.3 Performance Evaluation Program

Requirements are established in 10 CFR 73.55(b)(4) through (b)(11) for the applicant to analyze and identify site-specific conditions, establish programs, plans, and procedures that address performance evaluations, access authorization, cyber security, insider mitigation, FFD, corrective actions, and operating procedures. Regulations in 10 CFR 73.55(b)(6) prescribe specific requirements to establish, maintain, and implement a performance evaluation program in accordance with 10 CFR Part 73, Appendix B, Section VI for implementation of the plant protective strategy.

Section 3.0 of the PSP describes that drills and exercises, as discussed in the T&QP, will be used to assess the effectiveness of the contingency response plan and the effectiveness of the applicant's response strategy. Other assessment methods include formal and informal exercises or drills, self-assessments, and internal and external audits and evaluations.

The performance evaluation processes and criteria that assess the effectiveness of the security program, including adequate protection against radiological sabotage, will be established in facility procedures and the deficiencies identified will be managed through the corrective action program.

Section 3.0 of the PSP references Section 4.0 of the T&QP, which provides additional details related to the performance evaluation of security personnel in accordance with 10 CFR Part 73 Appendix B Section VI. Section 4.0 of the T&QP includes provisions to conduct security force tactical drills and force-on-force exercises to evaluate the effectiveness of security systems and the response performances of security personnel. In addition, Section 17 of the PSP describes additional detail regarding the applicant's processes for reviews, evaluations, and audits that will complement the performance evaluation program.

The staff has reviewed the applicant's description in PSP Section 3 and the T&QP Section 4 (evaluated separately) for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the PSP meets the requirements of 10 CFR 73.55(b)(6), and therefore is acceptable.

13.6.4.1.4 Establishment of Security Organization

The provisions of 10 CFR 73.55(d) establish requirements to describe a security organization, including the management system for oversight of the physical protection program. The security organization must be designed, staffed, trained, qualified, periodically re-qualified, and equipped to implement the physical protection program as required by 10 CFR 73.55(b) and 10 CFR Part 73, Appendices B and C.

As explained below, Section 4.0 of the PSP describes how the applicant meets the requirements of 10 CFR 73.55(d)(1).

Security Organization Management

Section 4.1 of the PSP describes the organization's management structure. The PSP establishes that the security organization is a critical component of the physical protection program and is responsible for the effective application of engineered systems, technologies, programs, equipment, procedures, and personnel that are necessary to detect, assess, interdict, and neutralize threats up to and including the DBT of radiological sabotage. The security organization may be proprietary, contract, or other qualified personnel.

The PSP describes that the organization will be staffed with appropriately trained and equipped personnel, in a command structure with administrative controls and procedures, to provide a comprehensive response. Section 4.1 of the PSP also describes the roles and responsibilities of the security organization. The PSP provides that at least one full time, dedicated security shift supervisor, who has the authority for command and control of all security operations, is on site at all times.

The security force implementing the security functions as described in this section of the plan will either be a proprietary force, or contractor or other qualified personnel. The training and qualification provisions are described in the T&QP.

The staff has reviewed the applicant's description in PSP Sections 4 and 4.1 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the PSP provides reasonable assurance that the licensee will meet the requirements of 10 CFR 73.55(d) and is, therefore, acceptable.

13.6.4.1.5 Qualification for Employment in Security

The requirements of 10 CFR 73.55(d)(3) state, in part, that the applicant may not permit any individual to implement any part of the physical protection program unless the individual has been trained, equipped and qualified to perform assigned duties and responsibilities in accordance with Appendix B to 10 CFR Part 73 and the applicant's T&QP.

Section 5 of the PSP describes that employment qualifications for members of the security force are delineated in the T&QP.

The staff has reviewed the applicant's description in PSP Section 5 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the PSP meets the requirements of 10 CFR 73.55(d)(3) and therefore is acceptable.

13.6.4.1.6 Training of Non-Security Personnel

Consistent with requirements in 10 CFR 73.55(d)(3), 10 CFR 73.56, "Personnel Access Authorization Requirements for Nuclear Power Plants," and 10 CFR Part 73, Appendix B, Section VI.C.1, all personnel who are authorized unescorted access to the applicant's PA receive training, in part, to ensure that they understand their role in security and their responsibilities in the event of a security incident. Individuals assigned to perform security-related duties or responsibilities, such as, but not limited to, material searches and vehicle escort are trained, qualified, and re-qualified in accordance with the T&QP to perform these duties and responsibilities and to ensure that each individual has the minimum knowledge, skills, and abilities required for effective performance of assigned duties and responsibilities.

Section 6 of the PSP describes the training provided for all personnel who have been granted unescorted access to the applicant's PA.

The staff has reviewed the applicant's description in PSP Section 6 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the PSP meets the requirements of 10 CFR 73.56 and 10 CFR Part 73, Appendix B, and therefore is acceptable.

13.6.4.1.7 Security Personnel Training

The provisions of 10 CFR 73.55(d) require that all security personnel are trained and qualified in accordance with 10 CFR Part 73, Appendix B, Section VI prior to performing their duties.

Section 7 of the PSP describes that all security personnel are trained, qualified and perform tasks at levels specific for their assignments in accordance with the applicant's T&QP.

The staff has reviewed the applicant's description in PSP Section 7 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the PSP and the T&QP meets the requirements of 10 CFR 73.55(d) and therefore is acceptable. The staff's review of the applicant's T&QP is located in Section 13.6.4.2 of this SER.

In RAI 13.06.01-70 dated May 6, 2014 (ADAMS Accession No. ML14126A406) , the staff requested information from the applicant regarding a discrepancy in training between the operating site's CTM and North Anna 3's COL CTM for the Remotely Operated Weapon System (ROWS) training for Task number 29, "Demonstrate Proficiency in use of ROWS:" for the column: "ROWS Operator (RO)." The staff also requested the applicant provide pertinent documentation concerning any planned use of ROWS at North Anna 3, and revise Task Number 29 as needed to reflect the planned use of ROWS as it applies to the North Anna 3 COLA T&QP. In the applicant response dated May 29, 2014 (ADAMS Accession No. ML14155A338), the applicant clarified that the North Anna site does not have or plan to have ROWS. By letter dated March 30, 2015 (ADAMS Accession No. ML15093A050), the applicant revised their COL CTM with a clarified depiction of training regarding ROWS.

Accordingly, the staff finds the response to RAI 13.06.01-70 acceptable, as it provides clarification that the North Anna combined site does not have ROWS. Therefore, RAI 13.06.01-70 is resolved and closed.

13.6.4.1.8 Local Law Enforcement Liaison

The following requirement is stated in 10 CFR 73.55(k)(9), "To the extent practicable, licensees shall document and maintain current agreements with applicable law enforcement agencies to include estimated response times and capabilities." In addition, 10 CFR 73.55(m)(2) requires that the periodic licensee reviews of the physical protection program required by that Section include an audit of the effectiveness of the response commitments by local, State, and Federal law enforcement authorities.

Section 8 of the PSP provides a detailed discussion of the ongoing relationship with local law enforcement agencies (LLEA). The plans addressing response, communication methodologies, and protocols, command and control structures and marshaling locations are located in the operations procedures, emergency plan procedures, and the site-specific law enforcement response plan. The law enforcement response plan is reviewed biennially concurrent with the PSP effectiveness review.

The staff has reviewed the applicant's description in PSP Section 8 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the PSP meets the requirements of 10 CFR 73.55(k)(9) and 10 CFR 73.55(m)(2), and therefore is acceptable.

13.6.4.1.9 Security Personnel Equipment

The requirements of 10 CFR 73.55(d)(3) state, in part, that the applicant may not permit any individual to implement any part of the physical protection program unless the individual has been trained, equipped and qualified in accordance with 10 CFR Part 73, Appendix B and the T&QP. Regulations in 10 CFR Part 73, Appendix B, Section VI.G.2(a) state, in part, that the applicant must ensure that each individual is equipped or has ready access to all personal equipment or devices required for the effective implementation of the NRC-approved security plans, the applicant's protective strategy, and implementing procedures. The provisions of 10 CFR Part 73, Appendix B, Sections VI.G.2(b) and VI.G.2(c) delineate the minimum equipment requirements for security personnel and armed response personnel.

The applicant addresses STD COL 13.6-18-A as follows: PSP Section 9 describes the equipment, including armament, ammunition and communications equipment that is provided to security personnel in order to ensure that security personnel are capable of performing the function stated in the Commission-approved security plans, applicant's protective strategy, and implementing procedures.

The staff has reviewed the applicant's description in PSP Section 9 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the PSP provides reasonable assurance that the licensee will meet the requirements of 10 CFR 73.55(d)(3) and Appendix B, Section VI.G.2(a), VI.G.2(b) and VI.G.2(c), and therefore is acceptable.

13.6.4.1.10 Work Hour Controls

The provisions of 10 CFR Part 26, "Fitness for Duty Programs," Subpart I, "Managing Fatigue," establish the requirements for managing fatigue. The provisions of 10 CFR 26.205, "Work Hours," establish requirements for work hours. The provisions of 10 CFR 26.205(a) require that any individual who performs duties identified in 10 CFR 26.4(a)(1) through (a)(5) shall be subject to the requirements of Section 26.205(a).

Section 10 of the PSP describes how the applicant will implement work hour controls in accordance with 10 CFR Part 26, Subpart I, and that site procedures shall describe performance objectives and implementing procedures.

The staff's review of the FFD program is found in Section 13.7 of this SER.

13.6.4.1.11 Physical Barriers

The following requirements are established in 10 CFR 73.55(e): "Each licensee shall identify and analyze site-specific conditions to determine the specific use, type, function, and placement of physical barriers needed to satisfy the physical protection program design requirements of 10 CFR 73.55(b)." (1) The applicant shall: (i) "Design, construct, install and maintain physical barriers as necessary to control access into facility areas for which access must be controlled or denied to satisfy the physical protection program design requirements of paragraph (b) of this Section." 10 CFR 73.55(b)(3) (ii) states that the physical protection program must: "Provide defense-in-depth through the integration of systems, technologies, programs, equipment, supporting processes, and implementing procedures as needed to ensure the effectiveness of the physical protection program."

Section 11 of the PSP provides a general description of how the applicant will implement its program for physical barriers, and that this implementation is in accordance with the performance objectives and requirements of 10 CFR 73.55(b).

Owner Controlled Area (OCA) Barriers

Section 11.1 of the PSP describes the use of OCA barriers at the site.

Vehicle Barriers

The PSP Sections 11.2.1 and 11.2.2 provides for vehicle control measures to protect against the DBT of radiological sabotage. The staff has verified that such measures are in accordance with site-specific analysis. Further, the staff has determined that these measures integrate systems, technologies, programs, supporting processes, and implementing procedures to provide defense-in-depth against the DBT land vehicle bomb assault. The staff has also determined that such measures provide for a VBS at a stand-off distance adequate to protect personnel, equipment, and systems necessary to prevent significant core damage and spent fuel sabotage against the effects of such an assault. Further, the staff confirmed that the applicant's PSP provides that the inspection, monitoring, and maintenance of the VBS are included in facility procedures. In view of the above, the staff concludes that the PSP identifies measures taken to provide high assurance that a land vehicle bomb assault can be defended against.

In RAI 13.06.01-22 (ADAMS Accession No. ML092881296) dated October 1, 2009, the staff asked the applicant to provide a general description of natural terrain features that make up portions of the outer VBS; provide a reference to the criteria used to determine the acceptability of these features, and to provide a reference to the criteria used to determine that the current North Anna outer VBS location and stand-off distance are appropriate given the proximity of the proposed North Anna 3 to the current outer VBS location. In a letter dated August 24, 2009), the applicant responded: "The natural terrain features that make up portions of the outer VBS include water and trees which have been analyzed in accordance with NUREG/CR–4250 for acceptability. A portion of the natural terrain of the current outer VBS will be removed and replaced with temporary man-made barriers during construction of North Anna 3. The location and design of the permanent VBS will be analyzed in accordance with the criteria of NUREG/CR–4250. The staff found the response to RAI 13.06.01-22 unacceptable, as it does not contain enough high assurance criterion that is used to determine applicable construction standards and stand-off distance for the final VBS for North Anna 1, 2, and 3.

In RAI 13.06.01-38 (ADAMS Accession No. ML092881296) dated October 1, 2009, the staff requested additional information concerning the response to RAI 13.06.01-22. In its response dated November 19, 2009 (ADAMS Accession No. ML093270043), the applicant stated that the blast calculations used in the design and layout of the permanent VBS, including determination of stand-off distance, were developed in accordance with the guidance given in NUREG/CR–4250 and NUREG–6190.

The staff found the response to RAI 13.06.01-38 (ADAMS Accession No. ML093270043) dated October 29, 2009, acceptable, as it provides details on how the applicant determined the applicable construction standards and stand-off distance for the final VBS, in accordance with 10 CFR 73.55(b) and 10 CFR 73.55(e)(10). Therefore, RAIs 13.06.01-22 and 13.06.01-38 are resolved and closed.

Accordingly, the staff found that the proposed vehicle control measures are consistent with the physical protection program design requirements of 10 CFR 73.55(b) and 10 CFR 73.55(e)(10).

Waterborne Threat Measures

The provisions of 10 CFR 73.55(e)(10)(ii) require the applicant to "identify areas from which a waterborne vehicle must be restricted, and where possible, in coordination with local, State, and Federal agencies having jurisdiction over waterway approaches, deploy buoys, markers, or other equipment. In accordance with the site-specific analysis, provide periodic surveillance and observation of waterway approaches and adjacent areas."

In a portion of RAI 13.06.01-65 dated May 6, 2014 (ADAMS Accession No. ML14126A406), the staff requested additional information on why certain information was removed from the North Anna COL security plan concerning monitored views of certain Sections of the adjacent waterways. In a letter dated May 29, 2014 (ADAMS Accession No. ML14155A338), the applicant came to the conclusion that the missing information was inadvertently removed and would be reinstated in the next revision update of their security plan. By letter dated March 30, 2015 (ADAMS Accession No. ML15093A050), the applicant submitted an update to the PSP providing the missing information.

The staff concludes that Section 11.2.3 of the PSP describes protection measures that are adequate to protect the North Anna 3 site against waterborne threats.

Accordingly, the staff finds the response to RAI 13.06.01-65 acceptable, as it provides details on how the applicant meets the regulatory requirements of 10 CFR 73.55(e)(10)(ii). Therefore, this portion of RAI 13.06.01-65 is resolved and closed.

Protected Area Barriers

The provisions of 10 CFR 73.55(e)(8)(i) require that the PA perimeter must be protected by physical barriers that are designed and constructed to: (1) limit access to only those personnel, vehicles, and materials required to perform official duties; (2) channel personnel, vehicles, and materials to designated access control portals; and (3) be separated from any other barrier designated as a vital area physical barrier, unless otherwise identified in the PSP.

The descriptions of the PA barrier are provided in PSP Section 11.3.

Section 11.3 of the PSP describes the extent to which the PA barrier at the perimeter is separated from a vital area. The security plan identifies where the PA barrier is not separated from a vital area barrier, as required by 10 CFR 73.55(e)(8)(i)(c).

Section 11.3 of the PSP describes isolation zones. As required in 10 CFR 73.55(e)(7), the isolation zone is maintained in outdoor areas adjacent to the PA perimeter barrier and is designed to ensure the ability to observe and assess activities on either side of the PA perimeter.

These descriptions meet the definitions of physical barrier and PA in 10 CFR 73.2 and the requirements of 10 CFR 73.55(e)(8).

Vital Area Barriers

The provisions of 10 CFR 73.55(e)(9) require that "Vital equipment must be located only within vital areas, which must be located within a protected area so that access to vital equipment requires passage through at least two physical barriers, except as otherwise approved by the Commission and identified in the security plans." In addition, 10 CFR 73.55(e)(5) requires that the physical barriers to access of certain vital areas shall be bullet resisting.

Section 11.4 of the PSP describes that vital areas are restricted access areas surrounded by physical barriers with the capability to restrict access to only authorized individuals.

Accordingly, the staff found all vital areas are constructed in accordance with established regulatory requirements. Section 11.4 also describes that the reactor CR, CAS, SAS and the location within which the last access control function for access to the PA is performed, must be bullet resisting. Accordingly, the staff finds all vital areas are constructed in accordance with established regulatory requirements.

Target Set Equipment

The provisions of 10 CFR 73.55(f) require the following:

> The licensee shall document and maintain the process used to develop and identify target sets, to include the site-specific analyses and methodologies used to determine and group the target set equipment or elements. The licensee shall consider cyber-attacks in the development and identification of target sets. Target set equipment or elements that are not contained within a protected or vital area must be identified and documented consistent with the requirements in 10 CFR 73.55(f)(1) and be accounted for in the licensee's protective strategy. The licensee shall implement a process for the oversight of target set equipment and systems to ensure that changes to the configuration of the identified equipment and systems are considered in the licensee's protective strategy. Where appropriate, changes must be made to documented target sets.

Section 11.5 of the PSP describes that target set equipment or elements that are not contained within a protected or vital area are identified and accounted for in the site protective strategy.

In connection with the review of the ESBWR physical protection program, the staff identified several RAIs relating to target sets. In light of these RAIs, GEH provided additional design detail to give the applicant insight into the development of site-specific target set analyses. The applicant incorporates by reference the design of physical protection systems within the design of the vital area and vital systems for the ESBWR, as described in the ESBWR DCD including topical reports, NEDE-33389, NEDE-33390, and NEDE-33391.

GEH stated in NEDE-33391 that target sets were created to aid in the development of the ESBWR physical security systems, which are not considered as final or fully comprehensive because of the simplified assumptions that were made, and that a comprehensive target set document must be developed following an approved development process. GEH also stated that the insights from the development of target sets described in the ESBWR Safeguards Assessment Report should be considered and included, as appropriate. However, the simplifying assumptions need to be expanded to include the necessary combinations of Target Set elements. In addition, the Target Set document should include adjustments to reflect site-specific conditions.

The staff has reviewed the applicant's description in Sections 11.5 and 14.5 of the PSP, Section 7 of the SCP, and information in NEDE-33391, for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in Sections 11.5 and 14.5 of the PSP, Section 7 of the SCP, and the information in NEDE-33391, is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in

Sections 11.5 and 14.5 of the PSP and Section 7 of the SCP meets the requirements of 10 CFR 73.55(f)(1), (3) and (4), and is, therefore, acceptable. The target sets, target set analysis and site protective strategy are in facility implementing procedures, which were not subject to staff review as part of this COL application and are, therefore, subject to future NRC inspection in accordance with 10 CFR 73.55(c)(7)(iv) and 10 CFR Part 73, Appendix C, Section II.B.5(iii).

Delay Barriers

The provisions of 10 CFR 73.55(e)(3)(ii) require that physical barriers must "provide deterrence, delay, or support access control" to perform the required function of the applicant's physical protection program. The PSP describes the use of delay barriers at North Anna 3.

Section 11.6 of the PSP includes a description of the use of delay barriers to meet the requirements of 10 CFR 73.55(e).

The staff has reviewed the applicant's description in PSP Sections 11, 11.1, 11.2, 11.2.1, 11.2.2, and 11.2.3, and Sections 11.3 through 11.6 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the PSP provides reasonable assurance that the licensee will meet the requirements of 10 CFR 73.55(e), and therefore is acceptable.

13.6.4.1.12 Security Posts and Structures

The provisions of 10 CFR 73.55(e)(5) require that the reactor CR, the CAS, and the location within which the last access control function for access to the PA is performed, must be bullet-resisting.

Section 12 of the PSP states that security posts and structures are qualified to a level commensurate with their application within the site protective strategy, and that these positions are constructed of bullet resisting materials. Section 11.4 of the PSP states the reactor CR, the CAS, SAS, and the location within which the last access control function for access to the PA is performed must be bullet resisting.

In a portion of RAI 13.06.01-66 dated May 6, 2014 (ADAMS Accession No. ML14126A406), the staff questioned how many alarm stations North Anna has between the combined site. In addition, the staff requested the applicant to update all appropriate sections and figures to reflect the appropriate amount of alarms stations for this combined site. In a letter dated May 29, 2014 (ADAMS Accession No. ML14155A338), the applicant responded with the amount of alarm stations between the combined site. In a letter dated March 30, 2015 (ADAMS Accession No. ML15093A050), the applicant revised Figure 7 of the PSP to depict the location of the SAS for the combined site.

Accordingly, the staff finds the response to RAI 13.06.01-66 acceptable, as the applicant provided details on how many alarm stations the combined site has. Therefore, this portion of RAI 13.06.01-66 is resolved and closed.

The staff has reviewed the applicant's description in PSP Section 12 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the PSP provides reasonable assurance that the licensee will meet the requirements of 10 CFR 73.55(e)(5), and therefore is acceptable.

13.6.4.1.13 Access Control Devices

Regulations in 10 CFR 73.55(g)(1) state that, consistent with the function of each barrier or barrier system, the applicant shall control personnel, vehicle, and material access, as applicable, at each access control point in accordance with the physical protection program design requirements of 10 CFR 73.55(b).

The applicant addresses STD COL 13.6-6-A by adhering to the provisions of 10 CFR 73.55(g)(6) which requires control of access control devices as stated in subparagraph (i): "The licensee shall control all keys, locks, combinations, passwords and related access control devices used to control access to PAs, vital areas and security systems to reduce the probability of compromise."

Types of Security-Related Access Control Devices

Section 13.1 of the PSP describes that the applicant uses security-related access control devices to control access to protected and vital areas and security systems.

Control and Accountability of Access Control Devices

Section 13.2 of the PSP describes the control of security-related locks and describes the controls associated with the changes to and replacements of access control devices and the accountability and inventory control process, and the circumstances that require changes in security-related locks. The applicant uses facility procedures to produce, control, and recover keys, locks, and combinations for all areas and equipment which serve to reduce the probability of compromise. The issue of access control devices is limited to individuals who have unescorted access authorization and need access to perform official duties and responsibilities. Keys and locks are accounted for through a key inventory control process as described in facility procedures.

The staff has reviewed the applicant's description in PSP Sections 13, 13.1, and 13.2, for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the descriptions provided in the PSP provides reasonable assurance that the licensee will meet the requirements of 10 CFR 73.55(g)(1) and (6), and therefore are acceptable.

13.6.4.1.14 Access Requirements

Access Authorization and Fitness for Duty

The provisions of 10 CFR 73.55(b)(7) require the applicant to establish, maintain, and implement an access authorization program in accordance with 10 CFR 73.56 and to describe the program in the PSP. The provisions of 10 CFR Part 26 require the applicant to establish and maintain an FFD program.

Section 14.1 of the PSP describes that the access authorization program implements regulatory requirements utilizing the provisions in RG 5.66, Revision 1, dated July 2009. RG 5.66 is an acceptable method for meeting the requirements of 10 CFR 73.55(b)(7).

The staff has reviewed the applicant's description in PSP Section 14.1 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the PSP provides reasonable assurance that the licensee will meet the requirements of 10 CFR 73.55(b)(7), 10 CFR 73.56 and 10 CFR Part 26 and therefore is acceptable.

Insider Mitigation Program

The provisions of 10 CFR 73.55(b)(9) require that the applicant establish, maintain, and implement an insider mitigation program and describe the program in the PSP. The insider mitigation program must monitor the initial and continuing trustworthiness and reliability of individuals granted or retaining unescorted access authorization to a protected or vital area, and implement defense-in-depth methodologies to minimize the potential for an insider to adversely affect, either directly or indirectly, the applicant's capability to prevent significant core damage and spent fuel sabotage. The insider mitigation program must include elements from: the access authorization program; the FFD program; the cyber security program; and the physical protection program.

Section 14.2 of the PSP describes how the applicant will establish, maintain, and implement an insider mitigation program utilizing the guidance in RG 5.77. The insider mitigation program requires elements from the access authorization program described in 10 CFR 73.56; the FFD program described in 10 CFR Part 26; the cyber security program described in 10 CFR 73.54, and the physical security program described in 10 CFR 73.55. In addition, Section 14.2 describes the integration of the programs mentioned above to form a cohesive and effective insider mitigation program. The applicant addresses the observations for the detection of tampering. RG 5.77 is an acceptable method for meeting the requirements of 10 CFR 73.55(b)(9).

The staff has reviewed the applicant's description in PSP Section 14.2 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the PSP provides reasonable assurance that the licensee will meet the requirements of 10 CFR 73.55(b)(9), and therefore is acceptable.

Picture Badge Systems

Requirements for badges are stated in 10 CFR 73.55(g)(6)(ii). "The licensee shall implement a numbered photo identification badge system for all individuals authorized unescorted access to the protected area and vital areas. In addition, identification badges may be removed from the protected area under limited conditions and only by authorized personnel. Records of all badges shall be retained and shall include name and areas to which persons are granted unescorted access."

The provisions of 10 CFR 73.55(g)(7)(ii) require that individuals not employed by the applicant, but who require frequent or extended unescorted access to the PA and/or vital areas to perform duties and responsibilities required by the applicant at irregular or intermittent intervals, shall satisfy the access authorization requirements of 10 CFR 73.56 and 10 CFR Part 26 of this chapter, and shall be issued a non-employee photo identification badge that is easily distinguished from other identification badges before being allowed unescorted access to the protected and vital areas. Non-employee photo identification badges must visually reflect that the individual is a non-employee and that no escort is required.

Section 14.3 of the PSP describes the site picture badge system. Identification badges will be displayed while individuals are inside the PA or vital areas. When not in use, badges may be removed from the PA by authorized holders, provided that a process exists to deactivate the badge upon exit and positively confirm the individual's true identity and authorization for unescorted access prior to entry into the PA. Records are maintained to include the name and areas to which unescorted access is granted of all individuals to whom photo identification badges have been issued.

The staff has reviewed the applicant's description in PSP Section 14.3 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the PSP provides reasonable assurance that the licensee will meet the requirements of 10 CFR 73.55(g)(6)(ii) and (7)(ii), and therefore is acceptable.

Searches

The provisions of 10 CFR 73.55(h) require, in part, that the applicant meet the objective to detect, deter, and prevent the introduction of firearms, explosives, incendiary devices, or other items that could be used to commit radiological sabotage. To accomplish this, the applicant shall search individuals, vehicles, and materials consistent with the physical protection program design requirements in paragraph (b) of this Section, and the function to be performed at each access control point or portal before granting access.

Section 14.4 of the PSP provides an overview description of the search process for vehicle, personnel, and materials. The search process is conducted using security personnel, specifically trained non-security personnel, and technology.

Vehicle Barrier System Access Control Point Searches

The provisions of 10 CFR 73.55(h)(2)(ii) through (v) provide the requirements for the applicant to search vehicles at the OCA and 10 CFR 73.55(h)(3) provides requirements for searches of personnel, vehicles and materials prior to entering the PA.

Section 14.4.1 of the PSP describes the process for the search of personnel, vehicles, and materials at predetermined locations prior to granting access to designated facility areas identified by the applicant as needed to satisfy the physical protection program. The applicant states that it has developed specific implementing procedures to address vehicle and materials searches at these locations.

Protected Area Personnel Search

Section 14.4 of the PSP describes the process for searches of all personnel requesting access into PAs. The PSP describes the search for firearms, explosives, incendiary devices, or other items that could be used to commit radiological sabotage using equipment capable of detecting these items or through visual and physical searches or both to ensure that all items are clearly identified prior to granting access into the PA. All persons except official Federal, State, and LLEA personnel on official duty are subject to these searches upon entry to the PA. Detailed discussions of observation and control measures are found in the implementing procedures.

Protected Area Packages and Materials Search

Section 14.4.3 of the PSP describes the process for conducting searches of packages and materials for firearms, explosives, incendiary devices, or other items that could be used to commit radiological sabotage using equipment capable of detecting these items or through visual and physical searches or both to ensure that all items are clearly identified before these items can enter the North Anna PA. Detailed provisions for conducting these searches are found in the applicant's implementing procedures and include the search and control of bulk materials and products. The applicant's implementing procedures also discuss the control of packages and materials previously searched and tamper sealed by personnel trained in accordance with the T&QP.

Protected Area Vehicle Search

Section 14.4.4 of the PSP describes the process for the search of vehicles for firearms, explosives, incendiary devices, or other items that could be used to commit radiological sabotage using equipment capable of detecting these items or through visual and physical searches or both to ensure that all items are clearly identified at the PA. Detailed provisions for conducting these searches are found in the applicant's implementing procedures. The applicant's implementing procedures also address the search methodologies for vehicles that must enter the PA under emergency conditions.

Protected Area Access Controls

Section 14.4.5 of the PSP describes the process for controlling access at all points where personnel or vehicles could gain access into the applicant's PA. The plan notes that all points of personnel access are through a lockable portal. The entry process is normally monitored by multiple security personnel. Personnel are normally allowed access through means that verify identity and authorization following the search process. Vehicles are controlled through positive control methods described in facility procedures.

Escort and Visitor Requirements

The provisions of 10 CFR 73.55(g)(7) state, in part, that the applicant may permit escorted access to protected and vital areas to individuals who have not been granted unescorted access in accordance with the requirements of 10 CFR 73.56 and 10 CFR Part 26. Provisions in 10 CFR 73.55(g)(8) establish escort requirements. The applicant is required to implement procedures for processing, escorting, and controlling visitors. Procedures will address confirmation of identity of visitors, maintenance of a visitor control register, visitor badging and escort controls including, training, communications, and escort ratios.

Section 14.4.6 of the PSP describes the process for control of visitors. The PSP affirms that procedures address the identification, processing, and escorting of visitors, and the maintenance of a visitor control register. Training provisions for escorting visitors include responsibilities, communications and escort ratios. All escorts are trained to perform escort duties in accordance with site requirements as described in the procedures. All visitors wear a badge that clearly indicates that an escort is required.

The staff has reviewed the applicant's description in PSP Sections 14.4, and 14.4.1 through 14.4.6 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the PSP provides reasonable assurance that the licensee will meet the requirements of 10 CFR 73.55(h)(2), (h)(3), (g)(7) and (g)(8), and therefore is acceptable.

Vital Area Access Controls

The provisions of 10 CFR 73.55(g)(4) require that the applicant control access into vital areas consistent with established access authorization lists. In response to a site-specific credible threat or other credible information, the applicant shall implement a two-person (line-of-sight) rule for all personnel in vital areas so that no one individual is permitted access to a vital area.

The provisions of 10 CFR 73.56(j) require the applicant to establish, implement, and maintain a list of individuals who are authorized to have unescorted access to specific nuclear power plant vital areas during non-emergency conditions. The list must include only those individuals who have a continued need for access to those specific vital areas in order to perform their duties and responsibilities. The list must be approved by a cognizant manager or supervisor who is responsible for directing the work activities of the individual who is granted unescorted access to each vital area, and be updated and reapproved no less frequently than every 31 days.

Section 14.5 of the PSP describes vital areas and that the applicant maintains vitals areas locked and protected by an active intrusion alarm system. An access authorization system is established to limit unescorted access that is controlled by an access authorization list that is reassessed and reapproved at least once every 31 days. Additional access control measures are described in the facility procedures.

The staff has reviewed the applicant's description in PSP Section 14.5 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the PSP provides reasonable assurance that the licensee will meet the requirements of 10 CFR 73.55(g)(4), and therefore is acceptable.

13.6.4.1.15 Surveillance Observation and Monitoring

The provisions of 10 CFR 73.55(i)(1) require that the applicant establish and maintain intrusion detection systems that satisfy the design requirements of 10 CFR 73.55(b) and provide, at all times, the capability to detect and assess unauthorized persons and facilitate the effective implementation of the protective strategy.

Illumination

The provisions of 10 CFR 73.55(i)(6) require, in part, that all areas of the facility are provided with illumination necessary to satisfy the design requirements of 10 CFR 73.55(b) and implement the protective strategy. Specific requirements include providing a minimum illumination level of 0.2 foot-candles, measured horizontally at ground level, in the isolation zones and appropriate exterior areas within the PA. Alternatively, the applicant may augment the facility illumination system by means of low-light technology to meet the requirements of this Section or otherwise implement the protective strategy. The applicant shall describe in the security plans how the lighting requirements of this Section are met and, if used, the type(s) and application of low-light technology.

Section 15.1 of the PSP describes that all isolation zones and appropriate exterior areas within the PA have lighting capabilities that provide illumination sufficient for the initiation of an adequate response to an attempted intrusion of the isolation zone, a PA, or a vital area. A discussion of the implementation of technology using fixed and non-fixed low-light level cameras or alternative technological means is provided. The applicant has addressed the potential for loss of lighting and the compensatory actions that would be taken if that event were to occur.

Surveillance Systems

The provisions of 10 CFR 73.55(i)(5) require, in part, that the applicant implement, establish, and maintain intrusion detection and assessment, surveillance, and observation and monitoring systems to satisfy the design requirements of 10 CFR 73.55(b), and to conform to the applicant's OCA.

Section 15.2 of the PSP describes that surveillance is accomplished by human observation and technology. Surveillance systems include a variety of cameras, video display, and annunciation systems designed to assist the security organization in observing, detecting, and assessing alarms or unauthorized activities. Certain systems provide real-time and recorded play back of recorded video images. The specifics of surveillance systems are described in facility implementing procedures.

Intrusion Detection Equipment

Section 15.3 of the PSP describes the perimeter intrusion detection system, and the PA and vital area intrusion detection systems. These systems are capable of detecting attempted and actual unauthorized penetration of the PA perimeter barrier; are monitored with assessment equipment designed to satisfy the requirements of 10 CFR 73.55(i) and provide real-time and play-back/recorded video images of the detected activities before and after each alarm annunciation. The PSP describes how the applicant will meet regulatory requirements for redundancy, tamper indication, and uninterruptable power supply.

Central Alarm Station (CAS) and Secondary Alarm Station (SAS) Operation

The applicant addresses STD COL 13.6-7-A and NAPS COL 13.6-8-A as follows: The provisions of 10 CFR 73.55(i)(4) provides requirements for alarm stations. It is required, in 10 CFR 73.55(i)(4)(i) that both alarm stations must be designed and equipped to ensure that a single act, in accordance with the DBT of radiological sabotage defined in 10 CFR 73.1, cannot disable both alarm stations. The applicant shall ensure the survivability of at least one alarm station to maintain the ability to perform the following functions: 1) detect and assess alarms; 2) initiate and coordinate an adequate response to an alarm; 3) summon offsite assistance; and 4) provide command and control. The provisions of 10 CFR 73.55(i)(4)(iii) require, in part, that the CAS and SAS alarm stations must be equal and redundant.

Section 15.4 of the PSP describes the functional operations of the CAS and the SAS. The PSP provides that the alarm stations are equipped such that no single act will disable both alarm stations. The applicant's PSP provides that each alarm station is properly manned and that no activities are permitted that would interfere with the operator's ability to execute assigned duties and responsibilities.

Security Patrols

Owner Controlled Area Surveillance and Response

The provisions of 10 CFR 73.55(e)(6) require that the applicant establish and maintain physical barriers in the OCA, as needed, to satisfy the physical protection program design requirements of 10 CFR 73.55(b). It is required in 10 CFR 73.55(i)(5)(ii), in part, that the applicant provide continuous surveillance, observation and monitoring of the OCA and that these responsibilities may be performed by security personnel during continuous patrols, through the use of video technology, or by a combination of both.

Section 15.5.1 of the PSP describes the processes used to meet this requirement. The PSP discusses the process to be used and provides that details regarding the implementation of

OCA surveillance techniques are found in facility procedures. The PSP provides a discussion regarding the implementation of manned and video options for patrolling and surveillance of the OCA.

In a portion of RAI 13.06.01-65 dated May 6, 2014 (ADAMS Accession No. ML14126A406), the staff requested additional information to explain inconsistencies in the OCA patrols as described in North Anna 3, Revision 4, PSP Section 11.2.3 and SCP Section 7, with North Anna 1 and 2, Revision 18, same Sections. In a letter dated May 29, 2014 (ADAMS Accession No. ML14155A338), the applicant came to the conclusion that the missing information was mistakenly removed and would be reinstated in the next revision update of their security plan. By letter dated March 30, 2015, (ADAMS Accession No. ML15093A050), the applicant submitted an update to the combined security plan providing the missing information**.**

The staff concludes that PSP Section 15.5.1, and SCP Section 7 describes surveillance and response measures adequate to protect the North Anna 3 against intrusion.

Accordingly, the staff found the response to RAI 13.06.01-65 acceptable, as it provided details on how the applicant meets the regulatory requirements of 10 CFR 73.55(e)(6). Therefore, this portion of RAI 13.06.01-65 is resolved and closed.

Protected and Vital Area

The provisions of 10 CFR 73.55(i)(5)(iii) through (viii) require, in part, that armed patrols check unattended openings that intersect a security boundary, such as an underground pathways, check external areas of the PA and vital area portals, periodically inspect vital areas, conduct random patrols of accessible target set equipment, be trained to recognize obvious tampering and if detected, initiate an appropriate response in accordance with established plans and procedures.

Section 15.5.2 of the PSP describes the process employed by the applicant to meet the above requirements. The PSP describes the areas of the facility that will be patrolled and observed, as well as the frequency of these patrols and observations. The applicant has addressed the observations for the detection of tampering in Section 14.2 of the PSP and in the facility procedures.

The staff has reviewed the applicant’s description in PSP Sections 15, 15.1 through 15.4, 15.5.1, and 15.5.2 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. The staff verified that the PSP provided for the identification of openings, areas, and equipment that must be checked, inspected, or otherwise observed by armed patrols. Further, the staff has determined that the PSP provides for training of patrols and procedures to recognize obvious tampering and to initiate an appropriate response to recognized tampering. In view of these staff determinations, the applicant’s description in the PSP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the PSP provides reasonable assurance that the licensee will meet the requirements of 10 CFR 73.55(b) and (i), and therefore are acceptable with respect to surveillance observation and monitoring.

13.6.4.1.16 Communications

The provisions of 10 CFR 73.55(j)(1) through (6) describe the requirements for establishment and maintenance of continuous communication capabilities with both onsite and offsite resources to ensure effective command and control during both normal and emergency situations. An individual assigned to an alarm station must be capable of calling for assistance, on-duty security force personnel must be capable of maintaining continuous communication with each alarm station and vehicle escorts, and personnel escorts must maintain timely communication with security personnel. Continuous communication capabilities must terminate in both alarm stations, including between LLEA and each alarm station and between the CR and each alarm station. Non-portable communications must remain operable from independent power sources. The applicant must identify areas where communications could be interrupted or not maintained.

Notifications (Security Contingency Event Notifications)

Section 16.1 of the PSP states that the applicant has a process to ensure that continuous communications are established and maintained between the onsite security force staff and the offsite support agencies.

System Descriptions

Section 16.2 of the PSP describes the establishment and maintenance of the communications system. Detailed descriptions of security systems are included in the facility procedures, including areas where communications could be interrupted or not maintained. The North Anna site security personnel have access to both hard wired and alternate communications systems. Site security personnel are assigned communications devices to maintain continuous communications with the CAS and SAS. All personnel and vehicles are assigned communications resources with which to maintain continuous communications. Continuous communication protocols are available between the CAS, SAS, and each CR. The applicant maintains a secondary power source, within a vital area, for all non-portable security communications equipment.

The staff has reviewed the applicant’s description in PSP Sections 16, 16.1, and 16.2 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant’s description in the PSP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the PSP meets the requirements of 10 CFR 73.55(j)(1) through (6), and therefore are acceptable.

13.6.4.1.17 Review, Evaluation, and Audit of the Physical Security Program

The provisions of 10 CFR 73.55(m) require, in part that each element of the physical protection program be reviewed at least every 24 months. A review is required within 12 months after initial physical protection program implementation or a change in personnel, procedures, equipment, or facilities that could have a potentially adverse effect on security. A review is also required as necessary based on site-specific analysis assessments, or other performance indicators. Reviews must be conducted by individuals independent of those responsible for security program and those directly responsible for implementation of the onsite physical protection program. Reviews must include an audit of security plans, implementing procedures and local law enforcement commitments. Results of reviews shall be presented to management at least one level above the level responsible for day-to-day plant operations, and findings must be entered in the site corrective action program.

Section 17 of the PSP describes that the physical security program is reviewed 12 months following initial implementation and at least every 24 months by individuals independent of both security program management and personnel who have a direct responsibility for implementation of the security program. The physical security program review includes, but is not limited to, an audit of the effectiveness of the physical security program, cyber security plans, implementing procedures, safety/security interface activities, the testing, maintenance, and calibration program, and response commitments by local, State, and Federal law enforcement authorities.

The PSP also states that a review shall be conducted as necessary based upon site-specific analyses, assessments, or other performance indicators and as soon as reasonably practical, but no longer than 12 months, after changes occur in personnel, procedures, equipment, or facilities that potentially could adversely affect safety/security.

The PSP provides further that the results and recommendations of the physical security program review, management's finding on whether the physical security program is currently effective and any actions taken as a result of recommendations from prior program reviews are documented in a report to plant management and to appropriate corporate management at least one level higher than that having responsibility for the day-to-day plant operation. The PSP provides that these reports are maintained in an auditable form and maintained for inspection.

The PSP states that findings from the onsite physical security program reviews are entered into the facility corrective action program.

The provisions of the PSP described above are virtually identical to the requirements of Section 73.55(m) summarized above, and the PSP satisfies those requirements. The staff, however, raised a question regarding the requirements of 10 CFR 73.58, “Safety/security requirements for nuclear power reactors.”

In RAI 13.06.01-36 (ADAMS Accession No. ML092730215) dated September 30, 2009, the staff requested that the applicant address the requirements of 10 CFR 73.58. “ In its response, dated November 9, 2009 (ADAMS Accession No. ML093270043), the applicant stated that a procedure will be developed and used to review planned and emergent activities on safety and security with guidance from RG 5.74. The procedure will be developed by March 31, 2010, for compliance with 10 CFR 73.58 for Safety/Security Interface. Additionally, a description of the North Anna 3 safety/security interface program will be included in North Anna COL FSAR, Section 13.6.2.

The staff finds that the response to RAI 13.06.01-36 meets the requirements of 10 CFR 73.58 and is acceptable, because it provides a commitment to implement administrative procedures to manage the safety/security interface. Specifically, the North Anna COL FSAR Revision 6, Section 13.6.2, dated July 2013, states in, CWR SUP-13.6-2:

Administrative procedures have been implemented that meet the requirements of 10 CFR 73.58 for managing the safety/security interface.

The staff has verified that CWR SUP-13.6-2 has been included in the North Anna 3 FSAR. Therefore, RAI 13.06.01-36 is resolved and closed.

The North Anna 3 COL applicant responding as the subsequent COL (S-COL) application in the design centered licensing review approach, see Section 1.2.3 of this SER, provided the results of its review of RAIs, including 13.06.01-57 submitted by the Fermi 3 reference COL (R-COL) applicant. The following clarification RAI was submitted to the ESBWR R-COL, Fermi 3:

In RAI 13.06.01-57, the NRC staff requested clarification pertaining to how the applicant, once licensed, will analyze and identify changes in the site specific conditions related to the ESBWR's structures, systems, and components (SSCs) (described in certain technical reports), resulting from changes made to the Fermi 3 COL between issuance of the COL and the security program implementation milestones provided in FSAR Table 13.4-201 to ensure that the security plan continues to meet 10 CFR 73.55(b)(4). Also, clarify how the applicant, once licensed, will ensure that the as-built plant continues to meet all physical protection program design and performance criteria in 10 CFR 73.55 at the time the physical protection program is implemented. During a public telephone call on August 4, 2014 (ML14281A128), the NRC staff provided feedback to the applicant concerning the addition of "NRC endorsed" and the removal of "currently accepted" to the RAI 13.06.01-57 response. In a letter dated August 4, 2014, the applicant submitted to the NRC a revised COLA markup associated with its response to RAI 13.06.01-57.

In its response, the applicant stated that the description of the content of the administrative procedures implementing the 10 CFR 73.58 Fermi 3 COLA FSAR, Section 13.6.2 will be revised as follows:

These procedures are in effect at the time of issuance of the COL and were developed using NRC endorsed industry guidance.

The NRC staff finds that the response to RAI 13.06.01-57 meets the requirements of 10 CFR 73.55(b)(4) and 10 CFR 73.58 and is acceptable, because it provides a commitment to implement administrative procedures to manage the safety/security interface during the construction phase and throughout the operational phase. The incorporation of changes to the Fermi 3 COL FSAR, Section 13.6.2 is being tracked as Confirmatory Item 13.6-1. The staff verified that FSAR Revision 7 incorporated changes provided in response to RAI 13.06.01-57. Therefore, Confirmatory Item 13.6-1 is resolved.

North Anna 3 representatives were also present during the above-stated public telephone call, and agreed to follow Fermi 3's response in a letter dated October 8, 2014 (ADAMS Accession No. ML14287A288).

> Administrative procedures have been implemented that meet the requirements of 10 CFR 73.58 for managing the safety/security interface. These procedures are in effect at the time of issuance of the combined license and were developed using NRC endorsed industry guidance.

The staff has reviewed the applicant's description in PSP Section 17 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. As set forth above, the applicant's description in the PSP provides reasonable assurance that the licensee will meet the requirements of 10 CFR 73.55(m), and therefore is acceptable

In FSAR Part 2, Revision 9, dated June 2016, the applicant provided an update to STD SUP-13.6-2 confirming the changes to match Fermi 3's response regarding Safety/Security interface. Therefore, confirmatory item 13.06-01 is closed.

13.6.4.1.18 Response Requirements

The provisions of 10 CFR 73.55(k) require, in part, that the applicant establish and maintain a properly trained, qualified and equipped security force required to interdict and neutralize threats up to and including the DBT defined in 10 CFR 73.1, to prevent significant core damage and spent fuel sabotage. To meet this objective, the applicant must ensure that necessary equipment is in supply, working, and readily available for use. The applicant must ensure training has been provided to all armed members of the security organization who will be available on site to implement the applicant's protective strategy as described in the facility procedures and 10 CFR Part 73, Appendix C. The applicant must have facility procedures to reconstitute armed response personnel and have established working agreement(s) with LLEA. The applicant must have implemented a threat warning system to accommodate heightened security threats and coordination with NRC representatives.

Section 18 of the PSP describes an armed response team, as well as its responsibilities, training and equipment, and the number of armed response force personnel required to be immediately available at all times to implement the site's protective strategy. The PSP provides for training in accordance with the requirements of 10 CFR Part 73, Appendix B that will ensure implementation of the site protective strategy in accordance with 10 CFR Part 73, Appendix C. Procedures are in place to reconstitute the armed response personnel as are agreements with LLEA. The PSP also describes procedures to manage the threat warning system.

The staff has reviewed the applicant's description in PSP Section 18 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria.

Because the applicant's description in the PSP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the PSP provides reasonable assurance that the licensee will meet the requirements of 10 CFR 73.55(k), and therefore is acceptable.

13.6.4.1.19 Special Situations Affecting Security

The provisions of 10 CFR 73.58 require that each nuclear power reactor applicant requesting a license under 10 CFR Part 50, or 10 CFR Part 52, comply with the following requirements: the applicant shall assess and manage the potential for adverse effects on safety and security, including the site emergency plan, before implementing changes to plant configurations, facility conditions, or security; the scope of changes to be assessed and managed must include planned and emergent activities (such as, but not limited to, physical modifications, procedural changes, changes to operator actions or security assignments, maintenance activities, system reconfiguration, access modification or restrictions, and changes to the security plan and its implementation); where potential conflicts are identified, the applicant shall communicate them to appropriate personnel and take compensatory and/or mitigative actions to maintain safety and security under applicable Commission regulations, requirements, and license conditions.

The provisions of 10 CFR 73.55(a)(2) require the applicant's security plans to identify, describe, and account for site-specific conditions that affect its capability to satisfy the requirements of that Section.

The provisions of 10 CFR 73.55(n)(8) require, in part, operational and post-maintenance performance testing to ensure operational readiness for security equipment and systems.

Refueling/Major Maintenance

Section 19.1 of the PSP describes that security procedures identify measures for implementation of actions prior to refueling or major maintenance activities. These measures include controls to ensure that a search is conducted prior to revitalizing an area, that protective barriers and alarms are fully operational, and that post-maintenance performance testing is performed to ensure operational readiness of equipment in accordance with 10 CFR 73.55(n)(8).

Construction and Maintenance

Section 19.2 of the PSP states that during periods of construction and maintenance when temporary modifications are necessary, the applicant will implement measures that provide for equivalency in the physical protective measures and features impacted by the activities such that physical protection measures are not degraded. The process for making such changes or modifications is included in the facility procedures.

The staff has reviewed the applicant's description in PSP Sections 19.1 and 19.2 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the PSP provides reasonable assurance that the licensee will meet the requirements of 10 CFR 73.55(n)(8) and 10 CFR 73.58, and are, therefore, acceptable.

13.6.4.1.20 Maintenance, Testing, and Calibration

In accordance with 10 CFR 73.55(n), the applicant is required to establish, maintain, and implement a maintenance, testing, and calibration program to ensure that security systems and equipment, including secondary and uninterruptible power supplies, are tested for operability and performance at predetermined intervals, maintained in operable condition, and have the capability of performing their intended functions. The regulation requires that the applicant describe its maintenance testing and calibrations program in the PSP, and that the implementing procedures describe the details and intervals for conducting these activities. Applicant procedures must identify criteria for documenting deficiencies in the corrective action program and ensuring data protection in accordance with 10 CFR 73.21. The applicant must conduct periodic operability testing of the intrusion alarm system and must conduct performance testing at the beginning and end of the period for which it is used for security, or if the period of continuous use exceeds 7 days, at least once every 7 days. Communication equipment must be tested not less than daily, and search equipment must also be tested periodically. Procedures must be established for testing equipment located in hazardous areas, and procedures must be established for returning equipment to service after each repair.

Sections 20.1 through 20.7 of the PSP describe the maintenance, testing, and calibration program for security-related equipment. Section 20.1 states that the applicant shall conduct intrusion detection testing in accordance with recommended testing procedures described in RG 5.44, Revision 3, which specifies testing frequency.

The staff has determined that Section 20.7 does not apply to North Anna 3, due to North Anna not having ROWS. North Anna security plan Revision 5, dated March 2015 (ADAMS Accession No. ML15093A050), appropriately identifies that ROWS is not applicable to this site.

Accordingly, the staff has determined that the PSP provides for testing of each operational component credited for the implementation of the security program at a frequency in accordance with 10 CFR 73.55(n), the PSP, and implementing procedures.

The staff has reviewed the applicant’s description in PSP Sections 20 and 20.1 through 20.7 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant’s description in the PSP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the PSP provides reasonable assurance that the licensee will meet the requirements of 10 CFR 73.55(n), and therefore is acceptable.

13.6.4.1.21 Compensatory Measures

The provisions of 10 CFR 73.55(o) requires, in part, that the applicant shall identify criteria and measures to compensate for degraded or inoperable equipment, systems, and components to meet the requirements of Section 73.55. Compensatory measures must provide a level of protection that is equivalent to the protection that was provided by the degraded or inoperable, equipment, system, or components. Compensatory measures must be implemented within specific time frames necessary to meet the appropriate portions of 10 CFR 73.55(b) and described in the security plans.

Section 21 of the PSP identifies measures and criteria to compensate for degraded or inoperable equipment, systems, and components in accordance with 10 CFR 73.55(o) to assure that the effectiveness of the physical protection system is not reduced by failure or other contingencies affecting the operation of the security-related equipment or structures. Sections 21.1 through 21.14 of the PSP address PA and vital area barriers, intrusion detection and alarm systems, lighting, fixed and non-fixed closed circuit television, play-back and recorded video systems, computer systems, access control devices, VBS, channeling barrier systems, other security related equipment, and UPS.

In a portion of RAI 13.06.01-66, the staff asked the applicant to explain the discrepancy between the operating site security plan and the combined site security plan concerning the site UPS. By letter dated May 29, 2015, the applicant stated that this discrepancy was made in error, and would be corrected. In Revision 5 of the North Anna COL security plan dated March 30, 2015 (ADAMS Accession No. ML15093A050), the applicant revised PSP Section 14.5 to correct the discrepancy between the operating and combined site security plans.

Accordingly, the staff found the response to this portion of RAI 13.06.01-66 acceptable, as it provides the corrected information in PSP Section 14.5 on how the applicant meets the regulatory requirements of 10 CFR 73.55(c)(1)(i) and 10 CFR 73.55(c)(1)(ii). Therefore, this portion of RAI 13.06.01-66 is resolved and closed.

The staff has reviewed the applicant's description in PSP Sections 21 and 21.1 through 21.14, for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the PSP provides reasonable assurance that the licensee will meet the requirements of 10 CFR 73.55(o), and therefore is acceptable.

13.6.4.1.22 Records

The provisions of 10 CFR 73.55(q) and 10 CFR Part 73, Appendix B, Section VI.H, and Appendix C, Section II.C, require, in part, that the applicant must retain and maintain all records required to be kept by the Commission regulations, orders, or license conditions until the Commission terminates the license for which the records were developed, and shall maintain superseded portions of these records for at least 3 years after the record is superseded, unless otherwise specified by the Commission. The provisions of 10 CFR Part 26, Subpart N, 10 CFR 73.56(o), and 10 CFR 73.70 include requirements for records regarding FFD, access authorization, and certain other security-related matters, respectively. Among other things, the applicant is required to keep records of contracts with any contracted security force that implements any portion of the onsite physical protection program for the duration of the contract. The applicant must make all records, required to be kept by the Commission, available to the Commission and the Commission may inspect, copy, retain and remove all such records, reports and documents whether kept by the applicant or a contractor. Review and audit reports must be maintained and available for inspection for a period of 3 years.

Section 22 of the PSP addresses the requirements to maintain records. Sections 22.1 through 22.13 address each kind of record that the applicant will maintain and the duration of retention for each record. The following types of records are maintained in accordance with the above mentioned regulations: access authorization; suitability, physical, and psychological qualification records for security personnel; PA and vital area access control records; PA visitor access records; PA vehicle access records; vital area access transaction records; vitalization and de-vitalization records; vital area access list reviews; security plans and procedures; security patrols, inspections and tests; maintenance; CAS and SAS alarm annunciation and security response records; LLEA records; records of audits and reviews; access control devices; security training and qualification records; firearms testing and maintenance records; and engineering analysis for the VBS.

In RAI 13.06.01-32 dated October 1, 2009 (ADAMS Accession No. ML092881296), the staff requested the applicant to clarify their commitment to RG 5.66 in the North Anna 3 COLA Part 2: FSAR - NAPS COL 1.9-3-A Table 1.9-202 “Conformance with Regulatory Guides.” In the applicant’s response (ADAMS Accession No. ML093270043) dated November 19, 2009, the applicant stated in part: “When the template [NEI 03-12] is revised and endorsed to include the sentence ["All elements of Regulatory Guide 5.66, Revision 1, have been implemented to satisfy the requirements of 10 CFR 73.56 and 10 CFR part 26 related to unescorted access and unescorted access authorization."], Dominion will include the sentence in the next revision to the Physical Security Plan.”

Accordingly, the staff finds the response to RAI 13.06.01-32 acceptable, as the applicant provides a commitment to update the North Anna PSP with the statement "All elements of Regulatory Guide 5.66, Revision 1, have been implemented to satisfy the requirements of 10 CFR 73.56 and 10 CFR part 26 related to unescorted access and unescorted access authorization.," once the NRC endorsed NEI 03-12, Section 14.1 has been updated with the sentence "All elements of Regulatory Guide 5.66, Revision 1, have been implemented to satisfy the requirements of 10 CFR 73.56 and 10 CFR Part 26 related to unescorted access and unescorted access authorization." Therefore, RAI 13.06.01-32 is resolved and closed.

The staff has reviewed the applicant’s description in PSP Sections 22 and 22.1 through 22.13 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant’s description in the PSP is consistent with the acceptance criteria in SRP, Section 13.6.1 the staff found that the descriptions provided in the PSP provides reasonable assurance that the licensee will meet the requirements of 10 CFR Part 26, 10 CFR 73.55(q), 10 CFR 73.56(o), and 10 CFR 73.70, and are, therefore, acceptable.

13.6.4.1.23 Digital Systems Security

Section 23 of the PSP addresses digital systems security. The applicant stated in its PSP that it has implemented the requirements of 10 CFR 73.54 and maintains a cyber security plan that describes how it has provided high assurance that safety, security, and emergency preparedness (SSEP) functions are protected against the DBT. Once the NRC reviews and approves the plan, it is a condition of the site license and the program is implemented consistent with the approved schedule in the plan.

The staff’s review of the cyber security plan is found in Section 13.8 of this SER.

13.6.4.1.24 Temporary Suspension of Security Measures

The provisions of 10 CFR 73.55(p) allow the applicant to suspend implementation of affected requirements of this Section under the following conditions: (i) In accordance with 10 CFR 50.54(x) and 50.54(y) of this chapter, the licensee may suspend any security measures under this Section in an emergency when this action is immediately needed to protect the public health and safety and no action consistent with license conditions and technical specifications that can provide adequate or equivalent protection is immediately apparent. This suspension of security measures must be approved as a minimum by a licensed senior operator before taking this action. (ii) During severe weather when the suspension of affected security measures is immediately needed to protect the personal health and safety of security force personnel and no other immediately apparent action consistent with the license conditions and technical specifications can provide adequate or equivalent protection. This suspension of security measures must be approved, as a minimum, by a licensed senior operator, with input from the security supervisor or manager, before taking this action.

Suspension of Security Measures in Accordance with 10 CFR 50.54(x) and (y)

Section 24.1 of the PSP addresses suspension of security measures in accordance with 10 CFR 50.54(x) and 10 CFR 50.54(y). Specifically, the plan provides description of the conditions under which suspension is permissible, the level of authority necessary to suspend security measures, and the provisions for reporting such a suspension.

Suspension of Security Measures during Severe Weather or Other Hazardous Conditions

As required in 10 CFR 73.55(p)(3), which states in part, “suspension of security measures are reported and documented in accordance with the provisions of 10 CFR 73.71.” This suspension of security measures must be approved, as a minimum, by a licensed senior operator, with input from the security supervisor or manager, before taking this action. Suspended security measures must be reinstated as soon as conditions permit.

Section 24.2 of the PSP provides that certain security measures may be temporarily suspended during circumstances such as imminent, severe, or hazardous weather conditions, but only when such action is immediately needed to protect the personal health and safety of security force personnel and no other immediately apparent action consistent with the security measures can provide adequate or equivalent protection. Under the PSP, suspended security measures shall be restored as soon as practical.

The staff has reviewed the applicant’s description in PSP Sections 24, 24.1, and 24.2 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant’s description in the PSP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the PSP provides reasonable assurance that the licensee will meet the requirements of 10 CFR 73.55(p), and therefore is acceptable.

13.6.4.1.25 Appendix A Glossary of Terms and Acronyms

Appendix A, “Glossary of Terms and Acronyms,” was reviewed and found to be consistent with the NRC endorsed NEI 03-12, Revision 7 template.

13.6.4.1.26 Conclusions on the Physical Security Plan

Accordingly, the staff’s review described in Sections 13.6.4.1.1 through 13.6.4.1.25 of this SER, the North Anna 3 PSP meets the requirements of 10 CFR 73.55(a) through (r). The target sets, target set analysis, and site protective strategy are in the facility implementing procedures, which were not subject to staff review as part of this COLA and are, therefore, subject to future NRC inspection in accordance with 10 CFR 73.55(c)(7)(iv) and procedurally correct implementation of the PSP will provide high assurance that activities involving SNM are not inimical to the common defense and security and do not constitute an unreasonable risk to the public health and safety.

13.6.4.2 Appendix B Training and Qualification Plan

13.6.4.2.1 Introduction

The provisions of 10 CFR 73.55(c)(4) state that the applicant shall establish, maintain, implement, and follow a T&QP that describes how the criteria set forth in 10 CFR Part 73, Appendix B will be implemented.

The provisions of 10 CFR 73.55(d)(3) state that the applicant may not permit any individual to implement any part of the physical protection program unless the individual has been trained, equipped, and qualified to perform their assigned duties and responsibilities in accordance with 10 CFR Part 73, Appendix B and the T&QP. Non-security personnel may be assigned duties and responsibilities required to implement the physical protection program and shall:

(i) Be trained through established applicant training programs to ensure each individual is trained, qualified, and periodically requalified to perform assigned duties.

(ii) Be properly equipped to perform assigned duties.

(iii) Possess the knowledge, skills, and abilities, to include physical attributes such as sight and hearing, required to perform their assigned duties and responsibilities.

In addition, 10 CFR Part 73, Appendix B, Section VI.D.2(a) states armed and unarmed individuals shall be requalified at least annually in accordance with the requirements of the Commission-approved T&QP.

The T&QP describes that it is written to address the requirements found in 10 CFR Part 73, Appendix B, Section VI. The applicant indicates that the objective of the plan is to provide a mechanism to ensure that members of the security organization, and all others who have duties and responsibilities in implementing the security requirements and protective strategy, are properly trained, equipped, and qualified. The T&QP describes, deficiencies identified during the administration of the T&QP requirements are documented in the site corrective action program. The staff has reviewed the introduction Section in the T&QP and has determined that it includes all of the programmatic elements necessary to satisfy the requirements of 10 CFR 73.55 and 10 CFR Part 73, Appendix B, Section VI applicable to the T&QP. Additional section-by-section evaluations and discussions are found in the following paragraphs.

13.6.4.2.2 Employment Suitability and Qualification

Provisions for mental qualifications, documentation, and physical requalification for security personnel (applicant employee and contractor) are described in the following T&QP Sections.

Suitability

The provisions of 10 CFR Part 73, Appendix B, Section VI.B.1(a) require, in part, that before employment, or assignment to the security organization, an individual shall: (1) possess a high school diploma or pass an equivalent performance examination designed to measure basic mathematical, language, and reasoning skills, abilities, and knowledge required to perform security duties and responsibilities; (2) have attained the age of 21 for an armed capacity or the age of 18 for an unarmed capacity; (3) not have any felony convictions that reflect on the individual's reliability; and (4) not be disqualified from possessing or using firearms or ammunition in accordance with applicable State or Federal law, including 18 U.S.C. 922, for individuals in an armed capacity. Applicants shall use information that has been obtained during the completion of the individual's background investigation for unescorted access to determine suitability. Satisfactory completion of a firearms background check for the individual under 10 CFR 73.19 of this part will also fulfill this requirement. The provisions of 10 CFR Part 73, Appendix B, Section VI.B.1(b) requires that the qualification of each individual to perform assigned duties and responsibilities must be documented by a qualified training instructor and attested to by a security supervisor.

Section 2.1 of the T&QP details the requirements of qualifications for employment in the security organization that follows the regulation in 10 CFR Part 73, Appendix B, Section VI.B.1(a).

Physical Qualifications

The provisions of 10 CFR Part 73, Appendix B, Section VI.B.2 require, in part, that individuals whose duties and responsibilities are directly associated with the effective implementation of the Commission-approved security plans, applicant protective strategy, and implementing procedures, may not have any physical conditions that would adversely affect their performance of assigned security duties and responsibilities.

Section 2.2 of the T&QP details that those individuals who are directly associated with implementation of the security plans, protective strategy and procedures, may not have any physical conditions that would adversely affect their performance of assigned security duties and responsibilities. All individuals that are found on the critical task matrix shall demonstrate the necessary physical qualifications prior to duty.

Physical Examination

It is stated in 10 CFR Part 73, Appendix B, Section VI.B.2(a)(2), that armed and unarmed individuals assigned security duties and responsibilities shall be subject to a physical examination designed to measure the individual's physical ability to perform assigned duties and responsibilities as identified in the Commission-approved security plans, applicant protective strategy, and implementing procedures.

The provisions of 10 CFR Part 73, Appendix B, Section VI.B.2(a)(3) state, in part, that the physical examination must be administered by a licensed health professional with the final determination being made by a licensed physician to verify the individual's physical capability to perform assigned duties and responsibilities.

The provisions of 10 CFR Part 73, Appendix B, Section VI.B.2(b) through (e) provide the minimum requirements that individuals must meet, and include requirements for vision, hearing, review of existing medical conditions, and examination for potential addictions.

The provisions of 10 CFR Part 73, Appendix B, Section VI.B.2(f) address medical examinations before returning to assigned duties following any incapacitation.

Section 2.3 of the T&QP describes the physical examinations for armed and unarmed individuals assigned security duties, as well as other individuals that implement parts of the physical protection program. Minimum requirements exist for physical examinations of vision, hearing, existing medical conditions, addiction, or other physical requirements.

The staff has reviewed the applicant's description in T&QP Sections 2.1, 2.2, and 2.3 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the T&QP provides reasonable assurance that the licensee will meet the requirements of 10 CFR Part 73 Appendix B, Sections VI.B.1 and VI.B.2, and are, therefore, acceptable.

Medical Examinations and Physical Fitness Qualifications

The provisions of 10 CFR Part 73, Appendix B, Section VI.B.4(a), require, in part, that armed members of the security organization shall be subject to a medical examination by a licensed physician, to determine the individual's fitness to participate in physical fitness tests, and that the applicant shall obtain and retain a written certification from the licensed physician that no medical conditions were disclosed by the medical examination that would preclude the individual's ability to participate in the physical fitness tests or meet the physical fitness attributes or objectives associated with assigned duties.

The provisions of 10 CFR Part 73, Appendix B, Section VI.B.4(b), require, in part, that before assignment, armed members of the security organization shall demonstrate physical fitness for assigned duties and responsibilities by performing a practical physical fitness test. The physical fitness test must consider physical conditions such as strenuous activity, physical exertion, levels of stress, and exposure to the elements as they pertain to each individual's assigned security duties. The physical fitness qualification of each armed member of the security organization must be documented by a qualified training instructor and attested to by a security supervisor.

Section 2.4 of the T&QP is explicit in its requirements for medical examinations and physical qualifications.

The staff has reviewed the applicant's description in T&QP Section 2.4 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the T&QP provides reasonable assurance that the licensee will meet the requirements of 10 CFR Part 73, Appendix B, Section VI.B.4(a) and 10 CFR Part 73, Appendix B, Section VI.B.4(b), and therefore is acceptable.

Psychological Qualifications

General Psychological Qualifications

The provisions of 10 CFR Part 73, Appendix B, Section VI.B.3(a), require, in part, that armed and unarmed individuals shall demonstrate the ability to apply good judgment, mental alertness, the capability to implement instructions and assigned tasks, and possess the acuity of senses and ability of expression sufficient to permit accurate communication by written, spoken, audible, visible, or other signals required by assigned duties and responsibilities.

Section 2.5.1 of the T&QP details that individuals whose security tasks and jobs are directly associated with the effective implementation of the security plan and protective strategy shall demonstrate the qualities in 10 CFR Part 73, Appendix B, Section VI.B.3(a).

Professional Psychological Examination

The provisions of 10 CFR Part 73, Appendix B, Section VI.B.3(b), require, in part, that a licensed psychologist, psychiatrist, or physician trained in part to identify emotional instability shall determine whether armed members of the security organization and alarm station operators in addition to meeting the requirement stated in Appendix B, Section VI.B.3(a), have no emotional instability that would interfere with the effective performance of assigned duties and responsibilities.

The provisions of 10 CFR Part 73, Appendix B, Section VI.B.3(c), require that a person professionally trained to identify emotional instability shall determine whether unarmed individuals, in addition to meeting the requirement stated in Appendix B, Section VI.B.3(a), have no emotional instability that would interfere with the effective performance of assigned duties and responsibilities.

Section 2.5.2 of the T&QP provides for the administration of psychological and emotional determination that will be conducted by appropriately licensed and trained individuals.

The staff has reviewed the applicant's description in T&QP Sections 2.5.1 and 2.5.2 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the T&QP provides reasonable assurance that the licensee will meet the requirements of 10 CFR Part 73, Appendix B, Sections VI.B.3(a), (b) and (c), and therefore are acceptable.

Documentation

The provisions of 10 CFR Part 73, Appendix B, Section VI.H.1 require, in part, the retention of all reports, records, or other documentation required by Appendix B in accordance with 10 CFR 75.55(q).

Section 2.6 of the T&QP describes that qualified training instructors create the documentation of training activities and that security supervisors attest to these records, as required. Records are retained in accordance with Section 22 of the PSP as described in Section 13.6.4.1.22 of this SER.

The staff has reviewed the applicant's description in T&QP Section 2.6 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the T&QP meets the requirements of 10 CFR Part 73, Appendix B, Section VI.H.1 and therefore is acceptable.

Physical Requalification

The provisions of 10 CFR Part 73, Appendix B, Section VI.B.5 require that: (a) at least annually, armed and unarmed individuals shall be required to demonstrate the capability to meet the physical requirements of this appendix and the applicant's T&QP; and (b) the physical requalification of each armed and unarmed individual must be documented by a qualified training instructor and attested to by a security supervisor.

Section 2.7 of the T&QP describes that physical requalification is conducted at least annually, and documented as described in the PSP and as has otherwise been described in 10 CFR Part 73, Appendix B, Section VI.B.5.

The staff has reviewed the applicant's description in T&QP Section 2.7 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the T&QP provides reasonable assurance that the licensee will meet the requirements of 10 CFR Part 73, Appendix B, Section VI.B.5 and therefore is acceptable.

13.6.4.2.3 Individual Training and Qualification

Duty Training

The provisions of 10 CFR Part 73, Appendix B, Section VI.C.1 provide for duty training and qualification requirements. The regulation states, in part, that all personnel who are assigned to perform any security-related duty or responsibility shall be trained and qualified to perform assigned duties and responsibilities to ensure that each individual possesses the minimum knowledge, skills, and abilities required to effectively carry out those assigned duties and responsibilities. Each individual who is assigned duties and responsibilities identified in the Commission-approved security plans shall be trained before assignment in accordance with the requirements of 10 CFR Part 73, Appendix B, the T&QP, and the PSP. Such personnel must be trained and qualified in the use of all equipment or devices required to effectively perform all assigned duties and responsibilities.

Section 3.1 of the T&QP details the requirements that individuals assigned duties must be trained and qualified in their duties, meet minimum qualifications or re-qualification requirements, and be trained and qualified in all equipment or devices required prior to performing their duties.

The staff has reviewed the applicant's description in T&QP Sections 3.0 and 3.1 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the T&QP provides reasonable assurance that the licensee will meet the requirements of 10 CFR Part 73, Appendix B, Section VI.C.1 and therefore are acceptable.

On-The-Job Training

The provisions of 10 CFR Part 73, Appendix B, Section VI.C.2(a) through (c) provides requirements for on-the-job training. On-the-job training performance standards and criteria must ensure that each individual demonstrates the requisite knowledge, skills, and abilities needed to effectively carry out assigned security duties and responsibilities. Individuals assigned contingency duties must complete a minimum of 40 hours of on-the-job training.

On-the-job training for contingency activities and drills must include, but is not limited to, hands-on application of knowledge, skills, and abilities related to: (1) response team duties; (2) use of force; (3) tactical movement; (4) cover and concealment; (5) defensive positions; (6) fields of fire; (7) redeployment; (8) communications (primary and alternate); (9) use of assigned equipment; (10) target sets; (11) table top drills; (12) command and control duties; and (13) applicant protective strategy.

The T&QP provides a comprehensive discussion of the applicant's approach to meeting the requirements for on-the-job training as identified above and covers each of the elements.

The staff has reviewed the applicant's description in T&QP Section 3.2 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the T&QP provides reasonable assurance that the licensee will meet the requirements of 10 CFR Part 73, Appendix B, Sections VI.C.2(a) through (c), and therefore is acceptable.

Critical Task Matrix

The provisions of 10 CFR Part 73, Appendix B, Section VI.C.1(b) require, in part, that each individual who is assigned duties and responsibilities identified in the Commission-approved security plans, applicant protective strategy, and implementing procedures shall, before assignment, demonstrate proficiencies in implementing the knowledge, skills and abilities to perform assigned duties.

The T&QP includes a critical task matrix as Table 1 of the T&QP. This matrix addresses the means through which each individual will demonstrate the required proficiencies. Tasks that individuals must perform are listed in RG 5.75.

The staff has reviewed the applicant's description in T&QP Section 3.3 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the T&QP provides reasonable assurance that the licensee will meet the requirements of 10 CFR Part 73, Appendix B, Section VI.C.1(b) and therefore is acceptable.

Initial Training and Qualification Requirements

The provisions of 10 CFR Part 73, Appendix B, Section VI.C.1(a) through (b), provide the requirements for duty training.

The provisions of 10 CFR Part 73, Appendix B, Section VI.D.1(a), provide requirements for demonstration of qualification.

Section 3.4 of the T&QP describes that the individuals must be trained and qualified prior to performing security-related duties within the security organization, and must meet the minimum qualifying standards in Sections 3.4.1 and 3.4.2.

Written Examination

The provisions of 10 CFR Part 73, Appendix B, Section VI.D.1(b)(1), provide that written exams must include those elements listed in the Commission-approved T&QP to demonstrate an acceptable understanding of assigned duties and responsibilities, to include the recognition of potential tampering involving both safety and security equipment and systems.

Section 3.4.1 of the T&QP describes the measures that are implemented by the applicant to meet the requirements in 10 CFR Part 73, Appendix B, Section VI.D.1(b)(1).

Hands on Performance Demonstration

The provisions of 10 CFR Part 73, Appendix B, Section VI.D.1(b)(2), require that armed and unarmed individuals shall demonstrate hands-on performance for assigned duties and responsibilities by performing a practical hands-on demonstration for required tasks. The hands-on demonstration must ensure that theory and associated learning objectives for each required task are considered and that each individual demonstrates the knowledge, skills, and abilities required to effectively perform the task.

Section 3.4.2 of the T&QP describes the measures that are implemented by the applicant that meet the requirements and as has otherwise been described in 10 CFR Part 73, Appendix B, Section VI.D.1(b)(2).

The staff has reviewed the applicant's description in T&QP Sections 3.4, 3.4.1, and 3.4.2 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the T&QP provides reasonable assurance that the licensee will meet the requirements of 10 CFR Part 73, Appendix B, Sections VI.C.1(b)(1) and VI.D.1(b)(2), and therefore are acceptable.

Continuing Training and Qualification

The provisions of 10 CFR Part 73, Appendix B, Section VI.D.2 state, in part, that armed and unarmed individuals shall be requalified at least annually in accordance with the requirements of this appendix and the Commission-approved T&QP. The results of requalification must be documented by a qualified training instructor and attested to by a security supervisor.

Section 3.5 of the T&QP provides a discussion regarding the management of the requalification program to ensure that each individual is trained and qualified. In part, the applicant's plan provides that annual requalification may be completed up to 3 months before or 3 months after the scheduled date. However, the next annual training must be scheduled 12 months from the previously scheduled date rather than the date the training was actually completed.

The staff has reviewed the applicant's description in T&QP Section 3.5 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the T&QP provides reasonable assurance that the licensee will meet the requirements of 10 CFR Part 73, Appendix B, Section VI.D.2, and therefore is acceptable.

Annual Written Examination

The provisions of 10 CFR Part 73, Appendix B, Section VI.D.1.(b)(3), provide that armed individuals shall be administered an annual written exam that demonstrates the required knowledge, skills, and abilities to carry out assigned duties and responsibilities as an armed member of the security organization. The annual written exam must include those elements listed in the Commission-approved T&QP to demonstrate an acceptable understanding of assigned duties and responsibilities.

Section 3.5.1 of the T&QP provides that each individual will be tested, in part, with an annual written exam that at a minimum covers: the role of security personnel; use of deadly force; the requirements in 10 CFR 73.21; authority of private security personnel; power of arrest; search and seizure; offsite law enforcement response; tactics; and tactical deployment and engagement.

The staff has reviewed the applicant's description in T&QP Section 3.5.1 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the T&QP provides reasonable assurance that the licensee will meet the requirements of 10 CFR Part 73, Appendix B, Section VI.D.1.(b)(3) and is, therefore, acceptable.

Demonstration of Knowledge, Skills, and Abilities

The provisions of 10 CFR Part 73, Appendix B, Sections VI.A., B., C., and D. (A.4, C.3(d), D.1(a), D.1(b)(2)) state, in part, that an individual must demonstrate required knowledge, skills and abilities, to carry out assigned duties and responsibilities.

Section 3.5.2 of the T&QP provides that all knowledge, skills, and abilities will be demonstrated in accordance with a SAT program, similar to what is described in RG 5.75.

The staff has reviewed the applicant's description in T&QP Section 3.5.2 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the T&QP provides reasonable assurance that the licensee will meet the requirements of 10 CFR Part 73, Appendix B, Sections VI.A., B., C., and D. and therefore is acceptable.

Weapons Training and Qualification

General Firearms Training

The provisions of 10 CFR Part 73, Appendix B, Section VI.E require that armed members of the security organization shall be trained and qualified in accordance with the requirements of this appendix and the Commission-approved T&QP. Training must be conducted by certified firearms instructors who shall be recertified at least every 3 years. Applicants shall conduct annual firearms familiarization and armed members of the security organization must participate in weapons range activities on a nominal 4-month periodicity.

Section 3.6.1 of the T&QP addresses the requirements in 10 CFR Part 73, Appendix B, Sections VI.E.1(d)(1) through (11), and includes provisions for training in the use of deadly force and participation in weapons range activities on a nominal 4-month periodicity. Each armed member of the security organization is trained and qualified by a certified firearms instructor for the use and maintenance of each assigned weapon to include, but not limited to, marksmanship, assembly, disassembly, cleaning, storage, handling, clearing, loading, unloading, and reloading, for each assigned weapon.

The staff has reviewed the applicant's description in T&QP Section 3.6.1 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the T&QP provides reasonable assurance that the licensee will meet the requirements of 10 CFR Part 73, Appendix B, Section VI.E.1 and therefore is acceptable.

General Weapons Qualification

The provisions of 10 CFR Part 73, Appendix B, Section VI.F.1, "Weapons Qualification and Requalification Program," require that qualification firing must be accomplished in accordance with Commission requirements and the Commission-approved T&QP for assigned weapons. The results of weapons qualification and requalification must be documented and retained as a record.

Section 3.6.2 of the T&QP provides that all armed personnel are qualified and requalified with assigned weapons. All weapons qualification and requalification must be documented and retained as a record.

The staff has reviewed the applicant's description in T&QP Section 3.6.2 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the T&QP provides reasonable assurance that the licensee will meet the requirements of 10 CFR Part 73, Appendix B, Section VI.F.1 and therefore is acceptable.

Tactical Weapons Qualification

The provisions of 10 CFR Part 73, Appendix B, Section VI.F.2 require that the applicant conduct tactical weapons qualification. The applicant's T&QP must describe the firearms used, the firearms qualification program, and other tactical training required to implement the Commission-approved security plans, applicant protective strategy, and implementing procedures. Applicant developed tactical qualification and requalification courses must describe the performance criteria needed to include the site-specific conditions (such as lighting, elevation, fields of fire) under which assigned personnel shall be required to carry out their assigned duties.

Section 3.6.3 of the T&QP provides that a tactical qualification course of fire is used to assess armed security force personnel in tactical situations to ensure they are able to demonstrate that their required tactical knowledge, skills, and abilities remain proficient.

The staff has reviewed the applicant's description in T&QP Section 3.6.3 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the T&QP provides reasonable assurance that the licensee will meet the requirements of 10 CFR Part 73, Appendix B, Section VI.F.2 and therefore is acceptable.

Firearms Qualification Courses

The provisions of 10 CFR Part 73, Appendix B, Section VI.F.3, state, in part, that the applicant shall conduct the following qualification courses for each weapon used: (a) an annual daylight fire qualification course; and (b) an annual night fire qualification course.

Courses of Fire

The provisions of 10 CFR Part 73, Appendix B, Section VI.F.4 describe required courses of fire.

Section 3.6.4 of the T&QP provides a description of the firearms qualification scores for each of the courses of fire used to ensure armed members of the security organization are properly trained and qualified. Courses of fire are used individually for handguns, semiautomatic rifles, and enhanced weapons.

The staff has reviewed the applicant's description in T&QP Section 3.6.4 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the T&QP provides reasonable assurance that the licensee will meet the requirements of 10 CFR Part 73, Appendix B, Section VI.F.3, and 10 CFR Part 73, Appendix B, Section VI.F.4 and therefore is acceptable.

Firearms Requalification

The provisions of 10 CFR Part 73, Appendix B, Section VI.F.5 provide that armed members of the security organization shall be requalified for each assigned weapon at least annually in accordance with Commission requirements and the Commission-approved T&QP, and the results documented and retained as a record. Firearms requalification must be conducted using the courses of fire outlined in 10 CFR Part 73, Appendix B, Sections VI.F.2, VI.F.3, and VI.F.4. Section 3.6.5 of the T&QP states that armed members of the security organization will requalify at least annually with each weapon assigned, using the courses of fire provided in the T&QP.

The staff has reviewed the applicant's description in T&QP Section 3.6.5 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the T&QP provides reasonable assurance that the licensee will meet the requirements of 10 CFR Part 73, Appendix B, Section VI.F.5 and therefore is acceptable.

Weapons, Personal Equipment and Maintenance

The provisions of 10 CFR Part 73, Appendix B, Section VI.G provide the requirements for weapons, personal equipment, and maintenance. These requirements provide that the applicant shall provide armed personnel with weapons that are capable of performing the function stated in the Commission-approved security plans, applicant protective strategy, and implementing procedures. In addition, the applicant shall ensure that each individual is equipped or has ready access to all personal equipment or devices required for the effective implementation of the Commission-approved security plans, applicant protective strategy, and implementing procedures.

Section 3.7 of the T&QP describes that personnel are provided with weapons and personnel equipment necessary to meet the plans and the protective strategy. The equipment provided is described in Section 9 of the PSP, and maintenance is performed as described in Section 20 of the PSP. The staff's review of Section 9.0, "Security Personnel Equipment," and Section 20, "Maintenance, Testing, and Calibration," of the PSP is in Sections 13.6.4.1.9 and 13.6.4.1.20 of this SER.

The staff has reviewed the applicant's description in T&QP Section 3.7 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the T&QP provides reasonable assurance that the licensee will meet the requirements of 10 CFR Part 73, Appendix B, Section VI.G, and therefore is acceptable.

Documentation

The provisions of 10 CFR Part 73, Appendix B, Section VI.H require that the applicant retain all reports, records, or other documentation required by this appendix in accordance with the requirements of 10 CFR 73.55(q). The applicant shall retain each individual's initial qualification record for 3 years after termination of the individual's employment and shall retain each requalification record for 3 years after it is superseded. The applicant shall document data and test results from each individual's suitability, physical, and psychological qualification and shall retain this documentation as a record for 3 years from the date of obtaining and recording these results.

Section 3.8 of the T&QP provides that records are retained in accordance with Section 22, "Records," of the PSP. The PSP Section 22.11 describes how the applicant will retain each individual's initial qualification record for 3 years after termination of the individual's employment and shall retain each re-qualification record for 3 years after it is superseded.

The staff has reviewed the applicant's description in T&QP Section 3.8 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the T&QP provides reasonable assurance that the licensee will meet the requirements of 10 CFR Part 73, Appendix B, Section VI.H and therefore is acceptable.

13.6.4.2.4 Performance Evaluation Program

The provisions in 10 CFR Part 73, Appendix B, Section VI.C.3, "Performance Evaluation Program," state, in part, that:

> (a) [Applicants] shall develop, implement, and maintain a Performance Evaluation Program that is documented in procedures [and] which describes how the [applicant] will demonstrate and assess the effectiveness of their onsite physical protection program and protective strategy, including the capability of the armed response team to carry out their assigned duties and responsibilities during safeguards contingency events. The Performance Evaluation Program and procedures shall be referenced in the [applicant's T&QP].
>
> (b) The Performance Evaluation Program shall include procedures for the conduct of tactical response drills and force-on-force exercises designed to demonstrate and assess the effectiveness of the [applicant's] physical protection program, protective strategy and contingency event response by all individuals with responsibilities for implementing the [SCP].
>
> (l) The Performance Evaluation Program must be designed to ensure that:
>
> (1) Each member of each shift who is assigned duties and responsibilities required to implement the SCP and applicant protective strategy participates in at least one (1) tactical response drill on a quarterly basis and one (1) force-on-force exercise on an annual basis[.]

Section 4 of the T&QP details the performance evaluation program consistent with the requirements of 10 CFR Part 73, Appendix B, Section VI.C.3(a) through (m). Additional details of the performance evaluation program are described in the facility procedures.

The staff has reviewed the applicant's description in T&QP Section 4 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the T&QP provides reasonable assurance that the licensee will meet the requirements of 10 CFR Part 73, Appendix B, Section VI.C.3 and therefore is acceptable.

13.6.4.2.5 Definitions

The provisions of 10 CFR Part 73, Appendix B, Section VI.J, state, in part, that terms defined in 10 CFR Part 50, 10 CFR Part 70, "Domestic Licensing of Special Nuclear Material," and 10 CFR Part 73 have the same meaning when used in this appendix. Definitions are found in the PSP, Appendix A, "Glossary of Terms and Acronyms." Included in this Section of the T&QP is the Critical Task Matrix, which is considered SGI and has not been included in this SER.

The staff has reviewed the applicant's description in the T&QP of the Critical Task Matrix tasks for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the T&QP provides reasonable assurance that the licensee will meet the requirements of 10 CFR Part 73, Appendix B, and therefore is acceptable.

13.6.4.2.6 Conclusion on the Training and Qualification Plan

Accordingly, the staff's review described in Sections 13.6.4.2.1 through 13.6.4.2.5 of this SER, the North Anna 3 T&QP meets the requirements of 10 CFR Part 73, Appendix B. The target sets, target set analysis, and site protective strategy will be in the facility implementing procedures, which are not subject to staff review as part of this COL application and are, therefore, subject to future NRC inspection in accordance with 10 CFR 73.55(c)(7)(iv) and 10 CFR Part 73, Appendix C, Section II.B.5(iii). The staff concludes that complete and procedurally correct implementation will provide high assurance that activities involving SNM are not inimical to the common defense and security and do not constitute an unreasonable risk to the public health and safety.

13.6.4.3 Appendix C Safeguards Contingency Plan

13.6.4.3.1 Background Information

This category of information identifies the perceived dangers and incidents that the plan addresses and a general description of how the response is organized.

Purpose of the Safeguards Contingency Plan

The provisions of 10 CFR Part 73, Appendix C, Section II.B.1.b, indicate that the applicant should discuss general goals, objectives, and operational concepts underlying the implementation of the SCP.

Section 1.1 of the SCP describes the purpose and goals of the SCP, including guidance to security and management for contingency events.

Scope of the Safeguards Contingency Plan

The provisions of 10 CFR Part 73, Appendix C, Section II.B.1.c, delineate the types of incidents that should be covered by the applicant in the SCP, how the onsite response effort is organized and coordinated to effectively respond to a safeguards contingency event, and how the onsite response for safeguards contingency events has been integrated into other site emergency response procedures.

Section 1.2 of the SCP states the scope of the SCP to analyze and define decisions and actions of security force personnel, as well as facility operations personnel, for achieving and maintaining safe shutdown.

Perceived Danger

The provisions of 10 CFR Part 73, Appendix C, Section II.B.1.a, require that, consistent with the DBT specified in 10 CFR 73.1(a)(1), the applicant shall identify and describe the perceived dangers, threats, and incidents against which the SCP is designed to protect.

Section 1.3 of the SCP outlines the threats used to design the physical protection systems.

The applicant adequately addresses perceived danger, provides a purpose of the plan, and describes the scope of the plan.

Definitions

Section 1.4 of the SCP describes that a list of terms and their definitions used in describing operational and technical aspects of the approved SCP as required by 10 CFR Part 73, Appendix C, Section II.B.1.d is found in Appendix A of the PSP.

The staff has reviewed the applicant’s description in SCP Sections 1, 1.1, 1.2, 1.3, and 1.4 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant’s description in the SCP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the SCP provides reasonable assurance that the licensee will meet the requirements of 10 CFR Part 73, Appendix C, Section II.B.1 and therefore is acceptable.

13.6.4.3.2 Generic Planning Base

As required in 10 CFR Part 73, Appendix C, Section II.B.2., this Section of the plan defines the criteria for initiation and termination of responses to security events to include the specific decisions, actions, and supporting information needed to respond to each type of incident covered by the approved SCP.

Situations Not Covered by the Contingency Plan

Section 2.1 of the SCP details the general types of conditions that are not covered in the plan.

<u>Situations Covered by the Contingency Plan</u>

The provisions of 10 CFR Part 73, Appendix C, Section II.B.2.a, require, in part, that the plan identify those events that will be used for signaling the beginning or aggravation of a safeguards contingency according to how they are perceived initially by the applicant's personnel. Applicants shall ensure detection of unauthorized activities and shall respond to all alarms or other indications signaling a security event, such as penetration of a PA, vital area, or unauthorized barrier penetration (vehicle or personnel); tampering, bomb threats, or other threat warnings—either verbal, such as telephoned threats, or implied, such as escalating civil disturbances.

The provisions of 10 CFR Part 73, Appendix C, Section II.B.2.b, require, in part, that the plan define the specific objective to be accomplished relative to each identified safeguards contingency event. The objective may be to obtain a level of awareness about the nature and severity of the safeguards contingency to prepare for further responses; to establish a level of response preparedness; or to successfully nullify or reduce any adverse safeguards consequences arising from the contingency.

The provisions of 10 CFR Part 73, Appendix C, Section II.B.2.c require, in part, that the applicant identify the data, criteria, procedures, mechanisms and logistical support necessary to achieve the objectives identified.

Section 2.2 of the SCP describes in detail the specific situations covered by and provides a list of objectives for each event and also provides objectives and data required for each event.

The staff has reviewed the applicant's description in SCP Sections 2, 2.1 and 2.2 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the SCP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the SCP provides reasonable assurance that the licensee will meet the requirements of 10 CFR Part 73, Appendix C Section II.B.2 and therefore are acceptable.

13.6.4.3.3 Responsibility Matrix

The provisions of 10 CFR Part 73, Appendix C, Section II.B.4 state that this category of information consists of the detailed identification of responsibilities and specific actions to be taken by the applicant's organizations and/or personnel in response to safeguards contingency events. To achieve this result the applicant must address the following:

- The provisions of 10 CFR Part 73, Appendix C, Section II.B.4.a require, in part, that the applicant develop site procedures that consist of matrixes detailing the organization and/or personnel responsible for decisions and actions associated with specific responses to safeguards contingency events. The responsibility matrix and procedures must be referenced in the applicant's SCP.

- The provisions of 10 CFR Part 73, Appendix C, Section II.B.4.b require, in part, that the responsibility matrix procedures shall be based on the events outlined in the applicant's generic planning base and must include specific objectives to be accomplished, descriptions of responsibilities for decisions and actions for each event, and overall description of response actions each responding entity.

- The provisions of 10 CFR Part 73, Appendix C, Section II.B.4.c require in part, that responsibilities are to be assigned in a manner that precludes conflict of duties and responsibilities that would prevent the execution of the SCP and emergency response plans.

- The provisions of 10 CFR Part 73, Appendix C, Section II.B.4.d require, in part, that the applicant ensure that predetermined actions can be completed under the postulated conditions.

Section 3 of the SCP includes a responsibility matrix, as required by Appendix C, Section II.B.4.a. The responsibility matrix integrates the response capabilities of the security organization (described in Section 4 of the SCP) with the background information relating to decision/actions and organizational structure (described in Section 1 of the SCP), as required by Appendix C, Section II.B.4.a. The responsibility matrix provides an overall description of the response actions and their interrelationships, as required by Appendix C, Section II.B.4.b. Responsibilities and actions have been predetermined to the maximum extent possible and assigned to specific entities to preclude conflicts that would interfere with or prevent the implementation of the SCP or the ability to protect against the DBT of radiological sabotage, as required by Appendix C, Section II.B.4.c. In part, the applicant shall ensure that predetermined actions can be completed under the postulated conditions as required by Appendix C, Section II.B.4.d.

The staff has reviewed the applicant's description in SCP Section 3 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the SCP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the SCP provides reasonable assurance that the licensee will meet the requirements of 10 CFR Part 73, Appendix C, Section II.B.4 and therefore is acceptable.

13.6.4.3.4 Licensee Planning Base

The provisions of 10 CFR Part 73, Appendix C, Section II.B.3 require, in part, that the applicant's planning base include factors affecting the SCP that are specific for each facility.

Licensee Organization

The provisions of 10 CFR Part 73, Appendix C, Section II.B.3.a require, in part, that the SCP describe the organization's chain of command and delegation of authority during safeguards contingency events, to include a general description of how command and control functions will be coordinated and maintained.

Duties/Communication Protocols

Section 4.1.1 of the SCP details the duties and communications protocols of each member of the security organization responsible for implementing any portion of the applicant's protective strategy, which will allow for coordination and maintenance of command and control functions as required by Appendix C, Section II.B.3.a.

Security Chain of Command/Delegation of Authority

Section 4.1.2 of the SCP describes in detail the chain of command and delegation of authority during contingency events, and this is also described in the responsibility matrix portions of the SCP. The chain of command and delegation of authority during normal operations is discussed in the PSP. Accordingly, the staff concludes that the applicant has described the chain of command and delegation of authority during contingency events as required by Appendix C, Section II.B.3.a.

Physical Layout

The provisions of 10 CFR Part 73, Appendix C, Section II.B.3.b, require, in part, that the SCP include a site map depicting the physical structures located on the site, including onsite ISFSI, and a description of the structures depicted on the map. Plans must also include a description and map of the site in relation to nearby towns, transportation routes (e.g., rail, water, and roads), pipelines, airports, hazardous material facilities, and pertinent environmental features that may have an effect upon coordination of response activities. Descriptions and maps must indicate main and alternate entry routes for law enforcement or other offsite response and support agencies and the location for marshaling and coordinating response activities.

Section 4.2 of the SCP references Sections 1.1 and 14.5 of the PSP for layouts of the OCA, PA, vital areas, site maps, and descriptions of site features. The staff confirmed that these layouts, maps, and descriptions include the detailed information required by Appendix C, Section II.B.3.b and described above.

Safeguards Systems

The provisions of 10 CFR Part 73, Appendix C, Section II.B.3.c require, in part, that the SCP include a description of the physical security systems that support and influence how the applicant will respond to an event in accordance with the DBT described in 10 CFR 73.1(a). The description must begin with onsite physical protection measures implemented at the outermost facility perimeter, and must move inward through those measures implemented to protect target set equipment.

Section 4.3 of the SCP describes that safeguards systems are described in PSP Sections 9, 11, 12, 13, 15 and 16, and in the facility implementing procedures/documents. Section 8 of the SCP describes how physical security systems will be used to respond to a threat at the site, as required by Appendix C, Section II.B.3.c. As further required by Appendix C, Section II.B.3.c, the SCP description begins with physical protection measures proposed at the outermost facility perimeter, and moves inward through those measures proposed protect target set equipment.

Law Enforcement Assistance

The provisions of 10 CFR Part 73, Appendix C, Section II.B.3.d require, in part, that the applicant provide a listing of available law enforcement agencies, a general description of their response capabilities, their criteria for response, and a discussion of working agreements or arrangements for communicating with these agencies.

Section 4.4 of the SCP states in detail the role of LLEA in the site protective strategy. In accordance with Appendix C, Section II.B.3.d, these details include LLEA response capabilities, LLEA criteria for response, and the working agreements or arrangements for communicating with these LLEAs. Additional details regarding LLEA are included in Section 8 of the PSP and Section 5.6 of the SCP.

Policy Constraints and Assumptions

The provisions of 10 CFR Part 73, Appendix C, Section II.B.3.e require, in part, that the SCP include a discussion of State laws, local ordinances, and company policies and practices that govern the applicant's response to incidents. These must include, but are not limited to, the following: 1) use of deadly force; 2) recall of off-duty employees; 3) site jurisdictional boundaries, and 4) use of enhanced weapons, if applicable.

Section 4.5 of the SCP details the site security policies, including the use of deadly force, provisions for the recall of off-duty employees, site jurisdictional boundaries, and authority to request offsite assistance, as required by Appendix C, Section II.B.3.e.

Administrative and Logistical Considerations

The provisions of 10 CFR Part 73, Appendix C, Section II.B.3.f require, in part, that the applicant provide descriptions of practices which influence how the security organization responds to a safeguards contingency event to include, but not limited to, a description of the procedures that will be used for ensuring that equipment needed to facilitate responses will be readily accessible, in good working order, and in sufficient supply.

Section 4.6 of the SCP outlines administrative duties of the Manager-Nuclear Security and the Security Shift Supervisor, and the use of facility procedures and administrative forms.

The staff has reviewed the applicant's description in SCP Sections 4, 4.1, 4.1.1, 4.1.2, and 4.2 through 4.6 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the SCP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the SCP provides reasonable assurance that the licensee will meet the requirements of 10 CFR Part 73, Appendix C, Section II.B.3 and therefore is acceptable.

13.6.4.3.5 Response Capabilities

This Section outlines the response by the applicant to threats to the facility. As set forth below, the applicant describes in detail how they protect against the DBT with onsite and offsite organizations, in accordance with the regulations in 10 CFR 50.54(p)(1) and (hh)(1), 10 CFR 73.55(k), 10 CFR Part 73, Appendix B, Section VI and 10 CFR Part 73, Appendix C, Section II.B.3. In addition, Appendix C, "Introduction," states, in part, that it is important to note that an applicant's SCP is intended to be complementary to any emergency plans developed pursuant to Appendix E of 10 CFR Part 50 and 10 CFR 52.79, "Contents of Applications; Technical Information and FSAR."

Response to Threats

Section 5.1 of the SCP describes the protective strategy design to defend the facility against all aspects of the DBT. Each organization has defined roles and responsibilities.

Armed Response Team

Section 5.2 of the SCP notes the individuals included in the responsibility matrix and their role in the site protective strategy. This Section also notes the minimum number of individuals and their contingency equipment for implementation of the protective strategy. The applicant described the armed response team consistent with 10 CFR 73.55(k)(4), (5), (6) and (7), 10 CFR Part 73, Appendix B, Section VI, and 10 CFR Part 73, Appendix C, Section II.B.3.

Supplemental Security Officer

Section 5.3 of the SCP describes in detail the use of supplemental security officers in the site protective strategy. The applicant described the use of supplemental security officers, consistent with the requirements in 10 CFR 73.55(k)(4).

Facility Operations Response

Section 5.4 of the SCP describes the role of operations personnel in the site protective strategy, including responsibilities, strategies and conditions for operator actions as discussed in 10 CFR 50.54(hh).

Emergency Plan Response

Section 5.5 of the SCP notes the integration of the Emergency Plan (EP) with the applicant's protective strategy, and it gives some examples of how the EP can influence the protective strategy as discussed in 10 CFR 73.55(b)(11).

Local Law Enforcement Agencies (LLEA)

SCP Section 5.6 documents the current agreements with applicable LLEA, and therefore meets the requirements of 10 CFR 73.55(k)(9) and 10 CFR Part 73, Appendix C, Section II.B.3.d and lists the LLEAs that will respond to the site as a part of the protective strategy. Details on the LLEA response are located in Section 8 of the PSP. Further SCP Section 5.6 provides a general description of the LLEA response capability and meets the corresponding portions of 10 CFR 73.55(k)(9).

State Response Agencies

Section 5.7 of the SCP documents the current agreements with applicable LLEA, and therefore meets the requirements of 10 CFR 73.55(k)(9) and 10 CFR Part 73, Appendix C, Section II.B.3.d and lists the State response agencies that support the site as a part of the protective strategy. Further Section 5.7 provides a general description of the LLEA response capability and meets the corresponding portions of 10 CFR 73.55(k)(9).

Federal Response Agencies

Section 5.8 of the SCP documents the current agreements with applicable LLEA, and therefore meets the requirements of 10 CFR 73.55(k)(9) and 10 CFR Part 73, Appendix C, Section II.B.3.d and lists the Federal response agencies that support the site as a part of the protective strategy. Further Section 5.7 provides a general description of the LLEA response capability and meets the corresponding portions of 10 CFR 73.55(k)(9).

Response to Independent Spent Fuel Storage Installation (ISFSI) Events

Section 5.9 of the SCP meets the requirements of 10 CFR 73.55(k)(9) and 10 CFR Part 73, Appendix C, Section II.B.3.d, and describes the Response Requirements for ISFSI as a part of the protective strategy.

The staff has reviewed the applicant's description in SCP Sections 5.0 through 5.9 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the SCP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the SCP meet the requirements of 10 CFR 50.54(p)(1) and (hh), 10 CFR 73.55(k), 10 CFR Part 73, Appendix B, Section VI and 10 CFR Part 73, Appendix C, Section II.B.3 and therefore are acceptable. In addition, Appendix C, "Introduction" states, in part, that it is important to note that an applicant's SCP is intended to be complementary to any EPs developed pursuant to Appendix E to 10 CFR Part 50 and 10 CFR 52.17.

13.6.4.3.6 Defense-In-Depth

Section 6 of the SCP lists site physical security characteristics, programs, and strategy elements that illustrate the defense-in-depth nature of the site protective strategy, as required in 10 CFR 73.55(b)(3).

The staff has reviewed the applicant's description in SCP Section 6 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the SCP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the SCP provides reasonable assurance that the licensee will meet the requirements of 10 CFR 73.55(b)(3) and therefore are acceptable.

13.6.4.3.7 Protective Strategy

The provisions of 10 CFR Part 73, Appendix C, Section II.B.3.c(v) require that applicants develop, implement, and maintain a written protective strategy that shall: 1) be designed to meet the performance objectives of 10 CFR 73.55 (a) through (r); 2) identify predetermined actions, areas of responsibilities, and timelines for the deployment of armed personnel; 3) include measures that limit the exposure of security personnel to possible attack; 4) include a description of the physical security systems and measures that provide defense in depth; 5) describe the specific structure and responsibilities of the armed response organization; and 6) provide a command and control structure.

Section 8 of the SCP describes the site protective strategy.

The staff has reviewed the applicant's description in SCP Section 8 for the implementation of the site-specific physical protection program in accordance with Commission regulations and the SRP acceptance criteria. Because the applicant's description in the SCP is consistent with the acceptance criteria in SRP, Section 13.6.1, the staff found that the description provided in the SCP provides reasonable assurance that the licensee will meet the requirements of 10 CFR 73.55(a) through (r) and 10 CFR Part 73, Appendix C and therefore is acceptable.

13.6.4.3.8 Conclusions on the Safeguards Contingency Plan

Accordingly, the staff's review described in Sections 13.6.4.3.1 through 13.6.4.3.8 of this SER, the SCP meets the requirements of 10 CFR Part 73, Appendix C, in accordance with the DBT of radiological sabotage as stated in 10 CFR 73.1. The target sets, target set analysis, and site protective strategy will be in facility implementing procedures, which are not subject to staff review as part of this COLA and are, therefore, subject to future NRC inspection in accordance with 10 CFR 73.55(c)(7)(iv) and 10 CFR Part 73, Appendix C, Section II.B.5(iii). The staff concludes that complete and procedurally correct implementation of the SCP will provide high assurance that activities involving SNM are not inimical to the common defense and security and do not constitute an unreasonable risk to the public health and safety.

13.6.5 Post Combined License Activities

For the reasons discussed in the technical evaluation Section above, the staff found the following license condition to track implementation of the Physical Security Program, the Safeguards Contingency Program, and the Training and Qualification Program, acceptable.

> License Condition (COLA Part 10 Section 3.6)
>
> Operational Program Readiness
>
> The licensee shall submit to the Director of NRO, a schedule, no later than 12 months after issuance of the COL, for implementation of the operational programs listed in FSAR Table 13.4-201. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until the operational programs in the FSAR table have been fully implemented.

This schedule shall also address:

- The implementation of site-specific Severe Accident Management Guidelines
- The spent fuel rack coupon monitoring program implementation

13.6.6 Conclusions

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant addressed the required information relating to physical security, and there is no outstanding information that needs to be addressed in the North Anna COL FSAR related to this Section. The results of the staff's technical evaluation of the information incorporated by reference in the North Anna COL application are documented in NUREG–1966.

The staff concludes that the relevant information presented in the North Anna COL FSAR is acceptable based on the applicable regulations specified in Section 13.6.4 of this SER. The staff based its conclusion on the following:

The staff's review of the PSP, T&QP and SCP has focused on ensuring the necessary programmatic elements are included in these plans in order to provide high assurance that activities involving SNM are not inimical to the common defense and security and do not constitute an unreasonable risk to the public health and safety.

As described in this Section, the staff has determined that these plans include the necessary programmatic elements that, when effectively implemented, will provide the required high assurance. The burden to effectively implement these plans remains with the applicant. Effective implementation is dependent on the procedures and practices the applicant develops to satisfy the programmatic elements of its PSP, T&QP, and SCP. The target sets, target set analysis and site protective strategy are in the facility implementing procedures, which were not subject to staff review as part of this COLA, and are therefore subject to future NRC inspection in accordance with 10 CFR 73.55(c)(7)(iv) and 10 CFR Part 73, Appendix C, Section II.B.5(iii). As provided by Section 3 of the applicant's PSP, a performance evaluation program will be implemented that periodically tests and evaluates the effectiveness of the overall protective strategy. This program provides that deficiencies be corrected. In addition, NRC inspectors will conduct periodic force-on-force exercises that will test the effectiveness of the applicant's protective strategy. Based on the results of the applicant's own testing and evaluation, the NRC's baseline inspections and force-on-force exercises, enhancements to the applicant's PSP, T&QP, and SCP may be necessary to ensure that the overall protective strategy can be effectively implemented. As such, the staff approval of the applicant's PSP, T&QP, and SCP is limited to the programmatic elements necessary to provide the required high assurance as stated above. Should deficiencies be identified with the programmatic elements of these plans as a result of the periodic applicant or NRC conducted drills or exercises that test the effectiveness of the overall protective strategy, the plans shall be corrected to address these deficiencies in a timely manner and the applicant should notify the NRC of these plan changes in accordance with the requirements of 10 CFR 50.54(p) or 10 CFR 50.90, "Application for amendment of license, construction permit, or early site permit."

The COL applicant's security plan information is withheld from public disclosure in accordance with the provisions of 10 CFR 73.21.

13.6A Site-Specific Inspection, Test, Analysis, and Acceptance Criteria for Physical Security

13.6A.1 Introduction

The North Anna 3 COLA describes in Part 10, "Proposed License Conditions (Including ITAAC)" "Inspection, Test, Analysis, and Acceptance Criteria" of the license conditions for the plant's physical protection systems or features to provide physical protection of the site-specific protective strategy and elements of a site security program. The COLA incorporates by reference the standard ESBWR design including physical protection systems within the design of the vital area and vital systems. The COLA incorporates by reference the ESBWR plant layout and configurations of barriers, and listed ITAAC related to the site-specific design for achieving detection, assessment, communications, delay, and response for physical protection against potential acts of radiological sabotage and theft of SNM.

The design bases or supporting security analyses and assumptions related to the design descriptions of security-related features incorporated as reference from the ESBWR DCD is Tier 2 information, including NEDE-33391, NEDE-33390, and NEDE-33389. Descriptions of site-specific security structures, programs and contingency measures are located in the North Anna 3 PSP, which includes the site PSP, training and qualification plan, and the SCP.

13.6A.2 Summary of Application

Section 14.3 of the North Anna 3 COL FSAR, Revision 7 incorporates by reference the Table 2.19-1 of the ESBWR DCD Revision 10 and TRs. Part 10, Revision 5, Section 2.2, of the North Anna 3 COLA incorporates by reference the Physical Security ITAAC (PS-ITAAC) for systems within the scope of the DCD Tier 1. Part 10, Revision 5, Section 2.2.1 also listed the Site-Specific Physical Security ITAAC and Design Description.

In addition, in Dominion COL FSAR Section 14.3, the applicant provided the following:

Supplemental Information

- CWR COL 14.3-2-A Site-Specific ITAAC

The selection criteria and methodology provided in this Section of the referenced DCD were utilized as the site-specific selection criteria and methodology for ITAAC. These criteria and methodology were applied to those site-specific (SS) systems that were not evaluated in the referenced DCD. The entire set of ITAAC for the facility, including DC-ITAAC, EP-ITAAC, PS-ITAAC, and SS-ITAAC, is included in a separate part of the COLA [COL Part 10].

License Condition

- Part 10, License Condition

  License Condition (COLA Part 10 Section 3.6)

  Operational Program Readiness

  The licensee shall submit to the Director of NRO, a schedule, no later than 12 months after issuance of the COL, for implementation of the operational programs listed in FSAR Table 13.4-201. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until the operational programs in the FSAR table have been fully implemented.

  This schedule shall also address:

  - The implementation of site-specific Severe Accident Management Guidelines
  - The spent fuel rack coupon monitoring program implementation

13.6A.3 Regulatory Basis

The regulatory basis on the information incorporated by reference is addressed in NUREG–1966, the FSER related to the ESBWR DCD. In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations are given in 10 CFR Part 73. 10 CFR Part 73 includes specific security and performance requirements that, when adequately implemented, are designed to protect nuclear power reactors against acts of radiological sabotage, prevent the theft or diversion of SNM, and protect SGI against unauthorized release.

Regulation in 10 CFR 52.80(a) requires that information submitted in a COLA include the proposed ITAAC that the licensee shall perform, and the acceptance criteria that are necessary and sufficient to provide reasonable assurance that, if the ITAAC are met, the facility has been constructed and will operate in conformity with the COL, the provisions of the Atomic Energy Act, and the NRC's regulations.

The North Anna 3 design descriptions, commitments, and acceptance criteria for the security features, including the plant's layout and determination of vital equipment and areas, for a certified design that are based on physical protection systems or hardware provided for meeting requirements including the following Commission regulations:

- 10 CFR Part 50
- 10 CFR Part 52
- 10 CFR 73.1(a)(1), "Radiological sabotage"
- 10 CFR 73.55
- 10 CFR Part 73, Appendix B, "General Criteria for Security Personnel"

- 10 CFR Part 73, Appendix C, “Nuclear Power Plant Safeguards Contingency Plans”

- 10 CFR Part 73, Appendix G, “Reportable Safeguards Events”

- 10 CFR Part 73, Appendix H, “Weapons Qualification Criteria”

- 10 CFR Part 74, “Material Control and Accounting of Special Nuclear Material”

- 10 CFR 100.21(f), “Non-Seismic Siting Criteria”

- Regulatory requirements and acceptance criteria related to physical protection systems or hardware are identified in SRP Section 14.3.12.

Regulatory guidance documents that are applicable to this evaluation are:

- RG 1.91, “Evaluations of Explosions Postulated to Occur at Transportation Routes Near Nuclear Power Plants,” Revision 1

- RG 1.206

- RG 4.7, “General Site Suitability Criteria for Nuclear Power Stations,” Revision 2

- RG 5.7, Revision 1

- RG 5.12

- RG 5.29, “Material Control and Accounting for Nuclear Power Reactors”

- RG 5.44, Revision 3

- RG 5.62, Revision 1

- RG 5.65

- RG 5.66

- Information Notice 86-83, “Underground Pathways into Protected Areas, Vital Areas, and Controlled Access Areas,” September 19, 1986.

- Regulatory Information Summary 2005-04, “Guidance on the Protection of Unattended Openings that Intersect a Security Boundary or Area,” April 14, 2005 (Exempt from public disclosure in accordance with 10 CFR 2.390)

- SECY-05-0197.

The COL applicant is required to describe commitments for establishing and maintaining a physical protection system (engineered and administrative controls), organization, programs, and procedures for implementing a site-specific strategy that demonstrate, if adequately implemented, high assurance of protection of the plant against the DBT. The site-specific physical protection system described must be reliable and available, and implement the concept of defense-in-depth protection in order to provide a high assurance of protection. The security operational programs and the physical protection system are required to meet specific and performance requirements of 10 CFR Part 26, 10 CFR 73.54, 10 CFR 73.55, 10 CFR 73.56, 10 CFR 73.57, "Requirements for criminal history records checks of individuals granted unescorted access to a nuclear power facility, a non-power reactor, or access to Safeguards Information." and 10 CFR 73.58. Within this context, the DC applicant is required only to address those elements or portion of physical protection system or features that are considered within the scope of design. The technical basis for physical protection hardware within the scope of the design provides the basis for ITAAC verification and closure.

13.6A.4 Technical Evaluation

As documented in NUREG–1966, the staff reviewed Section 14.3 of the ESBWR DCD, Revision 10, and checked to ensure that the combination of the information in the COL FSAR and the information in the ESBWR DCD represents the complete scope of information relating to this review topic. The staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to ITAAC for physical security. The results of the staff's evaluation of the information incorporated by reference in the North Anna 3 COLA are documented in NUREG–1966 and its supplements.

The staff reviewed the information in the North Anna 3 COL FSAR:

Supplemental Information

- CWR COL 14.3-2-A Site-Specific ITAAC

The CWR COL 14.3-2-A adds the following after DCD Section 14.3.9.

> The selection criteria and methodology provided in this Section of the referenced DCD were utilized as the site-specific selection criteria and methodology for ITAAC. These criteria and methodology were applied to those site-specific (SS) systems that were not evaluated in the referenced DCD. The entire set of ITAAC for the facility, including DC-ITAAC, EP-ITAAC, PS-ITAAC, and SS-ITAAC, is included in a separate part of the COLA [COL Part 10].

In Part 10, of the North Anna 3 COLA, Dominion describes the PS-ITAAC for the plant's physical protection systems or features to provide physical protection of the site-specific protective strategy and elements of a site security program. The COLA incorporates by reference Tier 1, Table 2.19-1 of the ESBWR DCD, including plant layout and configurations of barriers, and listed ITAAC related to the site-specific design for achieving detection, assessment, communications, delay, and response for physical protection against potential acts of radiological sabotage and theft of SNM. DCD Tier 1, Table 2.19-1 includes the PS-ITAACs that are in the scope of the ESBWR standard design. Site-specific PS-ITAAC that are outside the scope of the ESBWR DCD Tier 1, Table 2.19-1 are provided in Table 2.2.1-1 of Part 10 of the North Anna 3 COLA.

The staff's evaluation of the PS-ITAAC (CWR COL 14.3-2-A) is documented in the Sections 13.6A.4.1 through 13.6A.4.3 of this SER.

13.6A.4.1 Detection and Assessment Hardware

The applicant submitted PS-ITAAC, in Revision 5 of the North Anna 3 COLA, Part 10, Table 2.2.1-1, "ITAAC for the Site-Specific Security System." The North Anna 3 COL application incorporates by reference the ESBWR DCD Tier 1, Table 2.19-1, Revision 10, design commitments and ITAAC for the physical security system to be used at North Anna 3.

The physical security system provides physical features to detect, delay, assist in response to, and defend against the DBT for radiological sabotage. The physical security system consists of physical barriers and an intrusion detection system. The details of the physical security system are categorized as SGI. The physical security system provides protection for vital equipment and plant personnel.

The PS-ITAAC reference numbers listed below are from SRP Section 14.3.12, "Physical Security Hardware - Appendix "A"," and are used to provide clarification of the ITAAC related to "Detection and Assessment Hardware."

PS-ITAAC 2 Protected Area Barrier:

a. Physical barriers for the protected area perimeter will not be part of vital area barriers.

b. Penetrations through the protected area barrier will be secured and monitored.

c. Unattended openings that intersect a security boundary, such as underground pathways, will be protected by a physical barrier and monitored by intrusion detection equipment or provided surveillance at a frequency sufficient to detect exploitation.

PS-ITAAC 3 Isolation Zone:

a. Isolation zones will exist in outdoor areas adjacent to the physical barrier at the perimeter of the protected area and will be designed of sufficient size to permit observation and assessment on either side of the barrier.

b. Isolation zones will be monitored with intrusion detection and assessment equipment that is designed to provide detection and assessment of activities within the isolation zone.

c. Areas where permanent buildings do not allow sufficient observation distance between the intrusion detection system and the protected area barrier (e.g., the building walls are immediately adjacent to, or are an integral part of the protected area barrier) will be monitored with intrusion detection and assessment equipment that is designed to detect the attempted or actual penetration of the protected area perimeter barrier before completed penetration of the barrier and assessment of detected activities.

PS-ITAAC 4 Protected Area Perimeter Intrusion Detection and Assessment Systems:

a. The perimeter intrusion detection system will be designed to detect penetration or attempted penetration of the protected area perimeter barrier before completed penetration of the barrier, and for subsequent alarms to annunciate concurrently in at least two continuously manned onsite alarm stations (central and secondary alarm stations).

b. The perimeter assessment equipment will be designed to provide video image recording with real-time and playback capability that can provide assessment of detected activities before and after each alarm annunciation at the protected area perimeter barrier.

c. The intrusion detection and assessment equipment at the protected area perimeter will be designed to remain operable from an uninterruptible power supply in the event of the loss of normal power.

PS-ITAAC 6 Bullet-Resisting Barriers Requirements:

The external walls, doors, ceiling, and floors in the Secondary Alarm Station, and the last access control function for access to the protected area will be bullet resistant, to at least Underwriters Laboratories Ballistic Standard 752, “The Standard of Safety for Bullet-Resisting Equipment,” Level 4, or National Institute of Justice Standard 0108.01, “Ballistic Resistant Protective Materials,” Type III.

PS-ITAAC 9 Picture Badge Identification System Requirements:

An access control system with a numbered photo identification badge system will be installed and designed for use by individuals who are authorized access to protected areas and vital areas without escort.

Accordingly, the staff determined that the North Anna 3 COLA, Part 10, Table 2.2.1-1 has adequately addressed PS-ITAAC for Detection and Assessment Hardware Items 2(a), 2(b), 2(c), 3(a), 3(b), 3(c), 4(a), 4(B), 4(c), 6 partially, and 9 identified in Appendix A to SRP Section 14.3.12.

The North Anna 3 COLA, Part 10, Table 2.2.1-1 partially addressed PS-ITAAC 6. The application references the ESBWR DCD, Revision 10, which also partially addressed PS-ITAAC 6. The staff determined the between both the North Anna 3 COL and the ESBWR DCD all elements of the PS-ITAAC 6 PS-ITAAC 6 are adequately addressed as identified in Appendix A to SRP Section 14.3.12.

The staff has determined that the Detection and Assessment Hardware PS-ITAAC, described in SRP, Section 14.3.12 has been fully addressed between the North Anna 3 submission in FSAR, Revision 8 and the ESBWR DCD, Revision 10.

13.6A.4.2 Delay or Barrier Design

The applicant submitted PS-ITAAC, in Revision 5 of the North Anna 3 COLA, Part 10, Table 2.2.1-1, "ITAAC for the Site-Specific Security System." The Dominion, North Anna 3 COLA incorporates by reference the ESBWR DCD Tier 1, Table 2.19-1, Revision 10, design commitments and ITAAC for the physical security system to be used at North Anna 3.

The PS-ITAAC listed below reference numbers are from SRP Section 14.3.12 Physical Security Hardware - Appendix "A" and are used to provide clarification of the ITAAC related to "Delay or Barrier Design."

PS-ITAAC 1. Vital Area and Vital Area Barrier:

a. Vital equipment will be located only within a vital area.

b. Access to vital equipment will require passage through at least two physical barriers.

PS-ITAAC 8. Personnel, Vehicle, and Material Access Control Portals and Search Equipment:

a. Access control points will be established and designed to control personnel and vehicle access into the protected area.

b. Access control points will be established and designed with equipment for the detection of firearms, explosives, and incendiary devices at the protected area personnel access points.

Accordingly, the staff determined that the North Anna 3 COLA, Part 10, Table 2.2.1-1 has adequately addressed, PS-ITAAC for Delay or Barrier Design Items 8(a), 8(b), identified in Appendix A to SRP Section 14.3.12.

The North Anna 3 COLA, Part 10, Table 2.2.1-1 partially addressed PS-ITAAC 1(a) and 1(b). The application references the ESBWR DCD, Revision 10, which also partially addressed PS-ITAAC 1(a) and 1(b). The staff determined that between both the North Anna 3 COL and the ESBWR DCD all elements of the PS-ITAAC 1(a) and 1(b) are adequately addressed as identified in Appendix A to SRP Section 14.3.12.

The staff has determined that PS-ITAAC described in SRP, Section 14.3.12 has been fully addressed between the North Anna 3 submission in FSAR, Revision 8 and the ESBWR DCD, Revision 10.

13.6A.4.3 Systems, Hardware, or Features Facilitating Security Response and Neutralization

The applicant submitted PS-ITAAC, in Revision 5 of the North Anna 3 COLA, Part 10, Table 2.2.1-1, "ITAAC for the Site-Specific Security System." The Dominion, North Anna 3 COLA incorporates by reference the ESBWR DCD Tier 1, Table 2.19-1, Revision 10, design commitments and ITAAC for the physical security system to be used as the North Anna 3.

The below listed PS-ITAAC reference numbers are from SRP Section 14.3.12 Physical Security Hardware - Appendix "A" and are used to provide clarification of the ITAAC related to "Systems, Hardware, or Features Facilitating Security Response and Neutralization."

PS-ITAAC 5 Illumination Requirements:

Isolation zones and exterior areas within the protected area will be provided with illumination to permit assessment in the isolation zones and observation of activities within exterior areas of the protected area.

PS-ITAAC 7 Vehicle Control Measures Requirements:

The vehicle barrier system will be designed, installed, and located at the necessary standoff distance to protect against the design-basis threat vehicle bombs.

PS-ITAAC 10 Vital Areas Access Control Requirements:

Unoccupied vital areas will be designed with locking devices and intrusion detection devices that annunciate in the Secondary Alarm Station.

PS-ITAAC 11 Alarm Station:

a. Intrusion detection equipment and video assessment equipment will annunciate and be displayed concurrently in at least two continuously manned onsite alarm stations (Central and Secondary Alarm Stations).

b. The Secondary Alarm Station will be located inside the protected area and will be designed so that the interior of the alarm station is not visible from the perimeter of the protected area.

c. Central and Secondary Alarm Stations will be designed, equipped and constructed such that no single act, in accordance with the design-basis threat of radiological sabotage, can simultaneously remove the ability of both the central and secondary alarm stations to (1) detect and assess alarms, (2) initiate and coordinate an adequate response to alarms, (3) summon offsite assistance, and (4) provide effective command and control.

d. Both the Central and Secondary Alarm Stations will be constructed, located, protected, and equipped to the standards for the Central Alarm Station (alarm stations need not be identical in design but shall be equal and redundant, capable of performing all functions required of alarm stations).

e. ITAAC 11(new) In May 2010, Standard Review Plan (SRP) Section 14.3.12 was revised during the review of this application; an additional PS-ITAAC task was added to this Section. This new task is addressed by the applicant in Section 15 of the North Anna 3 PSP. The ITAAC SRP dated January 2010, that was used for review is published in the *Federal Register*. The initial (2007) SRP on date of application meets the requirements under 10 CFR 50.34(H)

PS-ITAAC 12 Secondary Power Supplies for Alarm Annunciation and Communication Equipment Requirements:

The secondary security power supply system for alarm annunciator equipment contained in the Secondary Alarm Station and non-portable communications equipment contained in the Secondary Alarm Station is located within a vital area.

PS-ITAAC 13 Intrusion Detection Systems Console Display:

a. Security alarm devices, including transmission lines to annunciators, will be tamper indicating and self-checking (e.g., an automatic indication is provided when failure of the alarm system or a component occurs or when on standby power), and alarm annunciation indicates the type of alarm (e.g., intrusion alarms, emergency exit alarm) and location.

b. Intrusion detection and assessment systems will be designed to provide visual display and audible annunciation of alarms in the Secondary Alarm Station.

PS-ITAAC 14 Intrusion Detection Systems Recording Requirements:

Intrusion detection systems recording equipment will record onsite security alarm annunciation including the location of the alarm, false alarm, alarm check, and tamper indication and the type of alarm, location, alarm circuit, date, and time.

PS-ITAAC 15 Vital Area Emergency Exits Requirements:

Emergency exits through the protected area perimeter and vital area boundaries will be alarmed with intrusion detection devices and secured by locking devices that allow prompt egress during an emergency.

PS-ITAAC 16 Communication:

a. The Secondary Alarm Station will have conventional (land line) telephone service with the Main Control Room and local law enforcement authorities.

b. The Secondary Alarm Station will be capable of continuous communication with on-duty security force personnel.

c. Non-portable communications equipment in the Secondary Alarm Station will remain operable from an independent power source in the event of loss of normal power.

Accordingly, the staff determined that the North Anna 3 COLA, Part 10, Table 2.2.1-1 has adequately addressed, PS-ITAAC for Systems, Hardware, or Features Facilitating Security Response and Neutralization Items 5, 7, 10 11(a), 11(b), 11(c), 11(d), (Note: 10 CFR 50.34(h), SRP Section 14.3.12 was revised during the review of this application, and an additional PS-ITAAC task was added to this Section. This new task is addressed by the applicant in Section 15 of the North Anna 3 PSP), 12, 13(a), 13(b), 15, 16(a)16(b), 16(c), identified in Appendix A to SRP Section 14.3.12.

The North Anna 3 COLA, Part 10, Table 2.2.1-1 partially addressed PS-ITAAC Items 10, 11(b), 12, 13(a), 13(b) 14, 15, 16(a), 16(b), 16(c). The application references the ESBWR DCD, Revision 10, which also partially addressed PS-ITAAC Items 10, 11(b), 12, 13(a), 13(b) 14, 15, 16(a), 16(b), 16(c). The staff determined the between both the North Anna 3 COL and the ESBWR DCD all elements of the PS-ITAAC Items 10, 11(b), 12, 13(a), 13(b) 14, 15, 16(a), 16(b), 16(c) are adequately addressed as identified in Appendix A to SRP Section 14.3.12.

The staff has determined that Systems, Hardware, or Features Facilitating Security Response and Neutralization PS-ITAAC described in SRP, Section 14.3.12 has been fully addressed between the North Anna 3 submission in FSAR Revision 8 and the ESBWR DCD, Revision 10.

License Condition

- Part 10, License Condition

The staff has reviewed the license condition below against the recommendations in SECY-05-0197 as endorsed by the related SRM dated February 22, 2006. The staff concluded that the proposed license condition conforms to the guidance in SECY-05-0197. In December 2013, Dominion submitted a revised FSAR Table 13.4-201 and Part 10, of their COLA, which confirms the addition of the Operational Program Readiness milestone requirements for Physical Security.

In addition, the staff proposes the following License Condition for ITAAC for Physical Security:

> License Condition (COLA Part 10 Section 3.6)
>
> Operational Program Readiness
>
> The licensee shall submit to the Director of NRO, a schedule, no later than 12 months after issuance of the COL, for implementation of the operational programs listed in FSAR Table 13.4-201. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until the operational programs in the FSAR table have been fully implemented. This schedule shall also address:
>
> - The implementation of site specific Severe Accident Management Guidance.
> - The spent fuel rack coupon monitoring program implementation.

The licensee shall perform and satisfy the ITAAC defined in FSAR Table 2.2.1-1, "ITAAC for the Site-Specific Physical Security."

13.6A.5 Post-Combined License Activities

North Anna 3 COLA Part 10 Section 3.6 Operational Program Readiness

> The licensee shall submit to the Director of NRO, a schedule, no later than 12 months after issuance of the COL, for implementation of the operational programs listed in FSAR Table 13.4-201. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until the operational programs in the FSAR table have been fully implemented. This schedule shall also address:
>
> - The implementation of site specific Severe Accident Management Guidance.
> - The spent fuel rack coupon monitoring program implementation.

License Condition 13.6.1: The licensee shall perform and satisfy the ITAAC defined in FSAR Table 2.2.1-1, "ITAAC for the Site-Specific Physical Security" and as shown in Attachment 1 of this SER.

13.6A.6 Conclusions

The staff's finding related to information incorporated by reference is in NUREG–1966. The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant addressed the required information relating to PS-ITAAC, and there is no outstanding information expected to be addressed in the Dominion's COL FSAR related to this Section. The results of the staff's technical evaluation of the information incorporated by reference in the North Anna 3 COLA are documented in NUREG–1966.

The staff concludes that the relevant information presented in the North Anna 3 COL FSAR, is acceptable based on the applicable regulations specified in Section 13.6A.3 of this SER. The staff based its conclusion on the following:

CWR COL 14.3-2-A, as related to PS-ITAAC is acceptable due to the staff finding that the applicant adequately describes the physical security systems and provided the implementation of the site-specific protective strategy and security programs as documented in Section 13.6 of this SER. The applicant adequately describes the site-specific PS-ITAAC for meeting the requirements of 10 CFR 73.55 and provides the technical bases for establishing a PS-ITAAC for the protection against acts of radiological sabotage and theft of SNM. The applicant includes systems and features as stated in North Anna 3 COL FSAR, Chapter 13 and referenced TRs. The applicant has provided adequate descriptions of objectives, prerequisites, test methods, data required, and acceptance criteria for security-related ITAAC for the approval of the North Anna 3 COL.

Attachment 1: FSAR Table 2.2.1-1, "ITAAC for the Site-Specific Physical Security"

Table 2.2.1-1 ITAAC for the Site-Specific Security System		
Design Commitment	**Inspections, Tests, Analyses**	**Acceptance Criteria**
1(a). Vital equipment will be located only within a vital area.	1(a). All vital equipment locations will be inspected.	1(a). Vital equipment is located only within a vital area.
1(b). Access to vital equipment will require passage through at least two physical barriers.	1(b). All vital equipment physical barriers will be inspected.	1(b). Vital equipment is located within a protected area such that access to the vital equipment requires passage through at least two physical barriers.
2(a). Physical barriers for the protected area perimeter will not be part of vital area barriers.	2(a). The protected area perimeter barriers will be inspected.	2(a). Physical barriers at the perimeter of the protected area are separated from any other barrier designated as a vital area barrier.
2(b). Penetrations through the protected area barrier will be secured and monitored.	2(b). All penetrations through the protected area barrier will be inspected.	2(b). All penetrations and openings through the protected area barrier are secured and monitored by intrusion detection equipment.
2(c). Unattended openings that intersect a security boundary, such as underground pathways, will be protected by a physical barrier and monitored by intrusion detection equipment or provided surveillance at a frequency sufficient to detect exploitation.	2(c). All unattended openings within the protected area barriers will be inspected.	2(c). All unattended openings (such as underground pathways) that intersect a security boundary (such as the protected area barrier), are protected by a physical barrier and monitored by intrusion detection equipment or provided surveillance at a frequency sufficient to detect exploitation.
3(a). Isolation zones will exist in outdoor areas adjacent to the physical barrier at the perimeter of the protected area and will be designed of sufficient size to permit observation and assessment on either side of the barrier.	3(a). The isolation zones in outdoor areas adjacent to the protected area perimeter barrier will be inspected.	3(a). The isolation zones exist in outdoor areas adjacent to the physical barrier at the perimeter of the protected area and are of sufficient size to permit observation and assessment of activities on either side of the barrier in the event of its penetration or attempted penetration.
3(b). Isolation zones will be monitored with intrusion detection and assessment equipment that is designed to provide detection and assessment of activities within the isolation zone.	3(b). The intrusion detection equipment within the isolation zones will be inspected.	3(b). Isolation zones are equipped with intrusion detection and assessment equipment capable of providing detection and assessment of activities within the isolation zone.

Table 2.2.1-1 ITAAC for the Site-Specific Security System		
Design Commitment	**Inspections, Tests, Analyses**	**Acceptance Criteria**
3(c). Areas where permanent buildings do not allow sufficient observation distance between the intrusion detection system and the protected area barrier (e.g., the building walls are immediately adjacent to, or are an integral part of the protected area barrier) will be monitored with intrusion detection and assessment equipment that is designed to detect the attempted or actual penetration of the protected area perimeter barrier before completed penetration of the barrier and assessment of detected activities.	3(c). Inspections of areas of the protected area perimeter barrier that do not have isolation zones will be performed.	3(c). Areas where permanent buildings do not allow sufficient observation distance between the intrusion detection system and the protected area barrier (e.g., the building walls are immediately adjacent to, or an integral part of, the protected area barrier) are monitored with intrusion detection and assessment equipment that detects attempted or actual penetration of the protected area perimeter barrier before completed penetration of the barrier and assessment of detected activities.
4(a). The perimeter intrusion detection system will be designed to detect penetration or attempted penetration of the protected area perimeter barrier before completed penetration of the barrier, and for subsequent alarms to annunciate concurrently in at least two continuously manned onsite alarm stations (central and secondary alarm stations).	4(a). Tests, inspections, or a combination of tests and inspections of the intrusion detection system will be performed.	4(a). The intrusion detection system can detect penetration or attempted penetration of the protected area perimeter barrier before completed penetration of the barrier, and subsequent alarms annunciate concurrently in at least two continuously manned on site alarms stations (central and secondary alarm stations).
4(b). The perimeter assessment equipment will be designed to provide video image recording with real-time and playback capability that can provide assessment of detected activities before and after each alarm annunciation at the protected area perimeter barrier.	4(b). Tests, inspections, or a combination of tests and inspections of the video assessment equipment will be performed.	4(b). The perimeter assessment equipment is capable of real-time and playback video image recording that provides assessment of detected activities before and after each alarm at the protected area perimeter barrier.
4(c). The intrusion detection and assessment equipment at the protected area perimeter will be designed to remain operable from an uninterruptible power supply in the event of the loss of normal power.	4(c). Tests, inspections, or a combination of tests and inspections of the uninterruptible power supply will be performed.	4(c). All Intrusion detection and assessment equipment at the protected area perimeter remains operable from an uninterruptible power supply in the event of the loss of normal power.

Table 2.2.1-1 ITAAC for the Site-Specific Security System		
Design Commitment	**Inspections, Tests, Analyses**	**Acceptance Criteria**
5. Isolation zones and exterior areas within the protected area will be provided with illumination to permit assessment in the isolation zones and observation of activities within exterior areas of the protected area.	5. The illumination in isolation zones and exterior areas within the protected area will be inspected.	5. Illumination in isolation zones and exterior areas within the protected area is 0.2 foot candles measured horizontally at ground level or alternatively augmented, sufficient to permit assessment and observation.
6. The external walls, doors, ceiling, and floors in the Secondary Alarm Station, and the last access control function for access to the protected area will be bullet resistant, to at least Underwriters Laboratories Ballistic Standard 752, "The Standard of Safety for Bullet-Resisting Equipment," Level 4, or National Institute of Justice Standard 0108.01, "Ballistic Resistant Protective Materials," Type III.	6. Type test, analysis, or a combination of type test and analysis of the external walls, doors, ceiling, and floors in the Secondary Alarm Station, and the last access control function for access to the protected area will be performed.	6. A report exists and concludes that the walls, doors, ceilings, and floors in the Secondary Alarm Station, and the last access control function for access to the protected area are bullet resistant to at least Underwriters Laboratories Ballistic Standard 752, Level 4, or National Institute of Justice Standard 0108.01, Type III.
7. The vehicle barrier system will be designed, installed, and located at the necessary standoff distance to protect against the design-basis threat vehicle bombs.	7. Type test, inspections, analysis or a combination of type tests, inspections, and analysis will be performed for the vehicle barrier system	7. A report exists and concludes that the vehicle barrier system will protect against the threat vehicle bombs based on the standoff distance for the system.
8(a). Access control points will be established and designed to control personnel and vehicle access into the protected area.	8(a). Tests, inspections, or a combination of tests and inspections of installed systems and equipment will be performed.	8(a). Access control points exist for the protected area and are configured to control access.
8(b). Access control points will be established and designed with equipment for the detection of firearms, explosives, and incendiary devices at the protected area personnel access points.	8(b). Tests, inspections, or a combination of tests and inspections of installed systems and equipment will be performed.	8(b). Detection equipment exists and is capable of detecting firearms, explosives, and incendiary devices at the protected area personnel access control points.
9. An access control system with a numbered photo identification badge system will be installed and designed for use by individuals who are authorized access to protected areas and vital areas without escort.	9. The access control system and the numbered photo identification badge system will be tested.	9. The access authorization system with a numbered photo identification badge system is installed and provides authorized access to protected and vital areas only to those individuals with unescorted access authorization.

Table 2.2.1-1
ITAAC for the Site-Specific Security System

Design Commitment	Inspections, Tests, Analyses	Acceptance Criteria
10. Unoccupied vital areas will be designed with locking devices and intrusion detection devices that annunciate in the Secondary Alarm Station.	10. Tests, inspections, or a combination of tests and inspections of unoccupied vital area intrusion detection equipment and locking devices will be performed.	10. Unoccupied vital areas are locked, and intrusion is detected and annunciated in the Secondary Alarm Station.
11(a). Intrusion detection equipment and video assessment equipment will annunciate and be displayed concurrently in at least two continuously manned onsite alarm stations (Central and Secondary Alarm Stations).	11(a). Tests, inspections, or a combination of tests and inspections of intrusion detection equipment and video assessment equipment will be performed.	11(a). Intrusion detection equipment and video assessment equipment annunciate and display concurrently in at least two continuously manned onsite alarm stations (Central and Secondary Alarm Stations).
11(b). The Secondary Alarm Station will be located inside the protected area and will be designed so that the interior of the alarm station is not visible from the perimeter of the protected area.	11(b). The Secondary Alarm Station location will be inspected.	11(b). The Secondary Alarm Station is located inside the protected area, and the interior of the alarm station is not visible from the perimeter of the protected area.
11(c). The alarm system will not allow the status of a detection point, locking mechanism or access control device to be changed without the knowledge and concurrence of the alarm station operator in the other alarm station.	11(c).Tests, inspections, or a combination of tests and inspections of intrusion detection equipment and access control equipment will be performed.	11(c). The alarm system will not allow the status of a detection point, locking mechanism or access control device to be changed without the knowledge and concurrence of the alarm station operator in the other alarm station.
11(d). Central and Secondary Alarm Stations will be designed, equipped and constructed such that no single act, in accordance with the design-basis threat of radiological sabotage, can simultaneously remove the ability of both the central and secondary alarm stations to (1) detect and assess alarms, (2) initiate and coordinate an adequate response to alarms, (3) summon offsite assistance, and (4) provide effective command and control.	11(d). Tests, inspections, or a combination of tests and inspections of the Central and Secondary Alarm Stations will be performed.	11(d). Central and Secondary Alarm Stations are designed, equipped, and constructed such that no single act, in accordance with the design-basis threat of radiological sabotage, can simultaneously remove the ability of both the central and secondary alarm stations to (1) detect and assess alarms, (2) initiate and coordinate an adequate response to alarms, (3) summon offsite assistance, and (4) provide effective command and control.

Table 2.2.1-1 ITAAC for the Site-Specific Security System		
Design Commitment	**Inspections, Tests, Analyses**	**Acceptance Criteria**
11(e). Both the Central and Secondary Alarm Stations will be constructed, located, protected, and equipped to the standards for the Central Alarm Station (alarm stations need not be identical in design but shall be equal and redundant, capable of performing all functions required of alarm stations).	11(e). Tests, inspections, or a combination of tests and inspections of the Central and Secondary Alarm Stations will be performed.	11(e). The Central and Secondary Alarm Stations are located, constructed, protected, and equipped to the standards of the Central Alarm Station and are functionally redundant (stations need not be identical in design).
12. The secondary security power supply system for alarm annunciator equipment contained in the Secondary Alarm Station and non-portable communications equipment contained in the Secondary Alarm Station is located within a vital area.	12. The secondary security power supply system will be inspected.	12. The secondary security power supply system for alarm annunciator equipment contained in the Secondary Alarm Station and non-portable communications equipment contained in the Secondary Alarm Station is located within a vital area.
13(a). Security alarm devices, including transmission lines to annunciators, will be tamper-indicating and self-checking (e.g., an automatic indication is provided when failure of the alarm system or a component occurs or when on standby power), and alarm annunciation indicates the type of alarm (e.g., intrusion alarms, emergency exit alarm) and location.	13(a). All security alarm devices and transmission lines will be tested.	13(a). Security alarm devices including transmission lines to annunciators are tamper indicating and self-checking (e.g., an automatic indication is provided when failure of the alarm system or a component occurs, or when the system is on standby power), and the alarm annunciation indicates the type of alarm (e.g., intrusion alarm, emergency exit alarm) and location.
13(b). Intrusion detection and assessment systems will be designed to provide visual display and audible annunciation of alarms in the Secondary Alarm Station.	13(b). Intrusion detection and assessment systems will be tested.	13(b). The intrusion detection and assessment systems provide a visual display and audible annunciation of alarms in the Secondary Alarm Station (concurrently with the display and annunciation in the Central Alarm Station).
14. No Site-Specific ITAAC specified.	14. No Site-Specific ITAAC specified.	14. No Site-Specific ITAAC specified.

Table 2.2.1-1 ITAAC for the Site-Specific Security System		
Design Commitment	**Inspections, Tests, Analyses**	**Acceptance Criteria**
15. Emergency exits through the protected area perimeter and vital area boundaries will be alarmed with intrusion detection devices and secured by locking devices that allow prompt egress during an emergency.	15. Tests, inspections, or a combination of tests and inspections of emergency exits through the protected area perimeter and vital area boundaries will be performed.	15. Emergency exits through the protected area perimeter and vital area boundaries are alarmed with intrusion detection devices and secured by locking devices that allow prompt egress during an emergency.
16(a). The Secondary Alarm Station will have conventional (land line) telephone service with the Main Control Room and local law enforcement authorities.	16(a). Tests, inspections, or a combination of tests and inspections of the Secondary Alarm Stations' conventional (land line) telephone service will be performed.	16(a). The Secondary Alarm Station is equipped with conventional (land line) telephone service with the Main Control Room and local law enforcement authorities.
16(b).The Secondary Alarm Station will be capable of continuous communication with on-duty security force personnel.	16(b). Tests, inspections, or a combination of tests and inspections of the Secondary Alarm Stations' continuous communication capabilities will be performed.	16(b). The Secondary Alarm Station is capable of continuous communication with on-duty watchmen, armed security officers, armed responders, or other security personnel who have responsibilities within the physical protection program and during contingency response events.
16(c). Non-portable communications equipment in the Secondary Alarm Station will remain operable from an independent power source in the event of loss of normal power.	16(c). Tests, inspections, or a combination of tests and inspections of the non-portable communications equipment will be performed.	l6(c). All non-portable communication devices (including conventional telephone systems) in the Secondary Alarm Station are wired to an independent power supply that enables those systems to remain operable (without disruption) during the loss of normal power.

13.7 Fitness for Duty

13.7.1 Introduction

Pursuant to 10 CFR 52.79(a)(44), COLA must include a description of the FFD program required by 10 CFR Part 26, and its implementation. The FFD program is designed to provide reasonable assurance that: (1) individuals are trustworthy and reliable as demonstrated by the avoidance of substance abuse; (2) individuals are not under the influence of any substance, legal or illegal, or mentally or physically impaired from any cause, which in any way adversely affects their ability to safely and competently perform their duties; (3) measures are established and implemented for the early detection of individuals who are not fit to perform their duties; (4) the construction site is free from the presence and effects of illegal drugs and alcohol; (5) the work places are free from the presence and effects of illegal drugs and alcohol; and, (6) the effects of fatigue and degraded alertness on an individual's ability to safely and competently perform their duties are managed commensurate with maintaining public health and safety.

13.7.2 Summary of Application

The COL applicant has provided Section 13.7 of the North Anna 3 COLA FSAR, Revision 5, for staff review. The COL applicant submitted the draft text of Revision 5 of COL FSAR Section 13.7 and Section 13.4-201 in March 16, 2012, NRC Docket No. 52-017 Dominion Virginia Power, North Anna 3 COL, SRP Section 13.07: Response to RAI Letter 52. In these documents, Dominion described conditions of the operations and construction FFD programs for North Anna 3. The staff review is based on the applicant's COL, Revision 5, dated March 2012.

Supplemental Information

The staff needed to obtain further clarity on the COL applicant's description of the FFD program. Information initially provided by the COL applicant was insufficient to perform a technical evaluation – additional site-specific information was needed from the COL applicant about the North Anna 3 FFD program. To accomplish this, the staff issued RAI 13.07-1, dated December 3, 2010 (ADAMS Accession No. ML103560107), Revisions to NEI 06-06 and question13.07-2, dated December 3, 2010 (ADAMS Accession No. ML103560107), site-specific FFD information) to the COL applicant. The COL applicant provided responses to the staff RAIs in a letter dated January 18, 2011 (ADAMS Accession No. ML103560139). The RAI responses described the FFD program for both the construction phase and the operations phase of North Anna 3. The FFD Program is implemented and maintained in two phases; the construction phase program and the operations phase program. The construction and operations phase programs are implemented as identified in North Anna COL FSAR Table 13.4-201. The construction phase program is consistent with the NRC-accepted NEI, "Fitness for Duty Program Guidance for New Nuclear Power Plant Construction Sites," NEI 06-06, Revision 5. The NRC FFD technical staff and managerial oversight staff has determined the North Anna operations phase program complies with 10 CFR Part 26.

License Conditions

There are no FFD license conditions for North Anna 3.

13.7.3 Regulatory Basis

The applicable regulatory requirements for COL FSAR Section13.7-1 and Section 13.4-201 are as follows:

- 10 CFR Part 26
- 10 CFR 52.79(a)(44

Pending the issuance of an NRC regulatory guide for NEI 06-06, applicants may cite NEI 06-06, Revision 5 as a reference in the development of site-specific applications.

13.7.4 Technical Evaluation

The staff reviewed COLA application Part 2, FSAR Sections 13.7, and 13.4-201 and found that the required information relating to the FFD program and the complete scope of information relating to this review topic are met.

The staff reviewed the following information in the COL applicant FSAR:

Supplemental Information

The COL applicant provided a new COL FSAR Section 13.7, and has revised COL FSAR 13.4-201 as a change to the COL FSAR Revision 5.

The staff review of COL FSAR Section 13.7-1 included the following: (1) The adequacy of the FFD program for the construction phase; (2) the adequacy of the FFD program for the operations phase; and (3) the program implementation milestones proposed by the COL applicant for both the construction phase and operations phase.

In RAI 13.07-1, dated December 3, 2010 (ADAMS Accession No. ML103560107), the staff asked the applicant the following:

> Under 10 CFR 52.79(a)(44), the Applicant's FSAR must contain a description of the fitness for duty (FFD) program required by 10 CFR Part 26 and its implementation. The Applicant intends to update its FFD program for the construction phase to comply with NEI 06-06. If future revisions to NEI 06-06 are endorsed by the NRC, does the Applicant intend to update its FFD program for the construction phase to comply with certain clarifications, additions, and exceptions in these future, endorsed revisions, as necessary?

In the January 18, 2011, response to RAI 13.07-1 (ADAMS Accession No. ML110270303), the COL applicant states the following:

> Dominion intends to update the construction phase FFD program to conform to the NRC-endorsed version of NEI 06-06, or provide justified alternative methods of conformance to regulations. After the COL is issued, Dominion will continue to meet the applicable FFD regulations.

In the January 18, 2011, response to RAI 13.07-1, the applicant committed to implement a construction phase (FFD) program to reflect the changes identified in response to RAI13.07-1. The staff verified that the applicant has included the proposed changes in FSAR, Revision 8. Therefore, RAI 13.07-01 is resolved and closed.

In RAI 13.07-2, dated December 3, 2010 (ADAMS Accession No. ML103560107), the staff asked the applicant the following:

> Under 10 CFR 52.79(a)(44), the Applicant's FSAR must contain a description of the fitness for duty (FFD) program required by 10 CFR Part 26 and its implementation. Describe how the COL Application, FSAR, Part 2, Table 13.4-201, item 20, (Sheet 13-58), comports with 10 CFR 26, Sections 26.3 and 26.4, and guidance in NRC's letter to the Nuclear Energy Institute dated December 2, 2009, entitled "Status of U. S. Nuclear Regulatory Commission Review and Endorsement of NEI 06-06, "Fitness for Duty Program Guidance for New Nuclear Power Plant Construction Sites" In particular, provide site-specific information to clearly and sufficiently describe your operational FFD program, in terms of the scope and level of detail to allow as reasonable assurance of finding of acceptability. For example, will North Anna base its Section 26.4(a) and (b) FFD program for Behavioral Observation Program and drug and alcohol testing on an operational unit program or develop its own specific program? Please describe substantial differences, if any.

In the January 18, 2011, response to RAI 13.07-2 (ADAMS Accession No. ML110270303), the COL applicant states the following:

> The COL Application, FSAR, Part 2, Table 13.4-201, item 20 references 10 CFR 26, Sections 26.3 and 26.4, as applicable, as requirements for implementation of the FFD Program for operation and for construction. Dominion will use both the current operational FFD program and a North Anna Unit 3 specific construction FFD program based on the individuals and the type of work being performed. In-particular, the 10 CFR Part 26.4(a) and (b) FFD program, which is the operational FFD program, will cover Dominion's employees and Dominion's subcontractors. Dominion's Engineering, Procurement, and Construction (EPC) contractor personnel and the EPC's subcontractors will be covered by a Dominion-approved contractor FFD program. The North Anna Unit 3 specific construction FFD program, 10 CFR Part 26.4(f), will cover the construction workers and first line supervisors. There are no substantial differences between the FFD programs, which are consistent with 10 CFR Part 26 and NEI 06-06, Revision 5. FSAR Table 13.4-201 and FSAR Section 13.7 will be revised to reflect the guidance provided in NRC's letter to the Nuclear Energy Institute dated December 2, 2009, entitled "Status of U. S. Nuclear Regulatory Commission Review and Endorsement of NEI 06-06,

“Fitness for Duty Program Guidance for New Nuclear Power Plant Construction Sites”. Also, site-specific information, including the applicable 10 CFR Part 26 element subparts, will be added to clearly describe the FFD programs.

FSAR, Part 2, Table 13.4-201 and Section 13.7 will be revised […].

In FSAR Part 2, Revision 6, the applicant revised COL FSAR Table 13.4-201(Operations Programs Required by NRC Regulations and Program Implementation) as follows:

COL FSAR Table 13.4-201 Operations Programs Required by NRC Regulations and Program Implementation

Program Title	Program Source	FSAR Section	Milestone	Requirement
FFD Program (Construction-Workers & First Line Supervisors)	10 CFR Part 26.4(f)	13.7	Prior to initiating 10 CFR 26 construction activities	10 CFR 26, Subpart K
FFD Program (Construction-Management & Oversight Personnel)	10 CFR Part 26.4(e)	13.7	Prior to initiating 10 CFR 26 construction activities	10 CFR 26, Subparts A through H, N and O
FFD Program for security personnel	10 CFR 26.4(e)(1)	13.7	Prior to initiating 10 CFR 26 construction activities	10 CFR 26, Subparts A through H, N and O
FFD Program for security personnel cont.	10 CFR 26.4(a)(5)	13.7	Prior to the earlier of: a. Receipt of SNM in the form of fuel assemblies, b. Establishment of a PA, or c. 10 CFR 52.103(g) finding	10 CFR 26, Subparts A through I, N and O

Program Title	Program Source	FSAR Section	Milestone	Requirement
FFD Program for FFD Program personnel	10 CFR Part 26.4(g)	13.7	Prior to initiating 10 CFR 26 construction activities	10 CFR 26, Subparts A, B, D through H, N, O and C per licensee's discretion
FFD Program for persons required to physically report to the Technical Support Center (TSC) or Emergency Operations Facility (EOF)	10 CFR Part 26.4(c)	13.7	Prior to the conduct of the first full participation emergency preparedness exercise under 10 CFR 50, Appendix E, Section F.2.a	10 CFR 26, Subparts A through I, N and O, except for 10 CFR 26.205 through 10 CFR 26.209
FFD Program for Operation	10 CFR 26.4(a) and 10 CFR 26.4(b)	13.7	Prior to the earlier of: a. Receipt of SNM in the form of fuel assemblies b. Establishment of a PA, or c. 10 CFR 52.103(g) finding	10 CFR 26, Subparts A through I, N and O, except for individuals listed in 10 CFR 26.4(b), who are not subject to 10 CFR 26.205 through 10 CFR 26.209

The COL applicant stated that their FFD program is implemented and maintained in two phases, the construction and operations phases, which are dependent on the activities, duties, or access afforded to certain individuals at the construction site.

The COL applicant stated that their construction FFD program conforms to the guidance in the NRC-accepted NEI 06-06, Revision 5, which applies to persons constructing or directing the construction of safety- and security-related SSCs performed onsite where the new reactor will be installed and operated. Other on-site key personnel will be subject to the operations FFD program that complies with the requirements of 10 CFR Part 26, Subparts A through H, N, and O. At the establishment of a protected area, all persons who are granted unescorted access will meet the requirements of an operations FFD program.

The COL applicant stated that their workforce population is subject to a random testing program and that the numbers are derived from weekly averages of active badges over a 7-day period and that persons to be tested are identified by a computerized testing generator.

The COL applicant stated their site-specific information at the construction site is provided:

- Dominion's Engineering, Procurement, and Construction (EPC) contractor personnel and the EPC's subcontractors working in the following areas are covered by a Dominion-approved contractor FFD Program (10 CFR Part 26, elements Subparts A-H, N and O):

    - FFD program personnel
    - Security personnel
    - Construction management and oversight personnel

- Dominion's EPC contractor personnel and the EPC's subcontractors working in the following area are covered by a Dominion-approved contractor FFD Program (10 CFR Part 26, elements Subpart K):

    - Construction workers and first-line supervisors

- Dominion's employees and Dominion's subcontractors working in the following areas are covered by the Dominion North Anna Units 1 and 2 Operations FFD Program (10 CFR Part 26, elements Subparts A-I, N and 0):

    - FFD program personnel

    - Security personnel protecting fuel assemblies

    - Personnel required to physically report to the Technical Support Center (TSC) or Emergency Operations Facility (EOF) by Emergency Plans and procedures (except for 10 CFR Part 26, Sections 26.205-209 and Subpart K, which do not apply)

- All other Dominion employees and Dominion subcontractors working at the construction site are covered by the Dominion North Anna Units 1 and 2 Operations FFD Program (10 CFR Part 26, elements Subparts A-H, N and O)

In the January 18, 2011 response to RAI 13.07-2, the applicant committed to modify the FSAR to indicate a replacement to Section 13.7, Fitness for Duty. They also agreed to provide site-specific information, and to provide explanation of their construction FFD program to comply with certain clarification, additions, and exceptions in these future, endorsed revisions as necessary. The staff has determined that this response, which includes site-specific information and milestones is acceptable. The staff verified that the applicant had included the proposed changes in COL FSAR revision 6. Therefore, this RAI is resolved and closed.

License Conditions

There are no license conditions applicable to the North Anna COLA.

13.7.5 Post Combined License Activities

There are no post license activities associated with the North Anna 3 COLA.

13.7.6 Conclusion

The staff reviewed FSAR Section 13.7 and the applicant's proposed revision to this Section. The staff's review confirmed that the applicant has addressed the required information relating to the FFD Program, and no outstanding information is expected to be addressed in the COL FSAR related to this Section.

The staff compared the information in the proposed FSAR markup changes to the relevant NRC regulations and the guidance in NEI 06-06. The staff concludes that the information in the North Anna 3 COL FSAR is acceptable because it meets the regulatory requirements in 10 CFR Part 26 and 10 CFR 52.79(a)(44). The staff based this conclusion on the following:

STD SUP 13.7-1, which relates to the FFD Program, is acceptable because it conforms to 10 CFR Part 26 and 10 CFR 52.79(a)(44), as clarified in the NRC letter to NEI dated December 2, 2009 (ADAMS Accession No. ML092881085).

13.8 Cyber Security

13.8.1 Introduction

This Section provides information relating to the preparations and plans for the Cyber Security program for North Anna 3. The purpose of this Section is to demonstrate that the COL applicant will establish and maintain a Cyber Security Program to provide high assurance that digital systems, networks, and communication systems are protected from cyber-attacks.

13.8.2 Summary of Application

On December 5, 2011, Dominion submitted a Revision 2 of the Cyber Security Plan (CSP) for North Anna 3. The CSP applies to all critical digital assets (CDA) required for North Anna 3 operation. In the submittal, Dominion describes how it establishes, implements, and maintains a Cyber Security program that protects digital computer and communication systems and networks associated with safety-related and important-to-safety functions; security functions; emergency preparedness functions, including offsite communications; and support systems and equipment which, if compromised, would adversely impact safety, security, or emergency preparedness functions.

13.8.3 Regulatory Basis

The following NRC regulations include the relevant requirements and guidance for the CSP:

- 10 CFR 73.54
- 10 CFR 73.55(a)(1), 10 CFR 73.55(b)(8), and 10 CFR 73.55(m)
- 10 CFR 73, Appendix G

The 10 CFR 73.54 requires each applicant to build and operate a nuclear power plant under 10 CFR Part 52, to submit, a CSP that satisfies the requirements of 10 CFR 73.54 for Commission review and approval.

The staff stated in a letter (Subject: Nuclear Energy Institute [NEI] 08-09, "Cyber Security Plan Template, Rev. 6), dated May 5, 2010 (ADAMS Accession No.: ML101190371), that an applicant may use the template in NEI 08-09, Revision 6, to prepare an acceptable CSP. Dominion submitted a CSP for North Anna 3 that was based on the template provided in NEI 08-09, Revision 6. The submitted CSP was reviewed against the template in NEI 08-09, Revision 6, which has been found acceptable for use by staff. NEI 08-09, Revision 6 is comparable to RG 5.71, "Cyber Security Programs For Nuclear Facilities," which is approved NRC guidance.

13.8.4 Technical Evaluation

The staff performed a technical evaluation of the applicant's CSP. The staff's review finds that the applicant's CSP conforms to the guidance in NEI 08-09, Revision 6, which is comparable to RG 5.71, to satisfy the requirements in 10 CFR 73.54. The staff also reviewed the applicant's CSP against the requirements of 10 CFR 73.54 in accordance with the guidance in RG 5.71. The staff's evaluation of each Section of the applicant's CSP is discussed below.

13.8.4.1 Scope and Purpose

The North Anna 3 CSP establishes a means to achieve high assurance that digital computer and communication systems and networks associated with the following functions are adequately protected against cyber-attacks up to and including the DBT:

- Safety-related and important-to-safety functions;
- Security functions;
- Emergency preparedness functions, including offsite communications; and
- Support systems and equipment which, if compromised, would adversely impact safety, security, or emergency preparedness functions.

The submitted CSP describes achievement of high assurance of adequate protection of systems associated with the above functions from cyber-attacks by:

- Implementing and documenting the "baseline" security controls as described in Section 3.1.6 of NEI 08-09, Revision 6, which is comparable to Regulatory Position C.3.3 described in RG 5.71; and

- Implementing and documenting a CSP to maintain the established cyber security controls through a comprehensive life cycle approach as described in Section 4 of NEI 08-09, Revision 6, which is comparable to Appendix A, Section A.2.1 of RG 5.71.

The applicants CSP states:

> Within the scope of NRC's cyber security rule at Title 10 of the *Code of Federal Regulations* structures, systems, and components (SSCs) in the balance of plant (BOP) that could directly or indirectly affect reactivity at a nuclear power plant and could result in an unplanned reactor shutdown or transient. Additionally, these SSCs are under the licensee's control and include electrical distribution equipment out to the first inter-tie with the offsite distribution system.

The staff reviewed the above information and found no substantive deviation from Regulatory Position C.3.3 in RG 5.71 and Appendix A, Section A.2.1 of RG 5.71. The staff finds that the applicant established adequate measures to implement and document the Cyber Security Program, including baseline security controls. Based on the review, the staff finds that the CSP adequately establishes the Cyber Security Program, including baseline security controls.

13.8.4.2 Analyzing Digital Computer Systems and Networks and Applying Cyber Security Controls

The Dominion North Anna 3 CSP describes that the Cyber Security Program is established, implemented, and maintained as described in Section 3.1 of NEI 08-09, Revision 6, which is comparable to Regulatory Position C.3 described in RG 5.71 to:

- analyze digital computer and communications systems and networks; and

- identify those assets that must be protected against cyber-attacks to satisfy 10 CFR 73.54(a)

The submitted CSP states that the cyber security controls in Appendices D and E of NEI 08-09, Revision 6, which are comparable to Appendices B and C in RG 5.71, are implemented to protect CDAs from cyber-attacks.

Based on the above, the staff finds that the CSP adequately addresses security controls.

13.8.4.3 Cyber Security Assessment and Authorization

The CSP provided information addressing the creation of a formal, documented, cyber security assessment and authorization policy. This included a description concerning the creation of a formal, documented procedure comparable to Section 3.1.1 of NEI 08-09, Revision 6.

The staff finds that the applicant established adequate measures to define and address the purpose, scope, roles, responsibilities, management commitment, and coordination, and facilitates the implementation of the cyber security assessment and authorization policy.

Based on the review, the staff finds that the CSP adequately established controls to develop disseminate and periodically update the cyber security assessment and authorization policy and implementing procedure.

13.8.4.4 Cyber Security Assessment Team

The Cyber Security Assessment Team (CSAT) responsibilities include conducting the cyber security assessment, documenting key findings during the assessment, and evaluating assumptions and conclusions about cyber security threats. The submitted CSP outlines the requirements, roles and responsibilities of the CSAT that are comparable to Section 3.1.2 of NEI 08-09, Revision 6. It also states that that the CSAT has the authority to conduct an independent assessment.

The submitted CSP describes that the CSAT will consist of individuals with knowledge about information and digital systems technology; nuclear power plant operations, engineering, and plant technical specifications; and physical security and emergency preparedness systems and programs. The CSAT description in the CSP is comparable to Regulatory Position C.3.1.2 in RG 5.71.

The submitted CSP lists the roles and responsibilities for the CSAT which included performing and overseeing the cyber security assessment process; documenting key observations; evaluating information about cyber security threats and vulnerabilities; confirming information obtained during tabletop reviews, walk-downs, or electronic validation of CDAs; and identifying potential new cyber security controls.

Based on the above, the staff finds that the CSP adequately establishes the requirements, roles, and responsibilities of the CSAT.

13.8.4.5 Identification of Critical Digital Assets

The submitted CSP states that the applicant will identify and document CDA and critical systems, including a general description, the overall function, the overall consequences if a compromise were to occur, and the security functional requirements or specifications as described in Section 3.1.3 of NEI 08-09, Revision 6, which is comparable to Regulatory Position C.3.1.3 of RG 5.71.

Based on the above, the staff finds that the CSP adequately describes the process to identify CDAs.

13.8.4.6 Examination of Cyber Security Practices

The submitted CSP describes how the CSAT will examine and document the existing cyber security procedures, and practices; existing cyber security controls; detailed descriptions of network and communication architectures (or network/communication architecture drawings); information on security devices; and any other information that may be helpful during the cyber security assessment process as described in Section 3.1.4 of NEI 08-09, Revision 6, which is comparable to Regulatory Position C.3.1.2 of RG 5.71. The examinations will include an analysis of the effectiveness of the existing Cyber Security program and cyber security controls. The CSAT will document the collected cyber security information and the results of their examination of the collected information.

Based on the above, the staff finds that the CSP adequately describes the examination of cyber security practices.

13.8.4.7 Reviews and Validation Testing

The submitted CSP describes tabletop reviews and validation testing, which confirm the direct and indirect connectivity of each CDA and identify direct and indirect pathways to CDAs. The CSP states that validation testing will be performed electronically or by physical walkdowns. The applicant’s plan for tabletop reviews and validation testing is comparable to Section 3.1.5 of NEI 08-09, Revision 6, which is comparable to Regulatory Position C.3.1.4 of RG 5.71.

Based on the above, the staff finds that the CSP adequately describes tabletop reviews and validation testing.

13.8.4.8 Mitigation of Vulnerabilities and Application of Cyber Security Controls

In accordance with Section 3.1.6 of NEI 08-09, Revision 6, which is comparable to Regulatory Position C.3.3 and Appendix A.3.1.6 to RG 5.71, the submitted CSP describes the use of information collected from Section 3.1.4 of the CSP to address cyber security controls.

The submitted CSP notes that before Dominion North Anna 3 can implement security controls on a CDA, it must assess the potential for adverse impact as per Section 3.1.6 of NEI 08-09, Revision 6, which is comparable to Regulatory Position C.3.3 of RG 5.71.

Based on the above, the staff finds that the CSP adequately describes mitigation of vulnerabilities and application of security controls.

13.8.4.9 Incorporating the Cyber Security Program into the Physical Protection Program

The submitted CSP states that the Cyber Security program will be reviewed as a component of the Physical Security Program in accordance with the requirements of 10 CFR 73.55(m). This information is comparable to Section 4.1 of NEI 08-09, Revision 6, which is comparable to Regulatory Position C.3.4 of RG 5.71.

Based on the above, the staff finds that the CSP adequately describes review of the CSP as a component of the physical security program.

13.8.4.10 Cyber Security Controls

The submitted CSP describes how the technical, operational and management cyber security controls contained in Appendices D and E of NEI 08-09, Revision 6, that are comparable to Appendices B and C in RG 5.71, are evaluated and dispositioned based on site-specific conditions during all phases of the cyber security program. The CSP describes that many security controls have actions that are required to be performed on specific frequencies and that the frequency of a security control is satisfied if the action is performed within 1.25 times the frequency specified in the control, as applied, and as measured from the previous performance of the action as described in Section 4.2 of NEI 08-09, Revision 6.

Based on the above, the staff finds that the CSP adequately describes implementation of cyber security controls.

13.8.4.11 Defense-in-Depth Protective Strategies

The submitted CSP describes the implementation of defensive strategies that ensure the capability to detect, respond to, and recover from a cyber-attack. The CSP specifies that the defensive strategies consist of security controls, defense-in-depth measures, and the defensive architecture. The submitted CSP notes that the defensive architecture establishes the logical and physical boundaries to control the data transfer between these boundaries.

The applicant established defense-in-depth strategies by: implementing and documenting a defensive architecture as described in Section 4.3 of NEI 08-09, Revision 6, which is comparable to Regulatory Position C.3.2 in RG 5.71; a Physical Security Program, including physical barriers; the operational and management controls described in Appendix E of NEI 08-09, Revision 6, which is comparable to Appendix C to RG 5.71; and the technical controls described in Appendix D of NEI 08-09, Revision 6, which is comparable to Appendix B to RG 5.71.

Based on the above review, the staff finds that the “Defense-in-Depth Protective Strategies” described in Section 4.3 of North Anna 3 CSP are acceptable.

13.8.4.12 Ongoing Monitoring and Assessment

The submitted CSP describes how ongoing monitoring of cyber security controls to support CDAs is implemented comparable to Appendix E of NEI 08-09, Revision 6, which is comparable to Regulatory Positions C.4.1 and C.4.2 of RG 5.71. The ongoing monitoring program includes configuration management and change control; cyber security impact analysis of changes and changed environments; ongoing assessments of cyber security controls; effectiveness analysis (to monitor and confirm that the cyber security controls are implemented correctly, operating as intended, and achieving the desired outcome) and vulnerability scans to identify new vulnerabilities that could affect the security posture of CDAs.

Based on the above, the staff finds that the CSP adequately describes ongoing monitoring and assessment.

13.8.4.13 Modification of Digital Assets

The submitted CSP describes how cyber security controls are established, implemented, and maintained to protect CDAs. These security controls ensure that modifications to CDAs are evaluated before implementation that the cyber security performance objectives are maintained, and that acquired CDAs have cyber security requirements in place to achieve the site's CSP objectives. This information is comparable to Section 4.5 of NEI 08-09, Revision 6, which is comparable to Appendices A.4.2.5 and A.4.2.6 of RG 5.71.

Based on the above, the staff finds that the CSP adequately describes modification of digital assets.

13.8.4.14 Attack Mitigation and Incident Response

The submitted CSP describes the process to ensure that SSEP functions are not adversely impacted due to cyber-attacks in accordance with Section 4.6 of NEI 08-09, Revision. 6, which is comparable to Appendix C, Section C.8 of RG 5.71. The CSP includes a discussion about creating incident response policy and procedures, and addresses training, testing and drills, incident handling, incident monitoring, and incident response assistance. It also describes identification, detection, response, containment, eradication, and recovery activities comparable to Section 4.6 of NEI 08-09, Revision 6.

Based on the above, the staff finds that the CSP adequately describes attack mitigation and incident response.

13.8.4.15 Cyber Security Contingency Plan

The submitted CSP describes creation of a Cyber Security Contingency Plan and policy that protects CDAs from the adverse impacts of a cyber-attack described in Section 4.7 of NEI 08-09, Revision 6, which is comparable to Regulatory Position C.3.3.2.7, and Appendix C.9 of RG 5.71. The applicant describes the Cyber Security Contingency Plan that would include the response to events. The plan includes procedures for operating CDAs in a contingency, roles and responsibilities of responders, processes and procedures for backup and storage of information, logical diagrams of network connectivity, current configuration information, and personnel lists for authorized access to CDAs.

Based on the above, the staff finds that the CSP adequately describes the cyber security contingency plan.

13.8.4.16 Cyber Security Training

The submitted CSP describes a program that establishes the training requirements necessary for the applicant's personnel and contractors to perform their assigned duties and responsibilities in implementing the Program in accordance with Section 4.8 of NEI 08-09, Revision 6, which is comparable to Regulatory Position C.3.3.2.8 of RG 5.71.

The CSP states that individuals will be trained with a level of cyber security knowledge commensurate with their assigned responsibilities in order to provide high assurance that individuals are able to perform their job functions in accordance with Appendix E of NEI 08-09, Revision 6, which is comparable to Regulatory Position C.3.3.2.8 of RG 5.71 and describes three levels of training: awareness training, technical training, and specialized cyber security training.

Based on the above, the staff finds that the CSP adequately describes the cyber security training and awareness.

13.8.4.17 Evaluate and Manage Cyber Risk

The submitted CSP describes how cyber risk is evaluated and managed utilizing site programs and procedures comparable to Section 4.9 of NEI 08-09, Revision 6, which is comparable to Regulatory Position C.4 and Appendix C, Section C.13 of RG 5.71. The CSP describes the Threat and Vulnerability Management Program; Risk Mitigation; Operational Experience Program; and the Corrective Action Program. The applicants CSP will describe how each CSP program will be used to evaluate and manage risk.

Based on the above, the staff finds that the CSP adequately describes evaluation and management of cyber risk.

13.8.4.18 Policies and Procedures

The CSP describes development and implementation of policies and procedures to meet security control objectives in accordance with Section 4.10 of NEI 08-09, Revision 6, which is comparable to Regulatory Position C.3.5 and Appendix A, Section A.3.3 of RG 5.71. This includes the process to document, review, approve, issue, use, and revise policies and procedures.

The CSP also describes the applicant’s procedures to establish specific responsibilities for positions described in Section 4.11 of NEI 08-09, Revision 6, which is comparable to Appendix C, Section C.10.10 of RG 5.71.

Based on the above, the staff finds that the CSP adequately describes cyber security policies and implementing procedures.

13.8.4.19 Roles and Responsibilities

The submitted CSP describes the roles and responsibilities for the qualified and experienced personnel, including the CSP Sponsor, the Cyber Security Program Manager, Cyber Security Specialists, the Cyber Security Incident Response Team (CSIRT), and other positions as needed. The CSIRT initiates in accordance with the Incident Response Plan and initiates emergency action when required to safeguard CDAs from cyber security compromise and to assist with the eventual recovery of compromised systems. Implementing procedures establish roles and responsibilities for each of the cyber security roles in accordance with Section 4.11 of NEI 08-09, Revision 6, which is comparable to Regulatory Position C.3.1.2, Appendix A, Section A.3.1.2, and Appendix C, Section C.10.10 of RG 5.71.

Based on the above, the staff finds that the CSP adequately describes cyber security roles and responsibilities.

13.8.4.20 Cyber Security Program Review

The submitted CSP describes how the Cyber Security program establishes the necessary procedures to implement reviews of applicable program elements in accordance with Section 4.12 of NEI 08-09, Revision 6, which is comparable to Regulatory Position C.4.3 and Appendix A, Section A.4.3 of RG 5.71.

Based on the above, the staff finds that the CSP adequately describes Cyber Security program review.

13.8.4.21 Document Control and Records Retention and Handling

The submitted CSP states that the applicant has established the necessary measures and procedures to ensure that sufficient records of items and activities affecting cyber security are developed, reviewed, approved, issued, used, and revised to reflect completed work.

The staff confirmed that the North Anna 3 discussion of records retention complies with 10 CFR 73.54(h).

Based on the above, the staff finds that the CSP adequately describes cyber security document control and records retention and handling.

13.8.4.22 Implementation Milestone

The FSAR Table 13.4-201 contains the implementation milestone for the cyber security program. The milestone is “prior to receipt of fuel on-site.” The staff’s review of the implementation milestone finds that it is satisfactory since it complies with 10 CFR 73.55(a)(4).

Based on the above review, the staff finds that the “Implementation Milestone” described in Table 13.4-201 of North Anna 3 FSAR is acceptable.

13.8.5 Post Combined License Activities

There are no post license activities associated with the North Anna 3 COLA.

13.8.6 Conclusion

The staff compared the Dominion North Anna 3 CSP and FSAR table 13.4-201 to the relevant NRC regulations and the criteria in RG 5.71 via NEI 08-09, Revision 6.

The staff concluded that Dominion North Anna 3 is in compliance with the NRC regulations. The staff finds that the information in the Dominion North Anna 3 CSP adequately addresses the relevant requirements and guidance of 10 CFR 73.54 and RG 5.71, respectively. Therefore, the staff finds the information contained in this Section acceptable.

The staff's review confirmed that the applicant addressed the relevant information necessary to satisfy the requirements of 10 CFR 73.54, 10 CFR 73.55(a)(1), 10 CFR 73.55(b)(8), 10 CFR 73.55(m), and Appendix G to 10 CFR Part 73, as applicable. Thus, the staff finds that the North Anna 3 CSP meets applicable NRC requirements and guidance and therefore is acceptable.

14.0 INITIAL TEST PROGRAM

14.0 INITIAL TEST PROGRAM

This chapter of the U.S. Nuclear Regulatory Commission's (NRC's) safety evaluation report (SER) provides the NRC staff evaluation of the North Anna 3 test programs, including preoperational tests, initial fuel loading and initial criticality, low-power tests, and power-ascension tests. In the North Anna 3 Combined License (COL) Final Safety Analysis Report (FSAR) the applicant addressed information concerning the initial test program (ITP) for structures, systems, and components (SSCs) and design features for both the nuclear portion of the North Anna 3 site, and the balance of plant. The COL applicant thus describes the scope of the ITP, as well as the general plans for accomplishing the ITP in sufficient detail to demonstrate that there is due consideration given to matters that normally require advance planning.

In accordance with Regulatory Guide (RG) 1.206, "Combined License Applications for Nuclear Power Plants (LWR Edition)," Regulatory Position C.I.14, "Verification Programs," dated June 2007, the COL applicant describes the technical aspects of the ITP in sufficient detail to show that (1) the test program adequately verifies the functional requirements of plant SSCs, and (2) the sequence of testing is such that the safety of the plant does not depend on untested SSCs. The COL applicant also describes measures to ensure that (1) the ITP will be accomplished with adequate numbers of qualified personnel; (2) there will be adequate administrative controls established to govern the ITP; (3) the ITP will be used, to the extent practicable, to train and familiarize the plant's operating and technical staff in the operation of the facility; and (4) the adequacy of plant operating and emergency procedures will be verified, to the extent practicable, during the period of the ITP. This chapter also provides information on the inspections, tests, analyses, and acceptance criteria (ITAAC) that are intended to demonstrate that, when the inspections, tests, and analyses are performed and the associated acceptance criteria met, the facility will have been constructed and will operate in conformity with (1) the COL; (2) the Atomic Energy Act of 1954, as amended; and (3) the U.S. Nuclear Regulatory Commission (NRC) regulations.

14.1. Initial Test Program for Preliminary Safety Analysis Reports

Section 14.1 of the North Anna 3 COL FSAR, Revision 8, incorporates by reference with no departures or supplements Section 14.1, "Initial Test Program For Preliminary Safety Analysis Reports," of Revision 10 of the Design Control Document (DCD) for the Economic Simplified Boiling-Water Reactor (ESBWR), referenced in Appendix E to Title 10 of the *Code of Federal Regulations* (10 CFR) Part 52, "Licenses, Certifications, and Approvals for Nuclear Power Plants." The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.[1] The staff's review confirmed that there is no outstanding issue related to this section. Pursuant to 10 CFR 52.63(a)(5) and Part 52, Appendix E, "Design Certification Rule for ESBWR Design," Section VI.B.1, all nuclear safety issues have been resolved relating to ITP for Preliminary Safety Analysis Reports that the applicant has incorporated by reference.

[1] See *"Finality of Referenced NRC Approvals"* in SER Section 1.2.2 for a discussion on the staff's review related to verification of the scope of information to be included in a COL application that references a design certification.

14.2 Initial Plant Test Program for Final Safety Analysis Reports

14.2.1 Introduction

This FSAR section presents an overview of the North Anna 3 ITP.

14.2.2 Summary of Application

Section 14.2, “Initial Plant Test Program for Final Safety Analysis Reports,” of the North Anna 3 COL FSAR, Revision 8, incorporates by reference Section 14.2, of the ESBWR DCD, Revision 10.

In addition, the North Anna 3 FSAR Section 14.2, provides the following:

COL Items

- STD COL 14.2-1-A Description – Initial Test Program Administration

The applicant developed and provided a description of the ITP administration in Appendix 14AA of the North Anna 3 COL FSAR, Revision 8.

- NAPS COL 14.2-1-A Description – Initial Test Program Administration

The applicant provided the site-specific administrative controls to be included in the Startup Administrative Manual (SAM) related to the ITP as Appendix 14AA, “Description of Initial Test Program Administration,” to address STD COL 14.2-1-A.

- STD COL 14.2-2-A Startup Administrative Manual

The applicant provided a milestone for completing the SAM.

- CWR COL 14.2-3-A Test Procedures

In the North Anna 3 COL FSAR, the applicant addressed the STD COL-14.2-3-A as consistent with reference (CWR) COL 14.2-3-A indicating the information is consistent with the reference COL. The applicant provided milestones for making approved test procedures satisfying the requirements of the ITP. The applicant addressed this COL information as information consistent with the Reference COL applicant, Fermi Unit 3 Station (COL 14.2-3-A), in its COL FSAR, Revision 8 for North Anna 3.

- STD COL 14.2-4-A Test Program Schedule and Sequence

The applicant provided a license condition to develop and make detailed testing schedules available for NRC review prior to actual implementation. The implementation milestones for the ITP are provided in the North Anna 3 COL FSAR, Revision 8, Section 13.4, “Operational Program Implementation.”

- NAPS COL 14.2-5-A		Site Specific Tests

The applicant described the site-specific preoperational and initial startup tests not addressed in DCD Section 14.2.8.

- NAPS COL 14.2-6-A		Site Specific Test Procedures

The applicant specified that site-specific testing will be performed and acceptance criteria for each preoperational and startup test are documented in test procedures available 60 days prior to their intended use.

Supplemental Information

- STD SUP 14.2-2		Test Records

The applicant specified that startup test reports are prepared in accordance with RG 1.16, "Reporting of Operating Information – Appendix A Technical Specifications."

- STD SUP 14.2-4		AC [Alternating Current] Power Distribution System Preoperational Test General Test Methods and Acceptance Criteria

The applicant specified proper operation of the automatic transfer capability of the normal preferred power source to the alternate preferred power source.

- NAPS SUP 14.2-1		Organization and Staffing

The applicant provided additional information regarding responsibilities, qualifications, and organization for the preoperational and startup testing program.

- NAPS SUP 14.2-2		Site-Specific Performance Test

The applicant specified that the objective of this test is to demonstrate acceptable performance of the waste heat rejection portion of the circulating water system (CWS or CIRC); (i.e., the dry cooling array and the hybrid cooling tower and basin).

- NAPS SUP 14.2-3		Site-Specific Pre-Operational Tests

The applicant specified site-specific preoperational tests for the station water system (SWS) and the Cooling Tower.

- NAPS SUP 14.2-4		Plant Service Water System (PSWS) Preoperational Test Purpose

The applicant specified the verification of proper operation of the PSWS.

- NAPS SUP 14.2-5 Plant Service Water System Performance Test Purpose

The applicant specified the verification of performance of the PSWS under expected reactor power operation load conditions.

14.2.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG–1966, "Final Safety Evaluation Report Related to the Certification of the Economic Simplified Boiling-Water Reactor."

The regulatory basis for acceptance of supplemental information related to operational programs is addressed in the following documents:

- Section 14.2 of NUREG–0800, "Standard Review Plan for the Review of Safety Analysis Reports for Nuclear Power Plants (LWR Edition)," the Standard Review Plan (SRP);

- Regulatory Position C.I.14, of RG 1.206; and

- RG 1.68, "Initial Test Programs for Water-Cooled Nuclear Power Plants."

The regulatory basis for applicant development of administrative controls that will be used to govern the ITP is addressed in SRP Sections 14.2.3.B.ii and iii, and in RG 1.206, Regulatory Position C.I.14. The applicable regulatory requirements for the information being reviewed in this section are 10 CFR 52.79(a)(28) and Criterion XI of Appendix B, "Quality Assurance Criteria for Nuclear Power Plants and Fuel Reprocessing Plants," to 10 CFR Part 50, "Domestic Licensing of Production and Utilization Facilities."

14.2.4 Technical Evaluation

As documented in NUREG–1966, the staff reviewed and approved Section 14.2 of the certified ESBWR DCD. The staff reviewed Section 14.2 of the North Anna 3 COL FSAR, Revision 8, and checked the referenced ESBWR DCD to ensure that the combination of the information in the North Anna 3 COL FSAR, Revision 8 and the information in the ESBWR DCD, appropriately represent the complete scope of information relating to this review topic.[1] The staff's review confirmed that the information contained in the application and the information incorporated by reference addresses the relevant information related to this section.

The North Anna 3 ITP includes a test program that will verify the functional requirements of plant SSCs. The ITP also includes the applicant's plans for the sequence of testing. The staff noted that the sequence of testing is organized in such a manner that the safety of the plant does not depend on any untested SSCs. In addition, the staff noted the following:

- The ITP is to be conducted with an adequate number of qualified personnel.

- Appropriate administrative controls have been established to govern the ITP.

- The test program will be used to train and familiarize the plant's operating and technical staff with general operation of the facility.

- The adequacy of plant operating and emergency procedures will be verified, to the extent practicable, during the ITP performance period.

The staff's technical evaluation of the FSAR sections affected by COL Items STD COL 14.2-1-A, NAPS COL 14.2-1-A, STD COL 14.2-2-A, STD COL 14.2-3-A, STD COL 14.2-4-A, NAPS COL 14.2-5-A, NAPS COL 14.2-6-A and supplemental information items STD SUP 14.2-2, STD SUP 14.2-4, NAPS SUP 14.2-1, NAPS SUP 14.2-2, NAPS SUP 14.2-3, NAPS SUP 14.2-4, and NAPS SUP 14.2-5 is discussed in Sections 14.2.4.1 through 14.2.4.8. The staff's evaluation of the North Anna 3 COL FSAR includes changes from Revision 2 to Revision 8.

14.2.4.1 Organization and Staffing

The staff reviewed the information in the North Anna 3 COL FSAR, Revision 8, as follows:

Supplemental Information

- NAPS SUP 14.2-1

In FSAR Section 14.2.1.4, "Organization and Staffing," the applicant added the following:

> Section 13.1 provides additional information regarding responsibilities, qualifications, and organization for implementing the preoperational and startup testing program.

The staff found the administrative addition of a pointer to Section 13.1 of the FSAR, regarding organization and staffing, acceptable.

14.2.4.2 Startup Administrative Manual

The staff reviewed the information in the North Anna 3 COL FSAR, Revision 8, as follows:

COL Items

- STD COL 14.2-1-A Description – Initial Test Program Administration

The applicant developed and provided a description of the ITP administration in Appendix 14AA of the North Anna 3 FSAR, Revision 8.

Section 14.2.2.1, "Startup Administrative Manual," of the DCD states in part that:

> A description of the initial test program administration is developed and made available to the NRC by the COL Applicant. This includes a discussion and description of the process and organizational controls and requirements that are included in the Startup Administrative Manual. See Section 14.2.10, COL Information Item 14.2-1-A.

The staff reviewed STD COL 14.2-1-A related to COL Information Item 14.2-1 and noted that in Revision 0 of North Anna 3 COL FSAR, the applicant did not include such administrative controls.

At public meetings on May 13 and May 22, 2008, the applicant and other design-centered working group (DCWG) representatives proposed a test program administrative document (proposed FSAR Appendix 14AA, "Description of Initial Test Program Administration," dated May 22, 2008). On June 23, 2008, the staff issued a request for additional information (RAI) 14.02-3 (Agencywide Documents Access and Management System (ADAMS) Accession No. ML082060489), requesting the applicant to formally submit this DCWG Appendix on the docket. In a response letter dated August 7, 2008, to RAI 14.02-3 (ADAMS Accession No. ML082240413), the applicant stated that it will include the referenced test program administrative document as Appendix 14AA of the FSAR in the next revision of the North Anna 3 COL FSAR. The staff subsequently reviewed North Anna 3 COL FSAR, Revision 8, and verified that the applicant has incorporated Appendix 14AA in Chapter 14. The staff confirmed that it provides an adequate discussion and description of the process and organizational controls and requirements that are to be included in the SAM consistent with the guidance provided in SRP Section 14.2. Therefore, RAI 14.2-03 is resolved and closed.

In North Anna 3 COL FSAR, Appendix 14AA, the applicant replaced STD COL 14.2-1-A as North Anna COL 14.2-1-A, indicating that the organization information is site-specific. The applicant revised Section 14AA.2, "Organization and Staffing," to include site-specific organizational description of the principal management positions (including any augmenting organizations) responsible for planning, executing, and documenting preoperational and startup testing activities, as well as revised Section 14AA.2.2, "Responsibilities," to include responsibilities and interfaces, and the degree of participation of each identified organizational unit that will be responsible for the administration and technical direction of the ITP in order to be aligned with that of Engineering, Procurement Construction contract and Chapter 13.

In addition, the applicant revised Table 13.1-201, "Generic Position/Site Specific Position Cross Reference," of Section 13.1, "Organizational Structure of Applicant," referenced in FSAR Section 14AA.2, to include the qualification and experience requirements for the preoperational and startup test engineer positions to meet the qualification requirements of inspection and test personnel defined in American Society of Mechanical Engineers (ASME) NQA-1-1994," Quality Assurance Requirements for Nuclear Facility Applications," and also added the preoperational and startup test managers positions including their associated education and experience. Table 13.1-201 was updated to align the startup and preoperational test personnel information consistent with North Anna 3 COL FSAR, Appendix 17AA, "North Anna Power Station Unit 3 Quality Assurance Program Description," and Dominion's current organization and resource estimates.

The staff reviewed the changes made in Table 13.1-201 and FSAR Section 14AA.2 of North Anna 3 COL FSAR and determined that the administrative control changes adequately define the organizations that will carry out the ITP; describe the authorities, responsibilities, and interfaces; and delineate training and qualification requirements for organizations participating in the implementation of the ITP, consistent with the guidance in RG 1.68. Additionally, the staff found that the applicant's commitment to RG 1.8, Revision 3, "Qualification and Training of Personnel for Nuclear Power Plants," which provides training and qualification guidance for nuclear power plant personnel, including personnel participating in ITP activities, found in Table 1.9-202 of the North Anna 3 COL, is adequate.

The staff reviewed the proposed North Anna 3 COL FSAR, Appendix 14AA and noted that in Section 14AA.3.4, "Test Procedure Changes," that the COL applicant provided a description of changes to test procedures; however, Section 14AA.3.4 did not include a description of the 10 CFR 50.59, "Changes, tests and experiments," for evaluating major test procedure changes for test abstracts in the ITP. In accordance with 10 CFR 50.59(c)(1)—

> A licensee may make changes to test procedures as described in the FSAR without obtaining a license amendment, only if:
>
> (i) a change to the technical specifications (TS) incorporated in the license is not required, and
>
> (ii) the change, test or experiment does not meet any of the criteria in (10 CFR 50.59(c)(2)).

On July 28, 2008, the staff initiated RAI 14.02-7 (ADAMS Accession No. ML082110133), requesting the COL applicant to include in Section 14AA.3.4, "Test Procedure Changes," the requirements to evaluate and obtain a license amendment, if it is revealed that a major test procedure change could result in a TS amendment in accordance with 10 CFR 50.59(c)(1) or it meets one of the eight criteria in 10 CFR 50.59(c)(2)(i) through (viii).

In a response letter dated September 11, 2008 to RAI 14.02-7 (ADAMS Accession No. ML082610417), the applicant proposed to revise FSAR Section 14AA.3.4, "Test Procedure Changes," with the following additional information:

> Review and approval requirements for procedure changes that do not change the intent are established in administrative procedures in the SAM.
>
> All test procedure intent changes will be revised against the following criteria (consistent with 10 CFR 50.59 and the design certification rule):
>
> - Departure from Tier 1 information
> - Departure from Tier 2 information that significantly decreases the level of safety in accordance with 10 CFR 50.59(c)(1) and meets any one of eight criteria in 10 CFR 50.59(c)(2)(i) through (viii) or 10 CFR [Part] 52, Design Certification Appendix, Section VIII.B.5.b.
> - Departure from Tier 2* information
> - Departure from Technical Specifications.
>
> Preoperational test procedure intent changes involving Tier 1, Tier 2*, Technical Specifications, or Tier 2 that require a license amendment must be approved by the NRC prior to procedure completion and approval. Startup test procedure intent changes involving Tier 1, Tier 2*, Technical Specifications, or Tier 2 that require a license amendment must be approved by the NRC prior to procedure use. Timely notification of the NRC is made when procedures are changed that have been sent to the NRC.

The staff found that this revision to FSAR Section 14AA.3.4 is acceptable, and therefore, RAI 14.02-7 is resolved and closed.

The staff reviewed the North Anna 3 COL FSAR, Appendix 14AA and determined that the applicant has provided an adequate discussion and description of the process and organizational controls and requirements that are to be included in the SAM. The staff also determined that the applicant provided an adequate description of the change control process similar to 10 CFR 50.59 for evaluating major test procedure changes for test abstracts in the ITP.

The staff evaluated STD COL 14.2-1-A and North Anna 3 COL 14.2-1-A according to relevant NRC regulations and acceptance criteria defined in SRP Section 14.2 along with the guidance in RGs 1.68 and 1.206, Section C.I.14, and finds that the applicant has satisfactorily addressed the ESBWR DCD COL Item 14.2-1-A.

- STD COL 14.2-2-A Startup Administrative Manual

Section 14.2.2.1 “Startup Administrative Manual,” of the DCD states in part that:

> The COL Applicant will provide a milestone for completing the Startup Administrative Manual and making it available for Nuclear Regulatory Commission (NRC) inspection (COL 14.2-2-A). [Note: The official designation of this manual may differ for the plant owner/operator referencing the ESBWR design certification Startup Administration Manual (SAM); [the term SAM is used throughout this discussion for illustrative purposes only.]

The applicant replaced the above section in Section 14.2.2.1 of the ESBWR DCD with a milestone for developing and providing the SAM no later than 60 days prior to initial use for preoperational test and scheduled fuel loading for initial startup tests. In Section 14.2.2.1 of the FSAR, the applicant stated that:

> The Startup Administration Manual will be developed and made available for review 60 days prior to scheduled start of the preoperational test program.

In addition, the applicant identified a license condition for STD COL 14.2-2-A. The applicant addressed the license condition for STD COL 14.2-2-A in Part 10: “Tier 1/ITAAC/Proposed License Conditions,” Revision 7, dated June 2014, Section 3.2.1,” Start-up Administrative Manual,” of North Anna 3 COL application (COLA), Revision 8, and is also addressed below in Post Combined License Activities. The licensee will track the development of the SAM in order to address this COL information item in accordance with applicable guidance.

14.2.4.3 Test Procedures

The staff reviewed the information in the North Anna 3 COL FSAR, Revision 8, as follows:

<u>COL Item</u>

- STD COL 14.2-3-A Test Procedures

The staff reviewed STD COL 14.2.3-A related to COL Information Item 14.2.3.

Section 14.2.2.2 “Test Procedures,” of the DCD states in part that:

> The COL Applicant will provide milestones for making available to the NRC approved test procedures satisfying the requirements for the ITP (COL 14.2-3-A).

The applicant replaced the above sentence of the ESBWR DCD with a milestone for developing and providing approved test procedures no later than 60 days prior to the intended use for preoperational test and scheduled fuel loading for initial startup tests. In Section 14.2.2.2 of the FSAR, the applicant stated that:

> Approved test procedures for satisfying this section will be developed and available for review no later than 60 days prior to their intended use for preoperational tests and scheduled fuel loading for initial startup tests.

In the North Anna 3 COL FSAR, the applicant addressed the STD COL-14.2-3-A as CWR COL 14.2-3-A indicating the information is consistent with the reference COL.

In addition, the applicant identified a license condition for STD COL 14.2-3-A. The applicant addressed the license condition for STD COL 14.2-3-A in Part 10: “Tier 1/ITAAC/Proposed License Conditions,” Revision 7, dated June 2014, Section 3.2.2, “Preoperational and Startup Test Procedures,” of the North Anna 3 COLA, Revision 8, and is also listed below in Post Combined License Activities. The licensee will track the development of test procedures in order to address this COL information item in accordance with applicable guidance.

The staff evaluated STD COL 14.2-3-A according to the relevant NRC regulations and acceptance criteria defined in SRP Section 14.2 along with the guidance in RGs 1.68 and 1.206, Section C.I.14, and finds that the applicant has satisfactorily addressed DCD COL Item 14.2-3-A.

14.2.4.4 Test Records

The staff reviewed the information in the North Anna 3 COL FSAR, Revision 8, as follows:

Supplemental Information

- STD SUP 14.2-2 Test Records

In FSAR Section 14.2.2.5, "Test Records," the applicant added the following:

> Startup test reports are prepared in accordance with RG 1.16.

SRP Section 14.2, Paragraph II.3.F, "Review, Evaluation, and Approval of Test Results," states that the applicant should develop procedures to control the review, evaluation, and approval of test results for each phase of the test program. RG 1.16, addresses startup test reports.

Upon review of Revision 0 of North Anna 3 COL FSAR, Section 14.2.2.5, the staff determined that Section 14.2.2.5 did not include provisions to ensure that design organizations participate in the resolution of design-related problems that result in, or contribute to, a failure to meet test acceptance criteria. Therefore on June 28, 2008, the staff issued RAI 14.02-4 (ADAMS Accession No. ML081750645), and asked the applicant to revise FSAR Section 14.2.2.5 to include such provisions.

In a response letter dated August 7, 2008 to RAI 14.02-04 (ADAMS Accession No. ML082240413), the applicant stated, in part, that it will include the description of the ITP administration as Appendix 14AA of the FSAR. Appendix 14AA, Section 14AA.4.2, includes provisions to ensure that design organizations participate in the resolution of design-related problems that result in, or contribute to, a failure to meet test acceptance criteria. In response to RAI 14.2-04, the applicant proposed to revise FSAR Chapter 14 to incorporate Appendix 14AA.

In North Anna 3 COL FSAR, Appendix 14AA, Section 14AA.4.2 the applicant included the statement that General Electric-Hitachi Nuclear America, LLC, and other design organizations participate in the resolution of design-related problems that result in, or contribute to, a failure to meet test acceptance criteria. The staff found that this response was acceptable.

The staff reviewed North Anna 3 COL FSAR, Appendix 14AA, Revision 8, and determined that the applicant's inclusion of design organizations participation in the resolution of design-related problems resulting in or contributing to, a failure to meet test acceptance criteria has addressed the responsibility for design organization participation in test reviews. The staff found that this response is acceptable, and therefore RAI 14.2-04 is resolved and closed.

The staff determined that the COL applicant's supplemental information STD SUP 14.2-2 regarding the development of startup test reports is acceptable because it meets the regulatory basis in SRP Section 14.2, Item 3.f.v, "Review, Evaluation, and Approval of Test Results."

14.2.4.5 Test Program Schedule and Sequence

The staff reviewed the information in the North Anna 3 COL FSAR, Revision 8, as follows:

COL Item

- STD COL 14.2-4-A Test Program Schedule and Sequence

The applicant provided a license condition to develop and make detailed testing schedules available for NRC review prior to actual implementation. The implementation milestones for the ITP are provided in Section 13.4 of the North Anna 3 COL FSAR, Revision 8.

Section 14.2.7 "Test Program Schedule and Sequence," of the DCD states in part that:

> The COL applicant will provide a milestone for completing the detailed testing schedule and making it available to the NRC (COL 14.2-4-A).

In FSAR Section 14.2.7, "Test Program Schedule and Sequence," the applicant replaced the last paragraph with a description stating that a detailed testing schedule will be developed and made available for review prior to actual implementation. The applicant added that the schedule may be updated and continually optimized to reflect actual progress and subsequently revised projections and that the implementation milestones for the ITP are provided in Section 13.4.

In Table 13.4-204, "Operational Programs Required by NRC Regulations," of Section 13.4 in North Anna 3 COL FSAR, the ITP schedule is identified as a license condition.

The applicant identified a license condition for STD COL 14.2-4-A. The applicant addressed the license condition for STD COL 14.2-4-A, in Part 10: "Tier 1/ITAAC/Proposed License Conditions," Revision 7, dated June 2014, Section 3.6, "Operational Program Readiness," of the North Anna 3 COLA, Revision 8, and is also listed below in Post Combined License Activities. The licensee will track the development of the detailed testing schedule in order to address this COL information item in accordance with applicable guidance.

The staff evaluated STD COL 14.2-4-A according to the relevant NRC regulations and acceptance criteria defined in SRP Section 14.2 along with the guidance in RGs 1.68 and 1.206, Section C.I.14, and finds that the applicant has satisfactorily addressed DCD COL Item 14.2-4-A.

14.2.4.6 AC Power Distribution System Preoperational Test General Test Methods and Acceptance Criteria

The staff reviewed the information in the North Anna 3 COL FSAR, Revision 8, as follows:

Supplemental Information

- STD SUP 14.2-4 — AC Power Distribution System Preoperational Test General Test Methods and Acceptance Criteria

In FSAR Section 14.2.8.1.36, "AC Power Distribution System Preoperational Test General Test Methods and Acceptance Criteria," the applicant added the following:

> Proper operation of the automatic transfer capability of the normal preferred power source to the alternate preferred power source.

The staff noted that the test requirement is consistent with the ESBWR DCD. The COL applicant also added STD SUP 14.2-4 to track supplemental preoperational test information in FSAR Section 14.2.8.1.36. The staff determined that the supplemental information item adequately addressed the need to verify the proper operation of the automatic transfer capability of the normal preferred power source to the alternate preferred power source. Therefore, the staff determined that STD SUP 14.2-4, which added the site-specific test acceptance criteria, is acceptable.

14.2.4.7 Plant Service Water System Preoperational Test and Purpose

The staff reviewed the information in the North Anna 3 COL FSAR, Revision 8, as follows:

Evaluation of Supplemental Information

- NAPS SUP 14.2-4 — Plant Service Water System Preoperational Test Purpose
- NAPS SUP 14.2-5 — Plant Service Water System Performance Test Purpose

In the North Anna 3 COL FSAR, Revision 6, the applicant added site-specific supplemental information that included details regarding preoperational and performance tests for the Alternate Heat Sink (AHS). Specifically, the applicant included AHS in the descriptions of the test objectives in Section 14.2.8.1.51, "Plant Service Water System Preoperational Test Purpose," and in Section 14.2.8.2.18, "Plant Service Water System Performance Test Purpose," of the FSAR. Further, the applicant replaced the first paragraph of Section 14.2.8.1.51 of the ESBWR DCD with the following description:

> The objective of this test is to verify proper operation of the PSWS including the AHS and its ability to supply design quantities of cooling water to the [reactor component cooling water system] RCCWS and [turbine component cooling water system] TCCWS heat exchangers.

In addition, the applicant added the following details and statement regarding AHS testing in FSAR Section 14.2.8.1.51:

- Proper operation of control interlocks and equipment protective devices in AHS fans, motors, and valves;
- Proper operation of the AHS fans, motors, and valves in all design operating modes;
- Automatic transfer between PSWS trains and components in response to Anticipated Operational Occurrences (AOOs); and
- Proper operation of water hammer mitigating design features.

> However, due to insufficient heat loads during preoperational test phase, the heat exchanger and the AHS performance verification is deferred until the startup phase.

In Section 14.2.8.2.18, "Plant Service Water System Performance Test Purpose," of North Anna 3 COL FSAR, the applicant replaced the first paragraph of Section 14.2.8.2.18 of the ESBWR DCD with the following description:

> The objective of this test is to verify performance of the PSWS including the AHS along with the RCCWS, and the TCCWS under expected reactor power operation load conditions.

Further, the applicant replaced the second sentence in the third paragraph of ESBWR DCD with the following description:

> Pertinent parameters shall be monitored in order to provide a verification of proper system flow balancing and heat exchanger and AHS performance under near design or special conditions, as appropriate.

The staff noted that the applicant's site-specific supplemental information NAPS SUP 14.2-4 and NAPS SUP 14.2-5 regarding preoperational and performance test for the AHS did not represent a reduction in commitment and were added based on the applicant's incorporation of its response dated August 3, 2009, to RAI 09.02.01-12 (ADAMS Accession No. ML092180975). In RAI 09.02.01-12 (ADAMS Accession No. ML091910257), dated July 8, 2009, the staff requested the applicant provide additional information to describe how the design capability of the plant-specific AHS will be verified by the initial plant test program. In addition, design features which minimize an AHS/PSWS water hammer event need to be tested to verify that a water hammer event does not occur when the PSWS pump starts. The staff's review of North Anna 3 response to RAI 09.02.01-12 is discussed in SER Section 9.2.1.4. The staff determined that the applicant's supplementary information (NAPS SUP 14.2-4 and NAPS SUP 14.2-5) relating to the AHS is acceptable.

North Anna 3 COL FSAR, Section 9.3.11.4, "Tests and Inspections," describes the tests and inspections for the Zinc Injection System. Since testing of the Zinc Injection System is not identified in either DCD Section 14.2.8 or the comparable section of the North Anna 3 COL FSAR (consistent with the guidance contained in RG 1.68, Appen43dix A, Item 1.n (6)), the staff issued RAI 14.02-17) (ADAMS Accession No. ML14318A601) requesting that the applicant revise the appropriate section of the North Anna 3 COL FSAR to describe the testing of the Zinc Injection System. Section 14.2.8.1.46, "Reactor Water Chemistry Control Systems Preoperational Test," of the ESBWR DCD describes the objectives of the preoperational test for the Oxygen Injection System, but not for the Zinc Injection System. In the applicant's response to RAI 14.02-17, dated January 8, 2015 (ADAMS Accession No. ML15009A235), the applicant stated that the North Anna 3 FSAR Section 14.2 will be revised to include testing of the Zinc Injection System. In addition, the applicant proposed to address testing of the Hydrogen Water Chemistry System (HWCS) and the On-line Noble Chem. Specifically, the applicant proposed to replace the first sentence of Section 14.2.8.1.46 of the DCD with the following:

> The objective of this test is to verify proper operation of the Oxygen Injection System, Zinc Injection System, Hydrogen Water Chemistry System (HWCS) and the On-line Noble Chem.

In addition, the applicant proposed to replace the second sentence of the DCD section entitled, "General Test Methods and Acceptance Criteria," with the following:

> Actual oxygen, zinc, hydrogen and On-line Noble Chem™ injection demonstrations and/or simulations shall be limited to only those cases where it is deemed practicable or appropriate with regards to the aforementioned precautions.

The staff finds the applicant's response to RAI 14.02-17 to be acceptable since the applicant proposes to amend North Anna 3 COL FSAR, Section 14.2.8.1.46 to include the Zinc Injection System, as well as the HWCS and the On-line Noble Chem™, as systems that will receive preoperational testing, in accordance with the guidance of RG 1.68 pertaining to chemistry control systems. Therefore, the staff determined that the applicant's supplementary information (NAPS SUP 14.2-4 and NAPS SUP 14.2-5) relating to the Zinc Injection System is acceptable.

The applicant has committed to incorporate the above described changes to the North Anna 3 FSAR in a future COLA submittal. The staff verified that the North Anna 3 FSAR Revision 9 incorporated the appropriate changes described in the applicant's January 8, 2016, letter regarding the testing of the Zinc Injection System; the HWCS and the On-line Noble Chem™. Therefore Confirmatory Item 14.2-1 from the staff advanced SER for North Anna 3 is resolved and closed.

14.2.4.8 Site-Specific Preoperational and Startup Tests

The staff reviewed the information in the North Anna 3 COL FSAR, Revision 8, as follows:

COL Items

- NAPS COL 14.2-5-A Site Specific Tests

Section 14.2.9, "Site-Specific Preoperational and Start up Tests," of the DCD states in part that:

> The COL Applicant will define any required site specific preoperational and startup testing. See Section 14.2.10 for COL Information item 14.2-5-A. Testing of such systems and components should be adequate to demonstrate conformance to such requirements as defined throughout the specific chapters of the Standard Safety Analysis Report (SSAR). Below are systems that may require such testing:
>
> - Electrical switchyard and equipment;
> - SWS;
> - Personnel monitors and radiation survey instruments; and

- The automatic dispatcher control system (if applicable)"

The applicant deleted FSAR Section 14.2.9.1.4 and moved preoperational tests for electrical switchyard equipment to FSAR Section 14.2.8.1.36. For additional details on preoperational testing of electrical equipment, see FSER Section 14.2.4.6. The applicant added site-specific supplemental information in North Anna 3, SUP 14.2-3 and North Anna 3, SUP 14.2-2 in FSAR Section 14.2.9.1.1, "Station Service Water Preoperational Test," and FSAR Section 14.2.9.2.1, "Cooling Tower Preoperational Test." The applicant also deleted FSAR Section 14.2.9.1.3 since the COL applicant took exception to guidance in RG 1.68, Appendix A, Items 1.k(2) "personnel monitors and radiation survey instruments" and 1.k(3) "laboratory equipment used to analyze or measure radiation levels and radioactivity concentrations." The applicant did not address the automatic dispatcher control system testing since it is not applicable to North Anna 3.

In the COL FSAR, the applicant states the following:

> This section describes the site specific preoperational and initial startup tests not addressed in DCD Section 14.2.8.

The applicant identified supplemental information in North Anna 3, SUP 14.2-2 and North Anna 3, SUP 14.2-3 regarding the preoperational and initial startup tests not addressed in DCD Section 14.2.8. North Anna 3, SUP 14.2-3 contains the test abstracts for "Station Water System Pre-Operational Test," and "Cooling Tower Preoperational Test." North Anna 3, SUP 14.2-2 contains the test abstract for "Cooling Tower Performance Test."

The staff noted that, in addition to the individual test descriptions in Sections 14.2.8 of the FSAR, the applicant defined its required site-specific preoperational and startup testing, as noted in North Anna 3, SUP 14.2-2 and North Anna 3, SUP 14.2-3.

The staff evaluated North Anna 3, COL 14.2-5-A according to the relevant NRC regulations and acceptance criteria defined in SRP Section 14.2 along with the guidance in RGs 1.68 and 1.206, Section C.I.14, and finds that the applicant satisfactorily addressed DCD COL Item 14.2- 5-A.

- NAPS COL 14.2-6-A Specific Testing - Test Procedures

Section 14.2.9 of the DCD states in part that:

> If site-specific preoperational or startup tests are identified as necessary, the appropriate procedures will be prepared by the same method and to the same standard as discussed in Section 14.2.2.2. The COL Applicant will provide milestones for making available to the NRC approved test procedures satisfying the requirements for the ITP (COL 14.2- 6-A).

In the COL FSAR, the applicant states the following:

> Specific testing to be performed and the applicable acceptance criteria for each preoperational and startup test are documented in test procedures to be made available to the NRC approximately 60 days prior to their intended use for preoperational tests, and not less than 60 days prior to scheduled fuel load for initial startup tests, or as otherwise specified in license conditions. Site-specific preoperational tests are in

accordance with the system specifications and associated equipment specifications for equipment in those systems provided by the licensee that are not part of the standard plant described in DCD Section 14.2.8. The tests demonstrate that the installed equipment and systems perform within the limits of these specifications.

The applicant identified a license condition for North Anna 3, COL 14.2-6-A, as discussed below in Post Combined License Activities. The licensee will track the development of test procedures for each preoperational and startup test in order to address this COL information item in accordance with applicable guidance.

The staff evaluated STD COL 14.2-6-A according to the relevant NRC regulations and acceptance criteria defined in SRP Section 14.2 along with the guidance in RG s 1.68 and 1.206, Sec tion C.I.14, and finds that the applicant has satisfactorily addressed DCD COL Item 14.2-6-A.

Supplemental Information

- NAPS SUP 14.2-2 Site-Specific Startup Tests
- NAPS SUP 14.2-3 Site-Specific Pre-Operational Tests

As noted above for North Anna 3, COL 14.2-5-A, the applicant provided these supplemental information items regarding site-specific performance and preoperational tests. The applicant included this supplemental information in the FSAR in order to describe the site-specific preoperational and initial startup tests not addressed in DCD Section 14.2.8 per the requirements of STD COL 14.2-5-A.

RG 1.68, Section C.1, "Criteria for Selection of Plant Features to Be Tested," provides the criteria for the selection of plant features to be tested during the ITP. FSAR Section 14.2.9 contains the site-specific ITP testing that will be required for SSCs outside the ESBWR DCD. The site-specific test abstracts appear in the three sections listed above. In RAI 14.2-02, issued on June 23, 2008 (ADAMS Accession No. ML081750645), the staff requested that the applicant confirm that there are no more additional site-specific SSCs or design features that would meet the criteria in RG 1.68, Section C.1, and, if additional testing is identified, to add such testing to Section 14.2 of the FSAR.

In a response letter dated August 7, 2008 to RAI 14.2-02 (ADAMS Accession No. ML082240134), the applicant stated, "the criteria in RG 1.68, Section C.1, for the selection of plant features to be tested during the ITP were reviewed against the site specific SSCs, design features, and performance capabilities to determine if any additional testing is required. There were no additional site specific SSCs, design features, or performance capabilities identified that meet these criteria." The staff found that this response is acceptable, and therefore, RAI 14.2-02 is resolved and closed.

The applicant identified two site-specific preoperational tests in the FSAR:

- 14.2.9.1.1 Station Water System Pre-Operational Test

FSER Section 9.2.10 provides the technical discussion of the SWS. In North Anna 3, COL FSAR, Revision 6, the applicant for consistency with the Detroit Edison Fermi 3 (EF3) COLA, added to the SWS Pre-Operational Test abstract, as follows:

- Proper operation of traveling screens and motorized self-cleaning strainers

The staff reviewed the test abstract for the SWS Pre-Operational Test and finds that it contains adequate guidance to develop test procedures to verify that the SWS will operate as designed.

- 14.2.9.1.2 Cooling Tower Preoperational Test

FSER Section 10.4.5.2.1 provides the technical discussion of the CIRC which includes the cooling towers. The staff reviewed the test abstract for the Cooling Tower Preoperational test and finds that it contains adequate guidance to develop test procedures to verify that the cooling tower will operate as designed.

The applicant identified one site-specific startup test in the FSAR:

- 14.2.9.2.1 Cooling Tower Performance Test

FSER Section 10.4.5.2.1 provides the technical discussion of the CIRC which includes the cooling towers. The staff reviewed the site-specific startup test abstract for the Cooling Tower Performance Test. The staff finds that the test abstract provides adequate guidance to develop test procedures to verify proper operation of the waste heat rejection portion of the CIRC.

The staff found that the applicant's site-specific supplemental information in NAPS SUP 14.2-2 and NAPS SUP 14.2-3 regarding site-specific performance and preoperational tests were consistent with applicable regulations and guidance. Therefore, the staff determined that the applicant's supplementary information is acceptable.

Evaluation of the Deletion of two Site-Specific Preoperational Tests

- FSAR Section 14.2.9.1.3, "Personnel Monitors and Radiation Survey Instruments Preoperational Test," (Deleted in Revision 1 to FSAR 14.2.9, per NAPS SUP 14.2-3)

- FSAR Section 14.2.9.1.4, "Electrical Switchyard System Preoperational Test" (Deleted in Revision 1 to FSAR 14.2.9 per NAPS SUP 14.2-3)

In Revision 0 of FSAR Section 14.2.9.1.3, "Personnel Monitors and Radiation Survey Instruments Preoperational Test," described the preoperational test for personnel monitors and radiation survey instruments. The staff issued RAI 14.02-5 dated July 15, 2008 (ADAMS Accession No. ML081970390), in order to determine the general types of personnel monitors and radiation survey instruments that are covered by this preoperational test. The staff also issued RAI 14.02-6 dated July 15, 2008 (ADAMS Accession No. ML081970390), to determine why the applicant did not specify a preoperational test in FSAR Section 14.2.9.1.3 for the testing of laboratory equipment used to analyze or measure radiation levels and radioactivity levels.

In the applicant's response dated August 28, 2008 (ADAMS Accession No. ML082460847), to these RAIs, and to supplemental RAIs 14.02-9 and 14.02-10 dated February 10, 2009 (ADAMS Accession No. ML090430159), that requested further clarification for testing of the monitoring systems and laboratory equipment, the applicant stated that, after further evaluation, since personnel monitors, radiation survey instruments, and laboratory equipment are purchased as standard plant commercial grade equipment, and are routinely replaced over the life of the plant, this equipment does not meet the RG 1.68 criteria for plant features to be tested in the ITP and, therefore, is not subject to the ITP. Accordingly, in Revision 1 to the FSAR, the applicant deleted Section 14.2.9.1.3 from the FSAR and modified FSAR Table 1.9-202 to take exception to RG 1.68, Appendix A, Items 1.k(2) "personnel monitors and radiation survey instruments" and 1.k(3) "laboratory equipment used to analyze or measure radiation levels and radioactivity concentrations."

In lieu of testing this equipment as part of the ITP, the applicant determined that the Radiation Protection Program (RPP) provides for adequate testing of both laboratory and portable instrumentation used for radiation protection. The applicant's RPP is described in Nuclear Energy Institute (NEI) 07-03A, Revision 0, "Generic FSAR Template Guidance for Radiation Protection Program Description," which has been incorporated by the applicant in Appendix 12BB of the North Anna 3 COL FSAR accordingly. NEI 07-03A, Revision 0, provides adequate descriptions of the types of radiation protection instruments and equipment that will be used in the plant. The applicant stated that each new survey instrument or personnel monitor is tested prior to being placed in service to assure conformance with performance requirements.

The applicant's RPP as described in NEI 07-03A, specifies, in Section 12.5.3.2, "Monitoring Instrumentation and Equipment," of NEI 07-03A, Revision 0, that "radiation monitoring instrumentation and equipment are selected, maintained and used to provide the appropriate detection capabilities, ranges, sensitivities and accuracies required for the types and levels of radiation anticipated at the plant and in the environs during routine operations, major outages, abnormal occurrences, and postulated accident conditions." NEI 07-03A, also specifies the types of instruments and equipment that will be available (i.e., tested and ready for service) at specified milestones for the RPP. On the basis of the applicant's response to RAIs 14.02-5 and 14.02-6 and to the supplemental RAIs 14.02-9 and 14.02-10, the staff finds that the applicant's laboratory and portable instrumentation used for radiation protection will be adequately tested and maintained under the applicant's RPP and, therefore, does not need to be included in the ITP. Therefore, the staff finds the COL applicant's response to be acceptable and RAIs 14.02-5, 14.02-6, 14.02-9, and 14.02-10 are resolved and closed.

To effectively test radiation monitors and survey instruments with range selection for proper functioning, the testing must include the selection of the correct operating range of the device. During its review, the staff determined that the test abstract described in Section 14.2.9.1.3 of the FSAR did not include this description. Accordingly on August 8, 2008, the staff issued RAI 14.02-8 (ADAMS Accession No. ML082210547), and asked the applicant to revise the "General Test Methods and Acceptance Criteria" in Section 14.2.9.1.3 of the FSAR to specifically include a statement regarding the "proper functioning and operation of range selection and response in each range."

In a response letter dated September 19, 2008, to RAI 14.02-08 (ADAMS Accession No. ML082700252), the applicant made a determination to delete FSAR Section 14.2.9.1.3 in its entirety. However, in response to RAI 14.02-5, the applicant stated that the applicable standards for testing radiation monitors and survey instruments, including a description of the proper functioning and operation of range selection and response in each range, are described in the following standards documents:

- American National Standards Institute/Institute of Electrical and Electronics Engineers (ANSI/IEEE) N323A, "Radiation Protection Instrumentation Test and Calibration, Portable Survey Instruments," dated December 31, 1997

- ANSI/IEEE N323D, "Installed Radiation Protection Instrumentation," issued in 2003

ANSI/IEEE N323A is referenced in Table 1.9-22 of the ESBWR DCD and is incorporated by reference by the COL applicant. Since the North Anna 3 FSAR did not contain a reference to ANSI/IEE N323D, the applicant added it to Table 1.9-204 of the FSAR in response to RAI 14.02-5. The staff reviewed Revision 8 of the North Anna 3 COL FSAR and verified that the COL applicant has added a reference to ANSI/IEEE N323D in Table 1.9-204. Therefore, RAI 14.02-8 is resolved and closed.

Revision 0 of North Anna 3 COL FSAR, Section 14.2.9.1.4 contained the following statement:

> Performance is observed and recorded during a series of individual component and integrated system tests to demonstrate the following:
>
> - Proper operation of initiating, transfer, and trip devices
>
> - Proper operation of relaying and logic
>
> - Proper operation of equipment protective devices, including permissive and prohibit interlocks
>
> - Proper operation of instrumentation and alarms used to monitor system and equipment status
>
> - Proper operation and load carrying capability of breakers, switchgear, transformers, and cables
>
> - The capability of transfer between onsite and offsite power sources as per design

The staff determined that additional information was required to complete its review in this area. On June 5, 2008, the staff issued RAI 14.02-1 (ADAMS Accession No. ML081580132) and asked the applicant to address the following additional items or provide justification for their exclusion: (a) availability of AC and direct current power to the switchyard equipment; (b) design limits of switchyard voltage, stability and switchyard interface agreements and protocols; (c) operation of current transformers and potential transformers; (d) operation of high-voltage disconnect switches and ground switches; and (e) proper operation of the automatic transfer capability of normal preferred power source to the alternate preferred power source.

In response to RAI 14.02-1 (ADAMS Accession No. ML082050559), the applicant proposed to delete this test from the FSAR and address the above RAI by cross-reference in the FSAR to ESBWR DCD test Section 14.2.8.1.36, "AC Power Distribution System Preoperational Test," since this DCD test abstract is exactly the same as FSAR test Section 14.2.9.1.4. In addition, the COL applicant added STD SUP 14.2-4, "Proper operation of the automatic transfer capability of the normal preferred power source to the alternate preferred power source," related to this test.

The staff found that this response was acceptable, given that the DCD describes this test and the FSAR incorporates it by reference. The staff reviewed the North Anna 3, COL FSAR, and verified that the applicant has deleted FSAR Section 14.2.9.1.4 and addressed the preoperational tests for electrical switchyard equipment in FSAR Section 14.2.8.1.36. Therefore, RAI 14.02-1 is resolved and closed.

License Conditions:

On May 27, 2010, in RAI 14.02-4 (ADAMS Accession No. ML101470123) to the Fermi 3 COL applicant, the staff identified license conditions that the applicant needs to address in its application. The NRC imposes license conditions for test activities that cannot be resolved during the COL applicant stage but are resolved after the COL is issued. In a North Anna 3 letter dated December 31, 2013, the applicant endorsed the Fermi 3 RAI response letter to RAI 14.02-4 on July 9, 2010 (ADAMS Accession No. ML101960646), and agreed that the license conditions proposed were appropriate. The applicant addressed these proposed license conditions in the North Anna 3 COLA, Part 10: "Tier 1/ITAAC/Proposed License Conditions," Revision 7, dated June 2014, Section 3.2, "License Conditions for Initial Test Program," and are presented in Section 14.2.5 below.

14.2.5 Post Combined License Activities

For the reasons discussed in the technical evaluation section above, the staff finds the following license conditions are acceptable:

Startup Administrative Manual, NAPS COL 14.2.2-A

> Prior to initiating the plant's initial test program (ITP), a site-specific SAM (procedures), which includes administrative procedures and requirements that govern the activities associated with the plant ITP is to be provided to on-site NRC inspectors 60 days prior to beginning of the preoperational test phase.

Preoperational and Startup Test Procedures, NAPS COL 14.2-3-A

> The licensee will make available to on-site NRC inspectors preoperational test procedures 60 days prior to their intended use and startup test procedures 60 days prior to fuel load.

Site-Specific Preoperational and Startup Test Procedures, NAPS COL 14.2.6-A

> The licensee will make available to on-site NRC inspectors site-specific preoperational test procedures 60 days prior to their intended use and startup test procedures 60 days prior to fuel load.

Power Ascension Test Phase Reports

In North Anna 3 COLA, Revision 8, Part 10: "Tier 1/ITAAC/Proposed License Conditions," Revision 7, dated June 2014, Section 3.2.4, "Power Ascension Test Phase Reports," the applicant proposed the following license conditions related to RAI 14.02-4:

Nuclear Fuel Loading and Pre-critical Testing

- Upon notifying the Director of the Office of New Reactors (NRO), or the Director's designee, in writing of successful completion of preoperational testing, and upon a Commission finding in accordance with 10 CFR 52.103(g) that all the acceptance criteria in the ITAAC in Appendix C to this license are met, the licensee is authorized to perform pre-critical tests in accordance with the conditions specified herein.

- The licensee shall review and evaluate the results of the pre-critical tests identified and confirm that these test results are within the range of acceptable values predicted or otherwise confirm that the tested systems perform their specified functions in accordance with the FSAR.

Initial Criticality and Low-Power Testing

- Upon notifying the Director of NRO, or the Director's designee, in writing of successful completion of pre-critical testing, the licensee is authorized to operate the facility at reactor steady-state core power levels not to exceed 5-percent thermal power in accordance with the conditions specified herein, but solely for the purposes of conducting initial criticality and low-power testing.

- The licensee shall review and evaluate the results of the initial criticality and low-power tests and confirm that these test results are within the range of acceptable values predicted or otherwise confirm that the tested systems perform their specified functions in accordance with the FSAR.

Power Ascension Testing

- Upon notifying the Director of NRO, or the Director's designee, in writing of successful completion of the initial criticality and low-power testing, the licensee is authorized to operate the facility at reactor steady-state core power levels not to exceed 100-percent thermal power in accordance with the conditions specified herein, but only for purposes of performing power ascension testing.

- The licensee shall review and evaluate the results of the power ascension tests and confirm that these test results are within the range of acceptable values predicted or otherwise confirm that the tested systems perform their specified functions in accordance with the FSAR.

The licensee is responsible for the review and evaluation of the adequacy of test results presented in the Power Ascension Test Phase reports, as well as final review of overall test results in these reports. Test results, which do not meet acceptance criteria, are identified and corrective actions and retests are performed. The Power Ascension Test Phase reports shall be made available to on-site NRC inspectors.

Test Changes

In the North Anna 3 COLA, Revision 8, of Part 10: "Tier 1/ITAAC/Proposed License Conditions," Revision 7, dated July 2014, Section 3.2.4, "Power Ascension Test Phase Reports," the applicant proposed the following license conditions related to RAI 14.02-4:

> Within 30 days of a change to the ITP described in FSAR Chapter 14, Initial Test Program, made in accordance with 10 CFR 50.59 or in accordance with 10 CFR Part 52, Appendix E, Section VIII, "Processes for Changes and Departures," the licensee shall report the changes or the Director of NRO, or the Director's designee, in accordance with 10 CFR 50.59(d).

Operational Program Readiness

In North Anna 3 COLA, Revision 8, of Part 10: "Tier 1/ITAAC/Proposed License Conditions," Revision 7, dated June 2014, Section 3.6," Operational Program Readiness," the staff has identified the following license condition which is related in part to STD COL 14.2-4-A:

> The licensee shall submit to the Director of the NRO, a schedule, no later than 12 months after issuance of the COL, for implementation of the operational programs listed in FSAR Table 13.4-201. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until the operational programs in the FSAR table have been fully implemented. This schedule should also address:
>
> (a) The implementation of site specific Severe Accident Management Guidelines.
> (b) The spent fuel rack coupon monitoring program implementation.

14.2.6 Conclusion

The staff's finding related to information incorporated by reference is in NUREG–1966. The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the required information, and there is no outstanding information expected to be addressed in the North Anna 3 COL FSAR related to this section. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to this section that were incorporated by reference have been resolved.

In addition, the staff concludes that the relevant information presented within the North Anna 3 COL FSAR is acceptable and meets the 10 CFR 52.79(a)(28), Criterion XI of Appendix B to 10 CFR Part 50 along with the guidance in RGs 1.68 and 1.206. The staff has evaluated the STD COL items, North Anna 3 COL items, STD SUP items, and North Anna 3, SUP items identified for this subsection according to the relevant NRC regulations and acceptance criteria defined in SRP Section 14.2 and finds that the applicant has satisfactorily addressed these items.

14.3 Inspections, Tests, Analyses, and Acceptance Criteria

14.3.1 Introduction

Section 14.3 of the FSAR discusses the criteria and methodology for selecting the SSCs to be included in the ITAAC. This section includes the definitions and general provisions, design descriptions, ITAAC, significant site parameters, and significant interface requirements in order to determine whether the resultant ITAAC are adequate to verify that a facility referencing the ESBWR design has been constructed and will be operated in compliance with the DC and applicable regulations.

14.3.2 Summary of Application

Part 10 of the North Anna 3 COLA, Revision 8 includes the entire set of ITAAC which consists of four parts: DC ITAAC, Emergency Planning ITAAC, Physical Security ITAAC, and Site-Specific ITAAC. The Tier 1 DC ITAAC have been incorporated by reference in Part 10, Section 2.1, "Design Certification ITAAC," of the North Anna 3 COL FSAR, Revision 8. The staff's finding related to DC ITAAC incorporated by reference is in NUREG–1966.

The Emergency Planning ITAAC are presented in Part 10, Section 2.3, "Emergency Planning ITAAC," of the North Anna 3 COL FSAR, Revision 8, and listed in Table 2.3-1, "ITAAC For Emergency Planning." Evaluations of these ITAAC are contained in FSER Chapter 13.0, "Conduct of Operations," Section 13.3, "Emergency Planning," and discussed below regarding the evaluation of STD COL 14.3-1-A.

The Tier 1 Physical Security ITAAC for systems within the scope of the DCD are incorporated by reference in Part 10, Section 2.2, "Physical Security ITAAC," of the North Anna 3 COL FSAR, Revision 8 and the staff's findings related to this information is incorporated by reference in NUREG–1966. In addition, the evaluation of the Site-Specific Physical Security ITAAC that have been identified by the applicant in Part 10, Section 2.2.1, "Site Specific Physical Security ITAAC," of the North Anna 3 COL FSAR, Revision 8 and listed in Table 2.2.1-1, "ITAAC for the Site-Specific Security System," can be found in FSER Chapter 13.0, "Conduct of Operations," Section 13.6, "Physical Security," and in Section 13.6A, "Site-Specific ITAAC for Physical Security."

The Site-Specific ITAAC for site-specific systems that were not evaluated in the referenced DCD are presented by the applicant in Part 10, Section 2.4, "Site-Specific ITAAC," of the North Anna 3 COL FSAR, Revision 8. The evaluations of these ITAAC are discussed below under the evaluation of STD COL 14.3-2-A.

Section 14.3, of the North Anna 3 FSAR, Revision 8, incorporates by reference Section 14.3 of the ESBWR DCD, Revision 10. In addition, the North Anna 3 FSAR, Revision 8, Section 14.3, provides the following:

COL Item

- STD COL 14.3-1-A   Emergency Planning ITAAC

The applicant provided information regarding their Emergency Planning ITAAC based on industry guidance.

- CWR COL 14.3-2-A		Site Specific ITAAC

The applicant provided information regarding their Site-Specific ITAAC for systems not evaluated in the DCD.

- NAPS COL 14.3A-1-1		Schedule for Design Acceptance Criteria (DAC) ITAAC Closure

The applicant provided a DAC ITAAC closure schedule.

14.3.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is in NUREG–1966 and NUREG–1966, Supplement 1, the FSER related to the certified ESBWR DCD. In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for seismic classification are given in SRP Section 14.3.

The applicable regulatory requirements and guidance for the ITAAC are as follows:

10 CFR 52.79(d)(2), "Contents of applications, technical information in final safety analysis report," requires the COL applicant's FSAR to demonstrate that the design meets the interface requirements established under 10 CFR 52.47, "Contents of applications; technical information."

10 CFR 52.80(a),"Contents of applications; additional technical information," requires that a COLA contain the proposed inspections, tests, and analyses, including those applicable to emergency planning, that the licensee shall perform, and the acceptance criteria that are necessary and sufficient to provide reasonable assurance that, if the inspections, tests, and analyses are performed and acceptance criteria met, the facility has been constructed and will operate in conformity with the COL, the provisions of the Act, and the Commission's rules and regulations.

10 CFR 52.99(a), "Inspection during construction," as it relates to ITAAC completion schedule

RG 1.206, Section C.II.1 as it relates to COL ITAAC and Section C.III.5 as it relates to DCA.

14.3.4 Technical Evaluation

As documented in NUREG–1966, staff reviewed and approved Section 14.3 of the certified ESBWR DCD. The staff reviewed Section 14.3 of the North Anna 3 COL FSAR, Revision 8, and checked the referenced ESBWR DCD to ensure that the combination of the information in the ESBWR DCD and the information in the North Anna 3 COL FSAR, Revision 8, appropriately represents the complete scope of information relating to this review topic.[1] The staff's review confirmed that the information contained in the application and the information incorporated by reference address the relevant information related to this section.

The staff reviewed the information in the North Anna 3 COL FSAR, Revision 8, as follows:

COL Item

- STD COL 14.3-1-A Emergency Planning (EP) ITAAC

The staff evaluation for STD COL 14.3-1-A, “Emergency Planning ITAAC,” is addressed in Section 13.3, “Emergency Planning,” of Chapter 13, “Conduct of Operations,” of the North Anna 3 SER. The staff’s evaluation found that the information provided to address this COL item was acceptable. Therefore, for the purposes of this Chapter 14 SER evaluation, the staff finds that the applicant has addressed STD COL 14.3-1-A.

- STD COL 14.3-2-A Site Specific ITAAC

The selection criteria and methodology provided in this section of the referenced DCD were utilized as the site-specific selection criteria and methodology for ITAAC. These criteria and methodology were applied to those site-specific systems that were not evaluated in the referenced DCD. In Section 14.3.9 of the North Anna 3 COL FSAR, the applicant states that the selection criteria and methodology provided in Section 14.3 of the referenced DCD were utilized as the site-specific selection criteria and methodology for ITAAC. These criteria and methodology were applied to those site-specific systems that were not evaluated in the referenced DCD. If a site-specific system described in the FSAR does not meet an ITAAC selection criterion, then the applicant includes just the system title and the statement “No entry for this system.” The North Anna 3 COLA, Part 10, Section 2.4 addresses the site-specific ITAAC for the following SSCs.

2.4.1 ITAAC for Fill Concrete Under and Around Surrounding the Sides of Seismic Category I Structures

Section 2.5.4 of this SER contains the staff’s evaluation of ITAAC for concrete fill. In addition the applicant addressed concerns from the staff RAIs 02.05.04-12, 02.05.04-13 and 02.05.04-19 which address concrete fill under and around the seismic Category I structures as follows:

ITAAC for fill concrete under and around the seismic Category I Structures

Fill concrete placed under and around the sides of seismic Category I Structures to a thickness greater than 5 feet is designed and tested as specified in FSAR Section 2.5.

The staff concludes that the applicant has satisfactorily addressed the foundation interface requirement and site-specific ITAAC for this item.

2.4.2 ITAAC for Structural Fill Surrounding Seismic Category I Structures.

Section 2.5.4 of this SER contains the staff’s evaluation of ITAAC for structural fill surrounding seismic Category I Structures. The applicant specified structural fill surrounding the seismic Category I structures as follows:

ITAAC for structural fill surrounding seismic Category I Structures

Structural fill surrounding the embedded walls for seismic Category I Structures meets properties for

(1) the angle of internal friction;

(2) the local effect on wall pressure as determined by the product of: peak ground acceleration α, (in g), Poisson' ratio v, and density γ; and (3) soil density.

The staff concludes that the applicant has satisfactorily addressed the foundation interface requirement and site-specific ITAAC for this item.

2.4.3 ITAAC for Plant Service Water System (Portion Outside the Scope of the Certified Design)

In COL Part 10, Section 2.4.3, the applicant has identified interface requirements and site-specific ITAAC for this system. In the staff's SER for Section 9.2.1, the staff concludes that the applicant has satisfactorily addressed the interface requirement and site-specific ITAAC for this system.

2.4.4 Circulating Water System (Portion Outside the Scope of the Certified Design)

In COL Part 10, Section 2.4.4, the applicant states that for the CWS there are no site-specific ITAAC required for this system. The staff concludes that the CWS does not perform a safety-related function and is not considered a system "important to safety" therefore, as-built verification, i.e., site-specific ITAAC, is not required.

2.4.5 Station Water System (Including Intake Structure and Servicing Equipment)

In COL Part 10, Section 2.4.5, the applicant states that for the SWS there are no site-specific ITAAC required for this system. The staff concludes that the SWS does not perform a safety-related function and is not considered a system "important to safety;" therefore, as-built verification, i.e., site-specific ITAAC, is not required.

2.4.6 Yard Fire Protection System (Portions Outside the Scope of the Certified Design)

In COL Part 10, Section 2.4.6, the applicant states that for the yard fire protection system there are no site-specific ITAAC required for this system. The staff concludes that the yard fire protection system does not perform a safety-related function and is not considered a system "important to safety;" therefore, as-built verification, i.e., site-specific ITAAC, is not required.

2.4.7 Potable and Sanitary Water Systems

In COL Part 10, Section 2.4.7, the applicant states that for the potable and sanitary water system there are no site-specific ITAAC required for this system. The staff concludes that the potable and sanitary water systems do not perform a safety-related function and are not considered a system "important to safety;" therefore, as-built verification, i.e., site-specific ITAAC, is not required.

2.4.8 Offsite Power Systems

In COL Part 10, Section 2.4.8, the applicant has identified interface requirements and site-specific ITAAC for this system. ITAAC for North Anna 3 is based on these interface requirements incorporated in Table 2.4.8-1 in Part 10 of the North Anna 3 COL Revision 8. As discussed in the staff's SER for Section 8.2, the staff has found that the proposed ITAAC for this system will ensure that each as-built offsite circuit has sufficient capacity and capability. The staff concludes that the applicant has satisfactorily addressed the interface requirement and site-specific ITAAC for this system.

2.4.9 Communication Systems (Emergency Notification System)

In COL Part 10, Section 2.4.9, the applicant states that the site-specific ITAAC for this system is addressed in Table 2.3-1, Topic 3.0, Emergency Communications. The complete review of the applicant's site-specific emergency plan ITAAC is contained in SER Section 13.3. Based on that evaluation, the staff has found that the applicant has satisfactorily addressed the site-specific ITAAC for this system.

2.4.10 Makeup Water System

In COL Part 10, Section 2.4.10, the applicant states that for the makeup water system there are no ITAAC required for this system. The staff concludes that the makeup water system does not perform a safety-related function and is not considered a system "important to safety;" therefore, as-built verification, i.e., site-specific ITAAC, is not required.

2.4.11 (Deleted)

In order to be consistent with the ESBWR DCD, on March 9, 2009 the staff issued RAI 14.03.07-1 (ADAMS Accession No. ML09068031) requesting for the applicant to update this section to no longer refer to the use of a mobile liquid waste management system. Per the applicant's RAI response dated April 3, 2009 (ADAMS Accession No. ML090990451), the applicant deleted this section accordingly. The staff found that this response is acceptable, and therefore, RAI 14.03.07-1 is resolved and closed.

2.4.12 (Deleted)

In order to be consistent with the ESBWR DCD, on March 9, 2009 the staff issued RAI 14.03.07-2 (ADAMS Accession No. ML09068031) requesting for the applicant to update this section to no longer refer to the use of a mobile solid waste management system. Per the applicant's RAI response dated April 9, 2009 (ADAMS Accession No. ML090990451), the applicant deleted this section accordingly. The staff found that this response is acceptable, and therefore, RAI 14.03.07-2 is resolved and closed.

2.4.13 Hydrogen Water Chemistry System

In COL Part 10, Section 2.4.13, the applicant states that for the HWCS there are no site-specific ITAAC required for this system. The staff concludes that the HWCS does not perform a safety-related function and is not considered a system "important to safety;" therefore, as described in ESBWR DCD, Table 14.3-1, Revision 9, an ITAAC is not required for this system.

2.4.14 Meteorological Monitoring System

In COL Part 10, Section 2.4.14, the applicant states that for the meteorological monitoring system there are no site-specific ITAAC required for this system. The staff notes that there are several emergency plan ITAACs in COL Part 10, Section 2.3 that require the acquisition and evaluation of meteorological data. The staff concludes that additional site-specific ITAAC are not required for the meteorological monitoring system.

Based on the staff evaluation of the information provided by the applicant related to the site-specific ITAAC cited above, the staff determined that the information meets the requirements in 10 CFR 52.79(d)(2), 52.80(a) and the acceptance criteria in SRP Section 14.3, “Inspections, Tests, analyses, and Acceptance Criteria.” In addition, the staff has reviewed the applicant’s information to address COL Item 14.3-2-A and found that it is acceptable and meets the relevant requirements and the guidance set forth in RG 1.206, Section C.II.1.

2.4.15 ITAAC for the Turbine Building

In COL Part 10, Section 2.4.15, the applicant has identified interface requirements and site-specific ITAAC for the North Anna 3 Turbine Building which is based on the interface requirements incorporated in Table 2.4.15-1 in Part 10 of the North Anna 3 COL Revision 8. As discussed in the staff’s SER for Section 3.7.2, the staff has found that the proposed ITAAC for this building will ensure that the Unit 3 site-specific soil structure interaction (SSI) is adequate for the Turbine Building seismic design. The staff concludes that the applicant has satisfactorily addressed the interface requirement and site-specific ITAAC for this building.

2.4.16 ITAAC for the Radwaste Building

In COL Part 10, Section 2.4.16, the applicant has identified interface requirements and site-specific ITAAC for the North Anna 3 Radwaste Building which is based on the interface requirements incorporated in Table 2.4.16-1 in Part 10 of the North Anna 3 COL Revision 8. As discussed in the staff’s SER for Section 3.7.2, the staff has found that the proposed ITAAC for this building will ensure that the Unit 3 site-specific SSI is adequate for the Radwaste Building seismic design. The staff concludes that the applicant has satisfactorily addressed the interface requirement and site-specific ITAAC for this building.

2.4.17 ITAAC for the Service Building

In COL Part 10, Section 2.4.17, the applicant has identified interface requirements and site-specific ITAAC for the North Anna 3 Service Building which is based on the interface requirements incorporated in Table 2.4.17-1 in Part 10 of the North Anna 3 COL Revision 8. As discussed in the staff’s SER for Section 3.7.2, the staff has found that the proposed ITAAC for this building will ensure that the Unit 3 site-specific SSI is adequate for the Service Building seismic design. The staff concludes that the applicant has satisfactorily addressed the interface requirement and site-specific ITAAC for this building.

2.4.18 ITAAC for the Ancillary Diesel Building

In COL Part 10, Section 2.4.18, the applicant has identified interface requirements and site-specific ITAAC for the North Anna 3 Ancillary Diesel Building which is based on the interface requirements incorporated in Table 2.4.18-1 in Part 10 of the North Anna 3 COL Revision 8. As discussed in the staff’s SER for Section 3.7.2, the staff has found that the proposed ITAAC for this building will ensure that the Unit 3 site-specific SSI is adequate for the Ancillary Diesel Building seismic design. The staff concludes that the applicant has satisfactorily addressed the interface requirement and site-specific ITAAC for this building.

2.4.19 ITAAC for the Control Rods

In COL Part 10, Section 2.4.19, the applicant has identified interface requirements and site-specific ITAAC for the North Anna 3 Control Rods which is based on the interface requirements incorporated in Table 2.4.19-1 in Part 10 of the North Anna 3 COL Revision 8. As discussed in the staff's SER for Section 4.2, the staff has found that the proposed ITAAC will ensure that the control rods to be loaded into the core of Unit 3 will be capable of withstanding design seismic and dynamic loadings. The staff concludes that the applicant has satisfactorily addressed the interface requirement and site-specific ITAAC for this component.

2.4.20 ITAAC for Seismic Category I Buried Piping, Conduits and Tunnels Design Description

In COL Part 10, Section 2.4.20, the applicant has identified interface requirements and site-specific ITAAC for the North Anna 3 Buried Piping, Conduits and Tunnels which is based on the interface requirements incorporated in Table 2.4.20-1 in Part 10 of the North Anna 3 COL Revision 8. As discussed in the staff's SER for Section 3.7.3, the staff has found that the proposed ITAAC will ensure that the buried piping, conduits and tunnels of Unit 3 will be capable of withstanding design seismic and dynamic loadings. The staff concludes that the applicant has satisfactorily addressed the interface requirement and site-specific ITAAC for these items.

2.4.21 ITAAC for Access Tunnel

In COL Part 10, Section 2.4.21, the applicant has identified interface requirements and site-specific ITAAC for the North Anna 3 Access Tunnel which is based on the interface requirements incorporated in Table 2.4.21-1 in Part 10 of the North Anna 3 COL Revision 8. As discussed in the staff's SER for Section 3.7.3, the staff has found that the proposed ITAAC will ensure that the Access Tunnel of Unit 3 will be capable of withstanding design seismic and dynamic loadings. The staff concludes that the applicant has satisfactorily addressed the interface requirement and site-specific ITAAC for the Access Tunnel.

2.4.22 ITAAC for Radwaste Tunnel

In COL Part 10, Section 2.4.22, the applicant has identified interface requirements and site-specific ITAAC for the North Anna 3 Radwaste Tunnel which is based on the interface requirements incorporated in Table 2.4.22-1 in Part 10 of the North Anna 3 COL Revision 8. As discussed in the staff's SER for Section 3.7.3, the staff has found that the proposed ITAAC will ensure that the Radwaste Tunnel of Unit 3 will be capable of withstanding design seismic and dynamic loadings. The staff concludes that the applicant has satisfactorily addressed the interface requirement and site-specific ITAAC for the Radwaste Tunnel.

14.3.5 Post-Combined License Activities

As discussed above, the staff finds the following applicant proposed post COL activities acceptable:

Dominion shall submit to the NRC, no later than 1 year after issuance of the combined license or at the start of construction as defined in 10 CFR 50.10(a), whichever is later, its implementation schedules for completion of the following ITAAC. Dominion shall submit updates to the ITAAC schedules every 6 months thereafter and, within 1 year of its scheduled date for initial loading of fuel, shall submit updates to the ITAAC schedules every 30 days until the final notification is provided to the NRC under paragraph (c)(1) of 10 CFR 52.99.

For piping DAC ITAAC, (1) the as-designed Pipe Break Analysis Report will be completed per DCD ITAAC Table 3.1-1 and (2) the ASME Code design reports for safety-related piping packages will be completed for DAC ITAAC Tables 2.1.2-3 (2b1), 2.2.2-7 (2b1), 2.2.4-6 (10b1), 2.4.1-3 (2b1), 2.4.2-3 (2b1), 2.6.1-1 (8b1), 2.6.2-2 (2b1), 2.11.1-1 (9a), 2.15.1-2 (2a3), and 2.15.4-2 (2b1) for the applicable systems in order to support the closure of the DAC ITAAC. Information will be made available for NRC review, inspection, and audit on a system basis. Information will be made available to the NRC to facilitate reviews, inspections, and audits throughout the process.

For human factors engineering (HFE) DAC, HFE DAC ITAAC consists of a series of results summary reports which verify that the specific associated Design Commitment is met. The summary reports will be made available at each stage for NRC review, inspection, and audit on an element by element basis. Information (procedures and test programs) will be made available to the NRC to facilitate reviews, inspections, and audits throughout the process.

For instrumentation and controls, the set of ESBWR digital instrumentation and control DAC ITAAC establishes a phased closure process. Procedures and test programs necessary to demonstrate that the DAC ITAAC requirements are met will be used at each phase to certify to the NRC that the design is in compliance with the certified design. Information will be made available for NRC review, inspection, and audit on a system basis. Information will be made available to the NRC to facilitate reviews, inspections, and audits throughout the process.

14.3.6 Conclusion

The staff's finding related to information incorporated by reference is in NUREG–1966 and NUREG–1966, Supplement 1. The staff reviewed the application and checked the referenced DCD. The staff's review confirms that the applicant has addressed the required information, and no outstanding information is expected to be addressed in the COL FSAR related to this section. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to this section that were incorporated by reference are resolved.

In addition, the staff compared the information in the application to the relevant NRC regulations, the guidance in SRP Section 14.3, and other NRC RGs. The staff's review concludes that the design features and performance characteristics of the SSCs described in the COL FSAR can be verified adequately by the proposed ITAAC. Therefore, the North Anna 3 ITAAC are acceptable and meet the requirements of 10 CFR 52.79(d)(2), 10 CFR 52.80, and 10 CFR 52.99(a); and the guidance in RG 1.206, Regulatory Positions C.II.1 and C.III.5.

15.0 SAFETY ANALYSES

15.0 SAFETY ANALYSES

15.1 Introduction

This chapter of the U.S. Nuclear Regulatory Commission's (NRC's) safety evaluation report (SER) provides the NRC staff evaluation of the North Anna 3 responses to postulated disturbances in process variables and postulated equipment failures or malfunctions, determines their consequences, and evaluates the capability of the plant to control or accommodate these events. These analyses help determine the limiting conditions for operation, limiting safety system settings, and design specifications for safety-related components and systems.

The analyses in this chapter include a discussion of: (1) the classification of the transients and accidents and their results in the context of a sufficiently broad spectrum of initiating events and postulated equipment failures, (2) the frequency of occurrence of initiating events for anticipated operational occurrences and highly unlikely accidents, (3) plant characteristics considered in the safety evaluation, (4) assumed protection system actions, (5) evaluation of individual initiating events and systems that operate to reduce the probability of occurrence of specific events, and (6) analysis of anticipated transients without scram. The safety analyses provide a significant contribution to the selection of limiting conditions for plant operation, limiting safety system settings, and design specifications for plant components and systems from the standpoint of public health and safety.

15.2 Summary of Application

Chapter 15 of the North Anna 3 Combined License (COL) Final Safety Analysis Report (FSAR), Revision 8, incorporates by reference Chapter 15 of the Economic Simplified Boiling–Water Reactor (ESBWR) Design Control Document (DCD), Revision 10, referenced in Appendix E, "Design Certification Rule for the ESBWR Design," to Title 10 of the Code of Federal Regulations (10 CFR) Part 52, "Licenses, Certifications, and Approvals for Nuclear Power Plants." In addition, in COL FSAR Chapter 15 the applicant provided the following additional information:

Supplemental Information:

- STD SUP 15.3-1 Radiological Consequences

The applicant added that procedures will detail the use of nuclear instrumentation to help in detecting a possible miss-located fuel bundle after fuel loading.

- NAPS SUP 15.3-2 Early Site Permit (ESP) Information

The applicant stated that Chapter 15 of the North Anna ESP Site Safety Analysis Report (SSAR) is incorporated by reference, except that plant parameter envelope (PPE) information in the ESP SSAR is replaced by Chapter 15 of the ESBWR DCD. This information is identified as NAPS ESP Variance (VAR) 2.0-6.

- NAPS SUP 15.4-1

The applicant provided supplemental information related to NAPS COL 2A.2 2 A, "Confirmation of Reactor Building χ/Q [V]alues," which discusses administrative control of certain doors or personnel air locks during movement of irradiated fuel, as related to the design-basis accident (DBA) control room habitability dose analysis for the fuel-handling accident (FHA).

15.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is in NUREG–1966, "Final Safety Evaluation Report Related to the Certification of the Economic Simplified Boiling-Water Reactor Standard Design," issued April 2014, and it's Supplement 1, issued September 2014.

Compliance with the non-seismic siting criteria of 10 CFR 100.21 and General Design Criterion (GDC) 19, "Control Room," in Appendix A, "General Design Criteria for Nuclear Power Plants," to 10 CFR Part 50, "Domestic Licensing of Production and Utilization Facilities," requires that the applicant show that, for a plant located at the North Anna site, the radiological consequences of postulated accidents meet the criteria set forth in 10 CFR 52.79(a)(1) and for GDC 19, that the control room provides adequate radiation protection to ensure that radiation exposures shall not exceed 0.05 sievert (Sv) (5 rem) total effective dose equivalent (TEDE) to permit access and occupancy of the control room under accident conditions for the duration of the accident. Requirements for the technical information in the FSAR in the COL application (COLA) for a combined license are given in 10 CFR 52.79. In particular, 10 CFR 52.79(a)(1)(vi) requires a description and safety assessment of the site on which the facility is to be located, including an evaluation of the offsite radiological consequences of postulated accidents to show that the site characteristics comply with 10 CFR Part 100.

Both 10 CFR 100.21, which references 10 CFR 50.34(a)(1), and 10 CFR 52.79(a)(1)(iv) have the same offsite radiological consequence evaluation factors as follows:

> *An individual located at any point on the boundary of the exclusion area for any 2-hour period following the onset of the postulated fission product release, would not receive a radiation dose in excess of [0.25 Sv] 25 rem total effective dose equivalent (TEDE).*
>
> *An individual located at any point on the outer boundary of the low population zone, who is exposed to the radioactive cloud resulting from the postulated fission product release (during the entire period of its passage) would not receive a radiation dose in excess of [0.25 Sv] 25 rem TEDE*

15.4 Technical Evaluation

The staff reviewed Chapter 15 of the North Anna 3 COL FSAR and the referenced DCD to ensure that the combination of the ESBWR DCD and the information in the COL FSAR, which incorporates the ESP SSAR, represents the complete scope of information relating to this review topic.[1] The staff's review confirmed that the information contained in and incorporated by reference addresses the required information related to the safety analyses. The staff's technical evaluation of the information in the ESBWR DCD related to accident analysis is documented in NUREG–1966.

---

[1] See "*Finality of Referenced NRC Approvals*" in Section 1.2.2 for a discussion on the staff's review related to verification of the scope of information to be included within a COL application that references a design certification.

In addition, the staff confirmed that the information contained in the North Anna 3 COLA, including information incorporated by reference, addresses the required information related to the DBA radiological consequence analyses. The staff's technical evaluation of the information incorporated by reference in the North Anna ESP SSAR related to the DBA radiological consequence analyses is documented in the corresponding SER (i.e., NUREG-1835, "Safety Evaluation Report for an Early Site Permit (ESP) at the North Anna ESP Site," issued September 2005).

.

The staff reviewed the relevant information in the COL FSAR:

<u>Supplemental Information</u>:

- STD SUP 15.3-1 Radiological Consequences
- NAPS SUP 15.3-2 (NAPS ESP VAR 2.0-6) ESP Information

North Anna COL FSAR, Revision 0, incorporated by reference the analysis of the radiological consequences from the ESBWR DCD, Revision 4, Section 15.4, and from Chapter 15 of North Anna ESP SSAR. The staff review of the sections that were incorporated by reference noted that the isotopic time-dependent fission product release rates to the environment for each DBA analyzed in the ESBWR DCD, Revision 4 were not bounded by the values specified in Appendix B, "Controlling Values of Parameters and Design-Basis Accident Source Term Plant Parameters," in ESP No. ESP-003 issued for the North Anna site.

Therefore, the staff requested, in request for additional information (RAI) 15.06.05-1, that if the isotopic activity releases per time period specified in the radiological consequence analyses for each DBA analyzed in the ESBWR DCD and from Chapter 15 of North Anna ESP SSAR are not bounded by those specified in Appendix B to the North Anna ESP, that the applicant provide the site-specific radiological consequence doses for the exclusion area boundary (EAB), the low population zone (LPZ), and the control room for each DBA to demonstrate that North Anna site still meets the dose evaluation factors set forth in 10 CFR 50.34(a)(1)(ii)(D), 10 CFR 52.79(a)(1)(vi), and GDC 19.

In its response to RAI 15.06.05-1, dated October 17, 2008 (Agencywide Documents Access and Management System (ADAMS) Accession No. ML082980134), the applicant clarified that that the COL FSAR would not incorporate by reference the information in the North Anna ESP PPE that was related to the ESBWR design, but instead would show compliance with the relevant regulations by incorporating by reference the DBA radiological consequence analyses from the ESBWR DCD. Revision 1 of the COL FSAR, and subsequent revisions, included this variance (NAPS ESP VAR 2.0-6) from the North Anna ESP, as described in Chapter 15 supplemental information NAPS SUP 15.3-2.

By taking a variance from the North Anna ESP with respect to the PPE information on the ESBWR, the analyses in the ESP SSAR that show compliance with the dose evaluation factors set forth in 10 CFR 50.34(a)(1) and 10 CFR 52.79(a)(1)(vi) are no longer being relied upon for the COL. Instead the COL FSAR is showing compliance with the relevant regulations by incorporating by reference the analyses from a more recent revision of the ESBWR DCD Chapter 15. Therefore, the staff agrees that it is unnecessary for the COL to show that the ESP PPE information is bounding for the COL, and the issue raised by the staff in RAI 15-06-05-1 is resolved and closed.

More specifically, the following summarizes the applicant's October 17, 2008, response to RAI 15.06.05-1 and the staff's evaluation:

- The applicant stated that, for the EAB and LPZ, North Anna 3 FSAR, Revision 0, Table 2.0-201, "Evaluation of Site/Design Parameters and Characteristics," shows that the site-specific atmospheric dispersion factor (χ/Q) values for Unit 3 fall within those values in DCD, Revision 5, and, therefore, North Anna 3 meets the dose evaluation factors set forth in 10 CFR 50.34(a)(1)(ii)(D) and 10 CFR 52.79(a)(1)(vi)..

The staff finds that this response is acceptable.

- For the control room, the DCD, Revision 5 χ/Qs also remain bounding except for those associated with the DCD COL Item 2A.2-2-A, "Confirmation of Reactor Building χ/Q values." This COL item specifies administrative controls to be implemented if the χ/Q values for a release from certain reactor building (RB) or fuel building (FB) doors are not bounded by the DCD, Revision 5 χ/Q values. The North Anna FSAR, Revision 0 did not specify this condition in its administrative controls. In the North Anna FSAR, Revision 1, Chapter 2, "Site Characteristics," NAPS COL 2A.2-2-A, the applicant stated that the North Anna administrative controls will be such that the doors and personnel air locks on the east side of the RB or FB are promptly closed under conditions indicative of a fuel handling accident.

The staff finds that this response is acceptable. The staff's evaluation of this topic, including additional supplemental information provided at a later date, is discussed in more detail below with regard to NAPS SUP 15.4-1.

- The bounding values for isotopic activity release rates to the environment for the DBAs in ESP No. ESP-003, Appendix B, were not available for inclusion in North Anna FSAR Revision 0 because the ESP was issued on the same day that the Unit 3 COLA was submitted. A subsequent review of the COLA with respect to the as-issued ESP by the applicant identified that the DBA source terms evaluated in the DCD Revision 4, Chapter 15 were not bounded by the ESP-003 source terms in all cases. Therefore, the applicant stated that it will revise the COLA to address the DCD Revision 5 source terms and will include a request for a variance to use the DCD Revision 5 source terms in lieu of the ESP values. In the North Anna FSAR, Revision 1, the applicant revised the FSAR to address the ESBWR DCD, Revision 5, Chapter 15 source terms and requested a variance, NAPS ESP VAR 2.0-6, to use the North Anna 3 source terms from the DCD Revision 5 in lieu of those values specified in the North Anna ESP.

The staff finds that this variance is acceptable because the calculated doses in the ESBWR, Revision 5 are within the regulatory limits and the site-specific χ/Q values are lower than those values specified in the ESBWR DCD, Revision 5.

- The applicant stated that the North Anna 3 COLA Departure Report is being revised to clarify the criteria under which a variance is requested. In the North Anna COL Departure Report, Revision 1, the applicant revised the variance sections to clarify the criteria under which a variance is requested.

Therefore, the staff requested information in RAI 15.06.05-1 is resolved and closed.

- NAPS SUP 15.4-1

By letter dated September 16, 2014, the applicant provided supplemental information to clarify operator actions that are related to the analysis of the design basis fuel-handling accident (FHA) radiological consequences in the North Anna Unit 3 control room. Specifically, the applicant proposes to add the following site-specific supplemental information to the next revision of FSAR Section 15.4.1.2.3, "Identification of Operator Actions:"

> During movement of irradiated fuel, those doors and personnel air locks on the plant east sides of the Reactor Building or Fuel Building that could act as a point source could result in control room χ/Q values that are higher than the ESBWR χ/Q values for a release in the Reactor Building or Fuel Building (See Section 2A.2.5). Therefore, those doors and personnel air locks on the plant east sides of the Reactor Building or Fuel Building that could act as a point source are administratively controlled to remain closed during movement of irradiated fuel. Administrative control of these doors and personnel air locks ensures that the control room habitability dose analysis for the fuel handling accident (FHA) incorporated by reference from DCD Section 15.4.1 is bounding for Unit 3 and control room doses do not exceed the requirements of GDC 19 in the event of an FHA.

ESBWR DCD, COL Item 2A.2-2-A, gives guidance to COL applicants that if the site-specific point source control room receptor χ/Q values for potential releases through doors or personnel air locks on the east sides of the RB and FB are greater than those used as site parameter values in the ESBWR DCD dose analysis for the FHA, and if the values would result in a higher radiological consequence than was reported in the DCD, then the affected doors or air locks are administratively controlled during movement of irradiated fuel. The applicant did not provide either site-specific point source control room receptor χ/Q values for releases through the doors and air locks on the east sides of the RB and FB or a comparison with the values used in the ESBWR DCD for the FHA to enable a determination of whether the dose in the control room for the FHA would be higher than reported in the ESBWR DCD. Instead, the applicant stated in NAPS COL 2A.2-2-A that those doors and personnel air locks on the plant east sides of the RB or FB that could act as a point source are administratively controlled to remain closed during movement of irradiated fuel. This statement was repeated in NAPS SUP 15.4-1 with additional information to include the relationship to the assumptions used in the FHA control room dose analysis. The staff found the supplemental information acceptable because administrative control of the doors and air locks on the east side of the RB and FB that could act as a point source during the movement of irradiated fuel provides assurance that, in the event of an FHA, releases through the doors are sufficiently prevented so that the FHA dose analysis incorporated by reference from ESBWR DCD, Section 15.4.1, is bounding for North Anna 3. The applicant committed to providing NAPS SUP 15.4-1 in a future revision of the FSAR. The staff verified that the North Anna 3 FSAR, Revision 9, includes the appropriate administrative controls to ensure that the air locks on the east side of the RB and FB would not act as a point source during the movement of irradiated fuel. Therefore, Confirmatory Item 15-1 from the staff's advanced SER for North Anna 3 is resolved and closed.

ESBWR DCD, Revision 10, Section 15.4, provides details and results of analyses of the radiological consequences for the DBAs. The following lists the DBAs analyzed for radiological consequences and the sections where the radiological consequence analyses for those DBAs are discussed in the ESBWR DCD.

DCD Section	Design-Basis Accident
15.4.1	Fuel Handling Accident
15.4.4	Loss-of-Coolant Accident Inside Containment Radiological Analysis
15.4.5	Main Steamline Break Accident Outside Containment
15.4.6	Control Rod Drop Accident
15.4.7	Feedwater Line Break Outside Containment
15.4.8	Failure of Small Line Carrying Primary Coolant Outside Containment
15.4.9	RWCU/SDC [Reactor Water Cleanup/Shutdown Cooling] System Line Failure Outside Containment
15.4.10	Spent Fuel Cask Drop Accident

The DBA radiological consequence analyses in the ESBWR DCD, Revision 10, used design reference site parameter values for the offsite atmospheric dispersion factors, in place of site characteristic (site-specific) values. The χ/Q values are the only input to the DBA radiological consequence analyses that are affected by the site characteristics. The applicant provided and discussed the North Anna site characteristic short-term accident χ/Q values in resolution of NAPS COL Item 2.0-10-A, "Short-Term Dispersion Estimates for Accidental Atmospheric Releases," and NAPS ESP COL Item 2.3-2, "Atmospheric Dispersion Factors for Control Room." The applicant also provided supplemental information in North Anna 3 COL FSAR Table 2.3-207, "Unit 3 Cross Unit χ/Q Result," for evaluating the impact of a postulated DBA in North Anna 1 and 2 on the North Anna 3 control room. Table 2.3.4 1 of the North Anna COL FSAR gives site characteristic EAB and LPZ χ/Q values.

In Section 2.3.4, "Short-Term Diffusion Estimates," of this SER, the staff discusses its review and resolution of (1) NAPS COL Item 2.0-10-A, (2) NAPS ESP COL Item 2.3-2, and (3) the supplemental information, related to the North Anna site characteristic χ/Q values as stated above, included under Section 2.3.4 of the North Anna COL FSAR.

The estimated DBA dose calculated for a particular site is affected by the site characteristics through the calculated χ/Q input to the analysis; therefore, the resulting dose would be different than that calculated generically for the ESBWR design in the DCD. All other inputs and assumptions in the radiological consequences analyses remain the same as in the DCD. Smaller χ/Q values are associated with greater dilution capability, resulting in lower radiological doses. When comparing a DCD site parameter χ/Q value and a site characteristic χ/Q value, the site is acceptable for the design if the site characteristic χ/Q value is smaller than the site parameter χ/Q value. Such a comparison shows that the site has better dispersion characteristics than that required by the reactor design.

For each time averaging period, the North Anna site characteristic offsite and control room short-term χ/Q values are less than the site parameter χ/Q values used by the ESBWR DCD, Revision 10, radiological consequence analysis for each of the DBAs. Because the result of the radiological consequence analysis for a DBA during any time period of radioactive material release from the plant is directly proportional to the χ/Q for that time period, and because the North Anna site characteristic χ/Q values are less than the comparable ESBWR DCD, Revision 10, site parameter χ/Q values for all time periods and all accidents, the North Anna site-specific total dose for each DBA is therefore less than the ESBWR DCD, Revision 10, generic total dose for each DBA.

Because the analyses in ESBWR DCD, Revision 10, show that the offsite and control room radiological consequences meet the regulatory dose requirements of 10 CFR 100.21, 10 CFR 50.34(a)(1), 10 CFR 52.79(a)(1), and GDC 19, and because, by the logic above, the North Anna site-specific DBA offsite and control room radiological consequences are less than those for ESBWR DCD, Revision 10, the applicant has sufficiently shown that the DBA radiological consequences meet the requirements of 10 CFR 100.21, 10 CFR 50.34(a)(1), 10 CFR 52.79(a)(1), and GDC 19.

15.5 Post-Combined License Activities

The applicant states in Supplemental Information NAPS SUP 15.4-1 that the doors and personnel air locks on the east sides of the RB and FB are administratively controlled to remain closed during movement of irradiated fuel.

15.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirms that the applicant has addressed the required information, and no outstanding information is expected to be addressed in the COL FSAR related to this chapter. The results of the staff's technical evaluation of the DCD information incorporated by reference is in NUREG 1966. With the exception of Confirmatory Item 15-1, pursuant to 10 CFR 52.63(a)(5) and Section VI.B.1 of Appendix E, "Design Certification Rule for the ESBWR Design," to 10 CFR Part 52, "Licenses, Certifications, and Approvals for Nuclear Power Plants," all nuclear safety issues relating to safety analyses that were incorporated by reference are resolved.

In addition, the staff has compared the additional COL supplemental information within the application to the relevant NRC regulations, acceptance criteria defined in Chapter 15, "Transient and Accident Analysis," of NUREG 0800, "Standard Review Plan for the Review of Safety Analysis Reports for Nuclear Power Plants: LWR Edition," issued March 2007, and other NRC regulatory guides and concludes that the applicant is in compliance with NRC regulations.

16.0 TECHNICAL SPECIFICATIONS

16.0 TECHNICAL SPECIFICATIONS

16.1 Introduction

This chapter of the U.S. Nuclear Regulatory Commission's (NRC's) safety evaluation report (SER) provides the NRC staff evaluation of the North Anna 3 proposed technical specifications (TS). The TS impose limits, operating conditions, and other requirements on reactor facility operation for the protection of public health and safety. The North Anna 3 plant-specific technical specifications (PTS) are derived from the analyses and evaluations in the Economic Simplified Boiling-Water Reactor (ESBWR) generic Design Control Document (DCD) and the North Anna 3 Final Safety Analysis Report (FSAR). In accordance with Title 10 of the *Code of Federal Regulations* (10 CFR) 50.36, "Technical Specifications"; 10 CFR 50.36a, "Technical Specifications on Effluents from Nuclear Power Reactors"; and 10 CFR 52.79(a)(30); Dominion Virginia Power (Dominion) provided PTS and the associated PTS bases for North Anna 3 in Chapter 16, "Technical Specifications," of Part 2, "Final Safety Analysis Report," and Part 4, "Technical Specifications," of the Combined License (COL) application.

16.2 Summary of Application

Chapter 16 of the North Anna 3 COL FSAR, Revision 8 incorporates by reference Chapters 16 and 16B (the generic TS [GTS] and the associated GTS bases [bases], respectively) of Revision 10 of the DCD for the ESBWR, referenced in Appendix E to 10 CFR Part 52, "Licenses, Certifications, and Approvals for Nuclear Power Plants." In addition, in FSAR Chapter 16, the applicant provides the following:

<u>COL Item</u>

- STD COL 16.0-1-A COL Applicant Bracketed Items

The applicant provided additional information in Part 4 of the North Anna 3 COL application (COLA) to address the ESBWR DCD standard (STD) COL [Item] 16.0-1-A. The applicant replaced information indicated with brackets in the GTS and bases with site-specific information (site-specific TS and bases).

<u>Supplemental Information</u>

- STD SUP 16.0-1

The applicant provided the following supplemental (SUP) information stating that the PTS and PTS bases are maintained as separate documents.

The proposed PTS consist of the GTS and site-specific information. Dominion also proposed bases for the PTS that consist of the GTS bases and site-specific information.

The GTS items regarding site-specific information that a COL applicant must provide include the PTS information necessary to complete a particular GTS provision (e.g., incorporation of the U.S. Nuclear Regulatory Commission [NRC] approved methodology into a plant's licensing basis). Detailed design information, equipment selection, instrumentation settings, and other information not available at the time of design certification (DC) are necessary to establish the values or information included in the PTS. The GTS and bases indicate each preliminary or missing information item with brackets and a COL item number. Although the ESBWR generic

DCD refers to this preliminary or missing information as COL applicant bracketed items, and the COLA designates this information collectively as STD COL 16.0-1-A, this report identifies this information collectively as COL Item 16.0-1-A. Except for the completion of this COL item, the PTS and bases are identical to the GTS and bases.

Exemptions

In North Anna 3 Part 7, Revision 1, Dominion proposed two exemptions from ESBWR GTS and bases in the PTS and bases. In Part 7, Revision 6, Dominion proposed no exemptions from the GTS and bases.

COL Item Resolution

Table 16.1 of this report lists the GTS requirements and associated bases that contain placeholders for preliminary or missing information associated with COL items. The COL applicant must finalize these items to complete the PTS and bases. This table also lists the method (i.e., Option 1, 2, or 3, described below) that Dominion used to resolve each COL item, thereby completing the associated provisions in the PTS and bases.

The listed resolution method (RM) for each COL item is taken from Part 4 of the COLA and is based on the interim staff guidance (ISG) DC/COL-ISG-08, “Necessary Content of Plant-Specific Technical Specifications When a Combined License Is Issued,” dated December 9, 2008, and Section 16.0, “Technical Specifications,” Revision 3, issued March 2010 of NUREG-0800, “Standard Review Plan for the Review of Safety Analysis Reports for Nuclear Power Plants (LWR Edition),” (the Standard Review Plan (SRP)). This guidance lists three acceptable RMs for resolving COL items and finalizing the PTS. For each COL item, the applicant must provide one of the following:

- a site-specific value or site-specific information (Option 1)
- a useable value or useable information that is bounding to the site-specific value or information (Option 2)
- a NRC staff-approved administrative control TS for the use of an NRC-approved methodology to determine the site-specific value or information and establish a document for recording the site-specific value or information outside the PTS (Option 3)

The GTS contains bracketed, optional provisions that provide operational flexibility. However, adopting that flexibility in the PTS requires a site-specific justification in accordance with the reviewer’s notes in Table 16.0-1-A of the ESBWR DCD. In most cases, Dominion has not adopted this flexibility in the North Anna 3 PTS. The RM for such items is listed as Option 1 in Table 16.1 because finalizing bracketed information, where the brackets provide for operational flexibility, is equivalent to providing site-specific information and has been applied by the applicant.

For all COL items listed in the table, the staff has verified that the PTS and bases have been updated in accordance with the stated RM.

Table 16.1. Site-Specific Information to Resolve COL Item 16.0-1-A

COL Item Number	GTS Reference	Information Needing Finalization (See description in Revision 9 of ESBWR DCD, Tier 2, Section 16.0, Table 16.0-1-A and Revision 4 of the COLA, Part 4)	Resolution Method
1.1-1	GTS 1.1	Pressure and temperature (P/T) limits report (PTLR) definition.	Option 2
3.1.3-1	GTS 3.1.3 Required Action A.1 and bases	Stuck control rod separation requirements between “slow” control rod(s). (Operational flexibility not adopted.)	Option 1
3.1.3-2	Surveillance Requirement (SR) 3.1.3.4 and bases	Maximum scram time limits for operable control rods. If adopting slow control rod optional allowance, the SR should state, “Verify each control rod scram time from fully withdrawn to [60%] rod insertion is ≤ [ ] seconds.” Otherwise, the SR should state, “Perform applicable SRs of LCO 3.1.4.” (Operational flexibility not adopted.)	Option 1
3.1.4-1	GTS 3.1.4 and bases; Limiting Condition for Operation (LCO) 3.1.4 and bases; Action A and bases; Table 3.1.4-1 Notes and bases; bases’ applicable safety analyses (ASA) discussion; bases for SR 3.1.4.2 and SR 3.1.4.3.	“Slow” control rod optional allowance. (Operational flexibility not adopted.) Dominion removed the bracketed provisions for “slow” scram times in the GTS and bases.	Option 1
3.1.5-1	SR 3.1.5.1 and bases	Minimum and nominal control rod scram accumulator pressure.	Option 2
3.1.7-1	GTS 3.1.7 Required Action A.1 and bases	Alternative action for sodium pentaborate concentration not within limits. (Operational flexibility not adopted.)	Option 1
3.3.1.1-2	Bases for SR 3.3.1.1.4	Allowance to exclude certain sensors or other instrumentation components from response time testing. (Operational flexibility not adopted.)	Option 1
3.3.1.2-1	Bases for SR 3.3.1.2.4	Allowance to exclude certain portions of the actuation circuitry from response time testing. (Operational flexibility not adopted.)	Option 1
3.3.1.4-2	Bases for SR 3.3.1.4.7	Allowance to exclude certain sensors or other instrumentation components from response time testing. (Operational flexibility not adopted.)	Option 1
3.3.1.5-2	Bases for SR 3.3.1.5.4	Allowance to exclude certain portions of the actuation circuitry from response time testing. (Operational flexibility not adopted.)	Option 1
3.3.5.1-2	Bases for SR 3.3.5.1.4	Allowance to exclude certain sensors or other instrumentation components from response time testing. (Operational flexibility not adopted.)	Option 1

COL Item Number	GTS Reference	**Information Needing Finalization** **(See description in Revision 9 of ESBWR DCD, Tier 2, Section 16.0, Table 16.0-1-A and Revision 4 of the COLA, Part 4)**	Resolution Method
3.3.5.2-1	Bases for SR 3.3.5.2.4	Allowance to exclude certain portions of the actuation circuitry from response time testing. (Operational flexibility not adopted.)	Option 1
3.3.5.3-2	Bases for SR 3.3.5.3.4	Allowance to exclude certain sensors or other instrumentation components from response time testing. (Operational flexibility not adopted.)	Option 1
3.3.5.4-1	Bases for SR 3.3.5.4.4	Allowance to exclude certain portions of the actuation circuitry from response time testing. (Operational flexibility not adopted.)	Option 1
3.3.6.1-2	Bases for SR 3.3.6.1.4	Allowance to exclude certain sensors or other instrumentation components from response time testing. (Operational flexibility not adopted.)	Option 1
3.3.6.2-1	Bases for SR 3.3.6.2.4	Allowance to exclude certain portions of the actuation circuitry from response time testing. (Operational flexibility not adopted.)	Option 1
3.3.6.3-2	Bases for SR 3.3.6.3.4	Allowance to exclude certain sensors or other instrumentation components from response time testing. (Operational flexibility not adopted.)	Option 1
3.3.6.4-1	Bases for SR 3.3.6.4.4	Allowance to exclude certain portions of the actuation circuitry from response time testing. (Operational flexibility not adopted.)	Option 1
3.3.7.1-2	Bases background for GTS 3.3.7.1	Control room habitability area (CRHA) option for design features to protect occupant exposures to hazardous chemicals. (Not adopted based on FSAR Section 6.4.5 and resolution of related Request for Additional Information (RAI) 02.02.03-8.)	Option 1
3.3.7.1-3	Bases for SR 3.3.7.1.4	Allowance to exclude certain sensors or other instrumentation components from response time testing. (Operational flexibility not adopted.)	Option 1
3.3.7.2-1	Bases background for GTS 3.3.7.2	CRHA option for design features to protect occupant exposures to hazardous chemicals. (Not adopted based on FSAR Section 6.4.5 and resolution of related RAI 02.02.03-8.)	Option 1
3.3.7.2-2	Bases for SR 3.3.7.2.4	Allowance to exclude certain portions of the actuation circuitry from response time testing. (Operational flexibility not adopted.)	Option 1
3.4.4-1	LCO 3.4.4 and bases; SRs 3.4.4.1, 2, 3, 4, and 5 and bases; bases background	Reference to PTLR or plant-specific P/T curves as figures in TS 3.4.4. (Adopted PTLR.)	Option 2
3.4.4-2	Notes to SR 3.4.4.4, and SR 3.4.4.5 and bases	Temperature for applicability of verification that reactor vessel flange and head flange temperatures are within limits.	Option 2

COL Item Number	GTS Reference	Information Needing Finalization (See description in Revision 9 of ESBWR DCD, Tier 2, Section 16.0, Table 16.0-1-A and Revision 4 of the COLA, Part 4)	Resolution Method
3.4.4-3	Bases references for GTS 3.4.4	Topical reports providing the methodology for determining the P/T limits. (Adopted PTLR.)	Option 2
3.7.2-1 (related to COL Item 6.4-2-A)	GTS 3.7.2 Required Action B.2 and bases; bases background discussion; bases ASA discussion; bases for LCO 3.7.2; bases for SR 3.7.2.7	CRHA option for design features to protect occupant exposures to hazardous chemicals. (Not adopted based on FSAR Section 6.4.5 and resolution of related RAI 02.02.03-8.)	Option 1
3.7.4-1	LCO 3.7.4 and bases; bases ASA discussion; bases for Required Action A.1	LCO 3.7.4 alternative to requiring the main turbine bypass system to be operable. The alternative LCO is to make applicable the LCO 3.2.2, "Minimum Critical Power Ratio (MCPR)," limits for an inoperable main turbine bypass system, as specified in the core operating limits report (COLR). (Operational flexibility not adopted.)	Option 1
3.7.4-2	SR 3.7.4.1 frequency and bases	Surveillance interval for cycling a turbine bypass valve. (Retained 31-day frequency. Operational flexibility not adopted.)	Option 1
3.7.6-1	LCO 3.7.6 and bases; bases ASA discussion; bases for Required Action A.1	LCO 3.7.6 alternative to requiring all selected control rod run-in (SCRRI) and select rod insert (SRI) functions to be operable. The alternative LCO is to make applicable the LCO 3.2.2 MCPR limits for an inoperable SCRRI and/or SRI function, as specified in the COLR. (Operational flexibility not adopted.)	Option 1
3.8.1-1	SR 3.8.1.2 and bases	Acceptance criteria for battery charger testing (minimum duration of test in hours) consistent with battery size. (Manufacturer's recommendations are the basis for bounding value for test duration.)	Option 2
3.8.1-4	Bases for SR 3.8.1.1	Battery cell parameters consistent with the manufacturer's specifications.	Option 1
3.8.1-5	Bases background for GTS 3.8.1, and bases for SR 3.8.1.1	Battery margin for aging factor and state of charge uncertainty (from expected battery life).	Option 1
3.8.3-1	Conditions B, C, and G; Required Actions B.2 and C.2; bases for Actions B, C, and G; bases for SR 3.8.3.1	Acceptance criteria for verification that battery is fully charged—maximum float current—consistent with manufacturer's recommendations.	Option 1

COL Item Number	GTS Reference	Information Needing Finalization **(See description in Revision 9 of ESBWR DCD, Tier 2, Section 16.0, Table 16.0-1-A and Revision 4 of the COLA, Part 4)**	Resolution Method
3.8.3-3	GTS 3.8.3: Actions A and G and SR 3.8.3.5; SR 3.8.3.2; bases background; bases for Actions A, B, C, and G; bases for SRs 3.8.3.2 and 3.8.3.5	Battery cell parameters consistent with the manufacturer's specifications. Minimum connected cell float voltage. Minimum pilot cell float voltage.	Option 1
3.8.3-4	SR 3.8.3.6 frequency and bases	Battery margin for aging factor and state of charge uncertainty (based on the manufacturer's recommendations).	Option 1
3.9.5-1	SR 3.9.5.2 and bases; bases for LCO 3.9.5	Minimum control rod drive scram accumulator pressure.	Option 2
4.1-1	GTS 4.1	Plant-specific description of site location.	Option 1
5.2.2-1	GTS 5.2.2	Non-licensed operator manning requirements for multi-unit site. (Not applicable; North Anna 3 is a single-unit facility.)	Option 1
5.3.1-1	GTS 5.3.1	Unit staff qualification requirements.	Option 1
5.4.1-1	GTS 5.4.1.a	Guidance documents for written procedures.	Option 1
5.4.1-2	GTS 5.4.1.b	Guidance documents for emergency operating procedures.	Option 1
5.5.6-1	GTS 5.5.6	Outdoor Liquid Storage Tank Radioactivity Monitoring Program. (Not applicable to North Anna 3.)	Option 1
5.5.9-1	GTS 5.5.9	Containment Leakage Rate Testing Program plant-specific exceptions to RG 1.163. (Dominion requested no additional plant-specific exceptions.)	Option 1
5.5.10-1	GTS 5.5.10.a	Battery cell parameters consistent with the manufacturer's specifications. Minimum connected cell float voltage.	Option 1
5.5.11-1	GTS 5.5.11	Setpoint Control Program references to NRC staff-approved setpoint methodology and the associated NRC SER.	Option 1
5.5.12-1	GTS 5.5.12	CRHA Boundary Program requirements for hazardous chemical releases. (Not adopted based on FSAR Section 6.4.5 and resolution of related RAI 02.02.03-8.)	Option 1
5.6.1-1	GTS 5.6.1	Applicant to determine if allowance for multiple-unit stations is applicable to PTS. If applicable, a single annual radiological environmental operating report may be prepared. (Allowance applies because North Anna 1, 2 and 3 are on the same site.)	Option 1
5.6.1-2	GTS 5.6.1	Applicant to determine format of annual radiological environmental operating report. (Multi-unit format applies.)	Option 1

COL Item Number	GTS Reference	Information Needing Finalization (See description in Revision 9 of ESBWR DCD, Tier 2, Section 16.0, Table 16.0-1-A and Revision 4 of the COLA, Part 4)	Resolution Method
5.6.2-1	GTS 5.6.2	Applicant to determine if allowance for multi-unit stations is applicable to PTS. If applicable, a single radioactive effluent release report, with content required for a multi-unit report, may be prepared. (Allowance applies because North Anna 2 and 3 are on the same site.)	Option 1
5.6.3-1	GTS 5.6.3	COLR reference to Specification 3.7.4, “Main Turbine Bypass System” (see COL Item 3.7.4-1). (Operational flexibility not adopted.)	Option 1
5.6.3-2	GTS 5.6.3.a	Reference in TS 5.6.3.a to any additional individual specifications that address core operating limits.	Option 1
5.6.4-1	GTS 5.6.4	Applicant to add list of analytical methods used to determine the reactor coolant system P/T limits in specification for PTLR, if PTLR adopted in PTS. In lieu of a PTLR, the applicant may insert its plant-specific P/T curves as figures in PTS 3.4.4 and omit PTS 5.6.4. (Adopted PTLR.)	Option 2

The above COL items are listed in Revision 10 to ESBWR DCD, Table 16.0-1-A, which provides the COL applicant with guidance on the necessary site-specific information for each item.

16.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is in NUREG–1966, “Final Safety Evaluation Report Related to the Certification of the Economic Simplified Boiling-Water Reactor Standard Design,” issued April 2014, and it’s Supplement 1, issued September 2014. In addition, the relevant requirements of the Commission regulations for TS, and the associated acceptance criteria, are in SRP Section 16.0.

The applicable regulatory requirements for TS are as follows:

- 10 CFR 50.36 and 50.36a
- 10 CFR 52.79(a)(30)

Section 182a of the Atomic Energy Act of 1954 (the Act) as amended (42 U.S.C. 2232), requires that applicants for nuclear power plant operating licenses will state the following:

> Such technical specifications, including information of the amount, kind, and source of special nuclear material required, the place of the use, the specific characteristics of the facility, and such other information as the Commission may, by rule or regulation, deem necessary in order to enable it to find that the utilization of special nuclear material will be in accord with the common defense and security and will provide adequate protection to the health and safety of the public. Such technical specifications shall be a part of any license issued.

In 10 CFR 50.36, the Commission established the regulatory requirements related to TS content. In doing so, the Commission emphasized matters related to the prevention of accidents and the mitigation of the consequences of accidents. As recorded in the Statements of Consideration, “Technical Specifications for Facility Licenses; Safety Analysis Reports” (Volume 33 of the *Federal Register,* page 18,610 (33 FR 18610; December 17, 1968)), the Commission noted that applicants are expected to incorporate into their TS “those items that are directly related to maintaining the integrity of the physical barriers designed to contain radioactivity.” In 10 CFR 50.36(c), the NRC requires the TS for utilization facilities to contain (1) safety limits, limiting safety system settings, and limiting control settings; (2) limiting conditions for operation (LCOs); (3) surveillance requirements; (4) design features; and (5) administrative controls.

In 10 CFR 50.36(c)(2)(ii), the NRC requires the TS to include an LCO for each item that meets one or more of the following four criteria:

- “Criterion 1*.* Installed instrumentation that is used to detect, and indicate in the control room, a significant abnormal degradation of the reactor coolant pressure boundary.”

- “Criterion 2*.* A process variable, design feature, or operating restriction that is an initial condition of a design basis accident or transient analysis that either assumes the failure of or presents a challenge to the integrity of a fission product barrier.”

- “Criterion 3*.* A structure, system, or component that is part of the primary success path and which functions or actuates to mitigate a design basis accident or transient that either assumes the failure of or presents a challenge to the integrity of a fission product barrier.”

- “Criterion 4. A structure, system, or component which operating experience or probabilistic risk assessment has shown to be significant to public health and safety.”

Regulatory Guidance

In 1992, the NRC issued standard TS (STS) to clarify the content and format of requirements necessary to ensure the safe operation of nuclear power plants. These STS were developed from the results of the TS improvement program in accordance with 10 CFR 50.36; the Commission’s “Proposed Policy Statement on TS Improvements for Nuclear Power Reactors,” (52 FR 3788; February 6, 1987) (interim policy statement); and SECY-93-067, “Final Policy Statement on Technical Specifications Improvements for Nuclear Power Reactors,” dated March 17, 1993 (58 FR 39132; July 22, 1993) (final policy statement). The NRC published major revisions to the STS in 1995 (Revision 1), 2001 (Revision 2), 2004 (Revision 3), and 2012 (Revision 4).

The following documents contain the STS for boiling-water reactors (BWRs).

- NUREG–1433, “Standard Technical Specifications, General Electric Plants (BWR/4),” Volumes 1 and 2, Revision 3, issued June 2004

- NUREG–1434, “Standard Technical Specifications, General Electric Plants (BWR/6),” Volumes 1 and 2, Revision 3, June 2004

For each document, Volume 1 contains the TS and Volume 2 contains the associated TS bases. The STS include the bases for safety limits, limiting safety system settings, LCOs, and associated action and surveillance requirements.

The STS reflect the results of a detailed review of the application of the Commission's interim policy statement criteria to generic system functions. The NRC published these results—known as the split report (ML11264A057)—in a May 9, 1988, letter from T. E. Murley of the NRC to the nuclear steam supply system (NSSS) vendor-owner groups (e.g., W. S. Wilgus of the Babcock & Wilcox Owners Group and R. F. Janecek of the BWR Owners' Group). The split report provides the results of the staff's review of the NSSS vendor-owner groups' application of the Commission's interim policy statement criteria to the existing STS LCOs (e.g., NUREG-0123, "Standard Technical Specifications for General Electric Boiling Water Reactors," issued August 1971, for General Electric plants). The STS also reflect the results of extensive discussions about various drafts of the STS to ensure that the application of TS criteria will consistently reflect detailed system configurations and operating characteristics for all reactor designs. Therefore, the STS bases provide abundant information about the extent to which the STS reflect requirements that are necessary to protect public health and safety.

In the final policy statement, the Commission expressed the view that satisfying the guidance in the policy statement also satisfies Section 182a of the Act and 10 CFR 50.36. The final policy statement describes the safety benefits of the STS. It also encourages licensees to use the STS as the basis for license amendments to partially or completely convert existing TS requirements to improved TS based on the STS.

The format and content of the PTS and bases in a COLA referencing a certified design should be based on the GTS and bases for the certified design. PTS and bases may include appropriate plant-specific departures from the referenced certified GTS and bases when warranted.

16.4 Technical Evaluation

As documented in NUREG–1966, the staff reviewed and approved Chapter 16 of the certified ESBWR DCD. The staff reviewed Chapter 16 of the North Anna 3 COLA and checked the referenced ESBWR DCD to ensure that the combination of the information in the COL FSAR and the information in the ESBWR DCD represents the complete scope of information relating to the review topic.[1] The staff's review confirmed that the information in the application and the information incorporated by reference address the required information related to this chapter.

The staff reviewed the PTS and bases which are in Part 4 of the North Anna 3 COLA, and the FSAR Chapter 16 which is in Part 2 of the COLA's FSAR, to ensure that this information incorporates by reference the latest revision to ESBWR DCD Section 16.0, "Introduction." DCD Section 16.0 contains guidance (i.e., reviewer's notes) for providing site-specific information to resolve the COL items, which are indicated by brackets in DCD Chapters 16 and 16B, the GTS and bases. The COL items are listed in Section 16.2, Table 16.1 of this SER. The PTS and bases contain the latest revision of the GTS and bases and the site-specific information in accordance with COL Item 16.0-1-A of the ESBWR DCD. The GTS and bases and the inserted site-specific information form a complete set of PTS and bases for staff review and approval. Part 4 of the COLA also describes and justifies the proposed RM for each COL item.

The staff confirmed that the PTS and bases, as presented in Part 4 of the COLA, incorporate the GTS and bases. The staff also reviewed the site-specific information provided in accordance with COL Item 16.0-1-A, as listed in Section 16.2, Table 16.1 of this report. The

[1] See "*Finality of Referenced NRC Approvals*" in SER Section 1.2.2, for a discussion on the staff's review related to verification of the scope of information to be included in a COL application that references a design certification.

staff focused the COLA review on the completion of the site-specific information in the PTS and bases.

Completion of the ESBWR Design Certification Rule (DCR)

The staff separately reviewed the GTS and bases on Docket No. 052-010 as part of the ESBWR DC review. The staff documents its review of the GTS and bases in Chapter 16 of the ESBWR DC Final Safety Evaluation Report (FSER). Because the staff's DC review of the GTS and bases applies to the PTS and bases, the staff did not review information in the PTS and bases that is identical to information in the GTS and bases.

Completion of the staff's technical evaluation of the PTS and bases was contingent on NRC approval and certification of the ESBWR design and publication of the ESBWR DCR. Consequently, the staff verified that except for the COL items, the PTS and bases are identical to the GTS and bases that have received final NRC approval. This technical evaluation thereby incorporates the resolution of all issues related to the GTS and bases that remain open at the time of the North Anna 3 COLA.

Resolution of COL Items Listed in Table 16.1

Dominion proposed to resolve each COL item using one of the three options permitted by DC/COL-ISG-08, as described in Section 16.2 of this SER (pg. 16-2).

Option 1. The staff determines whether the site-specific information provided under Option 1 is acceptable by verifying that the information is accurate and useable for unit operation. To make this determination, the staff (1) compares the information with the FSAR and the conditions in the associated reviewer's note in ESBWR DCD Section 16.0; and (2) reviews the justification included in the COLA. The following are the COL items resolved using Option 1:

- Optional provisions that would provide additional operational flexibility. The associated reviewer's notes for such COL items require the COL applicant to provide additional site-specific justifications in order to incorporate the operational flexibility in the PTS. These COL items are indicated in Table 16.1 by the phrase "(Operational flexibility not adopted)."
  - action and surveillance requirements for slow control rods (COL Items 3.1.3-1, 3.1.3-2 and 3.1.4-1)
  - action requirements for an out-of-limit sodium pentaborate concentration in the standby liquid control system accumulator (COL Item 3.1.7-1)
  - exclusion of instrumentation components from response time testing (COL Items 3.3.1.1-2, 3.3.1.2-1, 3.3.1.4-2, 3.3.1.5-2, 3.3.5.1-2, 3.3.5.2-1, 3.3.5.3-2, 3.3.5.4-1, 3.3.6.1-2, 3.3.6.2-1, 3.3.6.3-2, 3.3.6.4-1, 3.3.7.1-3, and 3.3.7.2-2)
  - specifying a minimum critical power ratio (MCPR) penalty in lieu of requiring an operable main turbine bypass system (COL Items 3.7.4-1 and 5.6.3-1)
  - specifying a surveillance frequency of greater than 31 days for cycling turbine bypass valves (COL Item 3.7.4-2)
  - specifying an MCPR penalty in lieu of requiring operable SCRRI/SRI functions (COL Item 3.7.6-1)

    For these COL items, Dominion elected to omit these allowances from the PTS. In each case, the resulting specification is more restrictive on unit operation than would be allowed by the omitted provision. Therefore, the resolution of these COL items is acceptable.

- Provisions related to protections against hazardous chemicals (COL Items 3.3.7.1-2, 3.3.7.2-1, 3.7.2-1, and 5.5.12-1). Dominion did not adopt these optional provisions based on the resolution of RAI 02.02.03-8 as discussed in Chapter 2 of this SER, and the evaluation of hazardous chemicals in FSAR Section 6.4.5.

- Unit staff minimum qualification standards (COL Item 5.3.1-1) in GTS 5.3.1. Dominion resolved this item in accordance with the reviewer's note in DCD Section 16.0, Table 16.0-1-A, by specifying the use of an overall qualification statement referencing an American National Standards Institute (ANSI) standard acceptable to the staff, as follows:

GTS 5.3.1 Each member of the unit staff shall meet or exceed the minimum qualifications of [Regulatory Guide 1.8, Revision 3, 2000, or more recent revisions, or ANSI Standard acceptable to the NRC staff]. [The staff not covered by Regulatory Guide 1.8 shall meet or exceed the minimum qualifications of Regulations, Regulatory Guides, or ANSI Standards acceptable to NRC staff].

PTS 5.3.1 Each member of the unit staff shall meet or exceed the minimum qualifications of Regulatory Guide 1.8, Revision 3, 2000, with the following exception:

a. During cold license operator training prior to Commercial Operation, the Regulatory Position C.1.b of Regulatory Guide 1.8, Revision 2, 1987, applies. Cold license operator candidates meet the training elements defined in ANSI/ANS 3.1-1993 but are exempt from the experience requirements defined in ANSI/ANS 3.1-1993.

The proposed minimum qualification standards reference Regulatory Guide (RG) 1.8, "Qualification and Training of Personnel for Nuclear Power Plants," Revision 3, issued May 2000; and American Nuclear Society (ANS)/ANSI 3.1-1993, "Selection, Qualification, and Training of Personnel for Nuclear Power Plants," which are acceptable to the staff. RG 1.8 will cover all North Anna 3 staff, so the second bracketed sentence is omitted. Therefore, the resolution of this COL item is acceptable.

- Guidance documents for written procedures (COL Items 5.4.1-1 and 5.4.1-2) in GTS 5.4.1. In PTS 5.4.1, Dominion retained the GTS bracketed references to Appendix A to RG 1.33, Revision 2, "Quality Assurance Program Requirements (Operation)," issued February 1978 and Generic Letter 82-33, "Supplement 1 to NUREG-0737—Emergency Response Capabilities," dated December 17, 1982, which are appropriate for North Anna 3. Therefore, the resolution of these COL items is acceptable.

- Containment leakage rate-testing program exceptions to RG 1.163, "Performance-Based Containment Leak-Test Program," issued September 1995 (COL Item 5.5.9-1) in GTS 5.5.9.a. In PTS 5.5.9.a, Dominion omitted the GTS 5.5.9.a bracketed placeholder for exceptions because Dominion did not propose any exceptions for North Anna 3. Therefore, the resolution of this COL item is acceptable.

- Annual radiological environmental operating report allowance for multiple-unit stations to submit a single report (COL Item 5.6.1-1) and the report format (COL Item 5.6.1-2) in GTS 5.6.1. In accordance with the reviewer's note in DCD Section 16.0, Table 16.0-1-A, Dominion retained in PTS 5.6.1 the GTS bracketed note (without the brackets) allowing a single report to be submitted for a multiple-unit station. Dominion also retained (without the brackets) the GTS bracketed phrase on the report format: "[in the format of the table in the Radiological Assessment Branch Technical Position, Revision 1, November 1979]." This information applies to North Anna 3 and is acceptable to the staff. Therefore, the resolution of these COL items is acceptable.

- Radioactive effluent release report allowance for multiple-unit stations to submit a single report (COL Item 5.6.2-1) in GTS 5.6.2. In accordance with the reviewer's note in DCD Section 16.0, Table 16.0-1-A, Dominion retained in PTS 5.6.2 the GTS bracketed note (without the brackets) allowing a single report to be submitted for a multiple-unit station. This information applies to North Anna 3 and is acceptable to the staff. Therefore, the resolution of this COL item is acceptable.
- References to any additional individual specifications that address core operating limits (COL Item 5.6.3-2) in GTS 5.6.3. Dominion omitted the GTS bracketed placeholder in PTS 5.6.3 because no additional plant-specific specifications address core operating limits. Therefore, the resolution of this COL item is acceptable.
- Description of site location (COL Item 4.1-1) in GTS 4.1. The staff verified that the PTS 4.1 description of the North Anna 3 site location is accurate. Therefore, the resolution of this COL item is acceptable.
- Non-licensed operator manning requirements (COL Item 5.2.2-1) in GTS 5.2.2. The reviewer's note in DCD Section 16.0, Table 16.0-1-A requires the COL applicant to determine whether the unit will be on a multi-unit site and clarifies that "two unit sites with both units shutdown or defueled require a total of three non-licensed operators for the two units." Because North Anna 3 is a stand-alone ESBWR unit, Dominion omitted the bracketed statement and retained the existing GTS 5.2.2.a unbracketed statement in PTS 5.2.2.a, which applies to both single-unit and two-unit sites. Therefore, the resolution of this COL item is acceptable.
- Outdoor liquid storage tank radioactivity monitoring program (COL Item 5.5.6-1). GTS 5.5.6, "Explosive Gas and [Storage Tank] Radioactivity Monitoring Program," contains bracketed provisions and a surveillance program for unprotected outdoor liquid radioactive waste storage tanks. The reviewer's note in DCD Section 16.0, Table 16.0-1-A requires the COL applicant to incorporate the GTS 5.5.6 bracketed requirements in PTS 5.5.6, if the site design includes such storage tanks. Because North Anna 3 does not include such storage tanks, PTS 5.5.6 omits these bracketed requirements. Therefore, the resolution of this COL item is acceptable.
- Battery cell parameters (COL Items 3.8.1-4, 3.8.3-3, and 5.5.10-1). The applicant has provided the site-specific values for battery parameters based on the manufacturer's recommendations for the BAE 2V-24OPzS-3000 battery, as in Table 16.2 of this SER.

The applicant completed the bases for PTS surveillance requirement (SR) 3.8.1.1, by replacing the GTS bracketed value with the plant-specific value of 2.22 volts per cell (Vpc) at 25 degrees Celsius (C) (77 degrees Fahrenheit [F]) for the minimum float voltage. This value is based on the battery manufacturer BAE's recommendation for the optimum long-term battery performance by limiting the formation of lead sulfate and self-discharge. Therefore, the staff finds the minimum float voltage of 2.22 Vpc at 25 degrees C for the optimum long-term battery performance acceptable. The staff also finds that the proposed location of "battery terminals" for monitoring the battery temperature for voltage compensation is acceptable because it is consistent with the battery manufacturer BAE's recommendation. Therefore, COL Item 3.8.1-4 is resolved.

The applicant completed Actions A and G, SR 3.8.3.2, and SR 3.8.3.5 and the associated bases of PTS 3.8.3, "Battery Parameters," by replacing the GTS bracketed values with the site-specific value of 2.09 volts (V) as the minimum battery cell float voltage. This value is based on the manufacturer BAE's recommendation.

Table 16.2. Battery Cell Parameters

COL Item	Location	Parameter/Information	PTS Value
3.8.1-4	"SR" section of bases for PTS SR 3.8.1.1	Minimum float voltage for a battery cell and for a battery with 120 cells	• 2.22 volts per cell (Vpc) • 266.4 V at 25 °C (77 °F) at the battery terminals
		Location for monitoring battery temperature for voltage compensation	Battery terminals
3.8.3-3	"Background" section of bases for PTS 3.8.3	Nominal specific gravity value of a fully charged battery cell	1.240
		Number of battery cells in battery	120
		Approximate open circuit voltage for a battery with 120 cells and a battery cell voltage corresponding to the nominal specific gravity value of a fully charged battery cell	• 249.6 V • ≥ 2.07 Vpc to 2.09 Vpc
		Time period that a fully charged battery cell will maintain its capacity without further charging	30 days
		Battery cell float voltage (over-potential) for optimal long-term performance and its benefit	• 2.22 to 2.24 Vpc at 25 °C (77 °F) • limits the formation of lead sulfate and self-discharge
		Nominal float voltage for a battery cell and for a battery with 120 cells	• 2.23 Vpc at 25 °C (77 °F) • 267.6 V
	PTS 3.8.3: • Condition A • Required Action A.3 • Bases for Actions A, B, C, and G • Condition G • SR 3.8.3.2 and bases • SR 3.8.3.5 and bases	Minimum battery cell float voltage	2.09 V
	SR 3.8.3.2 bases and SR 3.8.3.5 bases	Nominal float voltage for a battery cell and for a battery with 120 cells	• 2.23 Vpc at 25 °C (77 °F) • 267.6 V
		Battery cell float voltages addressed by PTS 5.5.10	< 2.13 Vpc but > 2.09 Vpc at 25 °C (77 °F)
		Short-term absolute minimum battery cell voltage	2.09 Vpc

COL Item	Location	Parameter/Information	PTS Value
	SR 3.8.3.4 bases	Battery pilot cell electrolyte design minimum temperature	16 °C (60 °F)
5.5.10-1	PTS 5.5.10.a	Minimum battery cell float voltage	< 2.13 V

The applicant also replaced other bracketed information with appropriate site-specific values. The staff found that a battery cell with a flooded lead-acid construction has a nominal specific gravity of 1.240. This specific gravity corresponds to a battery cell that has an open circuit voltage of 2.07 to 2.09 Vpc for a 120-cell battery at 25 degrees C (77 degrees F). Per the manufacturer’s instruction, the battery cell will maintain its capacity for 30 days without further charging once it is fully charged with its open-circuit voltage greater than or equal to 2.07 to 2.09 Vpc. The staff calculated the open-circuit voltage to be 2.085 Vpc (1.240 + 0.845), using the Institute of Electrical and Electronics Engineers (IEEE) Standard (Std.) 450–2010, “IEEE Recommended Practice for Maintenance, Testing, and Replacement of Vented Lead-Acid Batteries for Stationary Applications,” which is consistent with the manufacturer’s recommendation. The staff finds the site-specific value of 2.09 Vpc for the short-term absolute minimum battery cell float voltage and the values of other associated parameters, such as the specific gravity and duration of capacity retention, to be acceptable. Therefore, COL Item 3.8.3-3 is resolved.

The applicant completed PTS 5.5.10, “Battery Monitoring and Maintenance Program,” which requires establishing a program that provides for battery restoration and maintenance, by replacing GTS bracketed values with site-specific values for a specified battery cell float voltage. Specifically, PTS 5.5.10.a states that the program must include “with battery cell float voltage < 2.13 V, actions to restore cell(s) to ≥ 2.13 V and perform SR 3.8.3.5.” SR 3.8.3.5 verifies that each required battery-connected cell float voltage is ≥ 2.09 V. The value of 2.13 V for implementing programmatic actions for restoration and maintenance is based on the manufacturer’s recommendation. The staff finds that the value cell float voltage selected for the battery restoration and maintenance program to be consistent with IEEE Std 450–2010 and, therefore, acceptable. Therefore, COL Item 5.5.10-1 is resolved.

- Battery margin including the aging factor and state-of-charge uncertainty (COL Item 3.8.1-5). The applicant completed the “Background” section of the bases for PTS 3.8.1-by replacing the GTS bracketed value with the plant-specific value of 80 percent of the battery ampere-hour rating for the battery end-of-life capacity limit. This value is based on the battery manufacturer BAE’s recommendation. The staff finds this value acceptable because the battery sizing includes an aging factor of 125 percent that will provide a 100-percent design demand load with 80 percent of the battery ampere-hour rating, which is consistent with IEEE Std. 485–2010, “IEEE Recommended Practice for Sizing Lead-Acid Batteries for Stationary Applications,” and IEEE Std. 450-2010. Therefore, COL Item 3.8.1-5 is resolved.

- Battery margin including the aging factor and state-of-charge uncertainty (COL Item 3.8.3-4). The applicant completed PTS SR 3.8.3.6 by replacing the GTS bracketed value with the plant-specific value of a battery capacity greater than or equal to 80 percent of the manufacturer’s ampere-hour rating, when subjected to a performance discharge test. This test determines the overall degradation of the battery from age and usage. The staff finds that the battery capacity of 80 percent will meet 100 percent of the design demand loads, because the battery sizing includes an aging factor of 125 percent. The staff also finds that the proposed value is consistent with IEEE Std. 450 and IEEE Std. 485, which recommend that the battery be replaced if its capacity is below 80 percent of the manufacturer's rating. Therefore, the proposed performance discharge test battery capacity acceptance criterion value of greater than or equal to 80 percent of the manufacturer's ampere-hour rating is acceptable. Thus, COL Item 3.8.3-4 is resolved.

- The applicant completed PTS 3.8.3 Conditions B, C, and G; and Required Actions B.2 and C.2; the bases for Actions B, C, and G; and the bases for SR 3.8.3.1 by providing the float current acceptance criterion for verifying a fully charged battery (COL Item 3.8.3-1). Dominion intends to use batteries manufactured by BAE in the 250 V Safety-Related DC (direct current) System. For the selected batteries, a 30 amp battery float current is based on returning the battery to 95 percent charge and assumes a 5 percent design margin to account for uncertainties in the use of float current to measure the state of charge of the battery. These values are recommended by the battery manufacturer and are used to complete the GTS bracketed items in the North Anna 3 TS Bases for TS 3.8.3. Therefore, COL 3.8.3-1 is resolved.

- The applicant completed COL Item 5.5.11-1 regarding PTS 5.5.11, "Setpoint Control Program," by replacing the bracketed information in paragraph b with a reference to the NRC-approved setpoint methodology, NEDE-33304P-A, "GEH ESBWR Setpoint Methodology," Revision 4, issued May 2010, which was approved as part of the ESBWR DC review as documented in NUREG–1966, Section 7.1.4. Specifically, paragraph b states the following:

  > The Limiting Trip Setpoint (LTSP), Nominal Trip Setpoint ($NTSP_F$), Allowable Value (AV), As-Found Tolerance (AFT), and As-Left Tolerance (ALT) for each Technical Specification required automatic protection instrumentation function shall be calculated in conformance with the instrumentation setpoint methodology previously reviewed and approved by the NRC in NEDE-33304P-A, "GEH ESBWR Setpoint Methodology," Revision 4, dated May 2010, (Public Version ML101450251), and the conditions stated in the associated NRC safety evaluation, Letter to GEH from NRC, "Final Safety Evaluation Report for the Economic Simplified Boiling Water Reactor Design," dated March 9, 2011, (ML110050215, specifically Chapter 7 FSER ML110030049 and Chapter 16 FSER ML110030064).

Therefore, COL Item 5.5.11-1 is resolved.

Option 2. The staff determines whether the site-specific information provided under Option 2 is acceptable by verifying that the information is bounding and useable for unit operation. This verification is based on (1) a comparison of the information with the FSAR and the conditions in the associated reviewer's note in DCD Section 16.0, Table 16.0-1-A; and (2) a review of the justification in the COLA that includes how the bounding value was determined. The applicant selected Option 2 for resolving the following COL items:

- Battery charger surveillance test duration (COL Item 3.8.1-1). The applicant stated in Item 19 of the Introduction to Part 4 of the COLA that the proposed minimum test duration of 8 hours for battery charger testing in PTS SR 3.8.1.2 is bounding based on the GUTOR manufacturer's recommendations for battery charger test duration. An 8-hour time period is sufficient for the charger temperature to be stabilized and maintained for at least 2 hours. The staff concludes that 8 hours is a useable bounding value for the battery charger test duration. Therefore, the proposed resolution of COL Item 3.8.1-1 is acceptable.

- Requirements related to the reactor coolant system P/T limits report (PTLR) (COL Items 1.1-1, 3.4.4-1, 3.4.4-2, 3.4.4-3, and 5.6.4-1). Revision 5, Part 4 of the North Anna 3 COLA identified NEDC-33441P, “GE Hitachi Nuclear Energy Methodology for the Development of ESBWR Reactor Pressure Vessel Pressure-Temperature Curves,” Revision 6 as the document that contains the analytical methods used to determine the reactor coolant system P/T limits. The staff’s evaluation of the P/T limits and P/T methodology for North Anna 3 is in Section 5.3.2 of this SER. Based on the staff’s determination that the P/T limits in NEDC-33441P are useable bounding values for North Anna 3, the applicant completed the PTLR-related COL Items by (1) removing brackets from around PTS 5.6.4; (2) replacing the associated bracketed placeholder for the P/T methodology in GTS 5.6.4.b with a reference to NEDC-33441P Revision 5 issued in February 2011, in PTS 5.6.4.b and in the “References” section of the bases for PTS 3.4.4; and (3) removing the brackets from “[PTLR]” in PTS Sections 1.1 and 3.4.4. The staff finds that referencing Revision 5 of NEDC-33441P in the PTS and bases is acceptable because it describes the NRC-approved P/T methodology and bounding P/T limits that are applicable to North Anna 3. Therefore, these PTLR-related COL items are resolved in accordance with Option 2.
- Minimum control rod drive scram accumulator pressure (COL Items 3.1.5-1 and 3.9.5-1). The applicant proposed to replace the bracketed information in the bases for SR 3.1.5.1 as follows:

The GTS SR 3.1.5.1 bases state the following:

> The minimum accumulator pressure of [12.76 MPaG (1850 psig) is well below the expected pressure of 14.82 MPaG (2150 psig) (Ref. 2)].

The PTS SR 3.1.5.1 bases, instead state the following:

> The minimum accumulator pressure of 12.75 MPaG (1849 psig) reflects a bounding value based on the ABWR CRD HCU accumulator minimum pressure value. Using the ABWR minimum pressure value is bounding and thereby justified based on:
>
> a) ESBWR frictional pressure loss is similar to the ABWR design,
>
> b) ESBWR control rod is lighter in weight than the ABWR control rod,
>
> c) ESBWR normal reactor pressure on scram initiation is similar to ABWR, and
>
> d) Mechanical losses should be bounded, since the basic mechanical designs are the same.

For the reasons stated above in the proposed bases for PTS SR 3.1.5.1, the staff concludes that the value of 12.75 megapascals gauge (MPaG) (1,849 pounds per square inch gauge [psig]) is a useable bounding value for the minimum accumulator pressure and is therefore acceptable as a control rod operability criterion in PTS 3.1.5 and PTS 3.9.5. Because the “expected pressure” value is not a criterion for control rod operability, stating it in the bases for PTS SR 3.1.5.1 is not necessary. Therefore, the proposed resolution of COL Items 3.1.5-1 and 3.9.5-1 is acceptable.

Option 3. The staff determines whether the site-specific information provided under Option 3 is acceptable by verifying that the PTS administrative program for controlling the relocated information (1) conforms to the GTS, if the GTS contains such a program, or conforms to applicable regulatory requirements; (2) specifies using an NRC-approved methodology for determining site-specific information to be maintained outside of the PTS; (3) specifies establishing a document to record the most recent version of the relocated information; (4) specifies controlling changes to the specified document in accordance with 10 CFR 50.59, "Changes, Tests and Experiments," and the specified NRC-approved methodology; and (5) specifies the schedule for providing the NRC with updates to the specified document. The staff also verifies that the PTS include appropriate references to the proposed PTS administrative program, if they are needed to establish a connection between the relocated information and the associated individual PTS requirements.

Dominion does not need to use Option 3 to resolve any COL items, because the two areas of site-specific information to which Option 3 would potentially apply were resolved as part of the ESBWR DCD. These areas are (1) instrumentation allowable values for as-found trip settings, and (2) the list of required instrumentation functions for post-accident monitoring (PAM). The GTS specifies instrumentation allowable values by (a) removing all instrumentation settings and (b) specifying a setpoint control program that meets the acceptance criteria stated above for a PTS administrative program under Option 3. The only COL information needed to complete the PTS instrumentation requirements is in PTS 5.5.11. COL Item 5.5.11-1 guidance in Table 16.0-1-A of DCD Section 16.0 states that a COL applicant may complete this item by providing the reference to the NRC-approved setpoint methodology. As described above, the applicant resolved COL Item 5.5.11-1 using Option 1. Dominion incorporated GTS 5.5.11 by reference into the PTS. Because the ESBWR DCD references RG 1.97, "Criteria for Accident Monitoring Instrumentation for Nuclear Power Plants," Revision 4, issued in June 2006, the DC applicant recognized that the list of PAM instrumentation functions specified in GTS 3.3.3.2, "PAM Instrumentation," could not be finalized before the issuance of a COL. Therefore, the GTS include Specification 5.5.14, "PAM Instrumentation Program," which requires a program to provide controls to establish accident-monitoring instrumentation required by GTS 3.3.3.2 to include all Type A, B, and C functions as determined by RG 1.97, Revision 4. Dominion incorporated GTS 5.5.14 by reference into the PTS. Therefore, the staff finds that PTS 5.5.11 and 5.5.14 are acceptable. Based on the above information, COL Item 16.0-1-A is resolved.

In the phase 2 SER with Open Items, the staff stated that RAI 16-1 was a SER open item because the applicant had not completed all the COL items in Table 16.1. The staff's review of the COLA finds the options to resolve each COL item acceptable and in accordance with DC/COL-ISG-08; therefore, Open Item RAI 16-1 is resolved and closed. Also, in the phase 2 SER with Open Items, the staff stated that 16-1 was a SER open item concerning the resolution of the two exemption requests, completion of all the items in Table 16.1, and the incorporation of ESBWR certified design GTS and bases. The applicant's two exemptions requests are no longer part of the COLA. The completion of the COL items is fully described above and the staff finds this acceptable and in accordance with DC/COL-ISG-08. The incorporation of the ESBWR certified design GTS and bases is described above and the staff verified that, except for the COL items, the PTS and bases are identical to the GTS and bases that have received final NRC approval. Therefore, Open Item 16-1 is now resolved and closed. Further, in the phase 2 SER with Open Items, the staff stated that item [1-1] was a SER open item to track completion of the SER on the ESBWR GTS and bases. As stated earlier in Section 16.4 of this document the staff's review of the GTS and bases is completed and documented as part of the ESBWR DC FSER. Therefore, the phase 2 SER Open Item [1-1] is resolved and closed.

The staff also determined, after reviewing Part 7 of the COLA, that the North Anna 3 COLA contains no Tier 1, Tier 2*, or Tier 2 departures from the ESBWR generic DCD that affect the PTS and bases. The COLA also contains no issues concerning information outside of the generic DCD that need to be resolved before completing the review of the PTS and bases.

16.5 Post Combined License Activities

There are no post-COL activities related to this chapter.

16.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirms that the applicant has addressed the required information, and no outstanding information is expected to be addressed in the COL FSAR related to this chapter. The results of the staff's technical evaluation of the information incorporated by reference in the North Anna 3 COLA are documented in NUREG-1966.

In addition, the staff compared the additional COL site-specific information (site-specific TS) in the application to the relevant NRC regulations, the acceptance criteria defined in SRP Section 16.0, and other regulatory guidance. The staff's evaluation finds that the site-specific information is acceptable and that the PTS and bases, without any exemptions, are complete and accurate for use in the operation of North Anna 3. The staff's review confirms that the applicant has adequately addressed COL Items STD COL 16.0-1-A and STD SUP 16.0-1.

Therefore, the staff concludes that the PTS and bases satisfy 10 CFR 50.36; 10 CFR 50.36a; 10 CFR 52.79(a)(30).

17.0 QUALITY ASSURANCE

17.0 QUALITY ASSURANCE

This chapter of the U.S. Nuclear Regulatory Commission's (NRC's) safety evaluation report (SER) provides the NRC staff evaluation of the North Anna 3 Combined License (COL) Quality Assurance (QA) Program, including the following:

- QA for design, fabrication, construction, testing, and operation
- The Reliability Assurance Program (RAP)
- The Maintenance Rule (MR) Program

17.0.1 Introduction

The QA Program for design, fabrication, construction, testing, and operation; the Design Reliability Program; and the MR Program are discussed in this chapter.

17.0.2 Summary of Application

Section 17.0 "Quality Assurance Records" of the North Anna 3, COL Final Safety Analysis Report (FSAR), Revision 8, incorporates by reference Section 17.0 of the certified Economic Simplified Boiling-Water Reactor (ESBWR) Design Control Document (DCD), Revision 10, issued April 2014, referenced in Appendix E, "Design Certification Rule for the ESBWR Design," to Title 10 of the *Code of Federal Regulations* (10 CFR) Part 52, "Licenses, Certifications, and Approvals for Nuclear Power Plants." In addition, in FSAR Section 17.0, the applicant provided the following information:

Supplemental Information

- NAPS SUP 17.0-1

In Section 17.0 of the North Anna 3 COL FSAR, Revision 8, the applicant provided supplemental information that states:

> The QAPD [Quality Assurance Program Description] applicable to the COL licensee is described in Section 17.5. The licensee's QAPD describes the basis of the program, its scope of activities, and the control of work performed by suppliers.

17.0.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is in NUREG–1966, "Final Safety Evaluation Report Related to the Certification of the Economic Simplified Boiling-Water Reactor Standard Design." In addition to the relevant requirements of the Commission regulations in 10 CFR Part 50, "Domestic Licensing of Production and Utilization Facilities," Appendix B, "Quality Assurance Criteria for Nuclear Power Plants and Fuel Reprocessing Plants," and in 10 CFR 52.79(a)(25) for QA during the design phase; the associated acceptance criteria are described in Section 17.5 of NUREG–0800, "Standard Review Plan for the Review of Safety Analysis Reports for Nuclear Power Plants (LWR Edition)," the Standard Review Plan (SRP).

17.0.4 Technical Evaluation

As documented in NUREG–1966, the staff reviewed and approved Section 17.0 of the certified ESBWR DCD. The staff reviewed Section 17.0 of the North Anna 3 COL FSAR, Revision 8, and checked the referenced ESBWR DCD to ensure that the combination of the information in the COL FSAR and the information in the ESBWR DCD appropriately represents the complete scope of information relating to this review topic.[1] The staff's review confirmed that the information in the application and the information incorporated by reference address the relevant information related to this section.

The staff reviewed the information in the North Anna 3 COL FSAR as follows:

<u>Supplemental Information</u>

- NAPS SUP 17.0-1

In FSAR Section 17.0, the applicant states:

> The QAPD applicable to the COL licensee is described in Section 17.5. The licensee's QAPD describes the basis of the program, its scope of activities, and the control of work performed by suppliers.

The staff's evaluation of North Anna 3 COL FSAR Section 17.0 is in Section 17.5 of this SER.

The staff reviewed NAPS SUP 17.0-1 and determined that it adequately references FSAR Section 17.5 for a description of the basis of the QA Program, its scope of activities, and the control of work performed by suppliers.

17.0.5 Post Combined License Activities

There are no post COL activities related to this section.

17.0.6 Conclusion

The staff's finding related to information incorporated by reference is in NUREG–1966. The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the required information, and no outstanding information is expected to be addressed in the North Anna 3 COL FSAR related to this section. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to this section that were incorporated by reference have been resolved.

In addition, the staff compared the additional information in the COL application (COLA) to the relevant NRC regulations, the guidance in SRP Sections 17.1 and 17.5, and other NRC regulatory guides (RGs). The staff's review finds that the applicant has adequately addressed the supplemental information by referencing FSAR Section 17.5.

---

[1] See "*Finality of Referenced NRC Approvals*" in SER Section 1.2.2, for a discussion on the staff's review related to verification of the scope of information to be included in a COL application that references a design certification.

17.1 Quality Assurance During Design

17.1.1 Introduction

This section of the North Anna 3 COL FSAR, Revision 8, addresses the QA Program related to the design phase, including the preparation of the COLA and site-specific design activities.

Nuclear Energy Institute (NEI) 06-14A, “Quality Assurance Program Description,” is a technical report that was approved by the staff to be used as a generic template by early site permit (ESP) and COL applicants to implement NRC regulatory requirements related to QA programs (Agencywide Documents Access and Management System (ADAMS) Accession No. ML070510300). Upon the issuance of the North Anna 3 COL Chapter 17 SER with open items in 2009 (ADAMS Accession No. ML091240315), the North Anna Unit 3 QAPD was developed using NEI 06-14A, Revision 4. The North Anna Unit 3 QAPD included in Revision 8 of the North Anna 3 COL FSAR was written consistent with the SRP. The staff’s requests for additional information (RAIs) from the initial review of the QAPD, their resolution, and the review of the North Anna 3 QAPD included in the North Anna 3 COL FSAR, Revision 8, were reviewed using SRP Section 17.5 and are addressed in Section 17.5 of this SER.

17.1.2 Summary of Application

Section 17.1 of the North Anna 3 COL FSAR, Revision 8, incorporates by reference Section 17.1 of the certified ESBWR DCD, Revision 10, referenced in 10 CFR Part 52, Appendix E. In addition, in FSAR Section 17.1, the applicant provides the following:

Supplemental Information

- NAPS SUP 17.1-1

In FSAR Revision 8 Section 17.1, the applicant provides supplemental information that states:

> QA applied during the preparation of the ESPA [early site permit application] is described in SSAR [site safety analysis report] Chapter 17, which is incorporated by reference.

- NAPS SUP 17.1-2

In FSAR Revision 8 Section 17.1, the applicant provides supplemental information that states:

> QA applied during COL application preparation and site specific design activities is addressed in Section 17.5.

17.1.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is in NUREG–1966. In addition to the relevant requirements of the Commission regulations in 10 CFR Part 50, Appendix B and in 10 CFR 52.79(a)(25) for QA during the design phase, the associated acceptance criteria are described in SRP Section.

17.1.4 Technical Evaluation

As documented in NUREG–1966, the staff reviewed and approved Section 17.1 of the certified ESBWR DCD. The staff reviewed Section 17.1 of the North Anna 3 COL FSAR, Revision 8, and checked the referenced ESBWR DCD to ensure that the combination of the information in the COL FSAR and the information in the ESBWR DCD appropriately represents the complete scope of information relating to this review topic.[1] The staff's review confirmed that the information in the application and the information incorporated by reference address the relevant information related to this section.

The staff reviewed the information in the North Anna 3 COL FSAR as follows:

Supplemental Information

- NAPS SUP 17.1-1

In FSAR Revision 8 Section 17.1, the applicant provides supplemental information that states:

> Quality Assurance (QA) applied during the preparation of the ESPA is described in SSAR Chapter 17, which is incorporated by reference.

- NAPS SUP 17.1-2

In FSAR Revision 8 Section 17.1, the applicant provides supplemental information that states:

> QA applied during COL application preparation and site specific design activities is addressed in Section 17.5.

The staff reviewed Supplemental Information NAPS SUP 17.1-1 and NAPS SUP 17.1-2 and determined that they adequately reference SSAR Chapter 17 and Section 17.5 of the North Anna 3 COL FSAR, Revision 8, for a description of the QA Program applied during the design phase and ESPA, including COLA preparation and site-specific design activities.

17.1.5 Post Combined License Activities

There are no post COL activities related to this section.

17.1.6 Conclusion

The staff's finding related to information incorporated by reference is in NUREG–1966. The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the required information, and no outstanding information is expected to be addressed in the North Anna 3 COL FSAR related to this section. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to this section that were incorporated by reference have been resolved.

In addition, the staff compared the additional supplemental information in the COLA to the relevant NRC regulations, the guidance in SRP Sections 17.1 and 17.5, and other NRC RGs. The staff's review in Section 17.5 of this SER concluded that the applicant has presented adequate information in the North Anna 3 COL FSAR, Revision 8, to meet the requirements.

17.2 Quality Assurance During Construction and Operations

17.2.1 Introduction

This section of the North Anna 3 COL FSAR, Revision 8, addresses the QA Program during the construction and operations phases of the plant, including adapting the design to the plant-specific implementation.

17.2.2 Summary of Application

Section 17.2 of the North Anna 3 COL FSAR, Revision 8, incorporates by reference Section 17.2 of the certified ESBWR DCD, Revision 10, referenced in 10 CFR Part 52, Appendix E. In addition, in FSAR Section 17.2, the applicant provides the following:

COL Items

- NAPS COL 17.2-1-A — QA Program for the Construction and Operations Phases
- NAPS COL 17.2-2-A — QA Program for Design Activities

The applicant provided additional information to address DCD COL Items 17.2-1-A and 17.2-2-A. The applicant stated that the QA Program in place during the construction and operations phases, including the adaptation of the design to the specific plant implementation, is described in Section 17.5 of the North Anna 3 COL FSAR.

17.2.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is in NUREG–1966. In addition to the relevant requirements of the Commission regulations in 10 CFR Part 50, Appendix B and in 10 CFR 52.79(a)(25) for QA during the design phase, the associated acceptance criteria are described in SRP Section 17.5.

17.2.4 Technical Evaluation

As documented in NUREG–1966, the staff reviewed and approved Section 17.2 of the certified ESBWR DCD. The staff reviewed Section 17.2 of the North Anna 3 COL FSAR, Revision 8, and checked the referenced ESBWR DCD to ensure that the combination of the information in the COL FSAR and the information in the ESBWR DCD appropriately represents the complete scope of information relating to this review topic.[1] The staff's review confirmed that the information in the application and the information incorporated by reference address the relevant information related to this section.

The staff reviewed the information in the North Anna 3 COL FSAR as follows:

COL Items

- NAPS COL 17.2-1-A — QA Program for the Construction and Operations Phases
- NAPS COL 17.2-2-A — QA Program for Design Activities

The licensee's QA Program in place during the construction and operations phases, including the adaptation of the design to the specific plant implementation, is described in Section 17.5. These COL Items are addressed in Section 17.5 of this SER.

The staff reviewed COL Items NAPS COL 17.2-1-A and NAPS COL 17.2-2-A to determine whether they meet NRC regulations by following the guidance in SRP Section 17.5. SRP Section 17.5 provides an outline of a QA program acceptable to the staff for the design certification, ESP, COL, construction permit, and operating license applicants. The staff developed SRP Section 17.5 using American Society of Mechanical Engineers (ASME) Nuclear Quality Assurance (NQA)-1–1994, "Quality Assurance Requirements for Nuclear Facility

Applications," supplemented by additional regulatory and industry guidance for nuclear operating facilities. SRP Section 17.5 also addresses additional QA requirements in 10 CFR Part 50, Appendix A, "General Design for Nuclear Power Plants," General Design Criterion 1 (GDC 1), and in 10 CFR 52.79(a)(25). GDC 1 requires that a QA program be established and implemented. 10 CFR 52.79(a)(25) addresses QA program requirements for the design, fabrication, construction, and testing of the structures, systems, and components (SSCs) of a facility.

The staff's safety evaluation of North Anna 3 COL FSAR Section 17.2 is in Section 17.5 of this SER. The staff determined that COL Items NAPS COL 17.2-1-A and NAPS COL 17.2-2-A adequately reference FSAR Section 17.5 for a description of the QA Program applied during the design, construction, and operations phases, including the adaptation of the design to the specific plant implementation. The technical evaluations of COL Items NAPS COL 17.2-1-A and NAPS COL 17.2-2-A are in Subsection 17.5.4.21, "Additional Quality Assurance and Administrative Controls for the Plant Operational Phase," of this SER.

17.2.5 Post Combined License Activities

There are no post COL activities related to this section.

17.2.6 Conclusion

The staff's finding related to information incorporated by reference is in NUREG–1966. The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the required information, and no outstanding information is expected to be addressed in the COL FSAR related to this section. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to this section that were incorporated by reference have been resolved.

In addition, the staff compared the additional COL information in the application to the relevant NRC regulations, the guidance in SRP Section 17.2, and other NRC RGs. The staff's safety evaluation of North Anna 3 COL FSAR Section 17.2 is in Section 17.5 of this SER. The staff concluded that the North Anna 3 COL FSAR, Revision 8 Section 17.2, is acceptable and meets NRC regulatory requirements.

17.3 <u>Quality Assurance Program Description</u>

17.3.1 Introduction

This section of the North Anna 3 COL FSAR, Revision 8, addresses the overall QA Program.

17.3.2 Summary of Application

Section 17.3 of the North Anna 3 COL FSAR, Revision 8, incorporates by reference Section 17.3 of the certified ESBWR DCD, Revision 10, referenced in 10 CFR Part 52, Appendix E. In addition, in FSAR Section 17.3, the applicant provides the following:

<u>COL Item</u>

- NAPS COL 17.3-1-A   Quality Assurance Program Document

In FSAR Section 17.3, the applicant states:

> The Quality Assurance Program Document applicable to the licensee is described in Section 17.5.

17.3.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is in NUREG–1966. In addition to the relevant requirements of the Commission regulations in 10 CFR Part 50, Appendix B and in 10 CFR 52.79(a)(25) for QA during the design phase, the associated acceptance criteria are described in SRP Section 17.5.

17.3.4 Technical Evaluation

As documented in NUREG–1966, staff reviewed and approved Section 17.3 of the certified ESBWR DCD. The staff reviewed Section 17.3 of the North Anna 3 COL FSAR, Revision 8, and checked the referenced ESBWR DCD to ensure that the combination of the information in the COL FSAR and the information in the ESBWR DCD appropriately represents the complete scope of information relating to this review topic.[1] The staff's review confirmed that the information in the application and the information incorporated by reference address the relevant information related to the QAPD.

The staff reviewed the information in the North Anna 3 COL FSAR as follows:

COL Item

- NAPS COL 17.3-1-A Quality Assurance Program Document

In FSAR Section 17.3, the applicant states:

> The Quality Assurance Program Document applicable to the licensee is described in Section 17.5.

The staff's review of this COL item is in Section 17.5 of this SER.

The staff reviewed COL Item NAPS COL 17.3-1-A to determine whether it meets NRC regulations by following the guidance in SRP Section 17.5. SRP Section 17.5 provides an outline of a QA program acceptable to the staff for the design certification, ESP, COL, construction permit, and operating license applicants. The staff developed SRP Section 17.5 using ASME NQA-1-1994 supplemented by additional regulatory and industry guidance for nuclear operating facilities. SRP Section 17.5 also addresses additional QA requirements in 10 CFR Part 50, Appendix A, GDC 1, and 10 CFR 52.79(a)(25). GDC 1 requires that a QA program be established and implemented. 10 CFR 52.79(a)(25) addresses QA program requirements for the design, fabrication, construction, and testing of the SSCs of a facility. The staff determined that COL Item 17.3-1-A adequately references FSAR Section 17.5 for details of the QAPD.

17.3.5 Post Combined License Activities

There are no post COL activities related to this section.

17.3.6 Conclusion

The staff's finding related to information incorporated by reference is in NUREG–1966. The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the required information, and no outstanding information is expected to be addressed in the COL FSAR related to this section. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to this section that were incorporated by reference have been resolved.

In addition, the staff compared the additional COL information in the application to the relevant NRC regulations, the guidance in SRP Section 17.3, and other NRC RGs. The staff's technical evaluation of the QAPD is in Section 17.5 of this SER. The staff concluded that the North Anna 3 COL FSAR, Revision 8 Section 17.3, is acceptable and meets NRC regulatory requirements.

17.4 Reliability Assurance Program During Design Phase

17.4.1 Introduction

This section of the North Anna 3 COL FSAR, Revision 8, addresses the Commission's direction in the staff requirements memorandum (SRM) dated June 28, 1995, for Item E, "Reliability Assurance Program," of SECY–95–132, "Policy and Technical Issues Associated with the Regulatory Treatment of Non-Safety Systems (RTNSS) in Passive Plant Designs (SECY-94-084)," dated May 22, 1995. The RAP was implemented using the guidance in Item E of SECY–95–132. The purposes of the RAP are to provide reasonable assurance that:

- A plant is designed, constructed, and operated consistent with the assumptions and risk insights for the SSCs in the scope of the RAP.
- These SSCs do not degrade to an unacceptable level of reliability, availability, or condition during plant operations.
- The frequency of transients that challenge these SSCs is minimized.
- These SSCs function reliably when challenged.

The purposes of the RAP can be achieved by implementing the program in two stages. The first stage applies to RAP activities that occur before the initial fuel load and is referred to as the Design-Reliability Assurance Program (D-RAP). The goal of the D-RAP is to ensure that the plant's design meets the considerations identified earlier through the plant's design, procurement, fabrication, construction, and preoperational testing activities and programs. The second stage applies to RAP activities for the operations phase of the plant's life cycle. The objective during this stage is to ensure that the reliability for the SSCs within the scope of the RAP is maintained during plant operations. Implementation of the D-RAP by the COL licensee is verified using the inspections, tests, analyses, and acceptance criteria (ITAAC) process, as well as inspections conducted during the detailed design and construction phases before the initial fuel load.

17.4.2 Summary of Application

Section 17.4 of the North Anna 3 COL FSAR, Revision 8, incorporates by reference Section 17.4 of the certified ESBWR DCD, Revision 10, referenced in 10 CFR Part 52, Appendix E. In addition, in FSAR Section 17.4, the applicant provides the following:

COL Item

- STD COL 17.4-1-A Identifying Site-Specific Structures, Systems, and Components Within the Scope of the Reliability Assurance Program

In FSAR Section 17.4.1, "Introduction," the applicant states:

> There are no site specific SSCs within the scope of the Reliability Assurance Program (RAP). The quality elements for all SSCs within the scope of the Design Reliability Assurance Program (D-RAP) are in accordance with the Quality Assurance Program Description (QAPD).

In FSAR Section 17.4.6, "SSC Identification/Prioritization," the applicant states:

> The list of risk-significant SSCs will be confirmed via the ITAAC (see DCD Tier 1 Table 3.6-1).

- STD COL 17.4-2-A Operation Reliability Assurance Activities

In FSAR Section 17.4.1, the applicant states:

> The objectives of reliability assurance during the operations phase are integrated into the Quality Assurance Program (Section 17.5), the MR Program (Section 17.6), and other operational programs. Specific reliability assurance activities are addressed within operational programs (e.g., maintenance rule, surveillance testing, in-service testing, in-service inspection, and quality assurance) and the maintenance programs.
>
> The MR Program incorporates the following aspects of operational reliability assurance (refer to Section 17.6):
>
> - Use of probabilistic risk assessment (PRA) importance measures, the expert panel process, and deterministic methods to determine the list of risk-significant SSCs.
> - Evaluation and maintenance of the reliability of SSCs in the scope of the D-RAP.
> - Monitoring the effectiveness of maintenance activities needed for operational reliability assurance.
> - Classifying, initially, as high-safety-significant, all SSCs that are in the scope of the D-RAP, or applying expert panel review for any exceptions.
> - Use of historical data and industry operating experience on equipment performance, as available.
> - Use of specific criteria to establish the level of performance or condition being maintained for SSCs within the scope of the MR Program; and use of monitoring to identify declining trends between surveillances and to minimize the likelihood of undetected performance or condition degradation to unacceptable levels, to the extent possible.

- Use of maintenance programs to determine the nature and frequency of maintenance activities to be performed on plant equipment, including SSCs within the scope of the MR Program.

In FSAR Section 17.4.9, "Operational Reliability Assurance Activities," the applicant states:

> Refer to Section 17.4.1 for the implementation of reliability assurance during the operations phase.

In FSAR Section 17.4.10, "Owner/Operator's Reliability Assurance Program," the applicant states:

> The MR Program is described in Section 17.6. Refer to Section 17.4.1 for the implementation of reliability assurance activities.

17.4.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is in NUREG–1966. In addition the associated acceptance criteria are described in SRP Section 17.4.

In particular, the relevant guidance for the RAP, including the associated acceptance criteria, is in the following sources:

- Item E of SECY-95-132

- Section 17.4, Revision 1, "Reliability Assurance Program," of NUREG–0800

17.4.4 Technical Evaluation

As documented in NUREG–1966, the staff reviewed and approved Section 17.4 of the certified ESBWR DCD. The staff reviewed Section 17.4 of the North Anna 3 COL FSAR, Revision 8, and checked the referenced ESBWR DCD to ensure that the combination of the information in the COL FSAR and the information in the ESBWR DCD appropriately represents the complete scope of information relating to this review topic.[1] The staff's review confirmed that the information in the application and the information incorporated by reference address the relevant information related to the RAP.

The staff reviewed the information in the North Anna 3 COL FSAR as follows:

<u>*COL Items*</u>

- STD COL 17.4-1-A — Identifying Site-Specific Structures, Systems, and Components Within the Scope of the Reliability Assurance Program

In Section 17.4.13 of the referenced ESBWR DCD, Tier 2, Revision 10, COL Item 17.4-1-A states:

> The COL Applicant will identify the site-specific SSCs within the scope of the RAP, and describe the quality elements for developing and implementing the D-RAP (that is, Organization, Design Control, Procedures and Instructions, Records, Corrective Action, and Audit Plans) that will be applied prior to the initial fuel load (Subsection 17.4.1).

The applicant addresses this COL item in Section 17.4.1 of the North Anna 3 COL FSAR, Revision 8.

ESBWR DCD, Tier 2, Revision 10, contains COL Item 17.4-1-A to ensure that COLAs referencing the ESBWR design contain a list of site-specific RAP SSCs (i.e., the RAP SSCs identified in Section 17.4 of ESBWR DCD Tier 2 and updated, as needed, using COL site- and plant-specific information) and describe the quality elements for developing and implementing the plant-specific D-RAP, which are applied during all plant design and construction activities prior to the initial fuel load. It is necessary to identify the site-specific RAP SSCs prior to the detailed design, procurement, fabrication, construction, inspection, and testing phases of the plant, because the nonsafety-related RAP SSCs are subjected to the appropriate QA controls in accordance with SRP Section 17.5, Part V ("Non-safety-Related SSC Quality Controls"). The quality elements of the D-RAP are processes and controls to ensure that (1) the risk insights and key assumptions from probabilistic, deterministic, and other methods of analysis used to identify and quantify risk are consistent with the designed and constructed plant; and (2) the list of RAP SSCs is appropriately developed, maintained, updated, and communicated to the appropriate organizations.

The applicant stated in Section 17.4.1 of the North Anna 3 COL FSAR, Revision 8 that no site-specific SSCs are within the scope of the RAP. The staff evaluated this assertion as follows.

In Appendix 19AA of the North Anna 3 COL FSAR, Revision 8, the applicant describes an evaluation of site-specific parameters to confirm that the values assumed in the PRA for these parameters provide bounding treatments of the parameters with respect to the results of the PRA. The staff considered this evaluation in its review of Appendix 19AA of the North Anna 3 COL FSAR, Revision 8, and found it acceptable. Further, in Appendix 19AA of the FSAR, the applicant states that in addition to the bounding treatment of the PRA parameters, there were no departures from the standard design in any systems considered in the PRA model. Therefore, there were no site-specific design features that affected the PRA because the boundary of the certified design covers all of the SSCs necessary for the PRA. Regarding the RTNSS SSCs, Appendix 19A of the ESBWR DCD, Tier 2, Revision 10, is incorporated by reference into North Anna 3 COL FSAR, Revision 8 with a single departure and no supplements. The departure specifies augmented design criteria for non-seismic structures housing the RTNSS Criterion C systems. This departure exceeds NRC expectations described in SECY-95-132 and will not result in the addition of site-specific nonsafety-related RTNSS systems beyond the scope of the DCD. Therefore, based on the review of information in Chapter 19 of North Anna 3 COL FSAR, Revision 8, the staff agrees that the list of SSCs within the scope of the RAP for North Anna 3 is identified in Section 17.4 of the ESBWR DCD, Tier 2, Revision 10, which is incorporated by reference into North Anna 3 COL FSAR, Revision 8.

The COL applicant added the following new paragraph at the end of FSAR Section 17.4.6:

> The list of risk-significant SSCs will be confirmed via ITAAC (see DCD Tier 1, Table 3.6-1).

The staff found this statement acceptable since the D-RAP ITAAC in ESBWR DCD Tier 1, Table 3.6-1 will ensure that the design of the SSCs within the scope of the RAP is consistent with the risk insights and key assumptions from the probabilistic, deterministic, and other methods of analysis used to identify and quantify risk. This includes applying the quality elements of the D-RAP during design and construction activities to ensure that the list of RAP SSCs is appropriately developed, maintained, and communicated to the appropriate organizations.

- STD COL 17.4-2-A Operation Reliability Assurance Activities

In Section 17.4.13 of the referenced ESBWR DCD Tier 2, Revision 10, COL Item 17.4-2-A requires the applicant to describe operational reliability assurance activities that meet the objectives of the RAP during the operations phase. In FSAR Section 17.4.1, the applicant describes an acceptable process for integrating the RAP into operational programs to meet the objectives of the RAP during the operations phase. The process involves integrating the RAP into operational programs that include the (1) MR Program with all RAP SSCs categorized as having a high safety significance; (2) QA Program for safety-related SSCs established through Appendix B to 10 CFR Part 50 requirements; (3) QA controls for nonsafety-related RAP SSCs established in accordance with Part V of SRP Section 17.5; and (4) in-service inspection, in-service testing, surveillance testing, and maintenance programs for the RAP SSCs. The applicant refers to FSAR Section 17.5 for the QA Program and Section 17.6 for the MR Program.

The second paragraph in Section 17.4.9 of the ESBWR DCD, Tier 2, Revision 10 states that the COL holder is responsible for implementing the operational reliability assurance activities. The applicant replaced the second paragraph with the following sentence:

> Refer to Section 17.4.1 for the implementation of reliability assurance during the operations phase.

The staff found this replacement acceptable, because FSAR Section 17.4.1 describes how the applicant will implement the reliability assurance activities during the operations phase.

The fifth bullet in Section 17.4.10 of the ESBWR DCD, Tier 2, Revision 10 describes the scope of the MR Program and that it is the responsibility of the licensee. The applicant replaced the fifth bullet with the following sentence:

> MR Program: The MR Program is described in Section 17.6.

The staff found this replacement acceptable because FSAR Section 17.6 describes the applicant’s MR Program, which meets the scope defined under the fifth bullet in DCD Section 17.4.10. The staff’s technical evaluation of North Anna 3 COL FSAR Section 17.6 is in Section 17.6 of this SER.

The last sentence in ESBWR DCD, Tier 2, Revision 10, Section 17.4.10 states, “See Subsection 17.4.1 for COL information requirements.” The applicant replaced this sentence with the following sentence:

> Refer to Section 17.4.1 for the implementation of reliability assurance activities.

The staff found this replacement appropriate.

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has adequately addressed the required information relating to COL Items STD COL 17.4-1-A and STD COL 17.4-2-A consistent with the applicable requirements described in Section 17.4.3 of this SER. Therefore, these COL items are closed.

17.4.5 Post Combined License Activities

There are no post COL activities related to this section.

17.4.6 Conclusion

The staff's finding related to information incorporated by reference is in NUREG–1966. The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the required information, and no outstanding information is expected to be addressed in the COL FSAR related to this section. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to the RAP that were incorporated by reference have been resolved.

In addition, the staff compared the additional information in the COLA to the relevant NRC regulations, the guidance in SRP Section 17.4, Revision 1, and other NRC RGs. The staff's review concluded that the applicant has provided sufficient information to address the COL items and to satisfy the NRC requirements in Section 17.4.3 of this SER.

17.5 Quality Assurance Program Description – Design Certification, Early Site Permits, and New License Applicants

17.5.1 Introduction

This section of the North Anna 3 COL FSAR, Revision 8, discusses the overall QA Program; including the QA Program that is applicable during the design, construction, and operations phases of a nuclear power plant.

17.5.2 Summary of Application

Section 17.5 of the North Anna 3 COL FSAR, Revision 8 refers to Section 17.1 of the certified ESBWR DCD, Revision 10, referenced in 10 CFR Part 52, Appendix E. In addition, in FSAR Section 17.5, the applicant provides the following:

COL Items

- NAPS COL 17.2-1-A — QA Program for the Construction and Operations Phases

- NAPS COL 17.2-2-A — QA Program for Design Activities

In FSAR Section 17.5, the applicant states:

> QA applied to activities to adapt the design to specific plant implementation, construction, and operations is addressed in Dominion QAPD (Appendix 17AA). The QAPD is based on NEI 06-14A.

- NAPS COL 17.3-1-A — Quality Assurance Program Document

In FSAR Section 17.5, the applicant states:

> QA applied to the DC activities is described in DCD Section 17.1.
>
> QA applied during the preparation of the ESP application is described in SSAR Chapter 17.

Supplemental Information

- NAPS SUP 17.5-2

In FSAR Section 17.5, the applicant states:

> QA applied to safety-related activities performed prior to start of construction (e.g., site investigation, design and safety analysis, early procurements) is described in the Dominion Nuclear Facility QAPD (Reference 17.5-201) topical report for the Dominion operating nuclear plants as supplemented by COL Project procedures.

- NAPS SUP 17.5-3

Supplemental Information NAPS SUP 17.5-3 addresses and resolves ESBWR DCD COL Items 17.2-1-A, 17.2-2-A, and 17.3-1-A. This supplemental information describes the QA Program that will be applied to the construction and operations phases. Appendices 17AA and 17BB of the North Anna 3 COL FSAR include the QAPD and the North Anna 3 QAPD, respectively, which will be applied during construction and operations.

17.5.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is in NUREG–1966. In addition the relevant requirements of the Commission regulations for the QAPD, and the associated acceptance criteria, are in SRP Section 17.5.

The applicable regulatory requirements for Dominion’s QAPD are as follows:

- Appendix B to 10 CFR Part 50 requires the applicant to include in the application a description of the QA Program that will be applied to the design, fabrication, construction, and testing of the SSCs of the facility and to establish QA requirements for the design, construction, and operation of those SSCs. The pertinent requirements of Appendix B apply to all activities affecting the safety-related functions of the SSCs including designing, purchasing, fabricating, handling, shipping, storing, cleaning, erecting, installing, inspecting, testing, operating, maintaining, repairing, refueling, and modifying these activities.

- 10 CFR 52.79(a)(17) requires that the application include information with respect to compliance with technically relevant positions of the Three Mile Island requirements of 10 CFR 50.34(f).

- 10 CFR 52.79(a)(25) requires that the description of the QA program include a discussion of how the applicable requirements of Appendix B have been and will be satisfied and a discussion of how the QA program will be implemented.

- 10 CFR 52.79(a)(27) requires that the application include information on the managerial and administrative controls to be used for a nuclear power plant and a discussion of how the applicable requirements of Appendix B will be satisfied.

From March 24 through March 27, 2014, the staff conducted a limited scope inspection at Dominion’s facility in Glen Allen, VA, as documented in Inspection Report 05200017/2014-202 dated April 15, 2014 (ADAMS Accession No. ML14101A098). The purpose of the NRC inspection was to verify that the QA processes and procedures were effectively implemented with regard to the North Anna 3 COLA. The NRC inspectors identified no findings of significance.

17.5.4 Technical Evaluation

Supplemental Information

- NAPS SUP 17.5-2

In RG 1.206, “Combined License Applications for Nuclear Power Plants (LWR Edition),” Regulatory Position C.I.17.5.3 states that applicants may use an existing QAPD that the NRC has approved for current use provided that the applicant identifies and justifies alternatives to or differences from the SRP in effect 6 months before the docket date of the application. The staff issued RAI 17.5-1 (ADAMS Accession No. ML081760334), dated June 24, 2008, and requested that the applicant provide an evaluation for the existing QAPD at that time against the acceptance criteria in SRP Section 17.5.

In the response to RAI 17.5-1 dated August 4, 2008 (ADAMS Accession No. ML082200545), the applicant evaluated the QAPD with respect to SRP Section 17.5 acceptance criteria. The applicant provided a table illustrating each acceptance criterion in SRP Section 17.5, and whether the QAPD met the criteria or the criteria were not applicable. The table was included in the COL FSAR as Table 1.9-201. As a result of the evaluation, the applicant found that with the exception of some criteria, the QAPD conformed to the acceptance criteria in SRP Section 17.5. The staff found the applicant’s response to RAI 17.5-1 acceptable. Therefore, RAI 17.5-1 is resolved and closed.

- NAPS SUP 17.5-3

On June 24, 2008, the staff issued RAI 17.5-2 (ADAMS Accession No. ML081760334) and requested that the applicant clarify the scope of work for each Appendix as it relates to design and procurement activities, by identifying when and where these design and procurement activities will take place and specifying under which QAPD these activities will be conducted.

In the response to RAI 17.5-2 dated August 4, 2008 (ADAMS Accession No. ML082200545), the applicant provided the current scope of work for each Appendix as it relates to design and procurement activities. The applicant clarified that General Electric-Hitachi (GEH) (Wilmington, NC) would be responsible for design activities associated with the COL review, and Bechtel (Frederick, MD) would be responsible for construction site preparation. In addition, Bechtel would oversee procurement for items and services such as design work, and GEH would oversee activities for manufacturing and fabricating the reactor pressure vessel. These activities would be conducted under the North Anna 3 QAPD described in FSAR Appendix 17BB. The North Anna 3 QAPD would be ready for implementation by June 2009. The staff found the applicant’s response to RAI 17.5-2 acceptable because the applicant had satisfactorily clarified the scope of each Appendix. Therefore, RAI 17.5-2 is resolved and closed.

The staff reviewed and evaluated the North Anna 3 QAPD supplemental information included in the RAI 17.5-2 response to determine whether it met NRC regulations by adhering to the guidance in SRP Section 17.5. SRP Section 17.5 provides the acceptance criteria for QA programs for DC, ESP, COL, and operating license applicants. The QAPD at this time for North Anna 3 was the top-level document that establishes the QA measures applied for activities related to the design, construction, and operation of an ESBWR at the North Anna 3 site. Part I, Section 1.1 of the North Anna 3 QAPD lists the quality activities to which the QAPD applies. Although this list is not all inclusive, the staff noted that siting is on the list. The staff issued RAI 17.5-3 (ADAMS Accession No. ML081760334) on June 24, 2008, and requested the applicant clarify how siting activities would be subject to this QAPD since the North Anna 3 ESP had been approved.

In the response to RAI 17.5-3 dated August 4, 2008 (ADAMS Accession No. ML082200545), the applicant stated that siting activities subject to the North Anna 3 QAPD are associated with any additional design work or measurements required to support construction. Additional subsurface measurement activities would be performed consistent with ASME NQA-1-1994, Basic Requirement 3, Supplement 3S-1, Basic Requirement 11, Supplement 11S-1, and subsurface investigation requirements in Subpart 2.20. The staff endorsed NQA-1-1994 as an acceptable approach to meet Appendix B to 10 CFR Part 50 requirements. Therefore, the staff finds the applicant’s response to RAI 17.5-3 acceptable. Therefore, RAI 17.5-3 is resolved and closed.

In evaluating the adequacy of the North Anna 3 QAPD, the staff used the guidance in SRP Section 17.5, “Quality Assurance Program Description – Design Certification, Early Site Permit and New License Applicants," hereafter referred to as SRP Section 17.5. SRP Section 17.5 provides acceptance criteria for the design certification, ESP, COL, construction permit, and operating license applicants and is based on ASME NQA-1-1994, as supplemented by additional regulatory and industry guidance for nuclear operating facilities. SRP Section 17.5 also addresses additional QA requirements in 10 CFR Part 50, Appendix A, GDC 1, and 10 CFR 52.79(a)(25). GDC 1 requires that a QA program be established and implemented. 10 CFR 52.79(a)(25) addresses the QA program requirements for the design, fabrication, construction, and testing of the SSCs of a facility.

The staff reviewed Revision 8 of the North Anna 3 COL FSAR. Appendix 17AA of the FSAR is the Topical Report DOM-QA-2, “North Anna Unit 3 Quality Assurance Program Description,” (North Anna 3 QAPD) Revision 6. The North Anna 3 QAPD addresses the QA Program that will be applied to activities after submitting the COLA to adapt the design to plant-specific implementation, construction, and operations.

The North Anna 3 QAPD is based on NEI 06–14A, Revision 7. The NRC concluded that the NEI 06-14 template provides an acceptable format for establishing a QA program that meets the requirements of Appendix B to 10 CFR Part 50, as documented in the SE for NEI 06-14, “Final Safety Evaluation for Technical Report NEI 06-14,’Quality Assurance Program Description,’ Revision 9,” (ADAMS Accession No. ML101800497).

17.5.4.1 Organization

The North Anna 3 QAPD follows the guidance of SRP Section 17.5, Paragraph II.A, by providing an organizational description for a new plant license, the independence of working and checking organizations, and the interrelationships of new plant and existing utility organizations. The North Anna 3 QAPD describes an organizational structure that clearly delineates those management positions responsible for establishing, maintaining, and implementing regulatory requirements from corporate through operating plant positions. The North Anna 3 QAPD describes functional responsibilities and position descriptions during the construction, preoperational, and operations phases; and characterizes the controls and transitions between phases. It allows management to size the QA organization commensurate with its assigned duties and responsibilities.

On June 24, 2008, the staff issued RAI 17.5-4 (ADAMS Accession No. ML081760334) and requested that the applicant provide a flow chart to delineate the organizational interfaces and interrelationships between the North Anna corporate and onsite QA organizations.

In the response to RAI 17.5-4 (ADAMS Accession No. ML082200545) dated August 4, 2008, and supplemented by a letter dated September 11, 2008 (ADAMS Accession No. ML082610417), the applicant included Figures II.1-1 and II.1-2 to identify the organization for the construction and operations phases, respectively. The staff's subsequent review of NEI 06-14A, which was used by the applicant to develop the QAPD and the evaluation of the extent of information that the organizational section of the QAPD needed to include, was tracked as Open Item 17.5-4. The NRC reviewed NEI 06-14A and concluded that the NEI template can be used by applicants of 10 CFR Part 52 permits or licenses, as applicable, for establishing a QA program that complies with the requirements of 10 CFR Part 50, Appendix B and 10 CFR Part 52. The review of the North Anna 3 QAPD, which is formatted to NEI 06-14A, provides a clear illustration in the QAPD of the interrelationships between the North Anna corporate and onsite QA organizations. The staff therefore finds the response to RAI 17.5-4 acceptable, and Open Item 17.5-4 is resolved and closed.

The staff noted that the North Anna 3 QAPD provides a reference to North Anna 3 COL FSAR Chapter 13 for a more detailed description of the operating organization. The staff issued RAI 17.5-7 (ADAMS Accession No. ML081760334), dated June 24, 2008, and requested the applicant to clarify which regulation (i.e., 10 CFR 50.54(a) or 10 CFR 50.59, "Changes, tests, and experiments,") will be applied to changes in the operating organizational description included in FSAR Chapter 13.

The applicant chose to describe the detailed organizational responsibilities for operating the facility in Chapter 13 of the FSAR to minimize duplication of information between Chapters 13 and 17. This detailed description is incorporated by reference in Chapter 17. Because the organization is implementing the QA Program described in Chapter 17, the applicant will manage any changes to the organization in accordance with 10 CFR 50.54(a) to ensure the appropriate review and approval process. On August 4, 2008, the applicant responded to RAI 17.5-7 (ADAMS Accession No. ML082200545) stating that FSAR Section 13.1.1 commits to the changes of the organization that will be reviewed under the provisions of 10 CFR 50.54(a). This review will ensure that any reduction in commitments under the QAPD will be submitted to and approved by the staff before implementation. On this basis, the staff finds the response to RAI 17.5-7 acceptable and therefore, RAI 17.5-7 is resolved and closed.

In establishing the QA Program controls, the North Anna 3 QAPD commits to implementing the quality requirements described in NQA-1-1994, Basic Requirement 1 and Supplement 1S-1, without alternatives or exceptions. The staff determined that the organization controls are in accordance with the guidance in SRP Section 17.5 and are therefore acceptable.

17.5.4.2 Quality Assurance Program

The North Anna 3 QAPD follows the guidance of SRP Section 17.5, Paragraph II.B for establishing the necessary measures to implement a QA program to ensure that the design, construction, and operation of nuclear power plants are in accordance with governing regulations and license requirements. The QA Program comprises those planned and systematic actions necessary to provide confidence that SSCs will perform their intended safety function, including certain nonsafety-related SSCs and activities that are significant contributors to plant safety. The QA Program requires a list or system identifying SSCs and activities applicable to the North Anna 3 QAPD.

10 CFR 52.79, "contents of applications; technical information in final safety analysis report," identifies the technical information required in the applicant's FSAR. The staff noted that an earlier version of the QAPD provides a reference to 10 CFR 50.34(b)(6)(ii). The staff issued

RAI 17.5-5 (ADAMS Accession No. ML081760334), dated June 24, 2008, and requested the applicant to revise the cited regulation.

In the response to RAI 17.5-5 dated August 4, 2008 (ADAMS Accession NO. ML082200545), the applicant correctly cited 10 CFR 52.79(a)(27) rather than 10 CFR 50.34(b)(6)(ii). The change was shown on the attached FSAR markup. The applicant submitted FSAR Revision 1 in December 2008 without incorporating the reference to the regulation. Instead, the applicant decided to change it to "Regulations." In a conference call on February 25, 2009, the applicant mentioned that the change was based on the latest revision to NEI 06-14A that included the word "regulation." The staff's subsequent review of NEI 06-14A that the applicant had used to develop the QAPD, and the evaluation of the reference to the regulation, were tracked as Open Item 17.5-5.

The applicant's change to the North Anna 3 QAPD in Revision 8, as discussed in Section 17.1 of this SER, and the submittal of FSAR Revision 8 updated the commitment to 10 CFR 50.54(a), which references 10 CFR 52.79 requirements. Therefore, Open Item 17.5-5 is resolved and closed.

The North Anna 3 QAPD provides measures to assess the adequacy of the QAPD and to ensure its effective implementation at least once each year or at least once during the life of a quality-related activity, whichever is shorter. The period for assessing the QAPD during the operations phase may be extended to once every 2 years. In addition, consistent with SRP Section 17.5, Paragraph II.B.8, a grace period of 90 days is applied to activities that must be performed on a periodic basis. The grace period does not allow the "clock" for a particular activity to be reset forward. However, the "clock" for an activity may be reset backwards when an activity is performed early.

The North Anna 3 QAPD follows the guidance of SRP Section 17.5, Paragraphs II.S and II.T, for describing the necessary measures to establish and maintain formal indoctrination and training programs for personnel performing, verifying, or maintaining activities within the scope of the QAPD to ensure that task-related proficiency is maintained. Plant technical specifications delineate the minimum qualifications for plant and support staff. Personnel complete the training for positions identified in 10 CFR 50.120, "Training and qualification of nuclear power plant personnel," according to programs accredited by the National Nuclear Accrediting Board of the National Academy for Nuclear Training. The North Anna 3 QAPD provides the minimum training requirements for managers responsible for QAPD implementation and for the manager responsible for planning, implementing, and maintaining the QAPD.

The North Anna 3 QAPD commits the applicant to the quality requirements described in NQA-1-1994, Basic Requirement 2 and Supplements 2S-1, 2S-2, 2S-3, and 2S-4, with the following clarifications and exceptions:

- NQA-1-1994, Supplement 2S-1

    Supplement 2S-1 will include use of the guidance provided in Appendix 2A-1 the same as if it were part of the Supplement. During the operations phase, the following two alternatives may be applied to the implementation of this Supplement and Appendix:

    (1) In lieu of being certified as Level I, II, or III in accordance with NQA-1-1994, personnel that perform independent quality verification inspections, examinations, measurements, or tests of material, products, or activities will be required to possess qualifications equal to or better than those required for performing the task being verified; and the verification is within the skills of these personnel and/or is addressed by procedures. These

individuals will not be responsible for the planning of quality verification inspections and tests (i.e., establishing hold points and acceptance criteria in procedures, and determining who will be responsible for performing the inspections), evaluating inspection training programs, nor certifying inspection personnel.

The staff evaluated this proposed alternative and determined that it is consistent with inspection and test personnel initial qualification requirements specified in SRP Section 17.5, Paragraph II.T.5. Therefore, the staff concluded that this alternative is acceptable.

(2) A qualified engineer may be used to plan inspections, evaluate the capabilities of an inspector, or evaluate the training program for inspectors. For the purpose of these functions, a qualified engineer is one who has a baccalaureate in engineering in a discipline related to the inspection activity (such as electrical, mechanical, civil) and has a minimum of five years engineering work experience with at least two years of this experience related to nuclear facilities. The staff evaluated this proposed alternative and determined that the designation of a qualified engineer to plan inspections, evaluate inspectors, or evaluate the inspector qualification programs is consistent with the training and qualification criteria of 10 CFR Part 50, Appendix B, Criterion II, "Quality Assurance Program," and NQA-1–1994, Supplement 2S-1. Therefore, the staff concluded that this alternative is acceptable.

The staff evaluated this proposed alternative and determined that the designation of a qualified engineer to plan inspections, evaluate inspectors, or evaluate the inspector qualification programs is consistent with the training and qualification criteria of Appendix B to 10 CFR Part 50, Criterion II, and NQA-1–1994, Supplement 2S-1. Therefore, the staff concluded that this alternative is acceptable.

- NQA-1-1994, Supplement 2S-2

In lieu of Supplement 2S-2, for qualification of nondestructive examination personnel, North Anna 3 will follow the applicable standard cited in the version(s) of Section III and Section XI of the ASME Boiler and Pressure Vessel Code approved by the NRC for use at the North Anna 3 site.

The staff evaluated this proposed alternative and determined that it is consistent with the regulation in 10 CFR Part 50, Appendix B, Criterion II. Therefore, the staff concluded that this alternative is acceptable.

- NQA-1-1994, Supplement 2S-3

The requirement that prospective Lead Auditors have participated in a minimum of five audits in the previous 3 years is replaced by the following, "The prospective lead auditor shall demonstrate his/her ability to properly implement the audit process, as implemented by Dominion, to effectively lead an audit team, and to effectively organize and report results, including participation in at least one nuclear audit within the year preceding the date of qualification."

The staff evaluated this proposed alternative and determined that it is consistent with the regulation in 10 CFR Part 50, Appendix B, Criterion II. Therefore, the staff concluded that this alternative is acceptable.

The staff evaluated this proposed alternative and determined that it is consistent with quality requirements in SRP Section 17.5 and is therefore acceptable.

In establishing the QA Program controls, the North Anna 3 QAPD commits to implement the quality requirements described in NQA-1-1994, Basic Requirement 2 and Supplements 2S-1, 2S-2, 2S-3, and 2S-4, with the exceptions and alternatives described above. The staff determined that the QA Program controls are in accordance with the guidance of SRP Section 17.5 and are therefore acceptable.

17.5.4.3 Design Control

The North Anna 3 QAPD follows the guidance of SRP Section 17.5, Paragraph II.C, for establishing the necessary measures to control the design; design changes; and temporary modifications (e.g., temporary bypass lines, electrical jumpers and lifted wires, and temporary setpoints) of items within the scope of the QAPD. The North Anna 3 QAPD includes provisions to control design inputs, outputs, changes, interfaces, records, and organizational interfaces among the applicant and the suppliers. These provisions ensure that the design inputs (such as design bases and the performance, regulatory, quality, and quality verification requirements) are correctly translated into design outputs (such as analyses, specifications, drawings, procedures, and instructions). In addition, the North Anna 3 QAPD provides for individuals knowledgeable about QA principles to review design documents to ensure that they contain the necessary QA requirements.

In establishing design controls, the North Anna 3 QAPD commits to implement the requirements described in NQA-1-1994, Basic Requirement 3, and Supplement 3S-1, Subpart 2.20 for subsurface investigation and Subpart 2.7 for computer software QA controls without alternatives or exceptions. The staff determined that the design controls are in accordance with the guidance of SRP Section 17.5 and are therefore acceptable.

17.5.4.4 Procurement Document Control

The North Anna 3 QAPD follows the guidance of SRP Section 17.5, Paragraph II.D, for establishing the necessary administrative controls and processes to ensure that procurement documents include or reference applicable regulatory, technical, and QA Program requirements. Applicable technical, regulatory, administrative, quality, and reporting requirements (such as specifications, codes, standards, tests, inspections, and special processes); and the regulation in 10 CFR Part 21, “Reporting of Defects and Noncompliance,” are invoked for the procurement of items and services.

The North Anna 3 QAPD commits the applicant to the quality requirements described in NQA-1-1994, Basic Requirement 4 and Supplement 4S-1, with the following alternatives and exceptions:

- NQA-1-1994, Supplement 4S-1

    Section 2.3 of Supplement 4S-1 includes a requirement that procurement documents require suppliers to have a documented QA program that implements NQA-1-1994, Part 1. In lieu of this requirement, Dominion may require suppliers to have a documented supplier QA program that is determined to meet the applicable requirements of 10 CFR 50 Appendix B, as appropriate to the circumstances of the procurement.

The staff evaluated this proposed alternative and determined that it is consistent with 10 CFR Part 50, Appendix B, Criterion IV, “Procurement Document Control.” Therefore, the staff concluded that this alternative is acceptable.

> With regard to service performed by a supplier, Dominion procurement documents may allow the supplier to work under the North Anna 3 QAPD, including the implementation of procedures, in lieu of the supplier's own QA program.

The staff evaluated this proposed alternative and determined that the applicant's QAPD follows the guidance of SRP Section 17.5, Paragraph II.G. Specifically, the QAPD provides measures for evaluating prospective suppliers so that only qualified suppliers are selected; acceptance actions are performed for procuring products and services; and suppliers are periodically audited and evaluated to ensure that qualified suppliers continue to provide acceptable products and services. Therefore, the staff concluded that this alternative is acceptable.

> In NQA-1–1994, Section 3 of Supplement 4S-1 requires procurement documents to be reviewed prior to bidding for or awarding a contract. The quality assurance review of procurement documents is satisfied through review of the applicable procurement specification, including the technical and quality procurement requirements, prior to bid or award of contract. Procurement document changes (e.g., scope, technical or quality requirements) will also receive the quality assurance review.

The staff evaluated this proposed alternative and determined that it is in accordance with SRP Section 17.5 and provides an adequate review of procurement documents before awarding a contract and after any changes. Therefore, the staff concluded that this alternative is acceptable.

> Procurement documents for commercial-grade items that will be procured by Dominion for use as safety-related items shall contain technical and quality requirements such that the procured item can be appropriately dedicated.

The staff evaluated and determined that Dominion's action is consistent with the staff guidance in Generic Letter (GL) 89–02, "Actions to Improve the Detection of Counterfeit and Fraudulently Marked Products," dated March 21, 1989; and GL 91–05, "Licensee Commercial-Grade Procurement and Dedication Programs," dated April 9, 1991; as delineated in SRP Section 17.5, Paragraphs II.U.1.d and II.U.1.e. Therefore, the staff concluded that this alternative is acceptable.

In establishing the procurement document controls, the North Anna 3 QAPD commits to implement the quality requirements described in NQA-1-1994, Basic Requirement 4 and Supplement 4S-1, with the alternatives and exceptions described above. The staff determined that the procurement document controls are in accordance with the guidance of SRP Section 17.5 and are therefore acceptable.

17.5.4.5 Instructions, Procedures, and Drawings

The North Anna 3 QAPD follows the guidance of SRP Section 17.5, Paragraph II.E, for establishing necessary measures and governing procedures to ensure that activities affecting quality are prescribed by and performed in accordance with documented instructions, procedures, and drawings.

In establishing controls for instructions, procedures, and drawings, the North Anna 3 QAPD commits to implement the quality requirements described in NQA-1-1994, Basic Requirement 5, without alternatives or exceptions. The staff determined that the controls for instructions, procedures, and drawings are in accordance with the guidance of SRP Section 17.5 and are therefore acceptable.

17.5.4.6 Document Control

The North Anna 3 QAPD establishes the necessary measures and governing procedures to ensure that activities affecting quality are prescribed by and performed in accordance with documented instructions, procedures, and drawings.

In establishing document controls, the North Anna 3 QAPD commits to implement the quality requirements described in NQA-1-1994, Basic Requirement 6, without alternatives or exceptions. The staff determined that the document controls are in accordance with the guidance of SRP Section 17.5 and are therefore acceptable.

17.5.4.7 Control of Purchased Material, Equipment, and Services

The North Anna 3 QAPD follows the guidance of SRP Section 17.5, Paragraph II.G, for establishing necessary measures and governing procedures that control the procurement of items and services to ensure conformance with specified requirements. The controls include measures for evaluating prospective suppliers and selecting only those that are qualified. In addition, controls include auditing and evaluating suppliers to ensure that qualified suppliers continue to provide acceptable products and services.

The program provides for acceptance actions such as source verification, receipt inspection, and pre- and post-installation tests and also reviews of documentation such as certificates of conformance to ensure that the procurement, inspection, and test requirements have been satisfied before relying on the item to perform its intended safety function. Purchased items (components, spares, and replacement parts necessary for plant operation, refueling, maintenance, and modifications) and services are subject to quality and technical requirements at least equivalent to those specified for original equipment or by properly reviewed and approved revisions to design documentation, thus ensuring that the items are suitable for the intended service and are of acceptable quality that is consistent with their effect on safety.

In establishing procurement verification controls, the North Anna 3 QAPD commits the applicant to the quality standards described in NQA-1-1994, Basic Requirement 7 and Supplement 7S-1, with the following clarifications and exceptions:

- NQA-1-1994, Supplement 7S-1

  North Anna 3 considers that other 10 CFR Part 50 licensees, authorized nuclear inspection agencies, National Institute of Standards and Technology (NIST), or other State and Federal agencies that may provide items or services to the Dominion North Anna 3 plant are not required to be evaluated or audited.

The staff acknowledged that no additional audits or evaluations are required for 10 CFR Part 50 licensees, authorized nuclear inspection agencies, the National Voluntary Laboratory Accreditation Program (NVLAP) administered by NIST, and other State and Federal agencies performing work under quality programs that are acceptable to the NRC. However, the applicant remains responsible for ensuring that procured items or services conform to Appendix B to 10 CFR Part 50, to applicable ASME Code requirements, and to other regulatory requirements and commitments. The applicant also remains responsible for ensuring that the items or services are suitable for their intended application and for documenting the evaluations that support this conclusion. The staff concluded that this exception is consistent with SRP Section 17.5 and is therefore acceptable.

When purchasing commercial-grade calibration services from a calibration laboratory, procurement source evaluation and selection measures do not need to be performed provided that all of the following conditions are met:

- The purchase documents impose any additional technical and administrative requirements, as necessary, to comply with the North Anna 3 QA Program and technical provisions. At a minimum, the purchase document shall require that the calibration certificate/report include identification of the laboratory equipment/standard used.

- The purchase documents require reporting as-found calibration data when calibrated items are found to be out-of-tolerance.

- A documented review of the supplier's accreditation will be performed and will include a verification of each of the following:

    1. The calibration laboratory holds a domestic (United States) accreditation by any one of the following bodies, which are recognized by the International Laboratory Accreditation Cooperation Mutual Recognition Arrangement:

        a. NVLAP, administered by NIST;
        b. American Association for Laboratory Accreditation (A2LA);
        c. ACLASS Accreditation Services (ACLASS);
        d. International Accreditation Service (IAS);
        e. Laboratory Accreditation Bureau (L-A-B);
        f. Other NRC-approved laboratory accrediting body.

    2. The accreditation encompasses American Nuclear Society (ANS)/International Organization for Standardization/International Electrotechnical Commission (ISO/IEC) 17025, "General Requirements for the Competence of Testing and Calibration Laboratories."

    3. The published scope of accreditation for the calibration laboratory covers the necessary measurement parameters, range, and uncertainties.

The staff determined that the provisions of this exception are consistent with the guidance in SRP Section 17.5, Paragraph II.L.8, for the procurement of commercial-grade calibration services for safety-related applications and as documented in a previous staff SE (ADAMS Accession No. ML052710224). The staff expects full conformance to the guidance in SRP Section 17.5, Paragraphs II.L.8 and II.L.8.h that the alternative method is limited to domestic calibration suppliers.

- For NQA-1-1994, Section 8.1, Dominion considers documents that may be stored in approved electronic media under Dominion or vendor control, not physically located on the plant site, but are accessible from the respective nuclear facility site, as meeting the NQA-1 requirement for documents to be available at the site. When construction is complete, sufficient as-built documentation will be turned over to Dominion to support operations. The Dominion records management system will provide for timely retrieval of necessary records.

The staff determined that the implementation of this alternative would allow access to and review of the necessary documented evidence at the nuclear facility site, both before installation and before use. Therefore, the staff concluded that this alternative is acceptable.

- In lieu of the requirements of NQA-1-1994, Supplement 7S-1, Section 10, “Commercial Grade Items,” controls for commercial-grade items and services are established in North Anna 3 documents using 10 CFR Part 21 and the guidance of Electrical Power Research Institute (EPRI) NP-5652, “Guideline for the Utilization of Commercial-Grade Items in Nuclear Safety-Related Applications (NCIG-07),” dated 1988 and as discussed in GL 89-02 and GL 91-05.

- For commercial-grade items, special quality verification requirements are established and described in Dominion documents to provide the necessary assurance that an item will perform satisfactorily in service. The Dominion documents address determining the critical characteristics to ensure that an item is suitable for its intended use, that there is a technical evaluation of the item, that receipt requirements are met, and that there is a quality evaluation of the item.

  In establishing controls for commercial-grade dedication, the North Anna 3 QAPD commits to implement the quality requirements described in NQA-1-1994, Basic Requirement 7 and Supplement 7S-1; and in the guidance of EPRI NP-5652 as discussed in GL 89-02 and GL 91-05. The staff determined that the controls for commercial-grade dedication are in accordance with the guidance in SRP Section 17.5 and are therefore acceptable.

- Dominion will also use other appropriate and approved regulatory means and controls to support Dominion’s commercial-grade dedication activities. Dominion will assume 10 CFR Part 21 reporting responsibility for all items that Dominion dedicates as safety-related.

The staff evaluated this clarification and concluded that it is acceptable with the understanding that any work conducted under this QA Program, Dominion assumes reporting responsibility.

In establishing the controls for purchased materials, equipment, and services, the North Anna 3 QAPD commits to implement the quality requirements described NQA-1-1994, Basic Requirement 7 and Supplement 7S-1, with the exceptions and alternatives described above. The staff determined that the controls for purchased materials, equipment, and services are in accordance with the guidance of SRP Section 17.5 and are therefore acceptable.

17.5.4.8 Identification and Control of Materials, Parts, and Components

The North Anna 3 QAPD follows the guidance of SRP Section 17.5, Paragraph II.H, for establishing necessary measures for the identification and control of items such as materials — including consumables and items with a limited shelf life; parts, components, and partially fabricated subassemblies. The identification of items is maintained throughout fabrication, erection, installation, and use so that the item is traceable to its documentation.

In establishing the controls for the identification and control of materials, parts, and components; the North Anna 3 QAPD commits to implement the quality requirements described in NQA-1-1994, Basic Requirement 8 and Supplement 8S-1, without alternatives or exceptions. The staff determined that the controls for the identification and control of materials, parts, and components are in accordance with the guidance of SRP Section 17.5 and are therefore acceptable.

17.5.4.9 Control of Special Processes

The North Anna 3 QAPD follows the guidance of SRP Section 17.5, Paragraph II.I, for the control of special processes. The North Anna 3 QAPD establishes programs, procedures, and processes to ensure that special processes requiring interim controls to maintain quality (such as welding, heat treating, and nondestructive examination); are implemented and controlled in accordance with applicable codes, specifications, and standards.

In establishing the controls for special processes, the North Anna 3 QAPD commits to implement the quality requirements described in NQA-1-1994, Basic Requirement 9 and Supplement 9S-1, without alternatives or exceptions. The staff determined that the controls for special processes are in accordance with the guidance of SRP Section 17.5 and are therefore acceptable.

17.5.4.10 Inspection

The North Anna 3 QAPD follows the guidance of SRP Section 17.5, Paragraph II.J, for establishing necessary measures to implement inspections ensuring that items, services, and activities affecting safety meet established requirements and conform to documented specifications, instructions, procedures, and design documents. The inspection program establishes requirements for planning inspections, determining applicable acceptance criteria, setting the frequency of inspection, and identifying special tools needed to perform the inspection. Qualified personnel perform the inspections and are independent of those who performed or directly supervised the work.

In establishing inspection requirements, the North Anna 3 QAPD commits the applicant to the quality requirements described in NQA-1-1994, Basic Requirement 10, Supplement 10S-1; and Subparts 2.4, 2.5, and 2.8, with the following alternatives and exceptions:

- Subpart 2.4 commits Dominion to the use of the Institute of Electrical and Electronics Engineers (IEEE) Standard (Std) 336–1985, “IEEE Standard Installation, Inspection, and Testing Requirements for Power, Instrumentation, and Control Equipment at Nuclear Facilities.” IEEE Std 336–1985 refers to IEEE Std 498–1985, “IEEE Standard Requirements for the Calibration and Control of Measuring and Test Equipment Used in Nuclear Facilities.” Both IEEE Std 336–1985 and IEEE Std 498-1985 use the definition of “Safety Systems” from IEEE Std 603–1980, “IEEE Standard Criteria for Safety Systems for Nuclear Power Generating Stations.” North Anna 3 commits to the definition of safety systems in IEEE Std 603–1980 but does not commit to the balance of that standard. This definition is only applicable to equipment in the context of Subpart 2.4.

- An additional exception to Subpart 2.4 is addressed in Part II, Section 12 of the QAPD.

- Where inspections at the operating facility are performed by persons within the same organization (e.g., maintenance group), Dominion takes exception to the requirements of NQA-1-1994, Supplement 10S-1, Section 3.1, in that the inspectors report to the site’s Senior Manager for Safety and Licensing while performing those inspections.

The staff concluded that the North Anna 3 QAPD follows the guidance of SRP Section 17.5, Paragraph II.J, for inspections. The North Anna 3 QAPD establishes the necessary measures for implementing inspections to ensure that items, services, and activities affecting safety meet established requirements and conform to applicable documented specifications, instructions, procedures, and design documents. The inspection program establishes requirements for planning inspections, determining applicable acceptance criteria, setting the frequency of inspections, and identifying special tools needed to perform the inspection. Properly qualified personnel independent of those who performed or directly supervised the work are required to perform the inspections.

In establishing the controls for inspections, the North Anna 3 QAPD commits to implement the quality requirements described in NQA-1-1994, Basic Requirement 10, Supplement 10S-1; and Subparts 2.4, 2.5, and 2.8, with the alternatives and exceptions described above. The staff determined that the controls for inspections are in accordance with the guidance of SRP Section 17.5 and are therefore acceptable.

17.5.4.11 Test Control

The North Anna 3 QAPD follows the guidance of SRP Section 17.5, Paragraph II.K, for establishing necessary measures and governing provisions to demonstrate that items within the scope of the QAPD will perform satisfactorily in service. Test programs include criteria for determining when testing is required, in order to demonstrate that the performance of equipment and plant systems is in accordance with the design. Testing programs also include provisions to establish and adjust test schedules, and to maintain the status for periodic or recurring tests when applicable. Tests are performed according to applicable procedures that include (as applicable and consistent with the effect on safety) (1) instructions and prerequisites for performing the tests; (2) the use of proper test equipment and acceptance criteria; (3) mandatory verification points as needed to confirm satisfactory test completion; (4) any special qualification requirements for personnel; and (5) any special environmental conditions. Test results are documented and evaluated by the organization performing the test and are reviewed by a responsible authority to assure that the test requirements have been satisfied.

In establishing provisions for testing, the North Anna 3 QAPD commits the applicant to comply with the quality requirements described in NQA-1-1994, Basic Requirement 11 and Supplement 11S-1. In establishing provisions to ensure that computer software used in applications affecting safety is prepared, documented, verified, tested, and used so that the expected outputs are obtained and the configuration control is maintained; the North Anna 3 QAPD commits the applicant to the quality requirements described in NQA-1-1994, Supplement 11S-2 and Subpart 2.7.

In establishing the test controls, the North Anna 3 QAPD commits to implement the quality requirements described in NQA-1-1994, Supplement 11S-2 and Subpart 2.7, to establish the appropriate provisions for testing and computer program testing with no alternatives or exceptions. The staff determined that the test controls are in accordance with the guidance of SRP Section 17.5 and are therefore acceptable.

17.5.4.12 Control of Measuring and Test Equipment

The North Anna 3 QAPD follows the guidance of SRP Section 17.5, Paragraph II.L, for establishing necessary measures to control the calibration; maintenance; and use of measuring and test equipment (M&TE) that provide information important to safe plant operation.

In establishing provisions for the control of M&TE, the North Anna 3 QAPD commits the applicant to comply with the quality standards described in NQA-1-1994, Basic Requirement 12 and Supplement 12S-1, with the following clarifications and exceptions:

- The out-of-calibration conditions described in Paragraph 3.2 of Supplement 12S-1 of NQA-1-1994 refers to when the M&TE is found to be out of the required accuracy limits (i.e., out of tolerance) during calibration.

The staff determined that this clarification for the out-of-calibration conditions is consistent with SRP Section 17.5. Therefore, the staff concluded that this alternative is acceptable.

- M&TE is not required to be marked with the calibration status when it is impossible or impractical due to equipment size or configuration (such as the label will interfere with the operation of the device), provided that the required information is maintained in suitable documentation traceable to the device. This exception also applies to the calibration labeling requirement stated in NQA-1-1994, Subpart 2.4, Section 7.2.1 (ANSI/IEEE Std 336–1985).

The staff determined that this alternative is consistent with the staff's guidance provided in SRP Section 17.5, Paragraph II.L.3. Therefore, the staff concluded that this alternative is acceptable.

In establishing the controls for M&TE, the North Anna 3 QAPD commits to implement the quality requirements described in NQA-1-1994, Basic Requirement 12 and Supplement 12S-1, with the alternatives and exceptions described above. The staff determined that the controls for M&TE are in accordance with the guidance of SRP Section 17.5 and are therefore acceptable.

17.5.4.13 Handling, Storage, and Shipping

The North Anna 3 QAPD follows the guidance of SRP Section 17.5, Paragraph II.M, for establishing necessary measures to control the handling, storage, packaging, shipping, cleaning, and preservation of items to prevent inadvertent damage or loss and to minimize deterioration.

In establishing provisions for handling, storage, and shipping, the North Anna 3 QAPD commits the applicant to the quality standards described in NQA-1-1994, Basic Requirement 13 and Supplement 13S-1. The North Anna 3 QAPD also commits the applicant—during the construction and preoperational phase of the plant as applicable—to comply with the guidance of NQA-1-1994, Subpart 2.1, Subpart 2.2, Subpart 2.3, Subpart 3.2, and Appendix 2.1, with the following clarifications and exceptions:

- NQA-1-1994, Subpart 2.1

  Subpart 2.1, Sections 3.1 and 3.2 establish criteria for classifying items into cleanness classes, with requirements for each class. Instead of using the cleanness level system of Subpart 2.1 during the operational phase, Dominion may establish cleanness requirements on a case-by-case basis that are consistent with the other provisions of Subpart 2.1. Dominion will establish appropriate cleanliness controls for work on safety-related equipment to minimize the introduction of foreign material and to maintain system/component cleanliness throughout maintenance or modification activities, including documented verification of the absence of foreign materials before system closure.

The staff determined that this alternative is consistent with the staff's guidance in SRP Section 17.5. Therefore, the staff concluded that this alternative is acceptable.

- NQA-1-1994, Subpart 2.2

Subpart 2.2, Section 2.2 establishes criteria for classifying items into protection levels. Instead of classifying items into protection levels during the operational phase, Dominion may establish controls for the packaging, shipping, handling, and storage of such items on a case-by-case basis; with regard to the item's complexity, use, and sensitivity to damage. Before installation or use, the items are inspected and serviced as needed to assure that no damage or deterioration exists that could affect their functionality.

The staff determined that this alternative is consistent with the staff's guidance in SRP Section 17.5. Therefore, the staff concluded that this alternative is acceptable.

Subpart 2.2, Section 6.6 requires written records containing information on personnel access. As an alternative to this requirement, North Anna 3 documents establish controls for storage areas that describe those who are authorized to access areas and the requirements for recording personnel access. However, these records of access are not considered quality records and will be retained in accordance with the administrative controls of the applicable plant.

The staff determined that these records did not meet the classification of a QA record as defined in NQA-1–1994 Supplement 17S-1, Section 2.7. Therefore, the staff concluded that this alternative is acceptable.

Subpart 2.2, Section 7.1 refers to Subpart 2.15 for requirements related to the handling of items. The scope of Subpart 2.15 includes hoisting, rigging, and transporting items for the nuclear power plant during construction. The staff determined that this clarification is acceptable because it distinguishes between the requirements for construction and operations.

- NQA-1-1994, Subpart 2.3

Subpart 2.3 of Section 2.3 requires the establishment of five zone designations for housekeeping cleanliness controls. Instead of the five-level zone designation during the operational phase, Dominion bases its control over housekeeping activities on a consideration of what is necessary and appropriate for the activity involved. The controls are implemented through procedures or instructions which, in the case of maintenance or modification work, are developed on a case-by-case basis. Factors considered in developing the procedures and instructions include cleanliness control, personnel safety, fire prevention and protection, and radiation control and security. The procedures and instructions make use of standard janitorial and work practices to the extent possible.

The staff concluded that this clarification is consistent with SRP Section 17.5 and is therefore acceptable.

- NQA-1-1994, Subpart 3.2

Subpart 3.2 of Appendix 2.1 establishes cleaning and cleanness controls for fluid systems and associated components. Dominion commits only to Section 3 precautions in accordance with RG 1.37, Revision 1, "Quality Assurance Requirements for Cleaning of Fluid Systems and Associated Components of Water-Cooled Nuclear Power Plants." In addition, North Anna 3 QAPD states that a suitable chloride stress-cracking inhibitor should be added to the fresh water used to flush systems containing austenitic stainless steels.

The staff concluded that this clarification is consistent with SRP Section 17.5 and is therefore acceptable.

In establishing the controls for handling, storage, and shipping, the North Anna 3 QAPD commits to implement the quality requirements described in NQA-1-1994, Basic Requirement 12 and Supplement 12S-1, with the exceptions and alternatives described above. The staff determined that the controls for handling, storage, and shipping are in accordance with the guidance of SRP Section 17.5 and are therefore acceptable.

17.5.4.14 Inspection, Test, and Operating Status

The North Anna 3 QAPD follows the guidance of SRP Section 17.5, Paragraph II.N, for establishing necessary measures to identify the inspection, testing, and operating status of items and components within the scope of the QAPD to maintain personnel and reactor safety; and to avert the inadvertent operation of equipment.

In establishing the inspection, test, and operating status controls, the North Anna 3 QAPD commits to implement the quality requirements described in NQA-1-1994, Basic Requirement 14, without alternatives or exceptions. The staff determined that the test controls are in accordance with the guidance of SRP Section 17.5 and are therefore acceptable.

17.5.4.15 Nonconforming Materials, Parts, or Components

The North Anna 3 QAPD follows the guidance of SRP Section 17.5, Paragraph II.O for establishing necessary measures to control items, including services that do not conform to specified requirements to prevent their inadvertent installation or use. Nonconformances are evaluated for their impact on the operability of quality SSCs to ensure that the final condition does not adversely affect the safety, operation, or maintenance of the item or service. Results of evaluations of conditions adverse to quality are analyzed to identify quality trends that are documented and reported to upper management, in accordance with the applicable procedures.

In addition, the North Anna 3 QAPD establishes the necessary interfaces between the QA Program for the identification and control of nonconforming materials, parts, and components; and the non-QA reporting programs that satisfy the applicable requirements of 10 CFR 50.55(e) and/or 10 CFR Part 21 during the design, construction, and operation phases.

In establishing the controls for nonconforming materials, parts, or components, the North Anna 3 QAPD commits to implement the quality requirements described in NQA-1-1994, Basic Requirement 15 and Supplement 15S-1, without alternatives or exceptions. The staff determined that the controls for nonconforming materials, parts, or components are in accordance with the guidance of SRP Section 17.5 and are therefore acceptable.

17.5.4.16 Corrective Action

The North Anna 3 QAPD follows the guidance of SRP Section 17.5, Paragraph II.P for establishing necessary measures to promptly identify, control, document, classify, and correct conditions adverse to quality. The QAPD template requires personnel to identify known conditions adverse to quality. Reports of these conditions are analyzed to identify trends. Significant conditions adverse to quality are documented and reported to the responsible management. In the case of suppliers working on safety-related activities or similar situations, the applicant or holder (as applicable) may delegate specific responsibility for the corrective action program, but the applicant or holder maintains responsibility for the program's effectiveness.

In addition, the North Anna 3 QAPD establishes the necessary interfaces between the QA corrective actions program and the non-QA reporting program to identify, evaluate, and report defects and non-compliance to satisfy the applicable requirements of 10 CFR 50.55(e) and/or 10 CFR Part 21.

In establishing the corrective action controls, the North Anna 3 QAPD commits to implement the quality requirements described in NQA-1-1994, Basic Requirement 16 without alternatives or exceptions. The staff determined that the corrective action controls are in accordance with the guidance of SRP Section 17.5 and are therefore acceptable.

17.5.4.17 Quality Assurance Records

The North Anna 3 QAPD follows the guidance of SRP Section 17.5, Paragraph II.Q, for establishing necessary measures to ensure that sufficient records of items and activities affecting quality are generated, identified, retained, maintained, and able to be retrieved.

Regulatory Position C.2 of RG 1.28, Revision 3, "Quality Assurance Program Requirements (Design and Construction)," provides record retention times for lifetime and nonpermanent records. In establishing the retention time for records, the North Anna 3 QAPD provides ESP and COL applicants with the guidance to base the retention on Regulatory Position C.2 and Table 1 of RG 1.28, Revision 3; or by including their specific table in the QAPD. Concerning the use of electronic records storage and retrieval systems, the North Anna 3 QAPD complies with the NRC guidance in GL 88-18, "Proposed Final NRC Generic Letter 88-18, Supplement 1"; "Guidance on Managing Quality Assurance Records in Electronic Media," dated September 13, 1999; RIS 2000-18, "Guidance on Managing Quality Assurance Records in Electronic Media," dated October 23, 2000; and associated Nuclear Information and Records Management Association (NIRMA) Technical Guidelines (TG) 11-1998, "Authentication of Records and Media"; TG 15- 1998, "Management of Electronic Records"; and TG 21-1998, "Electronic Records Protection and Restoration."

In establishing provisions for records, the North Anna 3 QAPD commits the applicant to comply with the quality requirements described in NQA-1-1994, Basic Requirement 17 and Supplement 17S-1, with the following alternatives and exception:

- NQA-1-1994, Supplement 17S-1

  Supplement 17S-1, Section 4.2(b) requires records to be firmly attached in binders or placed in folders or envelopes for storage in steel file cabinets or on shelving in containers. For hard-copy records maintained by Dominion, the records are suitably stored in steel file cabinets or on shelving in containers, except that methods other than binders, folders, or envelopes may be used to organize the records for storage.

The staff concluded that this alternative is consistent with SRP Section 17.5 and is therefore acceptable.

In establishing the controls for QA records, the North Anna 3 QAPD commits to implement the quality requirements described in NQA-1-1994, Basic Requirement 17 and Supplement 17S-1, with the exception described above. The staff determined that the controls for QA records are in accordance with the guidance of SRP Section 17.5 and are therefore acceptable.

17.5.4.18 Quality Assurance Audits

The North Anna 3 QAPD follows the guidance of SRP Section 17.5, Paragraph II.R, for establishing necessary measures to implement audits verifying that activities covered by the

North Anna 3 QAPD are performed in conformance with the established requirements. The effectiveness of the audit program is reviewed as part of the overall audit process. The North Anna 3 QAPD provides for the applicant or holder (as applicable) to conduct periodic internal and external audits. Internal audits are conducted to determine the adequacy of the program and its procedures and to determine whether they are meaningful and comply with North Anna 3 QAPD requirements. Internal audits are performed with a frequency commensurate with safety significance and in such a manner as to ensure that an audit of all applicable QA Program elements is completed for each functional area within a period of 2 years after the initial determination that the audit program has been soundly established. External audits determine the adequacy of a supplier's or contractor's QA Program. The applicant's responsible management reviews audit results; these reviews are documented. Management responds to all audit findings and initiates corrective action where indicated. Where corrective actions are indicated, documented follow-up of applicable areas are conducted through inspections, reviews, re-audits, or other appropriate means to verify that corrective actions have been adequately implemented.

In establishing the controls for audits, the North Anna 3 QAPD commits to implement the quality requirements described in NQA-1-1994, Basic Requirement 18 and Supplement 18S-1, without alternatives or exceptions. The staff determined that the controls for audits are in accordance with the guidance of SRP Section 17.5 and are therefore acceptable.

17.5.4.19 Nonsafety-Related SSC Quality Assurance Control

17.5.4.19.1 Nonsafety-Related SSCs – Significant Contributors to Plant Safety

The North Anna 3 QAPD follows the guidance of SRP Section 17.5, Paragraph II.V.1, for establishing specific program controls to be applied to nonsafety-related SSCs that are significant contributors to plant safety and to which Appendix B of 10 CFR Part 50 does not apply. The North Anna 3 QAPD applies specific controls to these items in a selected manner, so as to target characteristics or critical attributes that render the SSC a significant contributor to plant safety consistent with applicable sections of the Dominion QA Program.

The staff determined that this approach, as described in the North Anna 3 QAPD, is acceptable because it is in alignment with the guidance of SRP Section 17.5, Paragraph II.V.1.

17.5.4.19.2 Nonsafety-Related SSCs Credited for Regulatory Events

In establishing the quality requirements for nonsafety-related SSCs credited for regulatory events, the North Anna 3 QAPD follows the guidance of SRP Section 17.5, Paragraph II.V.2; and Dominion commits to implement the following regulatory guidance:

- The quality requirements for the fire protection system are in accordance with Regulatory Position 1.7, "Quality Assurance," in RG 1.189, Revision 2, "Fire Protection for Operating Nuclear Power Plants," dated October 2009.

- The quality requirements for anticipated transient without scram (ATWS) equipment are in accordance with GL 85-06, "Quality Assurance Guidance for ATWS Equipment That Is Not Safety Related," dated January 16, 1985.

- The quality requirements for station blackout equipment are in accordance with Regulatory Position 3.5, "Quality Assurance and Specific Guidance for Station Blackout Equipment That Is Not Safety-Related," and Appendix A, "Quality Assurance Guidance for Non-Safety Systems and Equipment," in RG 1.155, "Station Blackout," dated August 1988.

The staff determined that this approach, as described in the North Anna 3 QAPD, is acceptable because it is in alignment with the guidance of SRP Section 17.5, Paragraph II.V.2.

17.5.4.20 Regulatory Commitments

The staff evaluated and determined that the North Anna 3 QAPD follows the guidance of SRP Section 17.5, Paragraph II.U, for describing regulatory commitments based on the following information. The QAPD establishes QA Program commitments. In the QAPD, the applicant provides assurance of compliance with the following RGs and other QA standards to supplement and support the QAPD:

- RG 1.8, Revision 3, “Qualification and Training of Personnel for Nuclear Power Plants.”
- RG 1.26, Revision 4, “Quality Group Classification and Standards for Water-, Steam-, and Radioactive-Waste-Containing Components of Nuclear Power Plants.” In the QAPD, the applicant provides assurance of compliance with the regulatory positions of this guidance for site-specific SSCs not classified by the ESBWR.
- RG 1.28, Revision 3, “Quality Assurance Program Requirements (Design and Construction).”
- RG 1.29, Revision 4, “Seismic Design Classification.” In the QAPD, the applicant provides assurance of compliance with the regulatory positions of this guidance for site-specific SSCs not classified by the ESBWR.
- RG 1.37, Revision 1, “Quality Assurance Requirements for Cleaning of Fluid Systems and Associated Components of Water-Cooled Nuclear Power Plants.”
- RG 1.54, Revision 1, “Service Level I, II, and III Protective Coatings Applied to Nuclear Power Plants.”
- RG 1.33, Revision 2, “Quality Assurance Program Requirements (Operations).”
- ASME NQA-1–1994 (Parts I, II, and III).
- NIRMA TGs, as described in Section 17 of the QAPD.

The staff issued RAI 17.5-6 (ADAMS Accession No. ML081760334), dated June 24, 2008, requesting the applicant to clarify its intent regarding its commitment to the guidance of RG 1.37, Revision 1 in DOM-QA-1. Specifically, the staff noted that Section 13.2 of the applicant’s QAPD references the commitment to RG 1.37, Revision 1; but Part IV, “Regulatory Commitments,” of the QAPD does not identify RG 1.37 as a commitment.

In the response to RAI 17.5-6 dated August 4, 2008 (ADAMS Accession No. ML082200545), the applicant stated that the omission of the commitment to RG 1.37 in Part IV of the QAPD was inadvertent. The applicant has revised the FSAR, including the North Anna 3 QAPD, to include the commitment to the guidance of RG 1.37. The staff finds the response to RAI 17.5-6 acceptable, and this RAI is therefore resolved and closed.

On December 2, 2010, the staff issued RAI 17.5-9 (ADAMS Accession No. ML103560116) which requests the following:

> Part IV, "Regulatory Commitments," of Appendix 17AA, "North Anna Power Station Unit 3 Quality Assurance Program Description," states under Regulatory Guide 1.28 that “in ANSI/ASME NQA-1-1983 and the NQA-1a-1993 Addenda provide an adequate basis for complying with the pertinent QA requirements of Appendix B during the design and construction phases of nuclear plants. Dominion commits to the basic and supplementary requirements of NQA-1-1994 in lieu of the 1993 edition and addendum of NQA-1 subject to the clarifications contained in Parts II, IV, and V.” Please clarify whether “NQA-1a-1993” and [the] “1993 edition” are the correct references to be cited in this paragraph.

In the response to this RAI dated January 10, 2011 (ADAMS Accession No. ML110110612), the applicant stated:

> The reference to “NQA-1a-1993 Addenda” and “1993 edition” in FSAR Appendix 17AA, Part IV, “Regulatory Commitments,” for Regulatory Guide 1.28 should be “NQA-1a-1983 Addenda” and “1983 edition,” respectively. FSAR Appendix 17AA will be revised to correct this administrative error.

The staff verified that the FSAR was revised to incorporate this correction. Therefore, RAI 17.5-9 is resolved and closed.

17.5.4.21 Additional Quality Assurance and Administrative Controls for the Plant Operational Phase

The staff evaluated and determined that Part V, “Additional Quality Assurance and Administrative Controls for the Plant Operational Phase,” of the QAPD provides requirements for meeting the regulatory positions of RG 1.33, Revision 2, as an alternative to RG 1.33. In a letter dated January 10, 2011 (ADAMS Accession No. ML110110612), the applicant verified that the North Anna 3 QAPD has incorporated the administrative controls in American Nuclear Standards Institute (ANSI) N18.7–1976/ANS-3.2, “Administrative Controls and Quality Assurance for the Operational Phase of Nuclear Power Plants,” and in RG 1.33, Revision 2, which are not included in NQA-1–1994. The applicant also provided an annotated version of NEI 06–14A, Revision 7, Appendix 1, “Table of Where Regulatory Guide 1.33, Revision 2, and ANSI N18.7-1976 Requirements are addressed by NQA-1–1994 Standards and/or the NEI 06-14A QAPD,” which documents this verification. The staff reviewed Part V of the QAPD and the annotated version of NEI 06–14A, Revision 7, Appendix 1. The staff evaluated and determined that the alternative is consistent with the guidance in NEI 06–14, Section 3.2.3.1, “Alternative for Commitment to RG 1.33,” and is therefore acceptable.

On December 2, 2010, the staff issued RAI 17.5-8 (ADAMS Accession No. ML103560116) requesting information on Appendix 17AA to Chapter 17, which was based on NEI 06-14A. Consistent with the staff’s safety evaluation of NEI 06-14A, applicants that do not wish to include a commitment to RG 1.33, Revision 2 in their QAPDs must explicitly address the provisions in Attachment 4 to NEI 06-14A, while also including Part V in their QAPDs. Accordingly, Dominion needed to submit (on the docket) the information in Attachment 4 to NEI 06-14A, as it pertains to the North Anna 3 application; or otherwise include an explicit commitment RG 1.33, Revision 2 in Part IV, “Regulatory Commitments,” of Appendix 17AA.

In the response to RAI 17.5-8 dated January 10, 2011 (ADAMS Accession No. ML110110612), the applicant presented information identified in an accompanying “Table 1” showing how the QAPD met the requirements of RG 1.33, Revision 2. “Table 1” contains and addresses the provisions of NEI 06-14A, Attachment 4. The applicant stated that because the QAPD has since been revised (Revision 2 submitted on June 28, 2010), a revised Table 1 is provided in

Attachment 1 to the RAI response. The revised Table 1 provides the comparison of how NQA-1-1994 and the North Anna 3 QAPD meet the requirements of RG 1.33, Revision 2 and ANSI N18.7-1976. In addition to the revised table, Attachment 1 included a summary of the Revision 2 changes to the North Anna Unit 3 QAPD. Furthermore, the applicant added that NEI 06-14A includes Part V which is required to be addressed; therefore it was incorporated into Revision 2 of the North Anna Unit 3 QAPD. The staff's review finds that the applicant's response is consistent with the guidance in SRP Section 17.5. The staff thus considers the QAPD revision acceptable, and therefore, RAI 17.5-8 is resolved and closed.

On February 9, 2011, the staff issued RAI 17.5-10 (ADAMS Accession No. ML110400768) requesting additional information on Appendix 17AA to Chapter 17, which is based on NEI 06-14A. The RAI states:

> Part V, "Additional Quality Assurance and Administrative Controls for the Operational Phase," Section 2, "Review of Activities Affecting Safe Plant Operation," of Appendix 17AA, describes the independent review function. However:
>
> 1. Reviews of internal audit reports," as a task performed by the organization that executes the independent review functions, is missing from the North Anna Power Station Unit 3 Quality Assurance Program Description. Please explain the basis for not performing the above task.
>
> 2. In NEI 06-14, Revision 9 (NEI 06-14, Rev 7), the independent review function performs, in part, "Reviews proposed tests and experiments not described in the SAR prior to implementation. Verifies the determination of whether changes to proposed tests and experiments not described in the SAR require a technical specification change or license amendment." Whereas the North Anna Power Station Unit 3 Quality Assurance Program Description states "Reviews proposed tests and experiments not described in the SAR. Changes to proposed tests and experiments not described in the SAR that do require a technical specification change must be reviewed by the IRC prior to NRC submittal and implementation." Please provide justification for the deviation from the exact language used in NEI 06-14, Revision 9 (NEI 06-14A, Rev 7).

In the response to RAI 17.5-10 dated March 1, 2011 (ADAMS Accession No. ML110630198), the applicant stated:

> The two discrepancies noted in the question are the result of an administrative error that occurred during the COLA revision process. It is Dominion's intent that the North Anna 3 QAPD be consistent with NEI 06-14, Revision 9 (NEI 06-14A, Rev 7) with regard to the independent review function. Therefore, the North Anna 3 QAPD will be revised to include the internal audit report review requirement as an independent review organization task. Similarly, the description of the independent review function regarding tests and experiments will be revised to be consistent with the wording in the NEI template.

The staff accepted the response to RAI 17.5-10 and verified that the subsequent QAPD revision is consistent with the guidance in SRP Section 17.5. Therefore, RAI 17.5-10 is resolved and closed.

Additionally, the staff verified that the administrative controls included in SRP Section 17.5 were appropriately incorporated into the North Anna 3 COL FSAR. The staff therefore accepted the applicant's verification that all of the required administrative controls had been incorporated into the North Anna 3 QAPD.

Based on the preceding information, the staff concluded that the applicant's QAPD follows the guidance in SRP Section 17.5 for describing additional QA and administrative controls during the operational phase.

The staff evaluated the alternative for the commitment to RG 1.33 and determined that the alternative is consistent with the guidance in SRP Section 17.5 and is therefore acceptable.

17.5.5 Post Combined License Activities

There are no post COL activities related to this section.

17.5.6 Conclusion

The staff reviewed and evaluated Section 17.5 of the North Anna 3 COL FSAR, Revision 8 and the North Anna Unit 3 QAPD, Revision 6. The staff's review concludes that the QA Program described in the Dominion QAPD follows the NRC guidance in and conforms to the format of, SRP Section 17.5. The staff used the acceptance criteria of SRP Section 17.5 as the basis for evaluating the acceptability of Dominion's QA Program and find it in conformance with the provisions of 10 CFR 52.79(a)(17), 10 CFR 52.79(a)(25), 10 CFR 52.79(a)(27), 10 CFR Part 21, and 10 CFR Part 50, Appendix B. The staff finds that the program description adequately describes how the requirements of Appendix B will be implemented. The staff concludes that the proposed Dominion QAPD, Revision 6 complies with Appendix B to 10 CFR Part 50; 10 CFR 52.79(a)(17); 10 CFR 52.79(a)(25); 10 CFR 52.79(a)(27); and 10 CFR Part 21 and is therefore acceptable.

17.6 <u>Maintenance Rule Program</u>

17.6.1 Introduction

This FSAR section addresses the program for MR implementation based on the requirements of 10 CFR 52.79(a)(15) and 10 CFR 50.65, "Requirements for monitoring the effectiveness of maintenance at nuclear power plants"; and on the guidance in RG 1.160, "Monitoring the Effectiveness of Maintenance at Nuclear Power Plants"; and RG 1.182, "Assessing and Managing Risk Before Maintenance Activities at Nuclear Power Plants." RG 1.160 endorses Nuclear Management and Resource Council (NUMARC) 93–01 Revision 2, "Industry Guideline for Monitoring the Effectiveness of Maintenance at Nuclear Power Plants," which provides one acceptable method for implementing the MR (ADAMS Accession No. ML101020415).
RG 1.182 was issued in May 2000 and is a companion guide to RG 1.160. RG 1.182 provides guidance on implementing the provisions of 10 CFR 50.65(a)(4) by endorsing the February 22, 2000, revision to Section 11 of NUMARC 93–01, Revision 2.

17.6.2 Summary of Application

In the North Anna 3 COL FSAR, Section 17.6, Revision 8, the applicant provides the following:

COL Items

- STD COL 17.4-2-A Maintenance Rule Program

In FSAR Section 17.6, the applicant states:

> NEI 07-02A, "Generic FSAR Template Guidance for Maintenance Rule Program Description for Plants Licensed under 10 CFR Part 52," (Reference 17.6-4) is incorporated by reference with the following supplemental information:

Supplemental Information

- STD SUP 17.6-1

In FSAR Section 17.6, the applicant states:

> The text of the template provided in NEI 07-02A is generically numbered as "17.X." When the template is incorporated by reference into this section, numbering is changed from "17.X" to "17.6."

- STD SUP 17.6-2

In FSAR Section 17.6.3, the applicant states:

> Reliability during the operations phase is assured through the implementation of operational programs described in the FSAR, i.e., the MR Program (FSAR Section 17.6), the Quality Assurance Program (FSAR Section 17.5), the In-service Inspection Program (FSAR Subsection 5.2.4, Section 6.6, and Subsection 3.8.1.7.3), and the In-service Testing Program (FSAR Subsection 3.9.6, and Subsection 3.9.3.7.1(3)(e), as well as the Technical Specifications Surveillance Requirements (FSAR Chapter 16), and maintenance programs.

- STD SUP 17.6-3

In FSAR Subsection 17.6.1.1, the applicant states:

> In Paragraph 17.6.1.1.b, replace "(DRAP - see FSAR Section 17.Y)" with the following text "(See Section 17.4)".

- STD SUP 17.6-4

In FSAR Section 17.6.4, the applicant states:

> Condition monitoring of underground or inaccessible cables is incorporated into the MR Program. The cable condition monitoring program incorporates lessons learned from industry operating experience addresses regulatory guidance, and utilizes information from detailed design and procurement documents to determine the appropriate inspections, tests and monitoring criteria for underground and inaccessible cables within the scope of the maintenance rule (10 CFR 50.65).

17.6.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is in NUREG–1966, the FSER related to the certified ESBWR DCD. In addition the program for MR implementation incorporated by reference is in the NRC final SER for NEI 07–02A, Revision 0 dated January 24, 2008 (ADAMS Accession No. ML073650081). NEI 07-02A, Revision 0 provides a complete generic program description for use in developing the section of the COL FSAR associated with SRP Section 17.6 (“Maintenance Rule”).

In addition, the regulatory basis for accepting the MR Program is in the following:

- 10 CFR 50.65
- 10 CFR 52.79(a)(15), which requires a COL FSAR to contain a description of the program and its implementation for monitoring the effectiveness of maintenance necessary to meet the requirements of 10 CFR 50.65.
- RG 1.206, Regulatory Position C.I.17.6, “Description of the Applicant’s Program for Implementation of 10 CFR 50.65, the Maintenance Rule.”

17.6.4 Technical Evaluation

The staff reviewed Section 17.6 of the North Anna 3 COL FSAR, Revision 8, and checked the referenced Topical Report NEI 07-02A template guidance to ensure that the combination of the information in the COL FSAR and the information in NEI 07-02A appropriately represents the complete scope of information relating to this review topic.[1] The staff's review confirmed that the information in the application and the information incorporated by reference address the required information relating to this MR Program.

The staff reviewed the information in the North Anna 3 COL FSAR as follows:

<u>COL Items</u>

- STD COL 17.4-2-A		Maintenance Rule Program

The applicant incorporates by reference NEI 07-02A with the following supplemental information. The text in the NEI template guidance is generically numbered as “17.X.” The staff approved this template for FSAR Section 17.6 with site-specific inputs (ADAMS Accession No. ML073650081).

Supplemental Information

- STD SUP 17.6-1

Because the NEI template guidance is generically numbered as “17.X,” the applicant has appropriately changed the numbering from “17.X” to “17.6.” The staff finds this change acceptable.

- STD SUP 17.6-2

In FSAR Section 17.6.3, the applicant specifies the various FSAR sections that discuss the relationship of the MR Program to the RAP activities. The applicant states that the reliability of the SSCs during the operations phase is assured through the implementation of operational programs (i.e., the MR Program) in Section 17.6; the QA Program in Section 17.5; the In-service Inspection Program in Section 5.2.4, Section 6.6, and Subsection 3.8.1.7.3; and the In-service Testing Program in Section 3.9.6 and Subsection 3.9.3.7.1(3)e; the Technical Specifications Surveillance Requirements in Chapter 16; and the maintenance programs. The staff finds that the applicant has adequately addressed this information in FSAR Section 17.6.3.

- STD SUP 17.6-3

Because the NEI template guidance is generically numbered as “17.X” in Paragraph 17.6.1.1.b, the applicant appropriately replaces “(DRAP - see FSAR Section 17.Y)” with “(See Section 17.4).” The staff finds this change acceptable.

- STD SUP 17.6-4

In FSAR Section 17.6.4, the applicant provides supplemental information that discusses the relationship of the MR Program with the industry operating experience activities. In this section, the applicant incorporates condition monitoring of underground or inaccessible cables into the MR Program. The applicant states that the Cable Condition Monitoring Program (1) incorporates lessons learned from industry operating experience; (2) addresses regulatory guidance; and (3) uses detailed design and procurement information to establish appropriate inspections, tests, and monitoring criteria for underground and inaccessible cables within the scope of the MR (10 CFR 50.65). The staff’s documented evaluation of the Cable Condition Monitoring Program is in Section 8.2.4 of this SER.

The staff reviewed the North Anna 3 COL FSAR, Revision 8, Table 13.4-201, “Operational Programs Required by NRC Regulations.” The staff determined that the applicant had identified the MR Program and its associated implementation milestone. The License Condition for the operational program implementation schedule, which includes the MR Program, is in Section 13.4.4, “Post Combined License Activities,” of this SER.

The staff concludes that the information above meets NRC requirements and is thus acceptable.

17.6.5 Post Combined License Activities

There are no post COL activities related to this section.

17.6.6 Conclusion

The staff’s finding related to information incorporated by reference is in NUREG–1966. The staff reviewed the application and checked the referenced DCD. The staff’s review confirmed that the applicant has addressed the required information, and no outstanding information is expected to be addressed in the North Anna 3 COL FSAR related to this section. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to the MR Program that were incorporated by reference have been resolved.

In addition, the staff compared the information in the COLA to the relevant NRC regulations; the guidance in SRP Section 17.6, Revision 1; and other NRC RGs. The staff's review concluded that the applicant has provided sufficient information to address the COL items and to satisfy the NRC requirements. Therefore, the staff finds that the information in Section 17.6 of the North Anna 3 COL FSAR is acceptable and meets the requirements of 10 CFR 52.79(a)(15) and 10 CFR 50.65.

18.0 HUMAN FACTORS ENGINEERING

18.0 HUMAN FACTORS ENGINEERING

18.1 Introduction

This chapter of the U.S. Nuclear Regulatory Commission's (NRC's) safety evaluation report (SER) provides the NRC staff evaluation of the proposed North Anna 3 Human Factors design. This includes the human-system interface (HSI) design development, the HSI design goals and bases, the standard HSI design features, and the detailed HSI design and implementation process, with embedded design acceptance criteria, for the Economic Simplified Boiling-Water Reactor (ESBWR).

18.2 Summary of Application

Chapter 18 of the North Anna 3 Combined License (COL) Final Safety Analysis Report (FSAR), Revision 9, incorporates by reference, with no departures and one supplement, Chapter 18 of Revision 10 of the Design Control Document (DCD) for the Economic Simplified Boiling-Water Reactor (ESBWR), referenced in Appendix E to Title 10 of the *Code of Federal Regulations* (10 CFR) Part 52, "Licenses, Certifications, and Approvals for Nuclear Power Plants." In addition, in FSAR Chapter 18, the applicant provides the following:

<u>*COL Item*</u>

- STD COL 18.13-1-A Milestone for Human Performance Monitoring Implementation.

The COL applicant is responsible for providing a milestone for the implementation of the Human Performance Monitoring (HPM) Program. The applicant indicates that a HPM Program will be implemented prior to the beginning of the first licensed operator training class.

18.3 Regulatory Basis

The regulatory basis for the information incorporated by reference is in NUREG-1966, "Final Safety Evaluation Report Related to the Certification of the Economic Simplified Boiling-Water Reactor Standard Design." In addition, the relevant requirements of the Commission regulations for human factors engineering (HFE), and the associated acceptance criteria, are in Chapter 18 of NUREG-0800, "Standard Review Plan (SRP) for the Review of Safety Analysis Reports for Nuclear Power Plants (LWR Edition)."

18.4 Technical Evaluation

As documented in NUREG-1966, "Final Safety Evaluation Report Related to the Certification of the ESBWR Standard Design," the staff reviewed and approved Chapter 18 of the certified ESBWR DCD. The staff reviewed Chapter 18 of the North Anna 3 COL FSAR and checked the referenced ESBWR DCD to ensure that the combination of the information in the COL FSAR and the information in the ESBWR DCD represents the complete scope of information relating to this review topic.[1] The staff's review confirmed that the information in the application and the information incorporated by reference addresses the required information related to HFE.

---

[1] See *"Finality of Referenced NRC Approvals"* in SER Section 1.2.2, for a discussion on the staff's review related to verification of the scope of information to be included in a COL application that references a design certification.

The staff reviewed the information in the North Anna 3 COL FSAR as follows:

COL Item

- STD COL 18.13-1-A   Milestone for Human Performance Monitoring Implementation.

The applicant stated that an HPM program will be implemented before the beginning of the first licensed operator training class.

In ESBWR DCD, Revision 10, Section 18.13.3, "Elements of Human Performance Monitoring Process" states that the HPM strategy is implemented through the use of a representative training simulator during periodic training exercises.

Senior reactor operator and reactor operator licensing requires the use of a full scope training simulator to develop and demonstrate operating competencies. By implementing the monitoring program at the beginning of the first licensing class, the COL applicant has selected the earliest opportunity subsequent to the completion of the HFE design verification and validation to begin collecting performance information. Accordingly, the staff finds that the applicant has adequately addressed this COL item.

18.5 Post Combined License Activities

- STD COL 18.13-1-A   Milestone for Human Performance Monitoring Implementation.

The HPM Program will be implemented prior to the beginning of the first licensed operator training class.

18.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff finds that the application includes all the information relevant to the North Anna 3 HFE design, and the staff confirmed that no outstanding information related to this section remains to be addressed in the COL FSAR. The staff's finding related to information incorporated by reference is in NUREG-1966.

In addition, the staff compared the additional COL information in the application to the relevant NRC regulations, the guidance in SRP Chapter 18, and other NRC regulatory guides. The staff concluded that the applicant has adequately addressed COL Item STD COL18.13-1-A.

19.0 PROBABILISTIC RISK ASSESSMENT AND SEVERE ACCIDENTS

ATTACHMENT 19.A LOSS OF LARGE AREAS OF THE PLANT DUE TO EXPLOSIONS OR FIRES

19.0 PROBABILISTIC RISK ASSESSMENT AND SEVERE ACCIDENTS

This chapter of the U.S. Nuclear Regulatory Commission's (NRC's) safety evaluation report (SER) provides the NRC staff evaluation of the North Anna 3 Combined License (COL) plant-specific probabilistic risk assessment (PRA) and severe accident evaluations and the applicants adherence to the corresponding regulatory requirements. In accordance with Title 10 of the *Code of Federal Regulations* (10 CFR) 52.79(a)(46), a combined license application (COLA) is required to contain a description of the plant-specific PRA and its results. In addition,10 CFR 52.79(d)(1) specifies that if the COLA references a design certification (DC), then plant-specific PRA information must use the PRA information from the DC and be updated to account for site-specific design information and any design changes or departures. The PRA provides an evaluation of the risk of core damage and release of radioactive material associated with both internal and external events that can occur during plant operation at power or while shut down.

Attachment 19.A, "Loss of Large Areas of the Plant Due to Explosions or Fire" (public-version), to this chapter of the North Anna 3 SER evaluates the measures identified by the applicant that are needed to comply with requirements to address the loss of large areas (LOLA) of the plant due to explosions or fires from a beyond-design-basis event (BDBE). The NRC regulations in 10 CFR 50.54(hh)(2) and 10 CFR 52.80(d) describe these requirements. It should be noted that the non-public Attachment 19.B "Loss of Large Areas of the Plant Due to Explosions or Fire," as well as some documents referenced in Attachment 19.A, include security-related or safeguards information. Therefore, Attachment 19.B, and the references that include security-related or Safeguards Information are withheld from the public in accordance with 10 CFR 2.390, "Public inspections, exemptions, requests for withholding."

19.1 Introduction

This section describes the objectives of the design-specific PRA and severe accident evaluations, and the corresponding regulatory requirements. Section 19.1 of the North Anna 3 COL Final Safety Analysis Report (FSAR), Revision 9, incorporates by reference, with supplemental information to Chapter 19.1, "Introduction," of the Economic Simplified Boiling–Water Reactor (ESBWR) Design Control Document (DCD), Revision 10, referenced in Appendix E, "Design Certification Rule for the ESBWR Design," to Title 10 of the *Code of Federal Regulations* (10 CFR) Part 52, "Licenses, Certifications, and Approvals for Nuclear Power Plants," The North Anna 3 COL FSAR Section 19.1 includes a description of site-specific assessments that supplement the standard design PRA and that will be considered when developing a plant-specific PRA prior to initial fuel load.

As documented in NUREG–1966, "Final Safety Evaluation Report related to the Certification of the Economic Simplified Boiling-Water Reactor Standard Design," the staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remains for review[1]. The staff's review confirmed that the application addressed the required information, and no outstanding information is expected to be addressed in the COL FSAR related to this section. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, "Licenses, Certifications, and Approvals for Nuclear Power Plants," Appendix E, "Design Certification Rule for the ESBWR Design," Section VI.B.1, all nuclear safety issues relating to the "Introduction" section, that were incorporated by reference have been resolved.

1 See *"Finality of Referenced NRC Approvals"* in SER Section 1.2.2 for a discussion on the staff's review related to verification of the scope of information to be included in a COL application that references a design certification.

In addition the applicant provided in this section of the COL FSAR and Appendix 19AA a description of the site-specific assessments that supplement the standard design PRA. The staff verified that the North Anna 3 FSAR Revision 9 incorporated the appropriate changes as a result of the NAPS DEP 3.7-1 referred to in this section. Therefore, Confirmatory Item 19.01-1 from the staff advanced SER for North Anna 3 is resolved and closed. This NAPS DEP 3.7-1 provides an evaluation of the impacts of the seismic exceedances of the Certified Seismic Design Response Spectra (CSDRS) on the seismic margin analysis (SMA) for site-specific evaluation of North Anna 3. The staff evaluated the North Anna 3 SMA in Section 19.2 of this SER.

19.2 PRA Results and Insights

19.2.1 Introduction

This section of the SER addresses the results and insights from the North Anna 3 plant-specific PRA, which are documented in Section 19.2, "PRA Results and Insights," of the North Anna 3 COL FSAR, Revision 9.

19.2.2 Summary of Application

Section 19.2 of the North Anna 3 COL FSAR, Revision 8 incorporates by reference Section 19.2 of the ESBWR DCD, Revision 10 with two departures.

Tier 2 Departure

- NAPS DEP 3.7-1 Seismic Margin Analysis

The applicant replaced the third and fourth sentences of the first paragraph under the heading, "Introduction to Evaluation of External Event Seismic," in Section 19.2.3.2.4 of the ESBWR DCD, Revision 10 with the following:

> The seismic margin earthquake for the PRA-based seismic margin assessment is the SSE for each seismic Category I structure as provided in Section 3.7.1. The site specific seismic margins High Confidence, Low Probability of Failures (HCLPF) accident sequence analysis shows that Unit 3 is inherently capable of safe shutdown in response to beyond design basis earthquakes and has a plant level HCLPF of at least 1.67 times the peak ground acceleration of a safe shutdown earthquake (SSE), where the SSE for each seismic Category I structure is provided in Section 3.7.1, in compliance with the SECY 93-087 (DCD Reference 19.2-7) requirement that "PRA insights will be used to support a margins-type assessment of seismic events. A PRA-based seismic margins analysis will consider sequence-level HCLPFs and fragilities for all sequences leading to core damage or containment failures up to approximately one and two-thirds the ground motion acceleration of the Design Basis SSE.

- NAPS DEP 3.7-1 Table 19.2-4R - ESBWR Systems and structures in Seismic Margins Analysis

The applicant replaced note 1 in Table 19.2-4R that stated that the ESBWR DCD minimum HCLPF value of 1.67*SSE, for each seismic Category I structure, will be met for the structures and equipment shown with the plant-specific SSE as described in North Anna 3 FSAR Section 3.7.1.

COL Item

- NAPS COL 19.2.6-1-A — Seismic High Confidence Low Probability of Failure Margins

The applicant replaced the second, third, and fourth sentences of the first paragraph under the heading, “Significant Core Damage Sequences of External Event Seismic,” in Section 19.2.3.2.4 of the ESBWR DCD, Revision 10 with the following.

> As-built SSC [systems, structures, and components] HCLPFs will be compared to those assumed in the seismic margin analysis for the SSCs listed in Table 19.2-4R for the Unit 3 SSE, as defined in Section 3.7.1. Deviations from the HCLPF values or other assumptions in the seismic margins evaluation will be analyzed to determine if any new vulnerabilities have been introduced. This comparison and analysis will be completed prior to fuel load. A minimum HCLPF value of 1.67*SSE will be met for the SSCs identified in Table 19.2-4R.

In Section 19.2.6 of North Anna 3 COL FSAR, Revision 8, the applicant stated that Section 19.2.3.2.4 of the COL FSAR addresses COL Item 19.2.6-1-A, “Seismic High Confidence Low Probability of Failure Margins.” In North Anna 3 FSAR, Section 19.2.3.2.4, the applicant provided information to address DCD COL Item 19.2.6 1 A. The applicant stated that an SMA update (Reference 19.1 201) using site-specific seismic loads documents the results of the fragility analyses and HCLPF values. In addition, a comparison of the as-built SSC HCLPFs will be performed before fuel load.

19.2.3 Regulatory Basis

The regulatory basis for the information incorporated by reference is in NUREG–1966. In addition, the relevant requirements of the Commission regulations for PRA results, and the associated acceptance criteria, are in Chapter 19, “Probabilistic Risk Assessment and Severe Accident Evaluation for New Reactors,” of NUREG 0800, “Standard Review Plan for the Review of Safety Analysis Reports for Nuclear Power Plants (LWR Edition)” (SRP). The staff review also follows the guidance in DC/COL ISG 020, “Implementation of a Probabilistic Risk Assessment-Based Seismic Margin Analysis for New Reactors,” dated March 15, 2010 (Agencywide Documents Access and Management System (ADAMS) Accession No. ML100491233), which contains a detailed process that a COL applicant may use to update the PRA-based SMA of the referenced DC.

The NRC has indicated in SECY-93-087, “Policy, Technical, and Licensing Issues Pertaining to Evolutionary and Advanced Light-Water Reactor (ALWR) Designs,” dated April 2, 1993, and the associated staff requirements memorandum (SRM), dated July 21, 1993, that a plant designed to withstand the design-basis SSE should have a plant HCLPF capacity of at least 1.67 times the acceleration of the SSE to demonstrate an adequate safety margin with respect to BDBEs.

- 10 CFR 52.79(a)(46) requires that each application for a COL must include a description of the plant-specific PRA and its results. 10 CFR 52.79 (d) (1) further requires that this plant-specific PRA must use the PRA information for the referenced

DC and must be updated to account for site-specific design information and any design changes or departures.

- 10 CFR 50.71(h)(1) requires each COL holder shall maintain and upgrade the PRA. The upgraded PRA must cover initiating events and modes of operation contained in NRC-endorsed consensus standards on PRA in effect 1 year prior to the scheduled date for initial loading of fuel and each required upgrade thereafter.

19.2.4 Technical Evaluation

As documented in NUREG–1966, the NTV staff reviewed and approved Section 19.2 of the certified ESBWR DCD, Revision 10. The staff reviewed Section 19.2, “PRA Results and Insights,” of the North Anna 3 COL FSAR, Revision 8, and checked the referenced DCD to ensure that the combination of the information in the ESBWR DCD and the information in the North Anna 3 COL FSAR, Revision 8 represents the complete scope of information relating to this review topic.[1] The staff’s review confirmed that the applicant has addressed the required information, and no outstanding information is expected to be addressed in the COL FSAR, related to this section. The results of the staff’s technical evaluation of the information incorporated by reference in the North Anna 3 COLA are documented in NUREG–1966.

In addition, the staff reviewed Parts 4 and 7 of the North Anna 3 COLA which includes the Technical Specifications and Departures Report, respectively. The staff has determined from this review that the ESBWR Generic Technical Specifications and Bases of the referenced certified design are incorporated by reference into the North Anna 3 plant-specific technical specifications with only minor modifications that would not impact the ESBWR design-specific PRA. The staff has also determined that the applicant has taken one departure from the information provided in Section 19.2.3.2.4 of the ESBWR DCD, Revision 10. The departure is described in two parts above in SER Section 19.2.2.

- NAPS DEP 3.7-1 Seismic Margins Analysis DCD

The staff has reviewed North Anna 3 DEP 3.7-1 with respect to the seismic margins assessment provided in ESBWR DCD, Revision 10, including a review of General Electric Hitachi (GEH) Report 003N1084, Revision 2, “North Anna Unit 3 Site-Specific Seismic Margins Analysis Update,” dated February 25, 2016. The staff has also conducted two audits of the applicant’s seismic analysis and seismic design evaluation of North Anna Unit 3, the latter of which included a review of the supporting documents for HCLPF calculations for reactor building/fuel building, reinforced concrete containment vessel, reactor pressure vessel (RPV) Support Brackets, RPV Pedestal, control building, firewater system, and fire protection equipment. From its review the staff has found that the applicant’s departure from the DCD included the use of the North Anna 3 site-specific SSE for seismic Category I structures as described in Section 3.7.1 of the North Anna 3 COL FSAR, Revision 9 as the seismic margin earthquake for the PRA-based site-specific seismic margin assessment rather than the ESBWR CSDRS. Section 3.7.1 of the North Anna 3 COL FSAR, Revision 9 describes the seismic design basis earthquake for structures that must withstand the effects of the earthquakes according to General Design Criteria (GDC) 2, “Design Bases for Protection Against Natural Phenomena,” Appendix S, “Earthquake Engineering Criteria for Nuclear Power Plants,” of 10 CFR Part 50, “Domestic Licensing of Production and Utilization Facilities” (i.e., the design basis SSE). The staff notes that the site-specific ground motion response spectra defined as the foundation input response spectra (FIRS) at the foundation level of each seismic Category I structure in the FSAR Section 3.7.1 are not enveloped by the ESBWR DC CSDRS. The staff finds that use of the North Anna 3 design basis SSE in the PRA-based seismic margins assessment as the bases for establishing adequate seismic margin is acceptable because it is consistent with guidance provided by the NRC in SECY-93-087, the associated SRM and DC/OL-ISG-020. As described in Section 3.7.1 of the North Anna 3 COL FSAR, Revision 9, the seismic demands for the North Anna 3 SSCs are based on the CSDRS and the site-specific FIRS. In response to a request for additional information (RAI) 19.02-1 dated December 16, 2015 (ADAMS Accession No ML15364A384), the applicant indicates that the SMA for the CSDRS continues to be applicable to North Anna 3, to the extent that seismic analyses using the CSDRS continue to apply, and is supplemented by the site-specific SMA update. The staff finds this approach is acceptable because the North Anna 3 site-specific design improvements in a limited number of locations are not considered to reduce the capacities of the SSCs to resist the CSDRS induced loads, and the applicant has updated the SMA for the standard design's seismic Category I structures to reflect the North Anna 3 site conditions in accordance with the DC/COL-ISG-020 guidance.

This RAI response also indicates that except for the seismic margin earthquake being the North Anna 3 design basis SSE, there is no other changes to the DCD PRA model including seismic initiating events, site-specific effects and plant-specific features, and the systems model. The North Anna 3 PRA-based site-specific SMA update as documented in GEH Report 003N1084, Revision 2, and the supporting calculations describes the seismic fragility calculations for the seismic Category I structures for which seismic design information is available. For safety-related components that do not have detailed information yet, the North Anna 3 site-specific SMA update assumes a HCLPF capacity of 1.67*SSE, with a commitment that these components will be designed to achieve at least this capacity. GEH Report 003N1084, Revision 2 also presents a brief summary of the seismic capacity results of the Lungmen Nuclear Power Plant and finds that there is a high confidence that a HCLPF capacity of 1.67*SSE is achievable for key components at North Anna 3. The North Anna 3 site-specific SMA update concludes that the North Anna 3 site-specific ESBWR plant is inherently capable of safe shutdown in response to beyond design-basis earthquake events, and the plant level HCLPF value is at least 1.67 times the North Anna 3 site-specific SSE. The staff review and audit confirmed the validity of the North Anna 3 seismic fragility calculations and the reasonableness of the assumptions (i.e., the commitment for safety-related components), and finds the North Anna 3 site-specific SMA updates acceptable.

NAPS DEP 3.7-1 also affects Table 19.2-4R - ESBWR Systems and structures in Seismic Margins Analysis, in that the applicant has taken a departure from the standard COL Item 19.2.6-1-A associated with Table 19.2-4R. The staff has reviewed the proposed departure and identified the following differences between the North Anna 3 departure and the ESBWR DCD.

The minimum plant-level HCLPF value (1.67*SSE) for the systems and structures listed in Table 19.2-4R will be different from that described in the ESBWR DCD, because the seismic margin earthquake for the North Anna 3 PRA-based seismic margin assessment is the North Anna 3 design basis SSE rather than the ESBWR CSDRS. The North Anna 3 design basis SSE is the SSE for seismic Category I structures as described in Section 3.7.1 of the North Anna 3 COL FSAR, Revision 9. The staff verified that the North Anna 3 FSAR, Revision 9, incorporated the appropriate changes described in the applicant's response to RAI 19.02-1. Therefore, Confirmatory Item 19.02-1, from the staff advanced SER for North Anna 3 is resolved and closed. This departure is acceptable because the applicant will ensure, prior to fuel load, that the as-built HCLPF capacity will be at least 1.67 times the acceleration of the site-specific SSE, consistent with the criteria provided in SECY 93-087 and DC/COL-ISG-020.

The staff reviewed the following COL information item contained in the North Anna 3 COL FSAR, Revision 8:

COL Item

- NAPS COL 19.2.6-1-A Seismic High Confidence Low Probability of Failure Margins

The standard COL item is described in ESBWR DCD Tier 2, Section 19.2.6, Revision 10, and reads as follows:

> The COL applicant will identify a milestone for completing a comparison of the as-built SSC HCLPFs to those assumed in the ESBWR seismic margin analysis shown in Table 19.2-4. Deviations from the HCLPF values or other assumptions in the seismic margins evaluation shall be analyzed to determine if any new vulnerabilities have been introduced. A minimum HCLPF value of 1.67*SSE will be met for the SSCs identified in DCD Table 19.2-4 (Subsection 19.2.3.2.4).

As-built SSCs whose HCLPF values will be compared with values assumed in the ESBWR SMA are described in Table 19.2-4R of the North Anna 3 COL FSAR, Revision 8 rather than Table 19.2-4 of the ESBWR DCD, Revision 10.

The acceptability of using a site-specific characterization for the design basis SSE instead of the ESBWR CSDRS is evaluated in SER Section 3.7.

The staff compared the list of SSCs in Table 19.2-4R of the North Anna 3 COL FSAR, Revision 8 with the list of SSCs in Table 19.2-4 of the ESBWR DCD, Revision 10 and found them to be identical. The staff compared the footnote referenced in the title of Table 19.2-4R and the footnote referenced in the title of Table 19.2-4 of the ESBWR DCD and found that both stated that a minimum HCLPF value of 1.67*SSE for each seismic Category I structure will be met for the structures and systems listed in the respective Table, but that the footnote in Table 19.2-4R defines the seismic margin earthquake as the North Anna 3 design basis SSE for seismic Category I structures as described in Section 3.7.1 of the North Anna 3 COL FSAR, Revision 8 while the footnote in Table 19.2-4 of the ESBWR DCD, Revision 10 defines the seismic margin earthquake as the ESBWR CSDRS.

The staff noted that the only difference between the two is the definition of seismic margin earthquake, which is used to determine the HCLPF values. GEH Report 003N1084, Revision 2 explains that verification of the plant-specific HCLPF includes an as-built engineering walk-down to verify assumptions made in the SMA and identify any components that require strengthening if the as-built SMA indicates additional capacity margin is required. The staff found the applicant’s response to this COL item acceptable because: (1) consistent with guidance in DC/COL-ISG-020, the applicant has updated the SMA for the standard design of seismic Category I structures to reflect the North Anna 3 site SSE and (2) the applicant will conduct an as-built engineering walk-down as part of verification of the plant-specific HCLPF values.

19.2.5 Post-Combined License Activities

The applicant identified the following in the FSAR to address COL Item 19.2.6-1-A:

As-built SSC HCLPFs will be compared to those assumed in the seismic margin analysis for the SSCs listed in Table 19.2-4R for the Unit 3 SSE, as defined in Section 3.7.1. Deviations from the HCLPF values or other assumptions in the seismic margins evaluation will be analyzed to determine if any new vulnerabilities have been introduced. This comparison and analysis will be completed prior to fuel load. A minimum HCLPF value of 1.67*SSE will be met for the SSCs identified in Table 19.2-4R.

19.2.6 Conclusion

The staff reviewed North Anna 3 COL FSAR Revision 8, the proposed North Anna 3 COL FSAR, Revision 9 markup and the associated reports and calculations in accordance with the relevant NRC regulations and the guidance in SRP Chapter 19 and DC/COL-ISG-020. The staff's review concludes that the applicant has presented adequate information in proposed North Anna 3 COL FSAR, Revision 9 markup, and finds acceptable the applicant's conclusion that the North Anna 3 site-specific ESBWR plant has a HCLPF capacity of at least 1.67 times the NA3 design basis SSE with a commitment that the as-built safety-related components will be ensured to have a HCLPF capacity of at least 1.67 times the North Anna 3 design basis SSE. The staff verified that the North Anna 3 FSAR, Revision 9, incorporated the appropriate changes described in the applicant's response to RAI 19.02-1. Therefore, Confirmatory Item 19.02-1 from the staff advanced SER for North Anna 3 is resolved and closed.

19.3 <u>Severe Accident Evaluation</u>

Section 19.3 of the North Anna 3 COL FSAR incorporates by reference, with no departures or supplements, Section 19.3, "Severe Accident Evaluations," of the ESBWR DCD, Revision 10. The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remains for review[1]. The staff's review confirmed that the application addressed the required information relating the severe accident evaluations and there is no outstanding information expected to be addressed in the North Anna 3 COL FSAR related to this section. The results of the staff's technical evaluation of the information incorporated by reference in the North Anna COLA are documented in NUREG–1966.

19.4 <u>PRA Maintenance</u>

Section 19.4 of the North Anna 3 COL FSAR incorporates by reference, with no departures or supplements, Section 19.4, "PRA Maintenance," of the ESBWR DCD, Revision 10. The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remains for review[1]. The staff's review confirmed that the application addressed the required information relating the severe accident evaluations and there is no outstanding information expected to be addressed in the North Anna 3 COL FSAR related to this section. The results of the staff's technical evaluation of the information incorporated by reference in the North Anna COLA are documented in NUREG–1966.

19.5 <u>Conclusions</u>

19.5.1 Introduction

The PRA and severe accident evaluations contained in Chapter 19 of the ESBWR DCD Tier 2, Revision 10 demonstrate that the ESBWR is designed with safety features that have high reliability and availability with significant redundancy and diversity.

19.5.2 Summary of Application

Section 19.5, “Conclusions,” of the North Anna 3 COL FSAR, Revision 8 incorporates by reference, with no departures, Section 19.5 of the ESBWR DCD, Tier 2, Revision 10.

In addition, in FSAR Section 19.5, the applicant provided the following information:

<u>Supplemental Information</u>

- NAPS SUP 19.5-1

In FSAR Section 19.5, the applicant stated that it reviewed site- and plant-specific information to determine if any changes from the certified design PRA were warranted.

- NAPS DEP 3.7-1

In FSAR, Revision 9, Section 19.5, the applicant stated that the description of the certified design PRA results and insights, together with the treatment of the seismic exceedance described in FSAR Section 19.2.3.2.4, satisfy the requirement of 10 CFR 52.79(a)(46) for a description of the plant-specific PRA and its results.

19.5.3 Regulatory Basis

The regulatory basis for the information incorporated by reference is in NUREG–1966. In addition, the regulatory basis for requiring the supplementary information on consideration of site-specific and plant-specific information and design features is established in 10 CFR 52.79(a)(46) and in 10 CFR 52.79(d)(1), which requires (1) a COL applicant referencing a certified design to include, in the FSAR, information sufficient to demonstrate that the site characteristics fall within the site parameters specified in the DC, and (2) that plant-specific PRA information in a COLA that references a standard DC must use the PRA information from the DC and must be updated to account for site-specific design information and any design changes or departures.

Consistent with 10 CFR 50.71(h)(1), each COL holder shall maintain and upgrade the PRA. The upgraded PRA must cover initiating events and modes of operation contained in NRC-endorsed consensus standards on PRA in effect 1 year before each required upgrade.

19.5.4 Technical Evaluation

As documented in NUREG–1966, the staff reviewed and approved Section 19.5 of the certified ESBWR DCD. The staff reviewed Section 19.5 of the North Anna 3 COL FSAR, Revision 9, and checked the referenced DCD to ensure that the combination of the information in the COL

FSAR and the information in the ESBWR DCD represents the complete scope of information relating to this review topic.[1]

The staff's review confirmed that the information in the application and the information incorporated by reference address the required information related to this section.

In addition the staff reviewed the following site-specific information in the COL FSAR:

Supplemental Information

- NAPS SUP 19.5-1
- NAPS DEP 3.7-1

In FSAR Section 19.5 and Appendix 19AA, the applicant provided supplementary information (North Anna 3 SUP 19.5-1 and NAPS DEP 3.7-1) which describes the results of its review and evaluation of site-specific information, plant-specific information, design changes and departures from the certified design. The purpose of this evaluation is to determine if any changes from the certified design PRA are warranted. The evaluation included consideration of site-specific information such as site meteorological data and site-specific population distributions, as well as plant-specific design information that replaced the conceptual design information described in the DCD. The applicant also reviewed Section 1.8.5 of North Anna 3 COL FSAR, Revision 8 to determine if there were any departures affecting the PRA results. The review of site-specific information and plant-specific design information determined that, with one exception, the DCD PRA bounds site-specific and plant-specific design parameters and design features. The exception is that the site-specific seismic design response spectra exceed the CSDRS for the SMA of the standard plant design. The applicant stated that this departure is accounted for in the plant-specific PRA by requiring a minimum HCLPF value of 1.67*SSE for each seismic Category I and II structure and therefore, did not have a measureable impact on the DCD PRA results and insights. The staff findings associated with North Anna 3 SUP 19.5-1 and NAPS DEP 3.7-1 are addressed as part of the staff evaluation of Appendix 19AA in Section 19AA of this SER below. The staff verified that the North Anna 3 COL FSAR, Revision 9, incorporated the appropriate changes as a result of NAPS DEP 3.7-1. Therefore, Confirmatory Item 19.05-1 from the staff's advanced SER for North Anna 3 is resolved and closed.

19.5.5 Post Combined License Activities

There are no post COL activities related to this section.

19.5.6 Conclusion

The staff's findings related to information incorporated by reference are in NUREG–1966. The staff reviewed the application and checked the referenced DCD. The staff's review finds that the applicant has addressed the required information and that there is no outstanding information expected to be addressed in the COL FSAR related to this section. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to this section that were incorporated by reference have been resolved.

Based on the above, the staff concludes that the applicant's information to address supplemental information item NAPS SUP 19.5-1 as provided in the North Anna 3 COL FSAR meets the relevant guidelines in SRP Chapter 19, and is therefore, acceptable.

The staff finds that the information in the evaluation summarized in Section 19.5 and discussed in Appendix 19AA of this SER supports the conclusion that differences between site-specific parameters and features and assumptions in the DCD are minimal and do not invalidate the applicant's reference of the DCD PRA results and insights provided in Chapter 19 of the certified ESBWR DCD.

Appendix 19A Regulatory Treatment of Non-Safety Systems (RTNSS)

Appendix 19A of the North Anna 3 COL FSAR incorporates by reference, with an exemption and two departures, Appendix 19A, "Regulatory Treatment of Non-Safety Systems," of the ESBWR DCD, Revision 10. The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remains for review[1]. In addition the staff reviewed the following North Anna 3 exemption and Tier 2 departures.

As discussed below, the staff requested that the applicant address site-specific missiles generated from hurricane winds associated with Exemption 5 and Departure 19A-1. The applicant provided the necessary information in North Anna 3 FSAR Revision 9 which incorporated the appropriate changes described in the applicant's response to RAI 03.05.01.04-2. Therefore, Confirmatory Item 19.A-1 from the staff advanced SER for North Anna 3 is resolved as discussed below under NAPS DEP 19A-1.

Exemption and Tier 1 and Tier 2 Departures

The applicant proposed a site-specific Tier 1 DCD departure from DCD Tier 1, Table 5.1-1, "Envelope of ESBWR Standard Plant Site Parameters," which includes criteria for the design of structures housing RTNSS SSCs to resist maximum hurricane winds and hurricane wind generated missiles.

- Exemption 5: Design of Structures Housing RTNSS Equipment for Hurricane Wind Generated Missiles

As permitted by 10 CFR 52.7, "Specific exemptions," and Section VIII.A.4 of the DC Rule, an exemption is requested for certain information described in ESBWR DCD Tier 1. The applicant has requested that DCD Tier 1 Table 5.1-1 be modified to include North Anna 3 structures housing RTNSS equipment to withstand the most limiting hurricane missiles generated by hurricane winds using a missile spectrum and velocities that take into account both the hurricane generated missiles described in the DCD and the Unit 3 site-specific hurricane generated missiles evaluated in accordance with new NRC guidance since the ESBWR DCD approval, in Regulatory Guide (RG) 1.221, "Design Basis-Hurricane and Hurricane Missiles for Nuclear Power Plants." The applicant stated that:

This exemption modifies Footnote 7 to DCD Tier I Table 5.1-1 to specify that the Unit 3 site-specific missile velocities derived in accordance with RG 1.221 are used in the design of structures housing RTNSS equipment when the site-specific missiles are more severe than the missiles specified in the DCD.

This Tier 1 departure is further described in detail below under NAPS DEP 19A-1.

Exemption Approval determination:

In the North Anna 3 COLA, Revision 7, Part 7, "Departures Report," the applicant requested an exemption from the provisions of 10 CFR Part 52, Appendix E, "Design Certification Rule for ESBWR Design," Section III.B, "Design Certification Rule for the ESBWR Design, Scope and Contents," which requires an applicant referencing a certified design to incorporate by reference Tier 1 information. Specifically, in North Anna Part 7, Exemption 5, the applicant proposed to revise the ESBWR DCD, Tier 1, Table 5.1-1, to include new RG 1.221 guidance on wind generated missile protection for RTNSS systems. This RG followed the final DC rule on October 15, 2014 (79 FR 61944) as Appendix E to 10 CFR Part 52.

Regulations

- 10 CFR Part 52, Appendix E, Section VIII.A.4 states that exemptions from Tier 1 information are governed by the requirements of 10 CFR 52.63(b) and 10 CFR 52.98(f). 10 CFR Part 52, Appendix E, Section VIII.A.4 also states that the Commission will deny such a request if it finds that the design change will result in a significant reduction in the level of safety otherwise provided by the design.

- 10 CFR Part 52.63(b)(1) allows an applicant to request NRC approval for an exemption from one or more elements of the certification information. The Commission may only grant such a request if it determines that the request complies with the requirements of 10 CFR 52.7, which, in turn, points to the requirements listed in 10 CFR 50.12 for specific exemptions, and if the special circumstances present outweigh the potential decrease in safety due to reduced standardization. Therefore, any exemption from the Tier 1 information certified by 10 CFR Part 52, Appendix E must meet the requirements of 10 CFR 50.12, "Specific exemptions," 10 CFR 52.7, and 10 CFR 52.63(b)(1).

Evaluation of Exemption

As stated in 10 CFR Part 52, Appendix E, Section VIII.A.4, an exemption from Tier 1 information is governed by the requirements of 10 CFR 52.63(b)(1) and 52.98(f). Additionally, the Commission will deny an exemption request if it finds that the requested change to Tier 1 information will result in a significant decrease in safety. Pursuant to 10 CFR 52.63(b)(1), the Commission may, upon application by an applicant or licensee referencing a certified design, grant exemptions from one or more elements of the certification information, as long as the criteria given in 10 CFR 50.12 are met and the special circumstances as defined by 10 CFR 50.12 outweigh any potential decrease in safety due to reduced standardization.

Applicable criteria for when the Commission may grant the requested specific exemption are provided in 10 CFR 50.12(a)(1) and (a)(2). 10 CFR 50.12(a)(1) provides that the requested exemption must be authorized by law, not present an undue risk to the public health and safety, and be consistent with the common defense and security. The provisions of 10 CFR 50.12(a)(2) list six special circumstances for which an exemption may be granted. It is necessary for one of these special circumstances to be present in order for NRC to consider granting an exemption request. The applicant stated that the requested exemption meets the special circumstances of 10 CFR 50.12(a)(2)(ii). That subsection defines special circumstances as when "…[a]pplication of the regulation in the particular circumstances would not serve the underlying purpose of the rule or is not necessary to achieve the underlying purpose of the rule." The staff's analysis of each of these findings is presented below.

Authorized by Law

This exemption would allow the applicant to implement approved changes to Tier 1 information. This is a permanent exemption limited in scope to particular Tier 1 information, and subsequent changes to this Tier 1 information or any other Tier 1 information would be subject to full compliance by the applicant as specified in 10 CFR Part 52, Appendix E, Section III.B. As stated above, 10 CFR 52.63(b)(1) allows the NRC to grant exemptions from one or more elements of the certification information, namely, Tier 1. The staff determined that granting of the applicant's proposed exemption will not result in a violation of the Atomic Energy Act of 1954, as amended, or NRC regulations. Therefore, as required by 10 CFR 50.12(a)(1), the exemption is authorized by law.

No Undue Risk to Public Health and Safety

The plant-specific Tier 1 DCD will continue to reflect the approved licensing basis for the applicant and will maintain a level of detail consistent with that which is currently provided elsewhere in Tier 1 of the plant-specific DCD. The affected design description in the plant-specific Tier 1 DCD will continue to provide the detail necessary to support the RTNSS requirements and the associated design function. The site-specific hurricane wind generated missile velocities derived in accordance with the new NRC guidance in RG 1.221 exceed the missile velocities specified in the DCD for certain missiles specified by RG 1.221. The applicant has incorporated protection from wind generated missiles from both the DCD requirements as well as the new RG 1.221 requirement; therefore, these proposed changes are evaluated and found to be acceptable. Consequently, the staff finds the exemption presents no undue risk to public health and safety as required by 10 CFR 50.12(a)(1).

Consistent with Common Defense and Security

The proposed exemption would allow the applicant to implement modifications to the Tier 1 information requested in the applicant's submittal. This is a permanent exemption limited in scope to this particular Tier 1 information. Subsequent changes to this Tier 1 information or any other Tier 1 information would be subject to full compliance by the applicant as specified in 10 CFR Part 52, Appendix E, Section VIII.A.4. This change is not related to security issues. Therefore, as required by 10 CFR 50.12(a)(1), the staff finds that the exemption is consistent with the common defense and security.

Special Circumstances

Special circumstances, in accordance with 10 CFR 50.12(a)(2)(ii), are present whenever application of the regulation in the particular circumstances would not serve the underlying purposes of the rule or is not necessary to achieve the underlying purpose of the rule. The applicant included wind generated missile protection from both the DCD requirements as well as from the new RG 1.221 requirements that followed the approval of the DCD in North Anna 3 FSAR Section 19A as NAPS DEP 19A-1 and therefore the underlying purpose of the specific ESBWR DCD Tier 1, RTNSS missile protection is not changed. Accordingly, special circumstances are present because application of the requirement to incorporate the certified design information in specific ESBWR DCD, Tier 1, Table 5.1-1, "Envelope of ESBWR Standard Plant Site Parameters," is not necessary to achieve the underlying purpose of the rule. Therefore, the staff finds that special circumstances required by 10 CFR 50.12(a)(2)(ii) for the granting of an exemption from Tier 1, exist.

Special Circumstances Outweigh Reduced Standardization

This exemption would allow the applicant to change certain ESBWR DCD Tier 1 information proposed in the North Anna 3 COLA. The key design functions of the RTNSS will be maintained. Since the changes are from new NRC guidance that is different than the generic ESBWR DCD Tier 1 design wind missile protection function for RTNSS, it is likely that all other ESBWR licensees and applicants would request the same exemption using the same required guidance in RG 1.221 in subsequent COLAs.

However, this exemption request and the associated changes to North Anna 3 COL Tier 1 information, demonstrate that there is a minimal change from the standard information provided in the ESBWR DCD. Consequently, the decrease in safety due to reduced standardization is minimal. For this reason, the staff determined that even if other ESBWR licensees and applicants do not request similar departures, the special circumstances outweigh the potential decrease in safety due to reduced standardization of the ESBWR design, as required by 10 CFR 52.63(b)(1).

No Significant Reduction in Safety

The proposed exemption would not significantly modify the function of the North Anna 3 missile protection for RTNSS as described in the ESBWR DCD. Therefore, the staff finds that granting the exemption would not result in a significant decrease in the level of safety otherwise provided by the design, as required by 10 CFR Part 52, Appendix E, Section VIII.A.4.

Conclusion

For the reasons set forth above, the staff has concluded that pursuant to 10 CFR Part 52, Appendix E, Section VIII.A.4, the exemption: (1) is authorized by law, (2) presents no undue risk to the public health and safety, (3) is consistent with the common defense and security, (4) has special circumstances that outweigh the potential decrease in safety due to reduced standardization, and (5) does not significantly reduce the level of safety at the licensee's facility. Therefore, the staff finds that the applicant's request to depart from the information in ESBWR DCD Tier 1, design of missile protection for RTNSS systems, to be acceptable and the applicant's request for an exemption from these Tier 1 requirements is granted.

The applicant has taken two departures from ESBWR DCD, Revision 10, regarding augmented design standards discussed in Section 19A.8.3.

The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remains for review[1]. In addition the staff reviewed the following North Anna 3 Tier 2 departures.

- NAPS DEP 3.7-1 — Non-seismic structures that house RTNSS Criterion C systems

The applicant has removed the reference to ESBWR Certified Seismic Design Spectra taken from Figures 2.0-1 and 2.0-2 of the ESBWR DCD, Revision 10, as the source for the SSE ground motion input for design of certain non-seismic structures that house RTNSS systems and replaced it with a reference to the site-dependent SSE at grade taken from Section 3.7.1 of the North Anna 3 COL FSAR, Revision 8. This departure is acceptable to the staff because the site-dependent SSE is the appropriate source for the SSE ground motion input for non-seismic structures that house RTNSS systems and are located on the North Anna 3 site.

- NAPS DEP 19A-1 — Design of Structures Housing RTNSS Equipment for Hurricane Wind Generated Missiles

This departure addresses higher North Anna 3 site-specific hurricane wind generated missile velocities since the site-specific missile parameters are more severe than those specified in the ESBWR DCD.

In 2011 the NRC issued new guidance for hurricanes in RG 1.221. This guidance demonstrated that hurricane missiles could be more severe than tornado missiles. In addition, the ESBWR DC rule (10 CFR Part 52, Appendix E) includes an exclusion from finality for loads on applicable SSCs from hurricane-generated missiles, but only to the extent that such loads are not bounded by other loads analyzed in the ESBWR DCD. It was not clear to the staff whether North Anna 3 site-specific hurricane missile loads were bounded by the ESBWR standard plant. Therefore, the staff issued RAI 03.05.01.04-1 dated April 2, 2014, (ADAMS Accession No. ML14092A573), requesting the applicant to address hurricane missiles in accordance with RG 1.221.

The applicant’s response to RAI 03.05.01.04-1 dated April 29, 2014 (ADAMS Accession No. ML14120A239), stated that for seismic Category I structures, all missiles generated by extreme winds at the North Anna 3 site are bounded by the DCD standard plant tornado missile spectrum, and provided a table showing the ESBWR standard-plant tornado and hurricane missile spectra and associated velocities compared to North Anna 3 site-specific values. This table indicates that site-specific wind-borne missiles are indeed bounded by the referenced DCD for seismic Category I structures. However, the response did not discuss other ESBWR standard plant structures, such as structures housing RTNSS equipment, which, as non-seismic Category I structures, are designed for hurricane missiles but not tornado missiles. The table included in the applicant’s response indicated that all site-specific missiles are bounded by the ESBWR standard plant design except for the hurricane induced automobile impact on RTNSS structures. Therefore, the staff issued follow-up RAI 03.05.01.04-2 dated June 18, 2014 (ADAMS Accession No. ML14169A655), requesting the applicant to address the site-specific automobile hurricane generated missile and its impact on RTNSS structures, and whether this requires a departure from the DCD.

The applicant’s response to RAI 03.05.01.04-2 dated November 25, 2014 (ADAMS Accession No. ML14337A116), stated that:

> Dominion is taking a departure and exemption from the ESBWR design certification rule in order to meet the guidance provided in RG 1.221…the methodology specified in the RG for calculating missile velocities results in higher velocities for certain hurricane wind generated missiles. Dominion will design structures housing RTNSS equipment to withstand the most limiting hurricane missiles generated by hurricane winds using a missile spectrum and velocities that take into account both the hurricane generated missiles described in the DCD and the Unit 3 site-specific hurricane generated missiles described in the response to RAI 03.05.01.04-01 dated April 29, 2014 (ML14120A239).

The applicant also proposed to insert the following at the end of the tenth paragraph of DCD Tier 2, Section 19A.8.3, “Augmented Design Standards:”

The design of these structures also accounts for the Unit 3 site-specific hurricane generated missile velocities calculated in accordance with RG 1.221. The limiting hurricane generated missile velocities are shown in Table 19A-201.

Table 19A-201, "Limiting Hurricane Missile Parameters for NA3 [North Anna 3] Structures Housing RTNSS Equipment," is a new table added to the FSAR and identifies which hurricane generated missiles are most limiting for RTNSS structures. In addition, the applicant identified conforming changes to FSAR Tables 2.0-201, 19A-3R, 19A-4R, and DCD Tier 1, Table 5.1-1, Footnote 7 in order to clarify that the design of RTNSS structures will account for the most limiting hurricane missile.

The applicant provided a description of departure NAPS DEP 19A-1 in COLA Part 7, which states, "[t]his departure add[s] requirements to address the site-specific hurricane wind generated missile velocities when the site specific missile parameters exceed those specified in the DCD." The applicant also included an evaluation of the departure and determined that it complies with the requirements of 10 CFR Part 52, Appendix E, Section VIIIB.5.

The staff reviewed the information above and finds that the applicant has provided sufficient information to determine NAPS DEP 19A-1 to be acceptable because it conforms to the guidance of RG 1.221, and complies with 10 CFR Part 52, Appendix E, Section VIIIB.5. In addition, the design requirements added by the departure ensure that RTNSS structures will be designed to the most limiting hurricane missile.

The staff verified that the North Anna 3 FSAR, Revision 9, incorporated the appropriate changes described in the applicant's response to 03.05.01.04-2. Therefore, Confirmatory Item 19.A-1 from the staff advanced SER for North Anna 3 is resolved and closed

The staff's review confirmed that the application addressed the required information relating to RTNSS and there is no outstanding information expected to be addressed in the North Anna 3 COL FSAR related to this appendix. The results of the staff's technical evaluation of the information incorporated by reference in the North Anna COLA are documented in NUREG-1966.

Appendix 19ACM **<u>Availability Controls Manual</u>**

Appendix 19ACM of the North Anna 3 COL FSAR incorporates by reference, with no departures or supplements, Appendix 19ACM, "Availability Controls Manual," of the ESBWR DCD, Revision 10. The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remains for review[1]. The staff's review confirmed that the application addressed the required information relating to the availability controls manual and there is no outstanding information expected to be addressed in the North Anna 3 COL FSAR related to this appendix. The results of the staff's technical evaluation of the information incorporated by reference in the North Anna 3 COLA are documented in NUREG–1966.

Appendix 19B Deterministic Analysis for Containment Pressure Capability

Appendix 19B of the North Anna 3 COL FSAR incorporates by reference, with no departures or supplements, Appendix 19B, "Deterministic Analysis for Containment Pressure Capability," of the ESBWR DCD, Revision 10. The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remains for review[1]. The staff's review confirmed that the application addressed the required information relating to the deterministic analysis performed and results obtained for the containment ultimate capability under internal pressure and there is no outstanding information expected to be addressed in the North Anna 3 COL FSAR related to this appendix. The results of the staff's technical evaluation of the information incorporated by reference in the North Anna 3 COLA are documented in NUREG–1966.

Appendix 19C Probabilistic Analysis for Containment Pressure Fragility

Appendix 19C of the North Anna 3 COL FSAR incorporates by reference, with no departures or supplements, Appendix 19C, "Probabilistic Analysis for Containment Pressure Fragility," of the ESBWR DCD, Revision 10. The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remains for review[1]. The staff's review confirmed that the application addressed the required information relating to the probabilistic analyses and results for the fragility of the ESBWR primary containment system for over-pressurization and there is no outstanding information expected to be addressed in the North Anna 3 COL FSAR related to this appendix. The results of the staff's technical evaluation of the information incorporated by reference in the North Anna 3 COLA are documented in NUREG–1966.

Appendix 19D Assessment of Malevolent Aircraft Impact

Appendix 19D of the North Anna 3 COL FSAR incorporates by reference, with no departures or supplements, Appendix 19D, "Assessment of Malevolent Aircraft Impact," of the ESBWR DCD, Revision 10. The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remains for review[1]. The staff's review confirmed that the application addressed the required information relating a design-specific assessment of the intentional impact of a large commercial aircraft on the ESBWR and there is no outstanding information expected to be addressed in the North Anna 3 COL FSAR related to this appendix. The results of the staff's technical evaluation of the information incorporated by reference in the North Anna 3 COLA are documented in NUREG–1966.

Appendix 19AA Summary of Plant-Specific PRA Review

19AA.1 Introduction

In accordance with 10 CFR 52.79(a)(46), this FSAR appendix provides a summary of plant-specific PRA and its results.

19AA.2 Summary of Application

Appendix 19AA of the North Anna 3 COL FSAR provides a summary of plant-specific PRA and its results. In FSAR Appendix 19AA, the applicant summarized the results of its evaluation of site-specific and plant-specific information with respect to pertinent assumptions made in the certified design PRA. In addition, the applicant provides a summary of the Supplemental Information NAPS SUP 19.5-1 in Appendix 19AA.

In Section 19AA.2 of the application, the applicant discussed the following North Anna 3 site-specific PRA attributes that were compared to ESBWR PRA.

The parameters and features discussed by the applicant included the following:

- loss of preferred power (LOPP) frequency
- loss of service water frequency
- site-specific terrain and meteorological data
- seismic fragilities
- other known site-specific issues

19AA.3 Regulatory Basis

The regulatory basis for the information incorporated by reference is in NUREG–1966. In addition, the regulatory basis for requiring the supplementary information on consideration of site-specific and plant-specific information and design features is established in 10 CFR 52.79(a)(46) and in 10 CFR 52.79(d)(1), which requires (1) COL applicants referencing a certified design to include, in the FSAR, information sufficient to demonstrate that the site characteristics fall within the site parameters specified in the DC, and (2) plant-specific PRA information in a COLA that references a standard DC must use the PRA information from the DC and must be updated to account for site-specific design information and any design changes or departures. Consistent with 10 CFR 50.71(h)(1), each COL holder shall maintain and upgrade the PRA. The upgraded PRA must cover initiating events and modes of operation contained in NRC-endorsed consensus standards on PRA in effect 1 year before each required upgrade.

19AA.4 Technical Evaluation

As documented in NUREG–1966, the staff reviewed and approved Chapter 19 of the certified ESBWR DCD, Revision 10. The staff reviewed Appendix 19AA of the North Anna 3 COL FSAR, Revision 8, and checked the referenced DCD to ensure that the combination of the information in the COL FSAR and the information in the ESBWR DCD represents the complete scope of information relating to this review topic.[1] The staff's review confirmed that information in the application and the information incorporated by reference address the required information related to this section.

Supplemental Information

The staff reviewed the following information in the COL FSAR:

- loss of preferred power (LOPP) frequency;
- loss of service water frequency;
- site-specific terrain and meteorological data
- seismic fragilities
- plant-specific flooding zones of the yard and service water building.

Each of these parameters and features are evaluated below.

Loss of Preferred Power Frequency

The applicant stated in Section 19AA.2 of the North Anna 3 COL FSAR, Revision 8 that North Anna 3 frequencies for LOPP accident scenarios were compared with LOPP frequencies assumed in the ESBWR design PRA described in the ESBWR DCD, Revision 10. The applicant also stated that, although there are variances between the values assumed for North Anna 3 and the values assumed in the ESBWR design PRA, they are minor and their range is acceptable.

To determine whether the North Anna 3 specific values for LOPP frequencies are bounded by the values assumed in the ESBWR design PRA, the staff issued RAI 19-7 dated November 7, 2013 (ADAMS Accession No. ML13311C289), which requested that the applicant (1) specify the plant-specific values of the LOPP frequencies expected for North Anna 3, (2) provide the technical basis for the values, and (3) provide a comparison of the LOPP frequencies assumed for North Anna 3 with those assumed in the ESBWR PRA. In its response to RAI 19-7 on December 11, 2013 (ADAMS Accession No. ML13351A046), the applicant provided the requested information for at-power and shutdown conditions and included tabular data and the related references. The staff compared the LOPP frequencies reported by the applicant for North Anna 3 with the latest published data for North Anna 1 and 2 and found the North Anna 3 frequencies to be the same as the higher of the values for North Anna 1 and 2. The staff considers this comparison to be acceptable and reasonable since all units are on the same site. The staff compared expected North Anna 3 values with values used in the ESBWR design PRA (NEDO-33201, “ESBWR Design Certification Probabilistic Risk Assessment,” Revision 6, dated October 25, 2010) and found the values used in the ESBWR design PRA to be bounding. Therefore, the staff finds that the ESBWR design PRA provides a bounding assessment of LOPP events.

Loss of Service Water Frequency

The applicant stated in Section 19AA.2 of the North Anna 3 COL FSAR, Revision 8 that the ESBWR loss of service water frequency is based on NUREG/CR-5750, “Rates of Initiating Events at U.S. Nuclear Power Plants: 1987-1995,” issued February 1999. The applicant also stated that the value assumed in the ESBWR PRA would be bounding for North Anna 3. To justify the assertion that this approach is bounding, the applicant provided a detailed description of the features included in the North Anna 3 service water system design to improve reliability over that of designs used in operating plants. The applicant also stated in Section 19AA.2 of the North Anna 3 COL FSAR, Revision 8 that in addition to the bounding treatment of PRA parameters, there are no changes from the standard design in any systems considered in the PRA model, and therefore, there are no site-specific design features that affect the PRA because the boundary of the certified design covers all of the SSCs necessary for the PRA.

The staff evaluated the assertions regarding service water system failure frequency by comparing the North Anna 3 service water system design with the service water system modeled in the ESBWR design PRA. The staff found that the North Anna 3 service water system design as described in the North Anna 3 COL FSAR, Revision 8 was included in the ESBWR PRA model. The staff finds this to be a reasonable basis to expect that the plant-specific service water system will not introduce design differences that would create substantial additional risk over and above that described in the certified ESBWR DCD.

Site-Specific Terrain and Meteorological Data

The applicant stated that there are no terrain features specific to North Anna 3 that would affect the meteorological data or plume dispersion and that the site is bounded by the DCD in Section 19.2.5 for offsite consequences.

Based on its review of information in the PRA report referenced in the ESBWR DCD, Tier 2, Revision 10, the staff found that the assumptions for tornado and hurricane frequencies in the ESBWR PRA are bounding with respect to the North Anna 3 site. Indeed, the tornado frequencies assumed in the ESBWR PRA were generated using data from the central region of the United States (U.S.) where the tornado intensities and frequencies of occurrence are highest. The North Anna 3 site is an inland site located in Virginia on the shore of Lake Anna. Historical data from the National Oceanic and Atmospheric Administration (NOAA) (www.noaa.gov) show that the frequency of tornados in Virginia is less than half of that for states in the middle of the United States. The hurricane frequencies applied in the ESBWR PRA were developed using data from a set of plants operating on the Atlantic coast in the southeastern U.S. Data in NOAA Technical Memorandum NWS NHC-6, dated August 2011, show the frequency of intense hurricane winds in Virginia to be far below that on the south eastern coast of the United States. Based on the location of the North Anna site, the staff finds it reasonable to conclude that the tornado and hurricane frequencies applied in the ESBWR PRA are bounding with respect to the North Anna 3 site.

Site-Specific Seismic Design Response Spectra

The acceptability of using the North Anna 3 site-specific characterization for the design basis SSE, which exceeds ESBWR CSDRS, is evaluated in Section 3.7 of this SER.

Plant-Specific Flooding Zones of the Yard and Service Water Building

The evaluation of flooding associated with the yard area provided in Section 19AA.3 of the North Anna 3 application indicated that site-specific design basis flooding conditions would not cause risk to increase beyond the level determined in the ESBWR design PRA because all SSCs modeled in the PRA are located above the design basis flood level. External flooding events that could cause a flood more severe than the design basis flood were not addressed in the application.

The applicant stated that the service water structure is a site-specific design feature and is treated in a bounding manner in the ESBWR PRA. The service water structure houses the four service water pumps and their associated power supplies and controls. The applicant stated that in the ESBWR PRA model, the service water structure is conservatively considered to be one flood zone and all four pumps are assumed to fail in an internal flood. It was also stated that the ESBWR PRA model does not credit operator actions to mitigate a service water structure flooding event, so differences in building location are not significant.

Based on its evaluation, the applicant concluded that none of the North Anna 3 parameters and features have a significant impact on the DCD PRA results and insights; and therefore, there is no significant change from the certified design PRA, and incorporation of DCD Chapter 19 into the North Anna 3 COL FSAR, Revision 8 satisfies the requirement of 10 CFR 52.79(a)(46) for a description of the plant-specific PRA and its results.

Plant-Specific Flooding Zone of the Yard

Because the applicant only addressed design basis flooding in the application, the staff issued RAI 19-8 dated November 7, 2013 (ADAMS Accession No. ML13311C289), requesting that the applicant address the risk associated with beyond design basis external flooding events for North Anna 3. In its response to RAI 19-8 dated December 11, 2013 (ADAMS Accession No ML13351A046), the applicant addressed potential flooding from severe precipitation, dam failures, surge or seiche flooding and tsunami flooding. The applicant also stated that flooding from extreme precipitation presented the highest potential risk from external flooding for the following reasons:

1. There are no dams located upstream of the facility, and therefore it is not subject to sudden flooding due to dam failure.

2. The facility is not located on an estuary or open coast, and therefore not subject to flooding due to seiche, surge or tsunami.

The staff considered the applicant's response and compared it with information regarding potential flooding at the site provided in Chapter 2 of the North Anna 3 COL FSAR, Revision 8. The information in the response is consistent with information provided in the North Anna 3 COL FSAR, Revision 8. Based on the features of the North Anna site listed above and information provided in Chapter 2 of the North Anna 3 COL FSAR, Revision 8 regarding flooding from extreme precipitation, the staff finds the applicant's bases for concluding that potential severe flooding from extreme precipitation poses the greatest risk from external flooding events are logical and reasonable, and therefore acceptable.

In its response, the applicant cited the following screening criterion from the American Society of Mechanical Engineers (ASME)/American Nuclear Society (ANS) RA-Sa-2009, "Standard for Level 1/Large Early Release Frequency Probabilistic Risk Assessment for Nuclear Power Plant Applications," as the basis for not providing a further risk evaluation of floods from precipitation beyond the probable maximum precipitation described in Chapter 2 of North Anna 3 COL FSAR, Revision 8:

> *Criterion 5:* The event is slow in developing, and it can be demonstrated that there is sufficient time to eliminate the source of the threat or to provide an adequate response.

The staff agrees that flooding from severe precipitation would present a challenge to the plant that is slow in developing compared to most upset conditions. The staff also finds that there is a reasonable basis for concluding that an adequate response to such a flooding event that challenged safe plant operation could be made expeditiously. This is because the design of North Anna 3, as described in the North Anna 3 COL FSAR, Revision 8, includes safety systems (i.e., the isolation condenser system, automatic depressurization system, gravity driven cooling system and the primary containment cooling system) whose components are located either inside containment or above the containment, and therefore protected from floods. Once initiated, these systems can be used to remove decay heat for up to 72 hours with no intervention, as described in the North Anna 3 COL FSAR, Revision 8. Initiating these safety systems generally involves only a few valve manipulations that can be performed from the control room. The isolation condenser system initiates automatically on loss of electric power. Since these are safety-related systems, procedures for initiating cooling with these systems must be provided in accordance with the Commission's regulations in 10 CFR Part 50, Appendix B, "Quality Assurance Criteria for Nuclear Power Plants and Fuel Reprocessing

Plants." After 72 hours, action is required to refill cooling water tanks in the containment which allows these systems to maintain cooling for an additional 4 days. These actions are described in the North Anna 3 COL FSAR, Revision 8 and the staff's review of these actions is contained in Chapter 22 of NUREG–1966.

Based on its evaluation, the staff finds the applicant's bases for screening external floods from quantitative analysis in the PRA to be acceptable.

Plant-specific Flooding Zone of the Service Water Building

The staff reviewed flooding analysis documented in Chapter 13 of the ESBWR PRA report referenced in the ESBWR DCD, Revision 10 and confirmed that the service water building is considered a single flood zone in the ESBWR PRA model. The staff also confirmed that all equipment in a single flood zone is assumed to fail in the model, and the model does not credit operator actions to mitigate a service water structure flooding event. In light of these assumptions, the staff finds that flooding of the service water building is treated in a bounding manner in the ESBWR PRA, and this provides reasonable assurance that site-specific differences in service water structure design will not have a significant effect on the PRA results.

19AA.5 Post-Combined License Activities

As-built SSC HCLPFs will be compared to those assumed in the ESBWR SMA and site-specific update shown for the SSCs listed in Table 19.2-4R for the Unit 3 SSE, as defined in Section 3.7.1. Deviations from the HCLPF values or other assumptions in the seismic margins evaluation will be analyzed to determine if any new vulnerabilities have been introduced. This comparison and analysis will be completed prior to fuel load. A minimum HCLPF value of 1.67*SSE will be met for the SSCs identified in Table 19.2-4R.

19AA.6 Conclusion

The staff's findings related to information incorporated by reference are in NUREG–1966. The staff reviewed the application and checked the referenced DCD. The staff's review confirms finds that the applicant has addressed the required information relating to the PRA and that there is no outstanding information expected to be addressed in the COL FSAR related to this section. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix E, Section VI.B.1, all nuclear safety issues relating to the summary of plant-specific PRA review that were incorporated by reference have been resolved.

The staff also compared the supplemental COL information within the application to the relevant NRC regulations. The regulatory basis for acceptance of the supplementary information on consideration of site-specific and plant-specific information and design features is established in 10 CFR 52.79(d)(1). The staff finds the applicant's consideration of site-specific and plant-specific information and design features sufficient to support the conclusion that differences between the site-specific parameters, other than the seismic ground motion departure NAPS DEP 3.7-1 that was explicitly evaluated to ensure a minimum plant-level HCLPF value of 1.67*SSE, and features and the assumptions in the DCD are small and do not invalidate the applicant's reference to the DCD PRA results and insights provided in Chapter 19 of the ESBWR DCD.

ATTACHMENT 19.A

LOSS OF LARGE AREAS OF THE PLANT DUE TO EXPLOSIONS OR FIRES

19.A.1 Introduction

The applicant described the strategies for North Anna 3 loss of large areas (LOLA) in Appendix 8B of the “North Anna 3 Combined License Application Part 8: Security,” Revision 4, submitted December 2013 (Agencywide Documents Access and Management System (ADAMS) Accession No. ML14007A424, non-public) (hereafter referred to as the mitigative strategies report (MSR)).

In the submittal, the applicant described how it will meet the requirements to address LOLAs of the plant due to explosions or fires from a beyond design basis event (BDBE). Title 10 of the *Code of Federal Regulations* (10 CFR) 52.80(d) and 10 CFR 50.54(hh)(2) detail these requirements. The attachment to this safety evaluation section, Attachment 19.B, “Loss of Large Areas of the Plant due to Explosions or Fire” (non-public), as well as some documents referenced in this safety evaluation section, include security-related or safeguards information and are not publicly available.

The provisions of 10 CFR 52.80(d) require an applicant for a combined license (COL) to submit a description and plans for implementation of the guidance and strategies intended to maintain or restore core cooling, containment, and spent fuel pool (SFP) cooling capabilities under the circumstances associated with LOLAs of the plant due to explosions or fire as required by 10 CFR 50.54(hh)(2).

The provisions of 10 CFR 50.54(hh)(2) require licensees to develop and implement guidance and strategies for addressing LOLAs of the plant due to explosions or fires from a BDBE. Specifically, the guidance and strategies are intended to maintain or restore core cooling, containment, and SFP cooling capabilities and include the following:

- Firefighting;
- Operations to mitigate fuel damage; and
- Actions to minimize radiological release.

19.A.2 Summary of Application

The applicant submitted (Appendix 8B to ADAMS Accession No. ML14007A424, non-public) the MSR for the North Anna 3 LOLA strategies titled “North Anna 3 Mitigative Strategies Description and Plans.” The applicant will incorporate this report, including any applicable changes identified in response to NRC requests for additional information into a future revision of the North Anna 3 COLA. The applicant stated that it would implement the LOLA mitigative strategies, including implementation of operational and programmatic aspects of responding to LOLA events, before initial fuel load.

19.A.3 Regulatory Basis

NRC regulations in 10 CFR Part 50, “Domestic Licensing of Production and Utilization Facilities,” and 10 CFR Part 52, “Licenses, Certifications, and Approvals for Nuclear Power Plants,” provide the regulatory basis for the staff’s review of the information in the North Anna 3 COLA. For example, the applicable regulatory requirements for LOLAs of the plant due to explosions or fires are as follows:

- 10 CFR 50.54(hh)(2); and
- 10 CFR 52.80(d).

The applicable regulatory guidance includes Interim Staff Guidance (ISG) DC/COL-ISG-016, “Interim Staff Guidance Compliance with 10 CFR 50.54(hh)(2) and 10 CFR 52.80(d) Loss of Large Areas of the Plant Due to Explosions or Fires from a Beyond-Design-Basis Event,” dated April 20, 2010 (ADAMS Accession No. ML101030529) (not publically available), which provides an acceptable means of meeting the requirements of 10 CFR 50.54(hh)(2) and 10 CFR 52.80(d). DC/COL-ISG-016 references the February 25, 2005, guidance letter (non-public) to operating reactor licensees for Phase 1 and the Nuclear Energy Institute (NEI) document NEI 06-12, Revision 3, “B.5.b Phase 2 & 3 Submittal Guideline,” issued September 2009, Revision 3 (ADAMS Accession No. ML092890400) (non-public), for Phases 2 and 3. DC/COL-ISG-016 takes exception to a few areas of NEI 06-12 and provides additional clarification and enhancement of NEI 06-12 and the staff’s guidance letter dated February 25, 2005, based on NRC inspections of operating reactor implementation. DC/COL-ISG-016 has two attachments: Attachment 1, “Supplementary Guidance for Implementing Mitigation Strategies;” and Attachment 2, “Experience Gained from Implementation of Temporary Instruction 2515/171 at Currently Licensed Power Reactor Sites and Related Staff Positions.”

19.A.4 Technical Evaluation

The staff reviewed the applicant’s submittal consistent with the requirements of 10 CFR 52.80(d) and 10 CFR 50.54(hh)(2). The staff also used the guidance in DC/COL-ISG-016 to perform its review. DC/COL-ISG-016 references the February 25, 2005, guidance letter for Phase 1 and NEI 06-12 for Phases 2 and 3. Attachment 19.B (non-public), discusses the staff’s technical evaluation of the North Anna 3 LOLA Plan submittal.

The North Anna 3 COL applicant provided the LOLA event evaluation via a three-phase approach similar to that for existing plants and consistent with Phases 1, 2, and 3 in the NEI 06-12 guidance. The applicant wrote its “Mitigative Strategies Description and Plans” issued December, 2013, at the programmatic level for licensing approval; the implementation details and documentation will be made available for inspection by the NRC before initial fuel load.

The applicant’s submittal of the MSR, the applicant follows the template guidance in Appendix D to NEI 06-12, addresses various areas and issues pertinent to LOLAs, and describes commitments for areas that are best resolved closer to the completion of the building of North Anna 3. All commitments made in the submittal will be implemented before the initial fuel load of the unit.

The MSR addresses the three phases considered in NEI 06-12:

- Phase 1—firefighting response strategy
- Phase 2—SFP cooling
- Phase 3—reactor core cooling and fission product release mitigation

Phases 1, 2, and 3 of NEI 06-12 are similar to the three areas included as part of the requirements in 10 CFR 50.54(hh)(2): firefighting, operations to mitigate fuel damage, and actions to minimize radiological release. However, the three phases are categorized differently. In 10 CFR 50.54(hh)(2), the category of operations to mitigate fuel damage includes both the reactor core and the SFP, and the category of actions to minimize radiological release is separate. In NEI 06-12, separate phases address SFP and reactor core cooling, and reactor core cooling and fission product release mitigation are combined. Despite the differences between the categorization of the phases in NEI 06-12 and the areas of the regulatory requirements, the staff finds that the submittal included all of the necessary information.

The guidance for Phases 1, 2, and 3 suggests development of certain strategies or processes to mitigate the consequences of a LOLA event. The applicant addressed all of these suggested strategies or processes. In evaluating each plant-specific mitigating strategy against its functional objective, the staff weighed whether the strategy reasonably can be expected to successfully provide SFP cooling or to maintain or restore the key safety functions necessary to protect the reactor core and containment. The staff's review considered the expected effectiveness of strategies and the ease and timeliness of strategy implementation.

The staff reviewed the MSR for content using DC/COL-ISG-016 and finds that it includes all strategies considered essential for such a program and is acceptable. The staff finds that the regulatory requirements of 10 CFR 52.80(d) and 10 CFR 50.54(hh)(2) are met.

19.A.5 Post Combined License Activities

Although some strategies needed to meet 10 CFR 50.54(hh)(2) can be developed and implemented in the near future, some strategies and planning efforts cannot be effectively determined or implemented until the plant is further along in construction.

In Part 10 of the North Anna 3 COLA Revision 8, the applicant has identified the following license conditions to meet the requirements of 10 CFR 50.54(hh)(2) and 10 CFR 52.80, "Contents of application; additional technical information."

Fuel Load Authorization

> The licensee shall implement the operational program identified below prior to fuel load authorization per 10 CFR 52.103(g):
>
> Mitigative Strategies Description and Plans (for responding to circumstances associated with loss of large areas of the plant due to explosions or fire developed in accordance with 10 CFR 50.54(hh)(2)).

Operational Program Implementation Schedule

The licensee shall submit to the Director of NRO, a schedule, no later than 12 months after issuance of the COL, for implementation of the operational programs listed in FSAR Table 13.4-201. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until the operational programs in the FSAR table have been fully implemented. This schedule shall also address:

- The implementation of site-specific Severe Accident Management Guidelines
- The spent fuel rack coupon monitoring program implementation

The staff reviewed the license conditions proposed by the applicant in its submittal and is satisfied that the timing of all procedural or strategy development was appropriately scheduled before the initial fuel load.

19.A.6 Conclusion

The staff reviewed the information provided by the applicant under 10 CFR 52.80(d). The staff concludes that the applicant has adequately followed the guidance of DC/COL-ISG-016, NEI 06-12, and the February 25, 2005, guidance letter. The staff finds that the applicant provided sufficient information at the COLA stage, including commitments made in the North Anna 3 COLA, to meet the requirements of 10 CFR 52.80(d) and to provide reasonable assurance that the requirements in 10 CFR 50.54(hh)(2) will be met before the initial fuel load of North Anna 3.

20.0 REQUIREMENTS RESULTING FROM FUKUSHIMA NEAR-TERM TASK FORCE RECOMMENDATIONS

20.0 REQUIREMENTS RESULTING FROM FUKUSHIMANEAR-TERM TASK FORCE RECOMMENDATIONS

This chapter of the U.S. Nuclear Regulatory Commission's (NRC's) safety evaluation report (SER) provides the NRC staff evaluation of the Fukushima Near-Term Task Force (NTTF) recommendations that are applicable to the North Anna 3 Combined License (COL). The applicable recommendations address three topics: mitigation strategies for beyond-design-basis external events (related to Recommendation 4.2), spent fuel pool (SFP) instrumentation (related to Recommendation 7.1), and emergency preparedness (EP) staffing and communications (related to Recommendation 9.3).

Background

In response to the events at Fukushima resulting from the March 11, 2011, Great Tohoku earthquake and tsunami in Japan, NRC established the NTTF to conduct a systematic and methodical review of NRC processes and regulations (1) to determine whether the agency should make additional improvements to its regulatory system, and (2) to make recommendations to the Commission for policy directions. In July 2011, the NTTF issued a 90-day report, SECY-11-0093, "Near Term Report and Recommendations for Agency Actions Following the Events in Japan," (Agencywide Documents Access and Management System (ADAMS) Accession Number ML11186A950) identifying 12 recommendations. On September 9, 2011, in SECY-11-0124, "Recommended Actions To Be Taken Without Delay From The NTTF Report," (ADAMS Accession No. ML11245A127), the staff submitted to the Commission for its consideration NTTF recommendations that can and—in the staff's judgment—should be partially or entirely initiated without delay. In SECY-11-0124, the staff identified and concluded that specific actions to address a subset of the NTTF recommendations would provide the greatest potential for improving safety in the near term:

1. Recommendation 2.1: Seismic and Flood Hazard Reevaluations

2. Recommendation 2.3: Seismic and Flood Walkdowns

3. Recommendation 4.1: Station Blackout Regulatory Actions

4. Recommendation 4.2: Equipment Covered under Title 10 of the *Code of Federal Regulations* (10 CFR) 50.54(hh)(2)

5. Recommendation 5.1: Reliable Hardened Vents for Mark I Containments

6. Recommendation 8: Strengthening and Integration of Emergency Operating Procedures, Severe Accidents Management Guidelines, and Extensive Damage Mitigation Guidelines

7. Recommendation 9.3: Emergency Preparedness Regulatory Actions (staffing and communications)

On October 3, 2011, in SECY-11-0137, "Prioritization of Recommended Actions to Be Taken in Response to Fukushima Lessons Learned" (ADAMS Accession No. ML11272A203), the staff identified two actions in addition to the actions discussed in SECY-11-0124 that had the greatest potential for improving safety in the near term. The additional actions are as follows:

- Inclusion of Mark II containments in the staff's recommendation for reliable hardened vents associated with NTTF Recommendation 5.1

- The implementation of SFP instrumentation proposed in Recommendation 7.1

The staff also proposed to the Commission three tiers of prioritization for the NTTF recommendations. The first tier consists of those NTTF recommendations that the staff determined should be started without unnecessary delay and for which sufficient resource flexibility, including availability of critical skill sets, exists. The second tier consists of those NTTF recommendations that could not be initiated in the near term due to factors that include the need for further technical assessment and alignment, dependence on Tier 1 issues, or availability of critical skill sets. These actions do not require long-term study and can be initiated when sufficient technical information and applicable resources become available. The third tier consists of those NTTF recommendations that require further staff study to support a regulatory action, have an associated shorter-term action that needs to be completed to inform the longer-term action, are dependent on the availability of critical skill sets, or are dependent on the resolution of NTTF Recommendation 1 (See SECY-11-0093).

On February 17, 2012, in SECY-12-0025, "Proposed Orders and Requests for Information in Response to Lessons Learned from Japan's March 11, 2011, Great Tohoku Earthquake and Tsunami" (ADAMS Accession No. ML12039A111), the staff provided the Commission with proposed orders and requests for information to be issued to all power reactor licensees and holders of construction permits.

On March 9, 2012, the Commission approved issuing the proposed orders with some modifications in the staff requirements memorandum (SRM) to SECY-12-0025. As set forth in SRM-SECY-12-0025, the proposed orders are needed for continued adequate protection or to provide a substantial increase in the protection of public health and safety. In accordance with its statutory authority under Section 161 of the Atomic Energy Act of 1954, as amended (the Act), the Commission may impose these requirements.

On March 12, 2012, the NRC issued Order EA-12-049, "Issuance of Order to Modify Licenses with Regard to Requirements for Mitigation Strategies for Beyond-Design-Basis External Events."; and Order EA-12-051, "Issuance of Order to Modify Licenses with Regard to Reliable Spent Fuel Pool Instrumentation" (ADAMS Accession Nos. ML12054A735 and ML12054A679, respectively), to the appropriate licensees and permit holders, including the only holder at that time of a COL issued under 10 CFR Part 52, Southern Nuclear Operating Company, the licensee and operator of the Vogtle Electric Generating Plant Units 3 and 4. The staff also issued the requests for information pursuant to 10 CFR 50.54(f) regarding Recommendations 2.1, 2.3, and 9.3 to the appropriate licensees and construction permit holders in March 12, 2012, letters (ADAMS Accession No. ML12053A340).

The following Tier 1 recommendations from SECY-11-0137, as modified in SECY-12-0025, were considered in determining those that are applicable to North Anna 3 COL review:

1. Recommendation 2.1: Seismic and Flood Hazard Reevaluations

2. Recommendation 2.3: Seismic and Flood Walkdowns

3. Recommendation 4.1: Station Blackout Regulatory Actions

4. Recommendation 4.2: Equipment Covered under 10 CFR 50.54(hh)(2)

5. Recommendation 5.1: Reliable Hardened Vents for Mark I and Mark II Containments

6. Recommendation 7.1: Spent Fuel Pool Instrumentation

7. Recommendation 8: Strengthening and Integration of Emergency Operating Procedures, Severe Accidents Management Guidelines, and Extensive Damage Mitigation Guidelines

8. Recommendation 9.3: Emergency Preparedness Regulatory Actions (staffing and communications)

The staff determined that the following three recommendations are applicable and should be addressed by the North Anna 3 COL applicant:

1. Recommendation 4.2: Equipment covered under 10 CFR 50.54(hh)(2) - Order licensees to provide reasonable protection for equipment currently provided pursuant to 10 CFR 50.54(hh)(2) from the effects of design-basis external events, and to add equipment as needed to address multiunit events while other requirements are being revised and implemented.

2. Recommendation 7.1: Spent fuel pool instrumentation - Order licensees to provide sufficient safety-related instrumentation, able to withstand design-basis natural phenomena, and to monitor SFP parameters (i.e., water level, temperature, and area radiation levels) from the control room.

3. Recommendation 9.3: Emergency preparedness regulatory actions (staffing and communications) - Order licensees to do the following until rulemaking is complete:

   - Determine and implement the required staff to fill all necessary positions for responding to a multi-unit event.

   - Provide a means to power communications equipment needed to communicate onsite (e.g., radios for response teams and between facilities) and offsite (e.g., cellular telephones and satellite telephones) during a prolonged station blackout.

The staff determined that the remaining Tier 1 recommendations did not need to be considered further in North Anna 3 COL application (COLA) review. The applicant evaluated the seismic and flood hazards using current guidance and methodologies. For the seismic hazard, the applicant performed an evaluation consistent with guidance in Regulatory Guide (RG) 1.208, “A Performance-Based Approach to Define the Site Specific Earthquake Ground Motion.” Regarding the need to consider the latest information in the evaluation of seismic hazard, the applicant’s evaluation included consideration of the NUREG–2115, “Central and Eastern United States

Seismic Source Characterization for Nuclear Facilities," (CEUSSSC) model as described in this SER for North Anna 3, Chapter 2, Section 2.5.2. For flood hazards, as evaluated in this SER Chapter 2, Sections 2.4.5 and 2.4.6, the applicant used RG 1.59, "Design Basis Floods for Nuclear Power Plants," supplemented by best current practices, as it relates to providing assurance that natural flooding phenomena that could potentially affect the site have been appropriately identified and characterized. Thus, the staff determined that the applicant has already addressed the seismic and flood hazard reevaluation portion of Recommendation 2.1. Therefore, there are no additional matters left to be addressed in Recommendation 2.1 for seismic and flooding reevaluations related to the North Anna 3 COLA. Additionally, the staff determined that Recommendation 2.3 was not applicable to the North Anna 3 COL because the plant is not yet constructed. The staff also determined that Recommendation 5.1 is not applicable because it applies to boiling-water reactor plant designs with Mark I and Mark II containments, which the Economic Simplified Boiling-Water Reactor (ESBWR) does not have.

Recommendations 4.1 and 8 did not need to be considered further because SECY-11-0137 and the associated SRM direct that regulatory actions associated with these recommendations should be initiated through rulemaking.

In SECY-12-0025, the staff stated that all COL applicants would be asked to provide the information addressed in the orders and the requests for information through the review process. Accordingly, for the North Anna 3 COLA, the staff issued several requests for additional information (RAIs) related to the implementation of Fukushima NTTF recommendations pertaining to mitigation strategies for beyond-design-basis external events; SFP instrumentation; and EP staffing and communications based on Recommendations 4.2, 7.1, and 9.3, as modified by SRM-SECY-12-0025. The following sections of this chapter present the staff's safety evaluation related to these areas.

20.1 Recommendation 4.2, Mitigation Strategies for Beyond-Design-Basis External Events

In a December 18, 2013, letter (ADAMS Accession No. ML14013A113), the North Anna 3 COL applicant provided the results of its review of RAIs, including RAIs related to the mitigating strategies for beyond-design-basis external events, submitted by the Fermi 3 COLA, considered for the purpose of this SER chapter the reference COL (R-COL) applicant. As the subsequent COL (S-COL) for the purposes of this SER chapter North Anna 3 indicated that the Fermi 3 responses to RAIs applicable to mitigating strategies were incorporated into the North Anna 3 COLA, or the North Anna 3 COLA meets the intent of those Fermi 3 RAI responses.

In a January 23, 2015, letter (ADAMS Accession No. ML15028A185) North Anna 3 submitted markups to align with the Fermi 3 October 2014 R-COL submissions (ADAMS Accession No. ML14295A354 and ML14308A337). These COLA markups for North Anna 3 in FSAR Section 1.5.1.1.1 are consistent with the standard COL information contained in the FERMI 3 application.

The staff completed the review and finds the evaluation of the Fermi 3 COL standard content directly applicable to the North Anna 3 COLA. This report identifies the standard content material with italicized, double-indented formatting.

The staff reviewed the information in the North Anna 3 COL FSAR as follows:

20.1.1 Introduction

20.2.1 Introduction

SECY-12-0025 states that the staff will request all COL applicants to provide the information addressed in the orders (EA-12-049, EA-12-050, and EA-12-051) through the review process. For mitigation strategies for beyond-design-basis external events, SECY-12-0025 outlines a three-phase approach. The initial phase involves the use of installed equipment and resources to maintain or restore core cooling, containment, and spent fuel pool cooling (SFPC) without alternating current power. The transition phase involves providing sufficient, portable, onsite equipment and consumables to maintain or restore these functions until they can be accomplished with resources brought from offsite. The final phase involves obtaining sufficient offsite resources to sustain those functions indefinitely.

The Japan Lesson-Learned Project Directorate (JLD)-ISG-2012-01, Revision 0, "Compliance with Order EA-12-049, Order Modifying Licenses with Regard to Requirements for Mitigation Strategies for Beyond-Design-Basis External Events," (ADAMS Accession No. ML12229A174) endorses with clarification the methodologies described in the industry guidance document Nuclear Energy Institute (NEI) 12–06, Revision 0, "Diverse and Flexible Coping Strategies (FLEX) Implementation Guide," (ADAMS Accession No. ML12242A378) and provides an acceptable approach for satisfying the applicable requirements.

Application of JLD-ISG-2012-01 to new reactors, such as Fermi 3, requires appropriate consideration of the approaches to nuclear safety inherent in the specific designs. The Fermi 3 nuclear power plant references the Economic Simplified Boiling-Water Reactor (ESBWR) standard design that utilizes passive design features that provide core cooling, containment, and SFPC capabilities for 72 hours without relying on alternating current (ac) power. The ESBWR design also includes additional installed ancillary equipment that could extend the time period from 72 hours to 7 days to maintain safety functions using available onsite resources.

20.1.2 Summary of Application

20.2.2 Summary of Application

The applicant addresses mitigation strategies in Section 1.5.1.1.1, "Recommendation 4.2, Mitigating Strategies for Beyond-Design-Basis External Events" of the application. The NRC issued RAI Letter Number 78 (RAI 01.05-3 and RAI 01.05-4) dated July 3, 2012 (ADAMS Accession No. ML121850099);

and RAI Letter Number 84 (RAI 01.05-5 and RAI 01.05-6) dated March 19, 2013 (ADAMS Accession No. ML13078A436). The NRC requested the applicant to address the three-phase approach for mitigating beyond-design-basis external events and the mitigating strategies for ensuring that core cooling, containment, and SFPC capabilities function indefinitely. In letters responding to RAI Letter 84 dated April 18, 2013 (ADAMS Accession No. ML13109A426); July 9, 2013 (ADAMS Accession No. ML13192A301); and February 28, 2014 (ADAMS Accession No. ML14064A284), the applicant described the three-phase mitigation strategies for beyond-design-basis external events. The applicant responded to RAI Letter Number 78 in a letter dated August 24, 2012 (ADAMS Accession No. ML12240A184); and in subsequent supplemental response letters dated January 25, 2013 (ADAMS Accession No. ML13028A402); and February 19, 2013 (ADAMS Accession No. ML13051A657). In the response to the RAIs, the applicant proposed adding the following license condition related to mitigation strategies for beyond-design-basis external events:

> *At least 180 days before the date scheduled for initial fuel load as set forth in the notification submitted in accordance with 10 CFR § 52.103(a), DTE Electric Company shall use the guidance contained in JLD-ISG-2012-01, "Compliance with Order EA-12-049, Order Modifying Licenses with Regard to Requirements for Mitigation Strategies for Beyond-Design-Basis External Events," Revision 0 and the information presented in Fermi FSAR Section 01.05 to complete the development of strategies and guidance for maintaining and, if necessary restoring core cooling, containment, and SFPC capabilities beginning 72 hours after loss of all normal and emergency ac power sources, including any alternate ac source under 10 CFR 50.63. These strategies must be capable of:*
>
> - *Mitigating a simultaneous loss of all ac power sources, both from the onsite and offsite power systems, and loss of normal access to normal heat sink,*
> - *Maintaining core cooling, containment, and SFPC capabilities for Fermi Unit 3 during and after such an event affecting both Fermi Unit 2 and 3, and*
> - *Being implemented in all plant modes.*
>
> *Before initial fuel load, DTE Electric Company shall fully implement the strategies and guidance required in this license condition, including procedures, training, and acquisition, staging or installation of equipment and consumables relied upon in the strategies.*

The RAI response also included a proposed revision to the COL application Part 10, Section 3.8.2, "Mitigation Strategies for Beyond-Design-Basis External Events."

In the response to the Fermi COLA RAIs as reflected in the Fermi R-COLA, the applicant added the following license condition related to mitigation strategies for beyond-design-basis external events in Revision 7 of the North Anna COLA Part 10, Section 3.8.2, Mitigation Strategies for Beyond-Design-Basis External Events:

At least 180 days before the date scheduled for initial fuel load as set forth in the notification submitted in accordance with 10 CFR 52.103(a), the licensee shall use the guidance contained in JLD-Interim Staff Guidance (ISG)-2012-01, "Compliance with Order EA-12-049, Order Modifying Licenses with Regard to Requirements for Mitigation Strategies for Beyond-Design-Basis External Events," Revision 0 and the information presented in FSAR Section 1.5 to complete the development of strategies and guidance to maintain and, if necessary, restore core cooling, containment, and spent fuel pool cooling capabilities beginning 72 hours after loss of all normal and emergency alternating current (ac) power sources, including any alternate ac source under 10 CFR 50.63. These strategies must be capable of:

- Mitigating a simultaneous loss of all ac power sources, both from the on-site and off-site power systems, and loss of normal access to the normal heat sink,
- Maintaining core cooling, containment, and spent fuel pool cooling capabilities for NA3 during and after such an event affecting all units on site, and
- Being implemented in all plant Modes.

Before initial fuel load, the licensee shall fully implement the strategies and guidance required in this license condition, including procedures, training, and acquisition, staging or installing of equipment and consumables relied upon in the strategies.

20.1.3 Regulatory Basis

20.2.3 Regulatory Basis

The requirements and guidance for mitigation strategies for beyond-design-basis external events are established or described in the following:

- *Atomic Energy Act of 1954, as amended (the Act), Section 161, authorizes the Commission to regulate the possession and utilization of special nuclear material in a manner that is protective of public health and in accordance with the common defense and security.*
- *10 CFR 52.97(a)(1) which authorizes the Commission to issue a COL if it finds, among other things, that issuance of the license will not be inimical to the health and safety of the public. This regulation applies here because the Commission found in Order EA-12-049 that it is necessary for power reactor licensees to develop, implement and maintain guidance and strategies to restore or maintain core cooling, containment, and SFP*

cooling capabilities in the event of a beyond-design-basis external event in order to ensure adequate protection of the public health and safety.

- *SRM-SECY-12-0025, "Staff Requirements – SECY-12-0025 – Proposed Orders and Requests for Information in Response to Lessons Learned from Japan's March 11, 2011, Great Tohoku Earthquake and Tsunami," dated March 9, 2012, approves the issuance of orders for beyond-design-basis external events, as necessary, for ensuring the continued adequate protection under the 10 CFR 50.109(a)(4)(ii) exception to the Backfit Rule.*

- *Order EA-12-049, "Issuance of Order to Modify Licenses with Regard to Requirements for Mitigation Strategies for Beyond-Design-Basis External Events," dated March 12, 2012. Although Order EA-12-049 does not apply to Fermi 3, the staff has followed the current NRC and industry guidance for mitigation strategies in evaluating the equipment used as part of the FLEX mitigation strategy for Fermi 3.*

- *JLD-ISG-2012-01, Revision 0, "Compliance with Order EA-12-049, Order Modifying Licenses with Regard to Requirements for Mitigation Strategies for Beyond-Design- Basis External Events," issued August 29, 2012, endorses NEI 12–06, Revision 0, "Diverse and Flexible Coping Strategies (FLEX) Implementation Guide" (issued August 21, 2012), with exceptions/clarifications.*

20.1.4 Technical Evaluation

20.2.4 Technical Evaluation

The NRC issued Order EA-12-049 on March 12, 2012, which required operating reactor licensees and construction permit holders to deploy strategies that will enhance their ability to cope with conditions resulting from beyond-design-basis external events. Attachment 2 to Order EA-12-049 specifies the use of a three-phase approach for mitigating these events. The initial phase involves the use of installed equipment and resources to maintain or restore core cooling, containment and SFPC capabilities. The transition phase involves providing sufficient, portable, onsite equipment and consumables to maintain or restore these functions until they can be accomplished with resources brought from offsite. The final phase involves obtaining sufficient offsite resources to sustain those functions indefinitely. Application of the three-phase approach to new reactors, such as Fermi 3, requires appropriate consideration of the approaches to nuclear safety inherent in the specific designs.

In RAI 01.05-5, the staff requested the applicant to address how the initial and transition phase mitigation will be accomplished in the event of an extended loss of ac power (ELAP) event at Fermi 3. RAI 01.05-3 requested the applicant to address the final phase mitigation describing the strategies for maintaining and restoring core cooling, containment and SFPC capabilities with use of offsite *resources. The staff also requested the applicant to address the ability to implement the strategies in all modes.*

<u>*Initial and Transition Phase Mitigation – Core Cooling and Containment Function*</u>

In the response to RAI 01.05-5 dated April 18, 2013 (ADAMS Accession No. ML13109A426), the applicant provided information on the mitigating strategies that would be used to cope with an ELAP resulting from a beyond-design-basis external event. For this evaluation, the applicant assumed that the plant would be in a station blackout (SBO), which assumes a loss of all offsite power sources with a concurrent loss of the onsite standby diesel generators.

The applicant's response indicated that, for the ESBWR, the underlying strategies for coping with an extended loss of ac power events involve a three-phase approach; and that the passive safety features of the ESBWR and the installed ancillary equipment provide a significant coping period.

In regard to the initial phase mitigation, the applicant's response to RAI 1.05-5 states the following:

> *Section 15.5.5 and Section 19A.2.2 of the ESBWR Design Control Document (DCD), which are incorporated by reference into the Fermi 3 FSAR, provide a performance evaluation for station blackout and show conformance to the requirements of 10 CFR 50.63 as it relates to maintaining core cooling, inventory control, and containment heat removal.*
>
> *The analysis in DCD Tier 2, Section 15.5.5 demonstrates that reactor water level is maintained above the top of the active fuel by operation of the ICS [isolation condenser system], a safety-related system. Because the ICS removes the reactor decay heat to the IC/PCCS [passive containment cooling system] pools that are outside the containment, the containment and suppression pool pressures and temperatures are maintained within the design limits. Therefore the integrity of the containment is maintained. As described in DCD, Section 15.2.2.9, during refueling mode, GDCS [gravity-driven cooling system] is available to ensure extended core cooling and inventory control for at least 72 hours.*

The applicant indicated that the design basis for the ESBWR standard plant includes passive features that provide core, containment, and SFPC capabilities for 72 hours, with no reliance on ac power. Section 19A.2.2 of the ESBWR DCD states that "the ESBWR is designed such that no operator actions or AC power are required for a station blackout event, for 72 hours," and the ESBWR is designed to successfully mitigate an SBO event to meet the requirements of 10 CFR 50.63, "Loss of all alternating current," using safety-related [systems structures and components]*SSCs. This 72-hour mitigation capability addresses the initial phase mitigation for ESBWR plants such as Fermi 3, and this mitigation* *capability provides adequate time to transition to final phase mitigation, without necessarily relying upon a transition phase. This is because the transition phase is defined as the time necessary for resources to be brought from offsite and 72 hours is a sufficiently long time period. Nevertheless, the ESBWR design includes installed ancillary equipment that could potentially extend the time period for transition from the initial phase mitigation to final phase mitigation to 7 days.*

10 CFR 50.63(a)(2) includes a provision that is the premise for the acceptance of an SBO for core cooling and the containment function. The provision requires the following:

> *The reactor core and associated coolant, control, and protection systems, including station batteries and any other necessary support systems, must provide sufficient capacity and capability to ensure that the core is cooled and appropriate containment integrity is maintained in the event of an SBO for the specified duration. The capability for coping with an SBO of specified duration shall be determined by an appropriate coping analysis.*

ESBWR DCD, Tier 2, Section 15.5.5 contains the results of the DCD applicant's performance evaluation for an SBO showing conformance to the requirements of 10 CFR 50.63.

NRC staff reviewed ESBWR DCD, Tier 2, Section 15.5.5, as part of the ESBWR DCD review. In Subsection 15.5.5.4 of the ESBWR Final Safety Evaluation Report SER (FSER) in NUREG–1966, "Final Safety Evaluation Report Related to the Certification of the Economic Simplified Boiling-Water Reactor," the staff concluded that

> *The ESBWR reactor core and associated coolant, control, and protection systems, including station batteries and other necessary support systems, provide sufficient capacity and capability to ensure that the core is cooled and appropriate containment integrity in the event of an SBO for 72 hours. The applicant conducted an appropriate coping analysis to demonstrate the capability for coping with an SBO with a 72-hour duration, and hence, the acceptance criteria are satisfied.*

Fulfilling the requirements for an SBO, per 10 CFR 50.63, but without reliance on an alternate ac source, assures adequate core and containment cooling of the plant for operating modes ranging from normal power operation (Mode 1) to safe shutdown (Mode 4). Adequate cooling must also be provided when the plant is in cold shutdown (Mode 5) and refueling (Mode 6).

In Mode 5, when insufficient steam is available to drive the ICS, the GDCS can be used to perform the core cooling function. In Mode 6, the only core cooling systems available during the ELAP event are the GDCS and the suppression pool. In ESBWR FSER Section 16.2.8, the staff's discussion of RAI 16.2-37 *states that General Electric-Hitachi performed an analysis to show that the water above the core will be sufficient to keep the core covered and to maintain an adequate level of shielding. Based on the results of this analysis, the staff concludes that in Mode 6 with the reactor cavity flooded up, a sufficient water inventory would exist for 72 hours to passively provide decay heat removal and to protect the fuel. DCD Tier 2, Subsection 19A.3.1.1 states that during shutdown conditions, either the GDCS or the flooded-up refueling volume is sufficient to ensure core cooling. Once activated, neither power nor controls are necessary to maintain these functions for 72 hours. The staff therefore concludes that the strategies adequately address that for an ELAP in Modes 5 and 6, core cooling, has been adequately addressed because sufficient water either from the GDCS pools and the suppression pool or from the flooded-up refueling volume will be available, and is sufficient to ensure core cooling for 72-hours.*

For the transition phase, NRC order EA-12-049 allows use of portable, onsite equipment and consumables to maintain or restore core cooling, containment, and SFPC functions until they can be accomplished with resources brought from offsite (e.g., on Page 4 of the order). As discussed above, the initial phase mitigation of 72 hours provides sufficient time for resources to be brought from offsite. As such, reliance on a transition phase is not necessary for Fermi 3.

In the response to RAI 01.05-5 the applicant also discusses a coping strategy to extend the cooling capability beyond 72 hours and for up to 7 days. In particular, the applicant states that following the 72-hour passive system coping time, support is required to continue passive system cooling and makeup to the IC/PCCS pools and spent fuel storage pools. This support could be provided by installed plant ancillary equipment as discussed in ESBWR DCD Tier 2, Section 19A.3.1, "Actions Required Beyond 72 Hours." Section 19A.3.1 describes the post 72- hour actions and the use of installed regulatory treatment of non-safety systems (RTNSS) equipment for core, containment, and spent fuel cooling safety functions. NRC's evaluation of the ESBWR RTNSS program is provided in Chapter 22, "Regulatory Treatment of Nonsafety Systems," of the ESBWR FSER, and includes an evaluation of the augmented design standards for RTNSS equipment to withstand external events such as earthquakes, hurricanes, tornadoes, and floods.

<u>Initial and Transition Phase Mitigation – Spent Fuel Pool Cooling</u>

The applicant addressed mitigation strategies for SFPC in the response to the first question in RAI 01.05-5. That response addressed the initial phase mitigation with the following statement:

> *As described in the ESBWR DCD, Section 9.1.3.2, which is incorporated by reference into the Fermi 3 FSAR, during a loss of spent fuel pool and buffer pool cooling, cooling of the spent fuel pool and buffer pool is accomplished by allowing the water in the*

> *pools to heat and boil. There is sufficient water in each pool to ensure adequate fuel cooling for 72 hours.*

The applicant addressed the transition phase mitigation by stating the following:

> *DCD Section 19A.3.1, which is incorporated by reference into the Fermi 3 FSAR, describes the post 72-hr actions and credits use of installed regulatory treatment of non-safety systems (RTNSS) equipment.*
>
> *After 72 hours, nonsafety-related systems are used to replenish the passive systems to perform these safety functions directly. As described in Section 9.1.3, and 19A.3.1, after 72 hours, makeup water can be provided through installed safety-related connection to the Fire Protection System (FPS) or spent fuel storage pool. Between 72 hours and seven days, the resources for performing theses safety functions are available onsite.*

The staff reviewed the information regarding the ESBWR SFPC as part of the review of the ESBWR DCD, which is documented in Section 9.1.3 of the ESBWR DCD FSER. The staff concludes that for both the buffer pool and the SFP, the water levels and free volumes are sufficient to ensure that for 72 hours following a loss of forced cooling without active cooling water makeup, the water levels in the pools will remain above the top of active fuel (TAF) which provides sufficient time for initial phase mitigation and for resources to be bought from offsite.

Similar to that for the core cooling and containment functions discussed above, installed plant ancillary equipment could potentially extend this time period to 7 days.

<u>Final Phase Mitigation</u>

To support core cooling, containment, and spent fuel pool cooling post 72-hours, the ESBWR design has installed ancillary equipment with sufficient capacity. This equipment is designed to augmented design standards for external events, such as earthquakes, hurricanes, tornadoes, and floods, as documented in the ESBWR DCD Section 19A.3.1 and the NRC's ESBWR FSER Section 22.5.6. The ancillary equipment is capable of delivering at least minimum water quantities, at the minimum makeup rates, needed to support heat removal from the core and spent fuel pool. In its response to RAI 01.05-5 the applicant describes the use of this equipment to allow the extension of the initial mitigation phase from 72 hours up to 7 days.

In its response to RAI 01.05-5, the applicant indicated that the ESBWR has safety-related connections through which makeup water can be supplied. These connections allow portable equipment brought in from offsite to be used to support continued operation of the ESBWR passive systems, as an alternative to the plant installed ancillary equipment if it is not available or operable. These connections would be used during the final mitigation phase.

The staff reviewed the North Anna application, RAI responses from FERMI, and the January 23, 2015, letter regarding alignment with the R-COLA, and determined that the supplemental Information is consistent with the FERMI R-COLA information. Therefore, the North Anna 3 supplemental information that addresses mitigating strategies for beyond-design-basis external events is acceptable. The staff provided a license condition with the same provisions as the comparable license condition for Fermi that reflects the same mitigating strategies. This license condition ensures that the applicant will have developed the overall plan of mitigating strategies for North Anna 3 at least 1 year before completion of the final inspections, tests, analyses, and acceptance criteria (ITAAC).

The staff verified that the North Anna 3 FSAR Revision 9 incorporated the appropriate changes described in the January 23, 2015, letter regarding R-COLA alignment, as listed in the North Anna 3 FSAR Section 1.5.1.1. Therefore Confirmatory Item 20.1-1 from the staff advanced SER for North Anna 3 is resolved and closed.

20.1.5 Post Combined License Activities

The ESBWR design, incorporated by reference into the North Anna 3 COL, includes passive design features that provide core cooling, containment, and SFPC for 72 hours without reliance on ac power. These features do not rely on access to any external water sources. The ESBWR design also includes onsite equipment to replenish water sources and charge batteries.

Connections are provided for using generators and pumping equipment that can be brought from offsite.

For the reasons discussed in Section 20.1.4 of this report, (Fermi Section 20.2.4), Technical Evaluation, the staff will include a license condition related to the mitigating strategies program:

> **License Condition (20.1-1)**: Mitigation Strategies for Beyond-Design-Basis External Events
>
> a. The Licensee shall complete development of an overall integrated plan of strategies to mitigate a beyond-design-basis external event at least 1 year before the completion of the last ITAAC on the schedule required by 10 CFR 52.99(a).
>
> b. The overall integrated plan required by this condition must include guidance and strategies to maintain or restore core cooling, containment, and spent fuel pool cooling capabilities. The overall integrated plan must include provisions to address all accident mitigation procedures and guidelines (including the guidance and strategies required by this section, emergency operating procedures, abnormal operating procedures, and extensive damage management guidelines).
>
> c. The guidance strategies required by this condition must be capable of (i) mitigating a simultaneous loss of all ac power and loss of normal access to the normal heat sink and (ii) providing for adequate capacity to perform the functions upon which the guidance and strategies rely for all units on the North Anna site and in all modes at each unit on the site.

d. Before initial fuel load, Dominion shall fully implement the guidance and strategies required by this condition, including:

1. Procedures;

2. Training;

3. Acquisition, staging, or installation of equipment and consumables relied upon in the strategies; and

4. Configuration controls and provisions for maintenance and testing (including testing procedures and frequencies for preventative maintenance) of the equipment upon which the strategies and guidance required by this condition rely.

e The training required by condition d.2 must use a Systematic Approach to Training (SAT) to evaluate training for station personnel, and must be based upon plant equipment and procedures upon which the guidance and strategies required by this condition rely.

f The Licensee shall maintain the guidance and strategies described in the application upon issuance of the license, and the integrated plan of strategies upon its completion as required by condition a. The Licensee may change the strategies and guidelines required by this condition provided that the Licensee evaluates each such change to ensure that the provisions of conditions b and c continue to be satisfied and the Licensee documents the evaluation in an auditable form.

20.1.6 Conclusion

The staff reviewed the applicant’s proposed mitigating strategies discussed in FSAR Section 1.5.1.1.1 of the application for ensuring that core cooling, containment, and SFPC capabilities function indefinitely without ac power, in the event of a beyond-design-basis external event resulting in an ELAP. The staff finds that the approach for mitigating beyond-design-basis external events to be used at North Anna 3 is consistent with NRC Order EA-12-049. The staff also finds that the ESBWR passive design features provide for initial phase mitigation because core cooling, containment function and SFPC are achieved without ac power or operator action for the first 72 hours. In addition, through the implementation of the final phase mitigation using offsite FLEX equipment, core cooling, containment function and SFPC can be extended indefinitely.

20.2 Recommendation 7.1, Reliable Spent Fuel Pool Instrumentation

In North Anna 3 FSAR Revision 7, the applicant incorporated Supplemental Information Consistent with R-COLA (CWR Sup) 1.5-1, which addresses Recommendation 7.1, Reliable Spent Fuel Pool Instrumentation.

Dominion, the North Anna 3 applicant, included in their application the same supplemental information submitted by Fermi 3 as the R-COLA.

The CWR Sup 1.5-1 includes FSAR Tier 2, Subsection 1.5.1.1.2, Recommendation 7.1, "Reliable Spent Fuel Pool Instrumentation," which describes the design features for SFP instrumentation as incorporated by reference in Revision 10 of the ESBWR DCD.

The staff completed the review and finds the evaluation of the Fermi 3 COL standard content directly applicable to the North Anna 3 COLA. This SER identifies the standard content material with italicized, double-indented formatting.

The staff reviewed the information in the North Anna 3 COL FSAR as follows:

20.2.1 Introduction

> ***20.3.1 Introduction***
>
> *During the events in Fukushima, responders were without reliable instrumentation to determine the water level in the SFP. This raised concerns that the pool may have boiled dry, resulting in fuel damage, which highlighted the need for reliable SFP instrumentation. The current SFP water level instrumentation at U.S. nuclear power plants is typically a narrow range and, therefore, it is only capable of monitoring normal and slightly off-normal conditions. Although the likelihood of a catastrophic event affecting nuclear power plants and the associated SFPs in the United States remains very low, beyond-design-basis external events could challenge the ability of existing SFP instrumentation to provide emergency responders with reliable information on the condition of the SFPs. Reliable and available indicators are essential to ensure that plant personnel can effectively prioritize emergency actions.*
>
> *SECY-12-0025 (ADAMS Accession No. ML12039A103) states that for DC* [direct current] *and COL applications submitted under 10 CFR Part 52 and in active staff review, the staff plans to assure that the Commission-approved Fukushima actions are addressed before certification or licensing. The staff will request all COL applicants to provide the information addressed in the orders (EA-12-049, EA-12-050, and EA-12-051) and the request for information letters described in this SECY paper, as applicable, through the review process.*
>
> *JLD-ISG-2012-03, Revision 0, "Compliance with Order EA-12-051, Reliable Spent Fuel Pool Instrumentation," (ADAMS Accession No. ML12221A339) endorses with exceptions and clarifications the methodologies described in the industry guidance document NEI 12–02, Revision 1, "Industry Guidance for Compliance with NRC Order EA-12-051, To Modify Licenses with Regard to Reliable Spent Fuel Pool Instrumentation," (ADAMS Accession No. ML122400399) and provides an acceptable approach for satisfying the applicable requirements.*

20.2.2 Summary of Application

20.3.2 Summary of Application

The applicant addresses reliable spent fuel pool instrumentation in Section 1.5.1.1.2, "Recommendation 7.1, Reliable Spent Fuel Pool Instrumentation" of the application. The NRC issued RAI Letter Number 78 (RAI 01.05-4) dated July 3, 2012 (ADAMS Accession No. ML121850099), and RAI Letter 84 (RAI 01.05-6) dated March 19, 2013 (ADAMS Accession No. ML13078A436). In these RAI letters, the staff requested the applicant to address the provisions for monitoring key SFP parameters as described in Order EA-12-051 dated March 12, 2012 (ADAMS Accession No. ML12054A679), which are not part of the ESBWR DCD, and to include any proposals for changes to the current application. The applicant responded to these RAIs in letters dated August 24, 2012 (ADAMS Accession No. ML12240A184); January 25, February 19, April 18, July 9 and October 15, 2013 (ADAMS Accession Nos. ML13028A402, ML13051A057, ML13109A426, ML13192A301, and ML13311A101 respectively). As part of the RAI responses, the applicant described the SFP and the buffer pool level instrument design features that ensure a reliable indication of the water level in the SFP and buffer pools. The applicant proposed changes to FSAR Tier 2, Subsection 1.5.1.1.2, "Recommendation 7.1, Reliable Spent Fuel Pool Instrumentation"; and a license condition in Part 10, Revision 4, Section 3.8.3, "Reliable Spent Fuel Pool/Buffer Pool Level Instrumentation," which verifies that the programmatic aspects of the order are completed and implemented prior to initial fuel loading.

20.2.3 Regulatory Basis

20.3.3 Regulatory Basis

The requirements and guidance for reliable SFP instrumentation are established or described in the following:

- *Atomic Energy Act of 1954, as amended, (the Act), Section 161, authorizes the Commission to regulate the possession and utilization of special nuclear material in a manner that is protective of public health and in accordance with common defense and security.*

- *10 CFR 52.97(a)(1) which authorizes the Commission to issue a COL if it finds, among other things, that issuance of the license will not be inimical to the health and safety of the public. This regulation applies here because the Commission found in Order EA-12-049 that it is necessary for power reactor licensees to develop, implement and maintain guidance and strategies to restore or maintain core cooling, containment, and SFP cooling capabilities in the event of a beyond-design-basis external event in order to ensure adequate protection of the public health and safety.*

- *SRM-SECY-12-0025, "Staff Requirements – SECY-12-0025 – Proposed Orders and Requests for Information in Response to Lessons Learned* *from Japan's March 11, 2011, Great Tohoku Earthquake and Tsunami," dated March 9, 2012, approves the issuance of orders for reliable SFP instrumentation under an administrative exemption to the Backfit Rule.*

- *Order EA-12-051, "Issuance of Order to Modify Licenses with Regard to Reliable Spent Fuel Pool Instrumentation," dated March 12, 2012.*

- *JLD-ISG-2012-03, Revision 0, "Compliance with Order EA-12-051, Reliable Spent Fuel Pool Instrumentation," issued August 29, 2012, endorses NEI 12–02, Revision 1, "Industry Guidance for Compliance with NRC Order EA-12-051, To Modify Licenses with Regard to Reliable Spent Fuel Pool Instrumentation," with exceptions and clarifications.*

20.2.4 Technical Evaluation

20.3.4 Technical Evaluation

As a result of SECY-12-0025, the staff issued RAI Letter 78 (RAI 01.05-4) requesting additional information in relation to the lessons learned from the Great Tohoku Earthquake and Tsunami. In RAI 01.05-4, the staff requested the applicant to address the provisions for monitoring key SFP parameters as described in the order dated March 12, 2012, which are not part of the ESBWR design—including any proposals for changes to the current application.

In Commission Order EA-12-051, the NRC describes the key parameters used to determine that a level instrument is considered reliable. NEI 12–02, Revision 1 provides an acceptable approach for satisfying the applicable requirements. The staff evaluated the applicant's response to RAI 01.05-4 and determined that additional information was needed. The staff issued RAI 01.05-6 requesting the applicant to provide further clarification on the level instrument design criteria and programmatic aspects. In the applicant's responses, they suggested the creation of a new license condition in Section 3.8.3 to Part 10 of the COL application; and FSAR changes to Tier 2, Subsection 1.5.1.1.2 that provided further design information and discussed how the SFP level instrument is designed to be reliable according to the guidance in NEI 12–02. The applicant's response and the proposed FSAR changes take credit for design information already described in several sections of the ESBWR DCD. The staff's evaluation of the DCD sections is discussed in the ESBWR DCD FSER (NUREG-1966) and is not part of this SER.

<u>Instruments</u>

In Commission Order EA-12-051, Attachment 2, Section 1.1 states that the SFP level instrument channels shall consist of a permanent and fixed primary instrument channel and a backup instrument channel. The backup instrument channel may be fixed or portable. Portable instruments shall have capabilities that enhance the ability of trained personnel to monitor the SFP water level under conditions which restrict direct personnel access to the pool, such as partial structural damage, high radiation levels, or heat and humidity from a boiling pool.

The applicant's response to RAI 01.05-6 (ADAMS Accession No. ML13192A301) proposed changes to FSAR Tier 2, Subsection 1.5.1.1.2, which references ESBWR DCD, Tier 2, Section 9.1.3 which states that the SFP and the buffer pool each have two wide-range, safety- related level transmitters that transmit signals to the main control room. These signals are used to indicate a collapsed water level and to initiate high/low-level alarms, both locally and in the main control room. ESBWR DCD, Tier 2, Subsection 7.5.5.3.1 indicates that the safety-related pool monitoring instrumentation design conforms to Institute for Electrical and Electronics Engineers (IEEE) Standard (Std) IEEE Std 603–1991, "IEEE Standard Criteria for Safety Systems for Nuclear Power Generating Stations."

The staff noted that the ESBWR DCD credits the SFP pool level instruments as operational in environmental conditions consistent with boiling down to the top of the active fuel. These conditions would result in a high temperature (100 degrees Celsius [212 degrees Fahrenheit]), high humidity, steaming environment, loss of shielding, and high radiation doses. The staff evaluated the instrument description in the RAI response and the proposed changes to the FSAR. The staff determined that crediting two permanently installed, safety-related, seismic Category I instruments is in accordance with the design features identified in Commission Order EA-12-051 and the guidance in JLD-ISG-2012-03. Therefore, this part of RAI 01.05-6 is resolved. Confirmation that the proposed FSAR changes are in the next FSAR revision was being tracked as Confirmatory Item 20.3-1. The staff confirmed that these changes have been incorporated into the Fermi 3 COL FSAR. Therefore, this part of Confirmatory Item 20.3-1 is closed.

Arrangement

In Commission Order EA-12-051, Attachment 2, Section 1.2 states that the SFP level instrument channels shall be arranged in a manner that provides reasonable protection of the level indication function against missiles that may result from damage to the structure over the SFP. This protection may be provided by locating the safety-related instruments to maintain instrument channel separation within the SFP area, and to utilize inherent shielding from missiles provided by existing recesses and corners in the SFP structure.

The applicant's response to RAI 01.05-6 states that the SFP level instrument channels will be arranged in a manner that provides reasonable protection of the level indication function against missiles that may result from damage to the structure over the SFP. The applicant's response refers to ESBWR DCD, Tier 2, Subsection 7.5.5.3.2, which indicates that the SFP and the buffer pool instrumentation meets the separation criteria set forth in 10 CFR Part 50, Appendix A, GDC 24, "Separation of protection and control system." Also, ESBWR DCD, Tier 2, Section 7.5.5 indicates that the safety-related pool monitoring instrumentation is designed to satisfy the requirements of IEEE Standard 603–1991, as endorsed by RG 1.153, Revision 1, "Criteria for Safety Systems," which includes requirements for the physical separation of channels to avoid a common mode failure due to a missile. ESBWR DCD, Tier 2, *Subsection 3.8.4.1.1 indicates that the reactor building, which houses the buffer pool, is a seismic Category I structure. ESBWR DCD, Tier 2, Subsection 3.8.4.1.3 describes the fuel building, which houses the SFP facilities and their supporting system and heat, ventilation, and air conditioning (HVAC) equipment, as a seismic Category I structure except for the penthouse that houses HVAC equipment. The penthouse is a seismic Category II structure. ESBWR DCD, Tier, 2 Section 3.5 describes the missile assessment for the ESBWR. The proposed changes to FSAR Tier 2, Subsection 1.5.1.1.2 reference the ESBWR DCD sections mentioned above.*

The staff evaluated the ESBWR DCD and confirmed that the DCD provides design features to protect safety-related components against missiles. The staff evaluated the instrument location description in the applicant's RAI response and the proposed changes to the FSAR. The staff determined that crediting the channel separation is an acceptable approach that provides reasonable protection against missiles. Therefore, the staff concludes that these features are in conformance with Commission Order EA-12-051 and the guidance in JLD- ISG-2012-03. Therefore, this part of RAI 01.05-6 is resolved. Confirmation that the proposed FSAR changes are in the next FSAR revision was being tracked as part of Confirmatory Item 20.3-1. The staff confirmed that these changes have been incorporated into the Fermi 3 COL FSAR. Therefore, this part of Confirmatory Item 20.3-1 is closed.

<u>Mounting</u>

In Commission Order EA-12-051, Attachment 2, Section 1.3 states that the installed instrument channel equipment within the SFP shall be mounted to retain its design configuration during and following the maximum seismic ground motion considered in the design of the SFP structure.

The applicant's response to RAI 01.05-6 noted that ESBWR DCD, Tier 2, Subsection 7.5.5.3.3 indicates that the SFP and the buffer pool instrumentation are seismically qualified and this includes the equipment mounting configuration. The proposed changes to FSAR Tier 2, Subsection 1.5.1.1.2 reference the ESBWR DCD section mentioned above.

The staff evaluated the RAI response and the proposed FSAR changes. The staff determined that designing the instrument and its mounting to be seismically qualified will ensure that both will retain their design functionality following a seismic event. The staff concludes that these features are in conformance with Commission Order EA-12-051 and the guidance in JLD-ISG-2012-03. Therefore, this part of RAI 01.05-6 is resolved. Confirmation that the proposed FSAR changes are in the next FSAR revision was being tracked as part of Confirmatory Item 20.3-1. The staff confirmed that these changes have been incorporated into the Fermi 3 COL FSAR. Therefore, this part of Confirmatory Item 20.3-1 is closed.

Qualification

In Commission Order EA-12-051, Attachment 2, Section 1.4 states that primary and backup instrument channels shall be reliable at temperature, humidity, and radiation levels consistent with the SFP water at saturation conditions for an extended period.

The applicant's response to RAI 01.05-6 noted that ESBWR DCD, Tier 2, Section 9.1.3 indicates that both the SFP and the buffer pool each have two wide-range, safety-related level transmitters. ESBWR DCD, Tier 2, Subsection 7.5.5.3.3 indicates that the pool instrumentation is subject to environmental qualification and post-accident monitoring criteria. ESBWR DCD, Tier 2, Subsections 7.5.5.3.1 and 7.5.5.3.2 indicate that the pool instrumentation system conforms to quality standards for safety-related equipment. The ESBWR DCD credits the SFP pool level instruments as operational in environmental conditions consistent with boiling down to the top of the active fuel. These conditions would result in a high temperature (100 degrees Celsius [212 degrees Fahrenheit]), high humidity, steaming environment, loss of shielding, and high radiation doses. The proposed changes to FSAR Tier 2, Subsection 1.5.1.1.2 reference the ESBWR DCD sections mentioned above.

The staff reviewed the applicant's response and the proposed FSAR changes. The staff determined that the instrumentation will be designed to quality standards for safety-related equipment and to remain operational while exposed to the environmental conditions following an accident event. The staff finds that these features are in conformance with Commission Order EA-12-051 and the guidance in JLD-ISG-2012-03. Therefore, this part of RAI 01.05-6 is resolved. Confirmation that the proposed FSAR changes are in the next FSAR revision was being tracked as part of Confirmatory Item 20.3-1.

Independence

In Commission Order EA-12-051, Attachment 2, Section 1.5 states that the primary instrument channel shall be independent of the backup instrument channel.

The applicant's response to RAI 01.05-6 noted that ESBWR DCD, Tier 2, Subsection 7.5.5.3.2 states that the instrument channels are physically and electronically independent, in accordance with GDC 24.

The staff reviewed the applicant's response and concludes that this feature is in conformance with Commission Order EA-12-051 and the guidance in JLD-ISG-2012-03. Therefore, this part of RAI 01.05-6 is resolved.

Power Sources

In Commission Order EA-12-051, Attachment 2, Section 1.6 states that the permanently installed instrumentation channels shall each be powered by a *separate power supply. Permanently installed and portable instrumentation channels shall provide for power connections from sources independent of the plant ac and direct current (dc) power distribution systems, such as portable generators or replaceable batteries.*

The applicant's response to RAI 01.05-6 noted that ESBWR DCD, Tier 2, Subsection 7.5.5.3.2 states that the instrument channels are physically and electronically independent, in accordance with GDC 24. The safety-related primary and backup instrumentation channels are controlled by the safety-related distributed control and information system (Q-DCIS). ESBWR DCD, Tier 2, Section 7.1.2 describes the divisional Q-DCIS components as powered by redundant, independent, and separated uninterruptible power supplies (UPSs) dedicated to their division with a battery backup (per division) for at least 72 hours. After 72 hours, the Q-DCIS can operate continuously on power from the ancillary diesel generators until offsite power is restored.

Commission Order EA-12-051 specifies that all permanently installed instrumentation channels are to be provided with power connections from sources independent of the plant ac and dc power distribution systems. The proposed changes to FSAR Tier 2, Subsection 1.5.1.1.2 state that the instrument channels will be provided with an alternate connection to sources independent of the plant ac and dc power distribution systems, such as portable generators or replaceable batteries, thus allowing for quick and accessible connections of sources. The alternate power source and replaceable batteries used for instrument channel power will have sufficient capacity to maintain the level indication function until offsite resource availability is reasonably assured.

The staff reviewed the applicant's response and the proposed changes to FSAR Subsection 1.5.1.1.2. The staff noted that the level instrument channels are powered by separated safety-related sources capable of powering the instruments for up to 72 hours. After 72 hours, the instrument channel can be powered by the ancillary diesel generators. In the event that these power sources are not available, the applicant's proposed changes to FSAR Subsection 1.5.1.1.2 state that these instrument channels will have the capability of being quickly connected to an alternate power source independent from the plant ac and dc power distribution systems. The staff evaluated the applicant's RAI response and the proposed FSAR changes. The staff concludes that these design features are in conformance with Commission Order EA-12-051 and the guidance in JLD-ISG-2012-03. Therefore, this part of RAI 01.05-6 is resolved. Confirmation that the proposed FSAR changes are in the next FSAR revision was being tracked as part of Confirmatory Item 20.3-1. The staff confirmed that these changes have been incorporated into the Fermi 3 COL FSAR. Therefore, this part of Confirmatory Item 20.3-1 is closed.

Accuracy

In Commission Order EA-12-051, Attachment 2, Section 1.7 states that the instrument shall maintain its designed accuracy following a power interruption or a change in the power source without recalibration.

The applicant's response to RAI 01.05-6 and the proposed changes to FSAR Subsection 1.5.1.1.2 state that the instrument channels will be capable of maintaining the original accuracy following a power interruption or a change in power source without recalibration. The revised FSAR subsection also references ESBWR DCD, Tier 1, Table 2.6.2-2, which verifies that the instruments meet the minimum instrument accuracy of ±300 millimeters (mm) (±1 ft).

The staff reviewed the applicant's system description and the proposed FSAR changes. The staff concludes that these design features are in conformance with Commission Order EA-12-051 and the guidance in JLD-ISG-2012-03. Therefore, this part of RAI 01.05-6 is resolved. Confirmation that the proposed FSAR changes are in the next FSAR revision was being tracked as part of Confirmatory Item 20.3-1. The staff confirmed that these changes have been incorporated into the Fermi 3 COL FSAR. Therefore, this part of Confirmatory Item 20.3-1 is closed.

Testing

In Commission Order EA-12-05, Attachment 2, Section 1.8 states that the instrument channel design shall provide for routine testing and calibration.

The applicant's response to RAI 01.05-6 noted that ESBWR DCD, Tier 2, Subsection 9.1.3.4 indicates that the fuel and auxiliary pools cooling system (FAPCS) is designed to permit surveillance testing and in-service inspection of the safety-related components and the components required to perform the post-accident recovery functions in accordance with GDC 45, "Inspection of cooling water system," and American Society of Mechanical Engineers (ASME) Boiler and Pressure Vessel Code (BPVC) Section XI. In addition, Fermi 3 COL Application Part 4, "Technical Specifications," Section 3.7.5, includes periodic surveillance of the fuel pools water level during the movement of irradiated fuel assemblies in the associated fuel storage pool or when irradiated fuel assemblies are stored in the associated fuel storage pool. The proposed changes to FSAR Tier 2, Subsection 1.5.1.1.2 reference the ESBWR DCD and the technical specifications sections mentioned above.

The staff reviewed the applicant's system description, the ESBWR design, and the proposed FSAR changes. The staff concludes that these design features are in conformance with Commission Order EA-12-051 and the guidance in JLD-ISG-2012-03. Therefore, this part of RAI 01.05-6 is resolved. Confirmation that the proposed FSAR changes are in the next FSAR revision was being tracked as part of Confirmatory Item 20.3-1. The staff confirmed that these *changes have been incorporated into the Fermi 3 COL FSAR. Therefore, this part of Confirmatory Item 20.3-1 is closed.*

Display

In Commission Order EA-12-051, Attachment 2, Section 1.9 states that trained personnel shall be able to monitor the SFP water level from the control room, the alternate shutdown panel, or other appropriate and accessible locations. The display shall provide on-demand or continuous indication of the SFP water level.

The applicant's response to RAI 01.05-6 noted that ESBWR DCD, Tier 2, Section 9.1.3 states that both the SFP and the buffer pool each have two wide-range, safety-related, level transmitters that transmit signals to the main control room. These signals are used for on demand or continuous collapsed water level indications and to initiate high/low-level alarms, both locally and in the main control room. The proposed changes to FSAR Tier 2, Subsection 1.5.1.1.2 reference the ESBWR DCD section mentioned above.

The staff reviewed the applicant's system description and the proposed FSAR changes. The staff concludes that these design features are in conformance with Commission Order EA-12-051 and the guidance in JLD-ISG-2012-03. Therefore, this part of RAI 01.05-6 is resolved. Confirmation that the proposed FSAR changes are in the next FSAR revision was being tracked as part of Confirmatory Item 20.3-1. The staff confirmed that these changes have been incorporated into the Fermi 3 COL FSAR. Therefore, this part of Confirmatory Item 20.3-1 is closed.

Programs

In Commission Order EA-12-051, Attachment 2, Section 2 states that the SFP instrumentation shall be maintained to be available and reliable through the appropriate development and implementation of a training program. Personnel shall be trained in the use and maintenance (including test and calibration), and in the procedures for providing alternate power to the level instrument channels.

The applicant's response to RAI 01.05-6 stated that FSAR Section 13.2 includes a description of the training programs for operators and emergency response actions. FSAR Section 13.5 describes the development of procedures under the Plant Operating Procedures Development Plan that will address the procedures, testing, and calibration requirements of the installed instrument channels as identified in the Commission's order. In addition, the applicant has proposed new license condition in Section 3.8.3 to Part 10 of the COL application requiring that prior to fuel loading, the SFP and the buffer pool instrumentation shall be maintained to be available and reliable through the appropriate development and implementation of a training program. Personnel shall be trained in the use and the provision of alternate power to the safety-related level instrument channels.

The staff evaluated the applicant's RAI response and the proposed license condition. The staff finds that the program descriptions provided are in *conformance with Commission Order EA-12-051 and the guidance in JLD-ISG-2012-03. Therefore, this part of RAI 01.05-6 is resolved. Confirmation that the license condition changes are in the next revision of the COL application, Part 10, Section 3.8.3, was being tracked as part of Confirmatory Item 20.3-1.*

The staff confirmed that these changes have been incorporated into the Fermi 3 COL FSAR. Therefore, this part of Confirmatory Item 20.3-1 is closed.

The staff reviewed the North Anna incorporated supplemental Information and finds that it is consistent with the FERMI R-COLA information in Section 1.5.1.1.2 of the FERMI R-COL FSER. Therefore, the North Anna 3 supplemental information that addresses reliable SFP level instrumentation is acceptable.

20.2.5 Post Combined License Activities

For the reasons discussed in the "Technical Evaluation" section above, and to be consistent with the R-COL, the staff proposed to include the following license condition related to the SFP instrumentation in order to verify that the programmatic aspects of the order are completed and implemented prior to initial fuel loading.

> **License Condition (20.3-1)**: Reliable Spent Fuel Pool/Buffer Pool Level Instrumentation
>
> Prior to initial fuel load, Dominion shall address the following requirements using the guidance contained in JLD-ISG-2012-03, "Compliance with Order EA-2012-051, Reliable Spent Fuel Pool Instrumentation," Revision 0:
>
>> The spent fuel pool/buffer pool instrumentation shall be maintained available and reliable through the development and implementation of a training program. The training program shall include provisions to ensure trained personnel can route the temporary power lines from the alternate power source to the appropriate connection points, and connect the alternate power source to the safety-related level instrument channels.

20.2.6 Conclusion

The staff evaluated the applicant's FSAR sections related to the SFP and Buffer Pool water level instrumentation and concluded that these instruments are designed in accordance with the guidance in JLD-ISG-2012-03. Therefore, these instruments are considered reliable, able to withstand beyond-design-basis natural phenomena, and able to monitor key SFP level parameters as described in Commission Order EA-12-051.

20.3 Recommendation 9.3, Emergency Preparedness

20.3.1 Introduction

The accident at Fukushima reinforced the need for effective EP. The objective of EP is to ensure that the capability exists for a licensee (or will exist for a COL applicant) to implement measures that mitigate the consequences of a radiological emergency and to provide for protective actions of the public. The accident at Fukushima highlighted the need to determine the staffing needed to respond to a multi-unit event. Additionally, there is a need to ensure that the communication equipment relied on has adequate power to coordinate the response to an event during an ELAP.

20.3.2 Summary of Application

In the North Anna 3 COLA, Part 10, the applicant proposed License Condition 3.8.1 to address Fukushima NTTF Recommendation 9.3.

20.3.3 Regulatory Basis

The requirements for EP for beyond-design-basis external events are established or described in the following:

- 10 CFR 50.47(b)(1) states, in part, that “each principal response organization has staff to respond and to augment its initial response on a continuous basis.”

- 10 CFR 50.47(b)(2) states, in part, that “adequate staffing to provide initial facility accident response in key functional areas is maintained at all times” and that “timely augmentation of response capabilities is available.”

- 10 CFR 50.47(b)(6) states that “[p]rovisions exist for prompt communications among principal response organizations to emergency personnel and to the public.”

- 10 CFR Part 50, Appendix E, “Emergency Planning and Preparedness for Production and Utilization Facilities,” Section IV.E.P, states, in part, that adequate provisions shall be made and described for emergency facilities and equipment, including at least one onsite and one offsite communications system, and that each system shall have a backup power source.

The guidance for EP for beyond-design-basis external events is established or described in the following:

- SECY-12-0025 states, in part, that the staff will also request all COL applicants to provide information required by the orders and request for information letters described in this paper, as applicable, through the review process.

- NEI 12–01, “Guideline for Assessing Beyond Design Basis Accident Response Staffing and Communications Capabilities,” Revision 0, May 2012 (ADAMS Accession No. ML12125A412).

- NUREG–0654/FEMA-REP-1, Revision 1, “Criteria for Preparation and Evaluation of Radiological Emergency Response Plans and Preparedness in Support of Nuclear Power Plants,” Section B, “Onsite Emergency Organization,” states, in part, the following:

> Each licensee shall specify the positions or title and major tasks to be performed by the persons to be assigned to the functional areas of emergency activity. . . .These assignments shall cover the emergency functions in Table B-1 entitled, “Minimum Staffing Requirements for Nuclear Power Plant Emergencies.” The minimum on-shift staffing levels shall be as indicated in Table B-1. The licensee must be able to augment on-shift capabilities within a short period after declaration of an emergency. This capability shall be as indicated in Table B-1.

- NUREG–0696, “Functional Criteria for Emergency Response Facilities,” offers guidance on how to meet the requirements of 10 CFR Part 50, Appendix E, and describes the onsite and offsite communications requirements for the licensee’s emergency response facilities.

20.3.4 Technical Evaluation

Regarding NTTF Recommendation 9.3 (Emergency Preparedness), the NRC request for information letter of March 12, 2012, requested that all power reactor licensees and holders of construction permits (in active or deferred status) assess their current staffing levels and determine the appropriate staff to fill all necessary positions for responding to a multi-unit event during a beyond-design-basis natural event, and determine if any enhancements are appropriate. Single-unit sites should provide the requested information, as it pertains to an extended loss of all ac power and impeded access to the site.

With regard to communications, NTTF Recommendation 9.3 requests that all power reactor licensees and holders of construction permits (in active or deferred status) assess their current communications systems and equipment used during an emergency event, including consideration of any enhancements that might be appropriate for the emergency plan with respect to the communications requirements of 10 CFR 50.47, 10 CFR Part 50, Appendix E, and NUREG–0696. In addition, the means necessary to power the new and existing communications equipment during a prolonged SBO should be considered.

Accordingly, the staff requested that the North Anna 3 COL applicant address staffing and communications provisions to enhance EP. The staff reviewed the applicant’s submitted information and documented its evaluation and conclusions involving the staffing levels and communications in Chapter 13, Sections 13.3.4.2 and 13.3.4.6, of this North Anna 3 SER respectively.

20.3.5 Post Combined License Activities

Post-combined license activities consist of two staff-proposed license conditions to address NTTF Recommendation 9.3, which are provided in this SER in Chapter 13, Section 13.3.4.2.

20.3.6 Conclusion

The staff’s conclusions regarding how the applicant addressed NTTF Recommendation 9.3 is provided in this SER in Chapter 13, Section 13.3.4.2.

APPENDIX A. POST NORTH ANNA 3 COMBINED LICENSE ACTIVITIES – LICENSE CONDITIONS, INSPECTIONS, TESTS, ANALYSES, AND ACCEPTANCE CRITERIA, AND FINAL SAFETY ANALYSIS REPORT COMMITMENTS

A.1 License Conditions

The United States (U.S.) Nuclear Regulatory Commission's (NRC's) regulations at Title 10 of the *Code of Federal Regulations* (10 CFR) 52.97, "Issuance of combined licenses," requires a combined license (COL) to specify any terms and conditions of the COL the Commission deems appropriate. A license condition is not needed when an existing NRC regulation requires a future regulatory review of a matter to ensure adequate safety during design, construction, inspection activities or operation for a new plant. The staff is proposing that the Commission include the following license conditions, which are set forth below, to control various safety matters.

Proposed License Condition	SER Section	Description
1-1	1.5.5.6	A. This COL applies to North Anna Unit 3, a light-water nuclear reactor and associated equipment (the facility), owned by Dominion. The facility would be located on the existing NAPS site; adjacent to and generally west of the existing Units 1 and 2. The NAPS site is located in Louisa County, Virginia, approximately 40 miles north northwest of Richmond, Virginia. B. Subject to the conditions and requirements incorporated herein, the Commission hereby licenses:
	1.5.5.6	(1)(a) Dominion, pursuant to Sections 103 and 185b. of the Act and 10 CFR Part 52, to construct, possess, use, and operate the facility at the designated location in accordance with the procedures and limitations set forth in this license;
3.3	1.5.5.6	(2)(a) Dominion, pursuant to the Act and 10 CFR Part 70, to receive and possess at any time, special nuclear material as reactor fuel, in accordance with the limitations for storage and in amounts necessary for reactor operation, described in the final safety analysis report (FSAR), as supplemented and amended;

	1.5.5.6	(b)Dominion, pursuant to the Act and 10 CFR Part 70, to use special nuclear material as reactor fuel, after a Commission finding under 10 CFR 52.103(g) has been made, in accordance with the limitations for storage and in amounts necessary for reactor operation, described in the FSAR, as supplemented and amended;
	1.5.5.6	(3)(a) Dominion, pursuant to the Act and 10 CFR Parts 30 and 70, to receive, possess, and use, at any time before a Commission finding under 10 CFR 52.103(g), such byproduct and special nuclear material as sealed neutron sources for reactor startup, sealed sources for reactor instrumentation and radiation monitoring equipment calibration, and as fission detectors in amounts as necessary;
	1.5.5.6	(b) Dominion, pursuant to the Act and 10 CFR Parts 30, 40, and 70, to receive, possess, and use, after a Commission finding under 10 CFR 52.103(g), any byproduct, source, and special nuclear material as sealed neutron sources for reactor startup, sealed sources for reactor instrumentation and radiation monitoring equipment calibration, and as fission detectors in amounts as necessary;
	1.5.5.6	(4)(a) Dominion, pursuant to the Act and 10 CFR Parts 30 and 70, to receive, possess, and use, before a Commission finding under 10 CFR 52.103(g), in amounts not exceeding those specified in 10 CFR 30.35(d) and 10 CFR 70.25(d) required for establishing decommissioning financial assurance, any byproduct or special nuclear material that is (1) in unsealed form; (2) on foils or plated surfaces, or (3) sealed in glass, for sample analysis or instrument calibration or other activity associated with radioactive apparatus or components;

	1.5.5.6	(b) Dominion, pursuant to the Act and 10 CFR Parts 30, 40, and 70, to receive, possess, and use, after a Commission finding under 10 CFR 52.103(g), in amounts as necessary, any byproduct, source, or special nuclear material without restriction as to chemical or physical form, for sample analysis or instrument calibration or other activity associated with radioactive apparatus or components but not uranium hexafluoride; and
	1.5.5.6	(5) Dominion, pursuant to the Act and 10 CFR Parts 30 and 70, to possess, but not separate, such byproduct and special nuclear materials as may be produced by the operation of the facility. C. The license is subject to, and the licensee shall comply with, all applicable provisions of the Act and the rules, regulations, and orders of the Commission, including the conditions set forth in 10 CFR Chapter I, now or hereafter in effect. D. The license is subject to, and Dominion shall comply with, the conditions specified and incorporated below: (1) <u>Changes during Construction</u> (a) Dominion may request use of a preliminary acceptability review (PAR) process, for license amendments, at any time before a Commission finding under 10 CFR 52.103(g). To use the PAR process, Dominion shall submit a written request to the Office of New Reactors (NRO) in accordance with COL-ISG-025, “Changes during Construction under Part 52.” (b) Before NRO’s issuance of a written PAR notification, Dominion shall submit the license amendment request (LAR). Thereafter, NRO will issue a written PAR notification, setting forth whether Dominion may proceed in accordance with the PAR, LAR, and COL-ISG-025. If Dominion elects to proceed and the LAR is subsequently denied, Dominion shall return the facility to its current licensing basis.

3.2.1	13.3.5	(2) Startup Administration Manual (SAM), Preoperational and Startup Test Procedures (a) Prior to initiating the plant's initial test program (ITP), a site-specific SAM (procedures), which includes administrative procedures and requirements that govern the activities associated with the plant ITP, is to be provided to on-site NRC inspectors 60 days prior to beginning of the preparation test phase. (b) Dominion will make available to on-site NRC inspectors preoperational test procedures 60 days prior to their intended use and startup test procedures 60 days prior to fuel load. (c) Dominion will make available to on-site NRC inspectors site-specific preoperational test procedures 60 days prior to their intended use and startup test procedures 60 days prior to fuel load.
3.2.4	13.3.5	(3) Nuclear Fuel Loading and Pre-Critical Testing (a) [RESERVED] (b) Upon a Commission finding in accordance with 10 CFR 52.103(g) that all the acceptance criteria in the inspections, tests, analyses, and acceptance criteria (ITAAC) in Appendix C to this license are met, Dominion is authorized to perform pre-critical tests in accordance with the conditions specified herein; (c) Dominion shall perform the pre-critical tests identified in ESBWR DCD, Revision 10, Sections 14.2.6 "Initial Fuel Loading and Initial Criticality," and 14.2.8.2 "General Discussion of Startup Tests."; (d) Dominion shall review and evaluate the results of the tests identified in Condition 2.D.(3)(c) of this license and confirm that these test results are within the range of acceptable values predicted or otherwise confirm that the tested systems perform their specified functions in accordance with ESBWR DCD, Revision 10, Section 14.2.8.2; and

	14.2.5	(e) Dominion shall notify the Director of NRO, or the Director's designee, in writing, upon successful completion of the pre-critical tests identified in Condition 2.D(3)(c) of this license
	14.2.5	(4) <u>Initial Criticality and Low-Power Testing</u> (a) Upon submission of the notification required by Condition 2.D.(3)(e) of this license, Dominion is authorized to operate the facility at reactor steady-state core power levels not to exceed 5-percent thermal power in accordance with the conditions specified herein; (b) Dominion shall perform the following: 1. the initial criticality and low-power tests identified in ESBWR DCD, Revision 10, Sections 14.2.6, "Initial Fuel Loading and Initial Criticality," 14.2.7, "Test Program Schedule and Sequence," tests and 2. the Reactor Pre Critical Heatup with Reactor Water Cleanup/Shutdown Cooling (RWCU/SDC) Natural Core Circulation Test (first of a kind test as identified in ESBWR DCD, Revision 10, Section 14.2.8.2.35.1, "Reactor Pre Critical Heatup With RWCU/SDC,") and the Isolation Condenser Performance Test and Heatup and Steady State Operation Test (first of a kind test) as identified in ESBWR DCD, Revision 10, Sections 14.2.8.2.34, "Isolation Condenser Performance Test," and 14.2.8.2.35.2, "Isolation Condenser System Heatup and Steady State Operation." (c) Dominion shall review and evaluate the results of the tests identified in: 1. Condition 2.D.(4)(b)1. of this license and confirm that these test results are within the range of acceptable values predicted or otherwise confirm that the tested systems perform their specified functions in accordance with ESBWR DCD, Revision 10, Section 14.2.6, 14.2.7, 14.2.8.2; and

		2. Condition 2.D.(4)(b)2. of this license and confirm that these test results are within the range of acceptable values predicted or otherwise confirm that the tested systems perform their specified functions in accordance with ESBWR DCD, Revision 10, Section 14.2.8.2; and (d) Dominion shall notify the Director of NRO, or the Director's designee, in writing, upon successful completion of initial criticality and low-power tests identified in Condition 2.D.(4)(b) of this license, including the design-specific tests identified therein.
3.2.4.3	14.2.5	(5) Power Ascension Testing (a) Upon submission of the notification required by Condition 2.D.(4)(d) of this license, Dominion is authorized to operate the facility at reactor steady-state core power levels not to exceed 100-percent thermal power in accordance with the conditions specified herein, but only for the purpose of performing power ascension testing; (b) Dominion shall perform: 1. the power ascension tests identified in the ESBWR DCD, Revision 10, Section 14.2.8.2 and Table 14.2-1, "Power Ascension Test Matrix"; and 2. the design-specific startup tests identified below: (i) Core Performance Test (first of a kind test as identified in ESBWR Design Control Document (DCD), Revision 10, Section 14.2.8.2.7); (ii) Power Maneuvering in the Feedwater (FW) Temperature Operation Domain Test (first of a kind test as identified in ESBWR DCD, Revision 10, Section 14.2.8.2.35.3, "Power Maneuvering In the FW Temperature Operating Domain");

		(iii) Load Maneuvering Capability Test (first of a kind test as identified in ESBWR DCD, Revision 10, Section 14.2.8.2.35.4, "Load Maneuvering Capability"); and (iv) Defense-In-Depth Stability Solution Evaluation Test (first of a kind plant test as identified in ESBWR DCD, Revision 10, Section 14.2.8.2.35.5, "Defense-In-Depth Stability Solution Evaluation Test").
	14.2.5	(c) Dominion shall review and evaluate the results of the tests identified in: 1. Condition 2.D.(5)(b)1. of this license and confirm that these test results are within the range of acceptable values predicted or otherwise confirm that the tested systems perform their specified functions in accordance with ESBWR DCD, Revision10, Section 14.2.8.2; and 2. Condition 2.D.(5)(b)2. of this license and confirm that these test results are within the range of acceptable values predicted or otherwise confirm that the tested systems perform their specified functions in accordance with ESBWR DCD, Revision 10, Section 14.2.8.2; and
	14.2.5	(d) Dominion shall notify the Director of NRO, or the Director's designee, in writing, upon successful completion of power ascension tests identified in Condition 2.D.(5)(b) of this license, including the design-specific tests identified therein.
3.2.4.4		(6) Maximum Power Level Upon submission of the notification required by Condition 2.D.(5)(d) of this license, Dominion is authorized to operate the facility at steady state reactor core power levels not to exceed 4500 megawatts thermal (100-percent thermal power), as described in the FSAR, in accordance with the conditions specified herein.

3.2.5	14.2.4	(7) Reporting Requirements (a) Within 30 days of a change to the initial test program described in FSAR Section 14, “Initial Test Program,” made in accordance with 10 CFR 50.59, “Changes, Tests and Experiments,” or in accordance with 10 CFR Part 52, Appendix E, Section VIII, “Processes for Changes and Departures,” Dominion shall report the change to the Director of NRO, or the Director’s designee, in accordance with 10 CFR 50.59(d). (b) Dominion shall report any violation of a requirement in Conditions 2.D.(3), 2.D.(4), 2.D.(5), and 2.D.(6) of this license within 24 hours. Initial notification shall be made to the NRC Operations Center in accordance with 10 CFR 50.72, “Immediate Notification Requirements for Operating Nuclear Power Reactors,” with written follow up in accordance with 10 CFR 50.73, “License Event Report System.: (8) Incorporation The Technical Specifications, Environmental Protection Plan, and ITAAC in Appendices A, B, and C, respectively, of this license are hereby incorporated into this license. (9) Technical Specifications The technical specifications in Appendix A to this license become effective upon a Commission finding that the ITAAC are met in accordance with 10 CFR 52.103(g).

3.5	13.4.4	(10) Operational Program Implementation Dominion shall implement the following: (a) the Environmental Qualification Program implemented before initial fuel load; (b) the Flow-Accelerated Corrosion Program implemented prior to commercial service; (c) the Reactor Vessel Material Surveillance Program implemented before initial fuel load; (d) the Preservice Testing Program implemented prior to initial fuel load; (e) the Containment Leakage Rate Testing Program implemented before initial fuel load;
	1.5.5.6	(f) the Fire Protection Program (for elements necessary to support receipt and storage of fuel) prior to initial receipt of fuel:
3.4		1. The fire protection measures in accordance with Regulatory Guide (RG) 1.189, "Fire Protection for Nuclear Power Plants," for designated storage building areas (including adjacent fire areas that could affect the storage area) implemented before initial receipt of byproduct or special nuclear materials that are not fuel (excluding exempt quantities as described in 10 CFR 30.18, "Exempt Quantities"); 2. The fire protection measures in accordance with RG 1.189 for new fuel storage area (including adjacent fire areas that could affect the new fuel storage area) implemented before receipt of fuel onsite; 3. Before receipt of fuel on site, a formal letter of agreement shall be in place with the local fire department specifying the arrangements in support of the Fire Protection Program;

		4. All fire protection program features implemented before initial fuel load; (g) the Standard Radiological Effluent Controls implemented before initial fuel load; (h) the Offsite Dose Calculation Manual implemented before initial fuel load; (i) the Radiological Environmental Monitoring Program implemented before initial fuel load; (j) the Process Control Program implemented before initial fuel load; (k) the Lifecycle Minimization of Contamination Program implemented before initial fuel load; (l) the Radiation Protection Program (RPP) (including ALARA principle) or applicable portions thereof as identified in FSAR Section 12.5, “Operational Radiation Protection Program”: 1. RPP features applicable to receipt of by-product, source, or special nuclear materials (excluding exempt quantities as described in 10 CFR 30.18) implemented before initial receipt of such materials; 2. RPP features (including the ALARA principle) applicable to new fuel implemented before receipt of initial fuel on site; 3. All other RPP features (including the ALARA principle) except for those applicable to control radioactive waste shipment implemented before initial fuel load; and 4. RPP features (including the ALARA principle) applicable to radioactive waste shipment implemented before first shipment of radioactive waste;

3.5.4	14.2.5 9.2.1	(m) the Initial Test Program: 1. Preoperational Test Program implemented 60 days before the first preoperational test; 2. Startup Test Program implemented 60 days before initial fuel load; (n) the Special Nuclear Material Control and Accounting Program implemented before initial receipt of special nuclear material; (o) the Special Nuclear Material Physical Protection Plan implemented before initial receipt of special nuclear material on site; and (p) the Reactor Operator Training Program implemented no later than 18 months before scheduled fuel load.
3.5	13.2.4 13.4.4	(11) Operational Program Implementation Schedule No later than 12 months after issuance of the COL, Dominion shall submit to the Director of NRO, or the Director's designee, a schedule for implementation of the operational programs listed in FSAR Table 13.4-201, "Operational Programs Required by NRC Regulations," including the associated estimated date for initial loading of fuel. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until all the operational programs listed in FSAR Table 13.4-201 have been fully implemented. This schedule shall also address: (a) The implementation of site specific Severe Accident Management Guidelines, and (b) The spent fuel rack coupon monitoring program implementation.

		(12) Site- and Unit-specific Conditions
3.10	3.9.5	(a) Steam Dryer Monitoring Plan 1. Dominion shall prepare a Steam Dryer Monitoring Plan (SDMP) and submit the SDMP to the NRC no later than 90 days before the scheduled date for initial fuel loading. 2. Dominion shall provide Power Ascension Test (PAT) procedures for steam dryer monitoring to the NRC resident inspectors at least 10 days before the scheduled date for initial fuel loading. The PAT procedures must include the following: (i) Level 1 and Level 2 acceptance limits, as defined in Report NEDE 33313P, "ESBWR Steam Dryer Structural Evaluation," (Revision 5, December 2013), for on-dryer strain gage and on-dryer accelerometer measurements to be used up to 100 percent power; (ii) The power levels at which the steam dryer will be monitored (subject to Conditions 2.D.(12)(a)3. and 2.D.(12)(a)4. of this license) during power ascension, and the duration of monitoring at each power level; (iii) A description of activities to be accomplished during monitoring at each power level; (iv) Plant parameters to be monitored; (v) A description of the actions to be taken if acceptance criteria are not satisfied; and (vi) A description of the process for verification of the completion of commitments and planned actions specified in the PAT procedures. 3. Dominion shall complete the actions specified in Item 2 of the model license condition specified in paragraph (c) of Section 10.2, "Comprehensive Vibration Program Elements for a COL Applicant," in NEDE-33313P, (Revision 5) between 65 and 75 percent thermal power.

		4. Dominion shall measure, record, and evaluate pressures, strains, and accelerations from the steam dryer instrumentation at power levels approximately 5 percent higher than the previous power level at which Dominion measured, recorded, and evaluated such parameters until 100 percent thermal power is reached. Dominion shall generate data trending and a projection of strain levels for each successive power level, including full power. Dominion shall use data trending analysis to assess whether the Level 1 or Level 2 acceptance limits would be exceeded at the next higher power level for which the PAT specifies monitoring. Dominion shall provide the data trending results and revised limit curves to the NRC project manager by facsimile or electronic transmission. 5. At each power level for which Conditions 2.D.(12)(a)3. and 2.D.(12)(a)4. of this license require steam dryer monitoring, Dominion shall measure and record pressure, strain, and acceleration responses over a range of plant conditions sufficient to confirm that loading and fatigue effects from normal variations in plant conditions at power levels up to and including 100 percent thermal power will not adversely affect the life of the dryer. Dominion shall include its evaluation of steam dryer performance during such variations in plant conditions, including during Power Maneuvering in the Feedwater Temperature Operating Domain testing, in the dryer structural response as part of the full stress analysis report described in Condition 2.D.(12)(a)9. of this license. 6. If a flow-induced resonance is identified at any power level at which Conditions 2.D.(12)(a)3and 2.D.(12)(a)4. of this license require steam dryer monitoring, and the strains or vibrations exceed the pre-determined Level 1 or Level 2 limit curve, Dominion shall cease power ascension until completing the actions specified in Item 5 of the model license condition specified in paragraph (c) of Section 10.2 in NEDE-33313P, (Revision 5) and the following:

		(i) If a Level 1 limit curve is exceeded, Dominion shall reduce power to the last power level at which Dominion performed steam dryer monitoring pursuant to Conditions 2.D.(12)(a)3. and 2.D.(12)(a)4. of this license and at which the Level 1 limit curve was not exceeded. Dominion shall perform a stress analysis to develop a new Level 1 limit curve before increasing power to the next level at which Condition 2.D.(12)(a)4. of this license requires steam dryer monitoring. (ii) If a Level 2 limit curve is exceeded, or if data trending indicates that a Level 1 limit curve may be challenged before the next power level at which Condition 2.D.(12)(a)4. of this license requires steam dryer monitoring is reached, Dominion shall evaluate the Level 1 and Level 2 limit curves and perform a stress analysis that demonstrates that the stress acceptance limits are satisfied at the higher power level before power is increased. 7. Dominion shall determine end-to-end bias and uncertainties by comparing the predicted and measured strain or acceleration on the steam dryer at each power level at which Dominion performs steam dryer monitoring pursuant to Conditions 2.D.(12)(a)3. and 2.D.(12)(a)4. of this license and confirm the conservatism of the predicted dryer stress field. At each such power level, Dominion shall adjust the predicted strain and acceleration responses using the frequency-dependent end-to-end bias errors and uncertainty values. If any of the measured sensor data at that power level exceeds the adjusted predictions, Dominion shall either (a) modify the bias errors and uncertainty values and limit curves and ensure measured sensor responses do not exceed the adjusted predictions, or (b) quantitatively evaluate the effect on fatigue life. 8. At the initial power level at which Condition 2.D.(12)(a)3. of this license requires steam dryer monitoring and at approximately 85 and 95 percent power, Dominion shall provide the steam dryer data analysis and results to the NRC project manager by facsimile or electronic transmission; and shall not exceed the power level at which it performed the steam dryer monitoring for at least 72 hours after the NRC project manager has confirmed receipt of the transmission.

		9. Dominion shall provide data collected from the steam dryer monitoring required by Condition 2.D.(12)(a)4. of this license at 100 percent power to the NRC project manager by facsimile or electronic transmission within 72 hours of completing the collection of that data, with receipt confirmation from the NRC project manager. Dominion shall submit a full stress analysis report and evaluation to the NRC document control desk in accordance with 10 CFR 52.3within 90 days of first reaching 100 percent thermal power. The report must include the minimum stress ratio and the final dryer load definition using steam dryer data, and associated bias errors and uncertainties, and must demonstrate that the steam dryer will maintain its structural integrity over its design life considering variations in plant parameters, including, but not limited to, reactor pressure and core flow rate. If the structural integrity of the steam dryer for the full plant life is not demonstrated by the stress analysis, Dominion shall describe its compensatory actions, such as future dryer replacement, in the stress analysis report. 10. Dominion shall implement a periodic steam dryer inspection program as follows: (i) During the first two refueling outages after first reaching 100 percent thermal power, Dominion shall perform a visual inspection of all accessible areas and susceptible locations of the steam dryer in accordance with industry guidance on steam dryer inspections in the latest NRC staff-approved version of BWRVIP-139-A, "BWR Vessel and Internals Project, Steam Dryer Inspection and Flaw Evaluation Guidelines," with any conditions or limitations specified in the NRC staff approval. The results of these baseline inspections shall be submitted to the NRC within 60 days following startup after each outage. (ii) At the end of the second refueling outage after reaching 100 percent thermal power, Dominion shall update the Steam Dryer Monitoring Program to include a long-term inspection plan based on plant-specific and industry operating experience, and shall submit the updated program to the NRC within 180 days following startup from the second refueling outage.

3.7.1	13.3.5	(b) No later than one hundred eighty (180) days before the date scheduled for initial fuel load set forth in the notification submitted in accordance with 10 CFR 52.103(a), Dominion shall submit to the Director of NRO, or the Director's designee, in writing, a fully developed set of plant-specific emergency action levels (EALs), in accordance with NEI 07-01, "Methodology for Development of Emergency Action Levels – Advanced Passive Light Water Reactors," Revision 0, with no deviations. The EALs shall have been discussed and agreed upon with State and local officials.
	13.3.4	(c) No later than eighteen (18) months before the latest date set forth in the schedule submitted in accordance with 10 CFR 52.99(a) for completing the inspections, tests, and analyses in the ITAAC, Dominion shall have performed a detailed staffing analysis, in accordance with NEI 10-05, "Assessment of On-Shift Emergency Response Organization Staffing and Capabilities," Revision 0. No later than one hundred eighty (180) days before the date scheduled for initial fuel load set forth in the notification submitted in accordance with 10 CFR 52.103(a), Dominion shall have revised the Emergency Plan to incorporate any changes identified in the staffing analysis that are needed to staffing to the required levels.
3.9.	3.9.5	(d) Before initial fuel load, Dominion shall: 1. Implement a surveillance program for explosively actuated valves (squib valves) in the Gravity Driven Cooling System and the Automatic Depressurization System at North Anna Unit 3 that includes the following provisions in addition to the requirements specified in the American Society of Mechanical Engineers (ASME) "Code for Operation and Maintenance of Nuclear Power Plants" (OM Code) as incorporated by reference in 10 CFR 50.55a.

3.9.a	3.9.5	(i) Preservice Testing All explosively actuated valves shall be preservice tested by verifying the operational readiness of the actuation logic and associated electrical circuits for each explosively actuated valve with its pyrotechnic charge removed from the valve. This must include confirmation that sufficient electrical parameters (voltage, current, and resistance) are available at the explosively actuated valve from each circuit that is relied upon to actuate the valve. In addition, a sample of at least 20 percent of the pyrotechnic charges in all explosively actuated valves shall be tested in the valve or a qualified test fixture to confirm the capability of each sampled pyrotechnic charge to provide the necessary motive force to operate the valve to perform its intended function without damage to the valve body or connected piping. The sampling must select at least one explosively actuated valve from each redundant safety train. Corrective action shall be taken to resolve any deficiencies identified in the operational readiness of the actuation logic or associated electrical circuits, or the capability of a pyrotechnic charge. If a charge fails to fire or its capability is not confirmed, all charges with the same batch number shall be removed, discarded, and replaced with charges from a different batch number that has demonstrated successful 20 percent sampling of the charges.
3.9.b	3.9.5	(ii) Operational Surveillance Explosively actuated valves shall be subject to the following surveillance activities after commencing plant operation: a. At least once every 2 years, each explosively actuated valve shall undergo visual external examination and remote internal examination (including evaluation and removal of fluids or contaminants that may interfere with operation of the valve) to verify the operational readiness of the valve and its actuator. This examination shall also verify the appropriate position of the internal actuating mechanism and proper operation of remote position indicators. Corrective action shall be taken to resolve any deficiencies identified during the examination with post-maintenance testing conducted that satisfies the PST requirements.

		b. At least once every 10 years, each explosively actuated valve shall be disassembled for internal examination of the valve and actuator to verify the operational readiness of the valve assembly and the integrity of individual components and to remove any foreign material, fluid, or corrosion. The examination schedule shall provide for each valve design used for explosively actuated valves at the facility to be included among the explosively actuated valves to be disassembled and examined every 2 years. Corrective action shall be taken to resolve any deficiencies identified during the examination with post-maintenance testing conducted that satisfies the PST requirements. c. For explosively actuated valves selected for test sampling every 2 years in accordance with the ASME OM Code, the operational readiness of the actuation logic and associated electrical circuits shall be verified for each sampled explosively actuated valve following removal of its charge. This must include confirmation that sufficient electrical parameters (voltage, current, resistance) are available for each valve actuation circuit. Corrective action shall be taken to resolve any deficiencies identified in the actuation logic or associated electrical circuits. d. For explosively actuated valves selected for test sampling every 2 years in accordance with the ASME OM Code, the sampling must select at least one explosively actuated valve from each redundant safety train. Each sampled pyrotechnic charge shall be tested in the valve or a qualified test fixture to confirm the capability of the charge to provide the necessary motive force to operate the valve to perform its intended function without damage to the valve body or connected piping. Corrective action shall be taken to resolve any deficiencies identified in the capability of a pyrotechnic charge in accordance with the PST requirements.

		This license condition shall expire upon (1) incorporation of the above surveillance provisions for explosively actuated valves into the facility's in-service testing program, or (2) incorporation of in-service testing requirements for explosively actuated valves in new reactors (i.e., plants receiving a construction permit, or COL for construction and operation, after January 1, 2000) to be specified in a future edition of the ASME OM Code as incorporated by reference in 10 CFR 50.55a, including any conditions imposed by the NRC, into the facility's in-service testing program. (e) Dominion shall perform detailed geologic mapping of excavations for safety related structures; examine and evaluate geologic features discovered in these excavations; and shall notify the Director of NRO, or the Director's designee, in writing, no later than 30 days before any such excavations are open for NRC examination and evaluation.
3.8.2	13.4.3.2 20.1.4 20.2.4	(f) Mitigation Strategies for Beyond-Design-Basis External Events 1. Dominion shall complete development of an overall integrated plan of strategies to mitigate a beyond-design-basis external event at least 1 year before the completion of the last ITAAC on the schedule required by 10 CFR 52.99(a). 2. The overall integrated plan required by this condition must include guidance and strategies to maintain or restore core cooling, containment, and spent fuel pool cooling capabilities. The overall integrated plan must include provisions to ensure that all accident mitigation procedures and guidelines (including the guidance and strategies required by this section, emergency operating procedures, abnormal operating procedures, and extensive damage management guidelines) are coherent and comprehensive.

		3. The guidance and strategies required by this condition must be capable of (i) mitigating a simultaneous loss of all alternating current (ac) power, both from the onsite and offsite power systems, and loss of normal access to the normal heat sink and (ii) providing for adequate capacity to perform the functions upon which the guidance and strategies rely for all units on the NAPS site and in all modes at each unit on the site. 4. Before initial fuel load, Dominion shall fully implement the guidance and strategies required by this condition, including: (i) Procedures; (ii) Training; (iii) Acquisition, staging, or installation of equipment and consumables relied upon in the strategies; and (iv) Configuration controls and provisions for maintenance and testing (including testing procedures and frequencies for preventative maintenance) of the equipment upon which the strategies and guidance required by this condition rely. 5. The training required by Condition 2.D.(12)(f)4.(ii) of this license must use a Systematic Approach to Training (SAT) to evaluate training for station personnel, and must be based upon plant equipment and procedures upon which the guidance and strategies required by Condition 2.D.(12)(f) of this license rely. 6. Dominion shall maintain the guidance and strategies described in the application upon issuance of the license, and the integrated plan of strategies upon its completion as required by Condition 2.D.(12)(f)1. of this license. Dominion may change the strategies and guidelines required by this Condition provided that Dominion evaluates each such change to ensure that the provisions of Conditions 2.D.(12)(f)2. and 2.D.(12)(f)3. of this license continue to be satisfied and Dominion documents the evaluation in an auditable form.

3.8.3	20.2.4	(g) Reliable Spent Fuel Pool/Buffer Pool Level Instrumentation Prior to initial fuel load, Dominion shall address the following requirements using the guidance contained in JLD-ISG-2012-03, “Compliance with Order EA 2012-051, Reliable Spent Fuel Pool Instrumentation,” Revision 0: The spent fuel pool/buffer pool instrumentation shall be maintained available and reliable through the development and implementation of a training program. The training program shall include provisions to ensure trained personnel can route the temporary power lines from the alternate power source to the appropriate connection points, and connect the alternate power source to the safety-related level instrument channels.
3.7	13.3.4.2	(h) Emergency Planning Actions 1. Communications (i) No later than eighteen (18) months before the latest date set forth in the schedule submitted in accordance with 10 CFR 52.99(a) for completing the inspections, tests, and analyses in the ITAAC, Dominion shall have performed an assessment of on-site and off-site communications systems and equipment relied upon during an emergency event to ensure communications capabilities can be maintained during an extended loss of alternating current power. The communications capabilities assessment shall be performed in accordance with NEI 12-01, “Guideline for Assessing Beyond Design Basis Accident Response Staffing and Communications Capabilities,” Revision 0. (ii) No later than one hundred eighty (180) days before the date scheduled for initial fuel load set forth in the notification submitted in accordance with 10 CFR 52.103(a), Dominion shall have completed implementation of corrective actions identified in the communications capability assessment, including revisions to the Emergency Plan.

3.7.2	13.3.4.2	2. Staffing (i) No later than eighteen (18) months before the latest date set forth in the schedule submitted in accordance with 10 CFR 52.99(a) for completing the inspections, tests, and analyses in the ITAAC, Dominion shall have performed an assessment of the on-site and augmented staffing capability for response to a multi-unit event. The staffing assessment shall be performed in accordance with NEI 12-01, “Guideline for Assessing Beyond Design Basis Accident Response Staffing and Communications Capabilities,” Revision 0.
	13.3.4.2	(ii) No later than one hundred eighty (180) days before the date scheduled for initial fuel load, as set forth in the notification submitted in accordance with 10 CFR 52.103(a), Dominion shall revise the Emergency Plan to include the following: a. Incorporation of corrective actions identified in the staffing assessment required by this license condition; and b. Identification of how the augmented staff will be notified, given degraded communications capabilities.
	13.3.4.2	(i) No later than one hundred eighty (180) days before the date scheduled for initial fuel load set forth in the notification submitted in accordance with 10 CFR 52.103(a), Dominion shall update its North Anna Units 1 and 2 Letters of Agreement with the following entities, or their successors, and revise the Unit 3 Emergency Plan to include these updated Letters of Agreement after they have been executed. These updated Letters of Agreement shall identify the specific nature of arrangements in support of emergency preparedness for the NAPS site, including North Anna Unit 3, and reflect expected assistance associated with hostile action at the NAPS site, as defined in 10 CFR Part 50, Appendix E, Section IV.A.7.

		1. Commonwealth of Virginia Department of Emergency Management 2. Commonwealth of Virginia Department of Health 3. Commonwealth of Virginia Department of State Police 4. Commonwealth of Virginia Department of Game and Inland Fisheries 5. Virginia Commonwealth University Medical Center 6. Louisa County Administrator 7. Louisa County Sheriff 8. Louisa County Department of Fire and Emergency Medical Services 9. Spotsylvania County Sheriff 10. Spotsylvania Department of Fire, Rescue, and Emergency Management 11. Orange County Administrator 12. Orange County Sheriff 13. Caroline County Sheriff 14. Caroline County Department of Fire, Rescue, and Emergency Management 15. Hanover County Administrator 16. Hanover County Sheriff These Letters of Agreement shall identify the specific nature of arrangements in support of emergency preparedness for operation of North Anna Unit 3. The Emergency Plan shall be revised to include these Letters of Agreement after they have been executed. (j) Reactor Vessel Material Surveillance Program Dominion shall, as part of its reactor vessel material surveillance program, withdraw and test three surveillance capsules in accordance with the schedule provided in Column 1 (Predicted transition temperature shift at vessel inner surface of less than or equal to 100 oF) of Table 1, "Minimum Recommended Number of Surveillance Capsules and Their Withdrawal Schedule," in the 1982 Revision of ASTM Standard E185 (ASTM E185-82), "Standard Practice for Conducting Surveillance Tests of Light-Water Cooled Nuclear Power Reactor Vessels." The scheduling of capsule withdrawals to meet this condition shall be in accordance with ASTM E185-82.

3.11	1.5.1	E. Dominion shall have and maintain financial protection of such type and in such amounts as the Commission shall require in accordance with Section 170 of the Atomic Energy Act of 1954, as amended, to cover public liability claims.
	1.5.1	(1) Prior to the scheduled date of initial fuel load, and within ninety (90) days after the NRC publishes the notice of intended operation in the Federal Register, Dominion shall provide evidence to the Director of NRO, or the Director's designee, that it would have the ability to pay into the industry self-insurance program in the event of a nuclear incident and in the amount specified in 10 CFR 140.11(a)(4) for one calendar year using one of the methods specified in 10 CFR 140.21, "Licensee Guarantees of Payment of Deferred Premiums." Thereafter, Dominion shall annually provide evidence of the guarantees of payment of deferred premiums in accordance with the provisions specified in 10 CFR 140.21.
	1.5.1	(2) Before the scheduled date for initial fuel load, and within ninety (90) days after the NRC publishes the notice of intended operation in the Federal Register, Dominion shall provide satisfactory documentary evidence to the Director of NRO, or the Director's designee, that it has obtained the appropriate amount of secondary financial protection pursuant to 10 CFR 140.11(a)(4), and the appropriate amount of financial protection pursuant to 10 CFR 50.54(w).

A.2 Inspections, Tests, Analyses, and Acceptance Criteria

The staff has identified the certain inspections, tests, analyses, and acceptance criteria (ITAAC) that it will recommend the Commission impose with respect to a COL issued to the applicant. The COL application ITAAC consists of the following four parts:

1. Design Certification ITAAC
2. Physical Security ITAAC
3. Emergency Planning ITAAC
4. Site-specific ITAAC

1. Design Certification ITAAC

The design certification ITAAC are in the ESBWR DCD, Revision 10, Tier 1, which will be incorporated by reference into the COL should a COL be issued to the applicant.

2. Physical Security ITAAC

The physical security ITAAC are provided in Table 2-1. The licensee shall perform and satisfy the ITAAC defined in Table 2-1 (from North Anna 3 SER Table 13.6-1 and North Anna 3 COL Application Part 10, Table 2.2-1).

Table 2-1
ITAAC For Site-Specific Security System

Table 2.2.1-1 ITAAC for the Site-Specific Security System		
Design Commitment	**Inspections, Tests, Analyses**	**Acceptance Criteria**
1(a). Vital equipment will be located only within a vital area.	1(a). All vital equipment locations will be inspected.	1(a). Vital equipment is located only within a vital area.
1(b). Access to vital equipment will require passage through at least two physical barriers.	1(b). All vital equipment physical barriers will be inspected.	1(b). Vital equipment is located within a protected area such that access to the vital equipment requires passage through at least two physical barriers.
2(a). Physical barriers for the protected area perimeter will not be part of vital area barriers.	2(a). The protected area perimeter barriers will be inspected.	2(a). Physical barriers at the perimeter of the protected area are separated from any other barrier designated as a vital area barrier.
2(b). Penetrations through the protected area barrier will be secured and monitored.	2(b). All penetrations through the protected area barrier will be inspected.	2(b). All penetrations and openings through the protected area barrier are secured and monitored by intrusion detection equipment.
2(c). Unattended openings that intersect a security boundary, such as underground pathways, will be protected by a physical barrier and monitored by intrusion detection equipment or provided surveillance at a frequency sufficient to detect exploitation.	2(c). All unattended openings within the protected area barriers will be inspected.	2(c). All unattended openings (such as underground pathways) that intersect a security boundary (such as the protected area barrier), are protected by a physical barrier and monitored by intrusion detection equipment or provided surveillance at a frequency sufficient to detect exploitation.

Table 2.2.1-1 ITAAC for the Site-Specific Security System		
Design Commitment	**Inspections, Tests, Analyses**	**Acceptance Criteria**
3(a). Isolation zones will exist in outdoor areas adjacent to the physical barrier at the perimeter of the protected area and will be designed of sufficient size to permit observation and assessment on either side of the barrier.	3(a). The isolation zones in outdoor areas adjacent to the protected area perimeter barrier will be inspected.	3(a). The isolation zones exist in outdoor areas adjacent to the physical barrier at the perimeter of the protected area and are of sufficient size to permit observation and assessment of activities on either side of the barrier in the event of its penetration or attempted penetration.
3(b). Isolation zones will be monitored with intrusion detection and assessment equipment that is designed to provide detection and assessment of activities within the isolation zone.	3(b). The intrusion detection equipment within the isolation zones will be inspected.	3(b). Isolation zones are equipped with intrusion detection and assessment equipment capable of providing detection and assessment of activities within the isolation zone.
3(c). Areas where permanent buildings do not allow sufficient observation distance between the intrusion detection system and the protected area barrier (e.g., the building walls are immediately adjacent to, or are an integral part of the protected area barrier) will be monitored with intrusion detection and assessment equipment that is designed to detect the attempted or actual penetration of the protected area perimeter barrier before completed penetration of the barrier and assessment of detected activities.	3(c). Inspections of areas of the protected area perimeter barrier that do not have isolation zones will be performed.	3(c). Areas where permanent buildings do not allow sufficient observation distance between the intrusion detection system and the protected area barrier (e.g., the building walls are immediately adjacent to, or an integral part of, the protected area barrier) are monitored with intrusion detection and assessment equipment that detects attempted or actual penetration of the protected area perimeter barrier before completed penetration of the barrier and assessment of detected activities.
4(a). The perimeter intrusion detection system will be designed to detect penetration or attempted penetration of the protected area perimeter barrier before completed penetration of the barrier, and for subsequent alarms to annunciate concurrently in at least two continuously manned onsite alarm stations (central and secondary alarm stations).	4(a). Tests, inspections, or a combination of tests and inspections of the intrusion detection system will be performed.	4(a). The intrusion detection system can detect penetration or attempted penetration of the protected area perimeter barrier before completed penetration of the barrier, and subsequent alarms annunciate concurrently in at least two continuously manned on site alarms stations (central and secondary alarm stations).
4(b). The perimeter assessment equipment will be designed to provide video image recording with real-time and playback capability that can provide assessment of detected activities before and after each alarm annunciation	4(b). Tests, inspections, or a combination of tests and inspections of the video assessment equipment will be performed.	4(b). The perimeter assessment equipment is capable of real-time and playback video image recording that provides assessment of detected activities before and after each

Table 2.2.1-1 ITAAC for the Site-Specific Security System		
Design Commitment	**Inspections, Tests, Analyses**	**Acceptance Criteria**
at the protected area perimeter barrier.		alarm at the protected area perimeter barrier.
4(c). The intrusion detection and assessment equipment at the protected area perimeter will be designed to remain operable from an uninterruptible power supply in the event of the loss of normal power.	4(c). Tests, inspections, or a combination of tests and inspections of the uninterruptible power supply will be performed.	4(c). All Intrusion detection and assessment equipment at the protected area perimeter remains operable from an uninterruptible power supply in the event of the loss of normal power.
Design Commitment	**Inspections, Tests, Analyses**	**Acceptance Criteria**
5. Isolation zones and exterior areas within the protected area will be provided with illumination to permit assessment in the isolation zones and observation of activities within exterior areas of the protected area.	5. The illumination in isolation zones and exterior areas within the protected area will be inspected.	5. Illumination in isolation zones and exterior areas within the protected area is 0.2 foot candles measured horizontally at ground level or alternatively augmented, sufficient to permit assessment and observation.
6. The external walls, doors, ceiling, and floors in the Secondary Alarm Station, and the last access control function for access to the protected area will be bullet resistant, to at least Underwriters Laboratories Ballistic Standard 752, “The Standard of Safety for Bullet-Resisting Equipment,” Level 4, or National Institute of Justice Standard 0108.01, “Ballistic Resistant Protective Materials,” Type III.	6. Type test, analysis, or a combination of type test and analysis of the external walls, doors, ceiling, and floors in the Secondary Alarm Station, and the last access control function for access to the protected area will be performed.	6. A report exists and concludes that the walls, doors, ceilings, and floors in the Secondary Alarm Station, and the last access control function for access to the protected area are bullet resistant to at least Underwriters Laboratories Ballistic Standard 752, Level 4, or National Institute of Justice Standard 0108.01, Type III.
7. The vehicle barrier system will be designed, installed, and located at the necessary standoff distance to protect against the design-basis threat vehicle bombs.	7. Type test, inspections, analysis or a combination of type tests, inspections, and analysis will be performed for the vehicle barrier system	7. A report exists and concludes that the vehicle barrier system will protect against the threat vehicle bombs based on the standoff distance for the system.
8(a). Access control points will be established and designed to control personnel and vehicle access into the protected area.	8(a). Tests, inspections, or a combination of tests and inspections of installed systems and equipment will be performed.	8(a). Access control points exist for the protected area and are configured to control access.
8(b). Access control points will be established and designed with equipment for the detection of firearms, explosives, and incendiary devices at the protected area personnel access points.	8(b). Tests, inspections, or a combination of tests and inspections of installed systems and equipment will be performed.	8(b). Detection equipment exists and is capable of detecting firearms, explosives, and incendiary devices at the protected area personnel access control points.
9. An access control system with a numbered photo	9. The access control system and the numbered photo	9. The access authorization system with a numbered photo

Table 2.2.1-1 ITAAC for the Site-Specific Security System		
Design Commitment	**Inspections, Tests, Analyses**	**Acceptance Criteria**
identification badge system will be installed and designed for use by individuals who are authorized access to protected areas and vital areas without escort.	identification badge system will be tested.	identification badge system is installed and provides authorized access to protected and vital areas only to those individuals with unescorted access authorization.
Design Commitment	**Inspections, Tests, Analyses**	**Acceptance Criteria**
10. Unoccupied vital areas will be designed with locking devices and intrusion detection devices that annunciate in the Secondary Alarm Station.	10. Tests, inspections, or a combination of tests and inspections of unoccupied vital area intrusion detection equipment and locking devices will be performed.	10. Unoccupied vital areas are locked, and intrusion is detected and annunciated in the Secondary Alarm Station.
11(a). Intrusion detection equipment and video assessment equipment will annunciate and be displayed concurrently in at least two continuously manned onsite alarm stations (Central and Secondary Alarm Stations).	11(a). Tests, inspections, or a combination of tests and inspections of intrusion detection equipment and video assessment equipment will be performed.	11(a). Intrusion detection equipment and video assessment equipment annunciate and display concurrently in at least two continuously manned onsite alarm stations (Central and Secondary Alarm Stations).
11(b). The Secondary Alarm Station will be located inside the protected area and will be designed so that the interior of the alarm station is not visible from the perimeter of the protected area.	11(b). The Secondary Alarm Station location will be inspected.	11(b). The Secondary Alarm Station is located inside the protected area, and the interior of the alarm station is not visible from the perimeter of the protected area.
11(c). The alarm system will not allow the status of a detection point, locking mechanism or access control device to be changed without the knowledge and concurrence of the alarm station operator in the other alarm station.	11(c).Tests, inspections, or a combination of tests and inspections of intrusion detection equipment and access control equipment will be performed.	11(c). The alarm system will not allow the status of a detection point, locking mechanism or access control device to be changed without the knowledge and concurrence of the alarm station operator in the other alarm station.
11(d). Central and Secondary Alarm Stations will be designed, equipped and constructed such that no single act, in accordance with the design-basis threat of radiological sabotage, can simultaneously remove the ability of both the central and secondary alarm stations to (1) detect and assess alarms, (2) initiate and coordinate an adequate response to alarms, (3) summon offsite assistance, and (4) provide effective command and control.	11(d). Tests, inspections, or a combination of tests and inspections of the Central and Secondary Alarm Stations will be performed.	11(d). Central and Secondary Alarm Stations are designed, equipped, and constructed such that no single act, in accordance with the design-basis threat of radiological sabotage, can simultaneously remove the ability of both the central and secondary alarm stations to (1) detect and assess alarms, (2) initiate and coordinate an adequate response to alarms, (3) summon offsite assistance, and (4) provide effective command and control.

Table 2.2.1-1
ITAAC for the Site-Specific Security System

Design Commitment	Inspections, Tests, Analyses	Acceptance Criteria
Design Commitment	**Inspections, Tests, Analyses**	**Acceptance Criteria**
11(e). Both the Central and Secondary Alarm Stations will be constructed, located, protected, and equipped to the standards for the Central Alarm Station (alarm stations need not be identical in design but shall be equal and redundant, capable of performing all functions required of alarm stations).	11(e). Tests, inspections, or a combination of tests and inspections of the Central and Secondary Alarm Stations will be performed.	11(e). The Central and Secondary Alarm Stations are located, constructed, protected, and equipped to the standards of the Central Alarm Station and are functionally redundant (stations need not be identical in design).
12. The secondary security power supply system for alarm annunciator equipment contained in the Secondary Alarm Station and non-portable communications equipment contained in the Secondary Alarm Station is located within a vital area.	12. The secondary security power supply system will be inspected.	12. The secondary security power supply system for alarm annunciator equipment contained in the Secondary Alarm Station and non-portable communications equipment contained in the Secondary Alarm Station is located within a vital area.
13(a). Security alarm devices, including transmission lines to annunciators, will be tamper-indicating and self-checking (e.g., an automatic indication is provided when failure of the alarm system or a component occurs or when on standby power), and alarm annunciation indicates the type of alarm (e.g., intrusion alarms, emergency exit alarm) and location.	13(a). All security alarm devices and transmission lines will be tested.	13(a). Security alarm devices including transmission lines to annunciators are tamper indicating and self-checking (e.g., an automatic indication is provided when failure of the alarm system or a component occurs, or when the system is on standby power), and the alarm annunciation indicates the type of alarm (e.g., intrusion alarm, emergency exit alarm) and location.
13(b). Intrusion detection and assessment systems will be designed to provide visual display and audible annunciation of alarms in the Secondary Alarm Station.	13(b). Intrusion detection and assessment systems will be tested.	13(b). The intrusion detection and assessment systems provide a visual display and audible annunciation of alarms in the Secondary Alarm Station (concurrently with the display and annunciation in the Central Alarm Station).
14. No Site-Specific ITAAC specified.	14. No Site-Specific ITAAC specified.	14. No Site-Specific ITAAC specified.

Table 2.2.1-1
ITAAC for the Site-Specific Security System

Design Commitment	Inspections, Tests, Analyses	Acceptance Criteria
Design Commitment	**Inspections, Tests, Analyses**	**Acceptance Criteria**
15. Emergency exits through the protected area perimeter and vital area boundaries will be alarmed with intrusion detection devices and secured by locking devices that allow prompt egress during an emergency.	15. Tests, inspections, or a combination of tests and inspections of emergency exits through the protected area perimeter and vital area boundaries will be performed.	15. Emergency exits through the protected area perimeter and vital area boundaries are alarmed with intrusion detection devices and secured by locking devices that allow prompt egress during an emergency.
16(a). The Secondary Alarm Station will have conventional (land line) telephone service with the Main Control Room and local law enforcement authorities.	16(a). Tests, inspections, or a combination of tests and inspections of the Secondary Alarm Stations' conventional (land line) telephone service will be performed.	16(a). The Secondary Alarm Station is equipped with conventional (land line) telephone service with the Main Control Room and local law enforcement authorities.
16(b).The Secondary Alarm Station will be capable of continuous communication with on-duty security force personnel.	16(b). Tests, inspections, or a combination of tests and inspections of the Secondary Alarm Stations' continuous communication capabilities will be performed.	16(b). The Secondary Alarm Station is capable of continuous communication with on-duty watchmen, armed security officers, armed responders, or other security personnel who have responsibilities within the physical protection program and during contingency response events.
16(c). Non-portable communications equipment in the Secondary Alarm Station will remain operable from an independent power source in the event of loss of normal power.	16(c). Tests, inspections, or a combination of tests and inspections of the non-portable communications equipment will be performed.	l6(c). All non-portable communication devices (including conventional telephone systems) in the Secondary Alarm Station are wired to an independent power supply that enables those systems to remain operable (without disruption) during the loss of normal power.

3. Emergency Planning ITAAC.

The emergency planning (EP)-ITAAC are provided in Table 3-1. The licensee shall perform and satisfy the ITAAC defined in Table 3.-1 (from North Anna 3 COL Application Part 10, Table 2.3-1)

Table 3-1
ITAAC For Emergency Planning

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
1.0 Emergency Classification System			
10 CFR 50.47(b)(4) – A standard emergency classification and action level scheme, the bases of which include facility system and effluent parameters, is in use by the nuclear facility licensee, and State and local response plans call for reliance on information provided by facility licensees for determinations of minimum initial offsite response measures.	1.1 A standard emergency classification and emergency action level (EAL) scheme exists, and identifies facility system and effluent parameters constituting the bases for the classification scheme. [D.1**] [**D.1 corresponds to NUREG-0654/FEMA-REP-1 evaluation criteria.] ITAAC element addressed in: Combined license (COL) Emergency Plan (EP) II.D.1	1.1 An inspection of the control room, technical support center (TSC), and emergency operations facility (EOF) will be performed to verify that they have displays for retrieving facility system and effluent parameters that constitute the bases for the classification scheme identified in the Emergency Plan Implementing Procedures (EPIPs).	1.1.1 The specific parameters identified in the EAL thresholds listed in the EPIPs have been retrieved and displayed in the control room, TSC, and EOF. 1.1.2 The ranges available in the control room, TSC, and EOF encompass the values for the specific parameters identified in the EAL thresholds listed in the EPIPs.
2.0 Notification Methods and Procedures			
10 CFR 50.47(b)(5) – Procedures have been established for notification, by the licensee, of State and local response organizations and for notification of emergency personnel by all organizations; the content of initial and follow-up messages to response organizations and the public has been established; and means to provide early notification and clear instruction to the populace within the plume exposure pathway Emergency Planning Zone	2.1 The means exist to notify responsible State and local organizations within 15 minutes after the licensee declares an emergency. [E.1] ITAAC element addressed in: COL EP II.E.1	2.1 A test will be performed of the capabilities.	2.1 A means to notify responsible organizations, within 15 minutes after the licensee declares an emergency, has been established via the Operational Hot Line among the control room, the Commonwealth of Virginia, Caroline County, Hanover County, Louisa County, Orange County, and Spotsylvania County.

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
(EPZ) have been established.			
	2.2 The means exist to notify emergency response personnel. [E.2] ITAAC element addressed in: COL EP II.E.2	2.2 A test will be performed of the capabilities.	2.2 A means exists to notify the North Anna 3 emergency response organization.
	2.3 The means exist to notify and provide instructions to the populace within the plume exposure EPZ. [E.6] ITAAC element addressed in: COL EP II.E.6	2.3 The full test of notification capabilities will be conducted.	2.3 A means exists to notify and provide instructions to the public in accordance with the emergency plan requirements.
3.0 Emergency Communications			
10 CFR 50.47(b)(6) – Provisions exist for prompt communications among principal response organizations to emergency personnel and to the public.	3.1 The means exist for communications among the control room, TSC, EOF, principal State and local emergency operations centers (EOCs), and radiological field assessment teams. [F.1.d] ITAAC element addressed in: COL EP II.F.1.d	3.1 A test will be performed of the capabilities.	3.1.1 Communications have been established between the control room and TSC. 3.1.2 Communications have been established among the control room, TSC, and EOF. 3.1.3 Communications via the Operational Hot Line have been established among the TSC and EOCs, which include the Commonwealth of Virginia, Caroline County, Hanover County, Louisa County, Orange County, and Spotsylvania County. 3.1.4 Communications have been established between the TSC and radiological monitoring teams. 3.1.5 Communications have been established between the EOF and radiological monitoring teams.
	3.2 The means exist for communications	3.2 A test will be performed of the capabilities.	3.2 Communications have been established from the control room,

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
	from the control room, TSC, and EOF to the Nuclear Regulatory Commission (NRC) headquarters and regional office EOCs (including establishment of the Emergency Response Data System (ERDS) between the onsite computer system and the NRC Operations Center). [F.1.f] ITAAC element addressed in: COL EP II.F.1.f		TSC, and EOF to the NRC headquarters and Region II EOCs and an access port for ERDS is provided.
4.0 Public Education and Information			
[Deleted]	[Deleted]	[Deleted]	[Deleted]
5.0 Emergency Facilities and Equipment			
10 CFR 50.47(b)(8) – Adequate emergency facilities and equipment to support the emergency response are provided and maintained.	5.1 The licensee has established a TSC and onsite operational support center (OSC). [H.1] ITAAC element addressed in: COL EP II.H.1	5.1 An inspection of the as-built TSC and OSC will be performed.	5.1.1 The TSC has at least 1950 square feet of floor space. 5.1.2 The following communications equipment have been provided in the TSC and voice transmission and reception have been accomplished: a. NRC systems: Emergency Notification System (ENS), Health Physics Network (HPN), Reactor Safety Counterpart Link (RSCL), Protective Measures Counterpart Link (PMCL),

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			Management Counterpart Link (MCL) b. Dedicated telephone to EOF c. Dedicated telephone to control room d. Dedicated telephone to OSC 5.1.3 The TSC has been located in the Electrical Building. 5.1.4 The TSC includes radiation monitors and a ventilation system with a high efficiency particulate air (HEPA) and charcoal filter. 5.1.5 A back-up electrical power supply is available for the TSC.
			5.1.6 The OSC is in a location separate from the control room. 5.1.7 The following communications equipment have been provided in the OSC and voice transmission and reception have been accomplished: a. Dedicated telephone to control room b. Dedicated telephone to TSC c. Plant page system (voice transmission only)
	5.2 The licensee has established an EOF. [H.2] ITAAC element addressed in: COL EP II.H.2	5.2 An inspection of the EOF will be performed.	5.2.1 A report exists that confirms the EOF has at least 243 square meters (2625 square feet). 5.2.2 Voice transmission and reception have been accomplished between the EOF and TSC. 5.2.3 A report exists that confirms voice transmission and reception have been accomplished via the Operational Hot Line among the EOF, Commonwealth of Virginia, Caroline County, Hanover County, Louisa County, Orange

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			County, and Spotsylvania County. 5.2.4 The EOF has the means to acquire, display and evaluate radiological, meteorological, and plant system data pertinent to determining offsite protective measures.
6.0 Accident Assessment			
10 CFR 50.47(b)(9) – Adequate methods, systems, and equipment for assessing and monitoring actual or potential offsite consequences of a radiological emergency condition are in use.	6.1 The means exist to provide initial and continuing radiological assessment throughout the course of an accident. [I.2] ITAAC element addressed in: COL EP II.I.2, Appendix 2	6.1 A test of the emergency plan will be conducted by performing an exercise or drill to verify the capability to perform accident assessment.	6.1 An exercise or drill has been accomplished, including use of selected monitoring parameters identified in the EAL thresholds listed in the EPIPs, to assess simulated degraded plant conditions and initiate protective actions in accordance with the following criteria: A. *Accident Assessment and Classification* 1. Initiating conditions identified, EAL parameters determined, and the emergency correctly classified throughout the drill. 2. Protective action recommendations developed and communicated to appropriate authorities. B. *Radiological Assessment and Control* 1. Onsite radiological surveys performed and samples collected. 2. Radiation exposure of emergency workers monitored and controlled. 3. Field monitoring teams assembled and deployed. 4. Field team data collected and disseminated. 5. Dose projections developed. .

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			6. The decision whether to issue radioprotective drugs to NAPS 6. The NAPS emergency workers made.
	6.2 The means exist to determine the source term of releases of radioactive material within plant systems, and the magnitude of the release of radioactive materials based on plant system parameters and effluent monitors. [I.3] ITAAC element addressed in: COL EP II.I.3, Appendix 2	6.2 An analysis of EPIPs and the Offsite Dose Calculation Manual (ODCM) will be completed to verify the ability to determine the source term and magnitude of release.	6.2 The EPIPs and ODCM correctly calculate source terms and magnitudes of postulated releases.
	6.3 The means exist to continuously assess the impact of the release of radioactive materials to the environment, accounting for the relationship between effluent monitor readings, and onsite and offsite exposures and contamination for various meteorological conditions. [I.4] ITAAC element addressed in: COL EP II.I.4, Appendix 2	6.3 An analysis of EPIPs and the ODCM will be completed to verify the relationship between effluent monitor readings and offsite exposures and contamination for various meteorological conditions has been established.	6.3 The EPIPs and ODCM calculate the relationship between effluent monitor readings and offsite exposures and contamination for various meteorological conditions.
	6.4 The means exist to acquire and evaluate meteorological information. [I.5] ITAAC element addressed in: COL EP II.I.5	6.4 An inspection of the control room, TSC, and EOF will be performed to verify the availability of the following meteorological data: • Wind speed (at 10 meters (m) and 48.4 m) • Wind direction (at 10 m and 48.4 m)	6.4 The following meteorological data is available in the control room, TSC, and EOF: • Wind speed (at 10 m and 48.4 m) • Wind direction (at 10 m and 48.4 m) • Ambient air temperature (at 10 m) • Differential air temperature (between 10 m and 48.4 m)

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
		• Ambient air temperature (at 10 m) • Differential air temperature (between 10 m and 48.4 m)	
	6.5 The means exist to make rapid assessments of actual or potential magnitude and locations of any radiological hazards through liquid or gaseous release pathways, including activation, notification means, field team composition, transportation, communication, monitoring equipment, and estimated deployment times. [I.8] ITAAC element addressed in: COL EP II.I.8	6.5 A test will be performed of the capabilities.	6.5 Demonstrate the capability for making rapid assessment of the actual or potential magnitude and locations of any radiological hazards through liquid or gaseous release pathways.
	6.6 The capability exists to detect and measure radioiodine concentrations in air in the plume exposure EPZ, as low as 10^{-7} μCi/cc (microcuries per cubic centimeter) under field conditions. [I.9] ITAAC element addressed in: COL EP II.I.9	6.6 A test of NAPS field survey instrumentation will be performed to verify the capability to detect airborne concentrations as low as 1E-07 μCi/cc.	6.6 Instrumentation used for monitoring I-131 to detect airborne concentrations as low as 1E-07 μCi/cc has been provided.
	6.7 The means exist to estimate integrated dose from the projected and actual dose rates, and for comparing these estimates with the Environmental Protection Agency (EPA) protective	6.7 An analysis of EPIPs will be performed to verify that a methodology is provided to establish means for relating contamination levels and airborne radioactivity levels to dose rates and gross radioactivity	6.7 A report exists and concludes a methodology has been established for relating contamination levels and airborne radioactivity levels to dose rates and gross radioactivity measurements for the specified isotopes (Kr-88, Ru-106, I-131, I-132,

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
	action guides (PAGs). [I.10] ITAAC element addressed in: COL EP II.I.10, Appendix 2	measurements for the following isotopes: Kr-88, Ru-106, I-131, I-132, I-133, I-134, I-135, Te-132, Xe-133, Xe-135, Cs-134, Cs-137, Ce-144	I-133, I-134, I-135, Te-132, Xe-133, Xe-135, Cs-134, Cs-137, Ce-144), and for comparing the dose estimates with the EPA PAGs.
7.0 Protective Response			
10 CFR 50.47(b)(10) – A range of protective actions has been developed for the plume exposure EPZ for emergency workers and the public. In developing this range of actions, consideration has been given to evacuation, sheltering, and, as a supplement to these, the prophylactic use of potassium iodide (KI), as appropriate. Guidelines for the choice of protective actions during an emergency, consistent with Federal guidance, are developed and in place, and protective actions for the ingestion exposure EPZ appropriate to the locale have been developed.	7.1 The means exist to warn and advise onsite individuals of an emergency, including those in areas controlled by the operator, including: [J.1] a. employees not having emergency assignments; b. visitors; c. contractor and construction personnel; and d. other persons who may be in the public access areas, on or passing through the site, or within the owner controlled area. ITAAC element addressed in: COL EP II.J.1	7.1 A test of the onsite warning and communications capability will be performed during a drill or exercise.	7.1.1 During a drill or exercise, notification and instructions were provided to onsite workers and visitors, within the Protected Area, over the plant public announcement system. 7.1.2 During a drill or exercise, audible warnings were provided to individuals outside the Protected Area, but within the Owner Controlled Area.

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
8.0 Exercises and Drills			
10 CFR 50.47(b)(14) – Periodic exercises are (will be) conducted to evaluate major portions of emergency response capabilities, periodic drills are (will be) conducted to develop and maintain key skills, and deficiencies identified as a result of exercises or drills are (will be) corrected.	8.1 Licensee conducts a full-participation exercise to evaluate major portions of emergency response capabilities, which includes participation by each State and local agency within the plume exposure EPZ, and each State within the ingestion control EPZ. [N.1] ITAAC element addressed in: COL EP II.N.1	8.1 A full-participation exercise (test) will be conducted within the specified time periods of Appendix E to 10 CFR Part 50.	8.1.1 The exercise is completed within the specified time periods of 10 CFR Part 50, Appendix E, and a report exists that confirms onsite exercise objectives listed below have been met and there are no uncorrected onsite exercise deficiencies. A. *Accident Assessment and Classification* 1. Demonstrate the ability to identify initiating conditions, determine EAL parameters, and correctly classify the emergency throughout the exercise. Standard Criteria: a. Determine the correct highest emergency classification level based on events which were in progress, considering past events and their impact on the current conditions, within 15 minutes from the time the initiating condition(s) or EAL(s) is (are) identified. B. *Notifications* 1. Demonstrate the ability to alert, notify, and mobilize site emergency response personnel. Standard Criteria: a. Initiate activation of the emergency recall system following initial event classification for an Alert or higher. 2. Demonstrate the ability to notify responsible State and local government agencies within 15 minutes and the NRC within 60 minutes after declaring an emergency. a. Initiate transmittal of initial information to the Commonwealth of

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			Virginia and risk jurisdictions using the designated EPIP within 15 minutes of event classification. b. Initiate transmittal of follow-up information to the Commonwealth of Virginia and risk jurisdictions using the designated EPIP within appropriate interval. c. Initiate transmittal of initial information to the NRC using the designated EPIP within 60 minutes of event classification. 3. Demonstrate the ability to warn or advise onsite individuals of emergency conditions. Standard Criteria: a. Initiate notification of onsite individuals (via plant page or telephone), using the designated EPIP within 15 minutes of notification. 4. Demonstrate the capability of the Alert and Notification System (ANS) sirens to operate properly when required. Standard Criteria: a. 90 percent of the sirens operate properly. C. *Emergency Response* 1. Demonstrate the capability to direct and control emergency operations. Standard Criteria: a. Command and control is demonstrated by the control room in the early phase of the emergency and the TSC, after its activation. 2. Demonstrate the ability to transfer emergency direction from the control room (simulator) to the TSC. Standard Criteria:

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			a. Briefings were conducted prior to turnover responsibility. Personnel document transfer of duties. 3. Demonstrate the ability to prepare for around-the-clock staffing requirements. Standard Criteria: a. Complete 24-hour staff assignments. 4. Demonstrate the ability to perform assembly and accountability for all onsite individuals during an emergency requiring Protected Area assembly and accountability. Standard Criteria: a. Protected Area personnel assembly and accountability completed within 30 minutes following initiation of assembly and accountability measures. D. *Emergency Response Facilities* 1. Demonstrate activation of the OSC, and full functional operation of the TSC and EOF. Standard Criteria: a. The TSC, OSC, and EOF are activated within about 60 minutes of the initial notification. 2. Demonstrate the adequacy of equipment, security provisions, and habitability precautions for the TSC, OSC, EOF, and Joint Information Center (JIC), as appropriate. Standard Criteria: a. Demonstrate the adequacy of the emergency equipment in the emergency response facilities. b. The Security Team Leader implements and follows applicable EPIPs.

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			c. The Health Physics (HP) personnel implement the designated EPIP provisions if an onsite or offsite release has occurred. 3. Demonstrate the adequacy of communications for all emergency support resources. Standard Criteria: a. Emergency response facility personnel are able to operate all specified communication systems. b. Clear primary or backup communications links are established and maintained for the duration of the exercise. E. *Radiological Assessment and Control* 1. Demonstrate the ability to obtain onsite radiological surveys and samples. Standard Criteria: a. HP personnel demonstrate the ability to obtain appropriate instruments (range and type) and take surveys. b. Airborne samples are taken when the conditions indicate the need for the information. 2. Demonstrate the ability to continuously monitor and control radiation exposure to emergency workers. Standard Criteria: a. Emergency workers are issued self-reading dosimeters when radiation levels require, and exposures are controlled to 10 CFR Part 20 occupational dose limits (unless the Emergency Coordinator/EOF

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			Director authorizes emergency limits). b. Exposure records are available. c. Emergency workers include Security and personnel within all emergency facilities. 3. Demonstrate the ability to assemble and deploy field monitoring teams. Standard Criteria: a. One field monitoring team is ready to be deployed within 60 minutes of being requested, and no later than 90 minutes from the declaration of an Alert or higher emergency. 4. Demonstrate the ability to satisfactorily collect and disseminate field team data. Standard Criteria: a. Field team data to be collected is dose rate or counts per minute (cpm) from the plume, both open and closed window, and air sample (gross/net cpm) for particulate and iodine, if applicable. b. Satisfactory data dissemination is from the field team to HP (Plume Tracking/Dose Assessment) personnel. 5. Demonstrate the ability to develop dose projections. Standard Criteria: a. Timely and accurate dose projections are performed in accordance with EPIPs. 6. Demonstrate the ability to make the decision whether to issue radioprotective drugs to emergency workers. Standard Criteria: a. Radioprotective drugs are taken (simulated) if the estimated dose to the

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			thyroid will exceed 25 rem committed dose equivalent (CDE). 7. Demonstrate the ability to develop appropriate protective action recommendation(s) (PAR(s)) and notify appropriate authorities within 15 minutes of development. Standard Criteria: a. Total effective dose equivalent (TEDE) and CDE dose projections from the dose assessment computer code are compared to criteria in EPIPs. b. PAR(s) is (are) developed within 15 minutes of data availability, as appropriate. c. PAR(s) is (are) transmitted to responsible State and local government agencies within 15 minutes of development. F. *Public Information* 1. Demonstrate the capability to develop and disseminate clear, accurate, and timely information to the news media. Standard Criteria: a. Media information (e.g., press releases, press briefings, electronic media) is made available following notification of Dominion External Affairs personnel. 2. Demonstrate the capability to establish and effectively operate rumor control in a coordinated fashion. Standard Criteria: a. Calls are answered in a timely manner with the correct information.

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			b. Rumors are identified and addressed. G. *Evaluation* 1. Demonstrate the ability to conduct a post-exercise critique, to determine areas requiring improvement and corrective action. Standard Criteria: a. An exercise time-line is developed, followed by an evaluation of the objectives. b. Significant problems in achieving the objectives are discussed to ensure understanding of why objectives were not fully achieved. c. Recommendations for improvement in non-objective areas are discussed.

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			8.1.2 Onsite emergency response personnel are mobilized in sufficient number to fill the emergency positions identified in COL EP II.B, Onsite Emergency Organization, and a report exists that confirms they successfully perform their assigned responsibilities as outlined in Acceptance Criterion 8.1.1.D, Emergency Response Facilities.
			8.1.3 The exercise is completed within the specified time periods of 10 CFR Part 50, Appendix E, a report exists that confirms offsite exercise objectives have been met and there are no uncorrected offsite deficiencies, or a license condition requires offsite deficiencies to be corrected prior to operation above 5 percent of rated power.
9.0 Implementing Procedures			
10 CFR Part 50, Appendix E.V – No less than 180 days prior to the scheduled issuance of an operating license for a nuclear power reactor or a license to possess nuclear material, the applicant's detailed implementing procedures for its emergency plan shall be submitted to the Commission.	9.1 The licensee has submitted detailed implementing procedures for its emergency plan no less than 180 days prior to fuel load.	9.1 An inspection will be performed to confirm that the detailed implementing procedures for the North Anna 3 Emergency Plan were submitted to the NRC.	9.1 Each of the detailed implementing procedures for the North Anna 3 Emergency Plan, as defined in Appendix 5 of the Emergency Plan, are submitted to the NRC no less than 180 day prior to fuel load.

4. Site-Specific ITAAC

The site-specific ITAAC are provided in Table 4-1 through 4-8.

4.1 ITAAC for Fill Concrete Under Seismic Category I Structure

ITAAC for Fill Concrete Under and Around the Sides of Seismic Category I Structures is provided in Table 4-1. The licensee shall perform and satisfy the ITAAC defined in Table 4-1 (from North Anna 3 COL Application Part 10, Table 2.4.1-1).

Table 4-1
ITAAC for Fill Concrete Under and Around Seismic Category I Structures

Design Commitment	Inspections, Tests, and Analyses	Acceptance Criteria
1. The foundation grade for the FWSC will be established using fill concrete. Fill concrete placed under and around the sides of Seismic Category I Structures to a thickness greater than 5 feet is designed and tested as specified in FSAR Section 2.5..	Testing will be performed to determine the mean compressive strength for the fill concrete.	A report exists that demonstrates that the mean 28-day compressive strength of the fill concrete is equal to, or greater than, 17.2 MPa (2,500 psi).

4.2 ITAAC for Backfill Surrounding Seismic Category I Structures

Structural fill surrounding the embedded walls for Seismic Category I structures meets properties for (1) the angle of internal friction; (2) the local effect on wall pressure as determined by the product of: peak ground acceleration α, (in g), Poisson's ratio v, and density γ; and (3) soil density. is provided in Table 4-2. The licensee shall perform and satisfy the ITAAC defined in Table 4-2 (from North Anna 3 COL Application Part 10, Table 2.4.2-1).

Table 4-2
ITAAC for Structural Fill Surrounding Seismic Category I Structures

Design Commitment	Inspections, Tests, and Analyses	Acceptance Criteria
1. The structural fill material surrounding Seismic Category I structures meets the following properties: • the angle of internal friction ≥35 degrees • the local effect on wall lateral pressures ≤1220 kg/m3 (76 lbf/ft3), as determined by the following equation: $\alpha\ (0.95\nu + 0.65)\gamma$ where: α = peak ground acceleration (in g) ν = Poisson's ratio γ = density • the soil density γ ≥2000 kg/m3 (125 lbf/ft3).	Tests, inspections, analyses, or a combination thereof, will be performed to evaluate the properties of the structural fill.	A report exists and concludes that the tests, inspections, analyses, or a combination thereof, confirm that the structural fill material surrounding Seismic Category I structures meets the following properties: • the angle of internal friction ≥35 degrees • the local effect on wall lateral pressures ≤1220 kg/m3 (76 lbf/ft3), as determined by the following equation: $\alpha\ (0.95\nu + 0.65)\gamma$ where: α = peak ground acceleration (in g) ν = Poisson's ratio γ = density • the soil density γ ≥2000 kg/m3 (125 lbf/ft3).

4.3 ITAAC for Plant Service Water System

The site-specific ITTAC for the plant service water system are related to plant service water reserve storage capacity as listed in Table 4-3. The licensee shall perform and satisfy the ITAAC defined in Table 4-3 (from North Anna 3 COL Application Part 10, Table 2.4.3-1).

Table 4-3
ITAAC for Plant Service Water Reserve Storage Capacity

Design Commitment	Inspections, Tests, and Analyses	Acceptance Criteria
1. The volume of water in the PSWS basin shall be sufficient such that:		
a. No active makeup shall be necessary to remove 2.02 × 107 MJ (1.92 × 1010 BTU) over a period of seven days.	Inspections and analysis will be performed of the PSWS basin and cooling towers.	A report exists and concludes that the volume of water in the PSWS basin is sufficient such that no active makeup is necessary to remove 2.02 × 107 MJ (1.92 × 1010 BTU) over a period of seven days.
b. The PSWS pumps must have sufficient available net positive suction head at the pump suction location for the lowest probable water level of the heat sink.	Inspections and analysis will be performed of the PSWS basin.	A report exists and concludes that the PSWS pumps have sufficient available net positive suction head at the pump suction location for the lowest probable water level of the heat sink.

4.4 Offsite Power Systems ITAAC

Table 4-4 provides the site-specific offsite power ITAAC. The licensee shall perform and satisfy the ITAAC defined in Table 4-4 (from North Anna 3 COL Application Part 10, Table 2.4.8-1).

Table 4-4
ITAAC for offsite Power Systems

Design Commitment	Inspections, Tests, and Analyses	Acceptance Criteria
1.Independent offsite power sources supply electric power from the transmission network to the interface with the onsite plant power system (PPS)		
a. A minimum of two offsite power circuits are provided to the interface with the onsite PPS and are physically separate.	a. Inspections of the as-built offsite power supply transmission system will be performed.	a. A report exists and concludes the following inspection results: i) At least two offsite transmission circuits are provided to the interface with the onsite PPS. ii) The two offsite power circuits are physically separated by distance or physical barriers so as to minimize to the extent practical the likelihood of their simultaneous failure under design basis conditions. iii) The two offsite power circuits do not have a common takeoff structure or use a common structure for support.
b. The two offsite power circuits interfacing with the onsite PPS are electrically independent.	b. Test of the as-built offsite power system will be conducted by providing a test signal in only one offsite power circuit at a time.	b. A report exists and concludes that a test signal exists in only the circuit under test.
c. The breaker control power. Instrumentation and control circuits for the two offsite Dower circuits interfacing with the onsite PPS are electrically independent.	c. Tests of the as-built offsite breaker control power. Instrumentation and control circuits will be conducted by providing a test signal in only one offsite power circuit at a time.	c. A report exists and concludes that a test signal exists in only the circuit under test.
2. At least two offsite power circuits interfacing with the onsite portions of the PPS are each adequately rated to supply necessary load requirements during design basis operating modes.	2. Analyses of the offsite power system will be performed to evaluate the as-built ratings of each offsite power circuit interfacing with the onsite portions of the PPS against the load requirements determined in DCD ITAAC 2.13.1-2, Item, 9.	2. A report exists and concludes that at least two offsite power circuits from the transmission network up to the interface with the onsite portions of the PPS are each rated to supply the load requirements, during design basis operating modes, of their respective safety-related and nonsafety-related load groups.
3. Under normal steady state operation of the transmission system, the offsite portion of the PPS is capable of supplying required voltage to the interface with the onsite portions of the	3. Analyses of the as-built offsite portion of the PPS will be performed to evaluate the capability of each offsite power circuit to supply the voltage requirements at the interface with the onsite portion	3. A report exists and concludes that as-built offsite portion of the PPS, under normal steady state operation of the transmission system, is capable of supplying voltage at the interface with the

PPS that will support operation of safety-related loads during design basis operating modes.	of the PPS determined in DCD ITAAC 2.13.1-2, Item 9.	onsite portions of the PPS that will support operation of safety-related loads during design basis operating modes.
4. Under normal steady state operation of the transmission system, the offsite portion of the PPS is capable of supplying required frequency to the interface with the onsite portions of the PPS that will support operation of safety-related loads during design basis operating modes.	4. Analyses of the as-built offsite portion of the PPS will be performed to evaluate the capability of each offsite power circuit to supply the frequency requirements at the interface with the onsite portions of the PPS determined in DCD ITAAC 2.13.1-2, Item 9.	4. A report exists and concludes that as-built offsite portion of the PPS, under normal steady state operation of the transmission system, is capable of supplying required frequency at the interface with the onsite portions of the PPS that will support operation of safety-related loads during design basis operating modes.
5. The fault current contribution of the offsite portion of the PPS is compatible with the interrupting capability of the onsite short circuit interrupting devices.	5. Analyses of the as-built offsite portion of the PPS will be performed to evaluate the fault current contribution of each offsite power circuit at the interface with the onsite portions of the PPS.	5. A report exists and concludes the short circuit contribution of the as-built offsite portion of the PPS at the interface with the onsite portions of the PPS is compatible with the interrupting capability of the onsite fault current interrupting devices as determined in DCD ITAAC 2.13.1-2, Item 10.

4.5 Turbine Building ITAAC

Table 4-5 provides the site-specific turbine building (TB) ITAAC. The licensee shall perform and satisfy the ITAAC defined in Table 4-5 (from North Anna 3 COL Application Part 10, Table 2.4.15-1).

Table 4-5
ITAAC for the Turbine Building

Design Commitment	Inspections, Tests, and Analyses	Acceptance Criteria
1. The site-specific seismic load demands for the Turbine Building structure are within acceptable limits to ensure that the structure is seismically adequate, using the same analysis methodology as a Seismic Category I structure, considering associated loads as described in DCD Tier 1 ITAAC Table 2.16.8-1, Item 1.	Perform site-specific SSI analysis, following the methodology specified for Seismic Category I structures in FSAR Section 3.7.2, to address ground motion exceedances and site-specific effects of subgrade properties. If the Turbine Building structure seismic load demands exceed the standard design seismic oads, perform a structural design evaluation of the Turbine Building n the same manner as for a Seismic Category I structure, ncluding the load combinations and the acceptance criteria, for the associated loads.	The Turbine Building structure seismic load demands obtained from the site-specific SSI analysis are acceptable if at least one of the following two criteria are satisfied: (1) the site-specific seismic loads are bounded by the standard design seismic oads used for the Turbine Building; or, (2) the results from the site-specific structural design evaluation demonstrate that the Turbine Building total stresses are bounded by the Code allowable stress imits for a Seismic Category I structure, for the associated loads.. Site-specific foundation input response spectra (FIRS) developed using site-specific soil properties and FSAR Sections 2.5.2 and 3.7.1 methodology are used in the SSI analysis.
2. Seismic SSSI of the non-Seismic Category I Turbine Building will not impair the ability of the adjacent Seismic Category I Reactor Building to perform its safety functions.	Perform site-specific SSSI analyses to evaluate seismic interaction between the Turbine Building and adjacent Seismic Category I Reactor Building, using methodology consistent with that used for the Seismic Category I structures.	Site-specific analyses conclude that there is no seismic SSSI of the non-Seismic Category I Turbine Building that impairs the ability of the adjacent Seismic Category I Reactor Building to perform its safety functions.

4.6 Radwaste Building ITAAC

Table 4-6 provides the site-specific radwaste building (RWB) ITAAC. The licensee shall perform and satisfy the ITAAC defined in Table 4-6 (from North Anna 3 COL Application Part 10, Table 2.4.16-1).

Table 4-6
ITAAC for the Radwaste Building

Design Commitment	Inspections, Tests, and	Acceptance Criteria
1. The site-specific seismic load demands for the Radwaste Building structure are within acceptable limits to ensure that the structure s seismically adequate, using the same analysis methodology as a Seismic Category I structure, considering associated oads as described in DCD Tier 1 ITAAC Table 2.16.9-1, Item 1. The SSI analysis uses site-specific foundation input response spectra (FIRS) developed using site-specific soil properties and FSAR Sections 2.5.2 and 3.7.1 methodology for Seismic Category I buildings.	Perform site-specific SSI analysis, following the methodology specified for Seismic Category I structures in FSAR Section 3.7.2, to address ground motion exceedances and site-specific effects of subgrade properties. If the Radwaste Building structure seismic load demands exceed the standard design seismic loads, perform a structural design evaluation of the Radwaste Building in the same manner as for a Seismic Category I structure, including the load combinations and the acceptance criteria, for the associated loads.	The Radwaste Building structure seismic load demands obtained from the site-specific SSI analysis for the Radwaste Building structure are acceptable if at least one of the following two criteria are satisfied: (1) the site-specific seismic loads are bounded by the standard design seismic loads used for the Radwaste Building; or, (2) the results from the site-specific structural evaluation demonstrate that the Radwaste Building total stresses are bounded by Code allowable stress limits that are the same as for a Seismic Category I structure, for the associated loads. Site-specific foundation input response spectra (FIRS) developed using site-specific soil properties and FSAR Sections 2.5.2 and 3.7.1 methodology are used in the SSI analysis.
2. The Radwaste Building has an exterior wall static pressure capacity of at least 3 psi.	Perform an analysis to determine the static wall pressure capacity of the exterior walls of the as-built Radwaste Building.	Results of the Radwaste Building analysis demonstrate that the exterior wall static pressure capacity s at least 3 psi.
3. Seismic SSSI of the non-Seismic Category I Radwaste Building will not impair the ability of the adjacent Seismic Category I Reactor Building to perform its safety functions.	Perform site-specific SSSI analyses to evaluate seismic interaction between the Radwaste Building and adjacent Seismic Category I Reactor Building, using methodology consistent with that used for the Seismic Category I structures.	Site-specific analyses conclude that there is no seismic SSSI of the non-Seismic Category I Radwaste Building that impairs the ability of the adjacent Seismic Category I Reactor Building to perform its safety functions.

4.7 Service Building ITAAC

Table 4-7 provides the site-specific service building (SB) ITAAC. The licensee shall perform and satisfy the ITAAC defined in Table 4-7 (from North Anna 3 COL Application Part 10, Table 2.4.17-1).

Table 4-7
ITAAC for the Service Building

Design Commitment	Inspections, Tests, and	Acceptance Criteria
1. The site-specific seismic load demands for the Service Building structure are within acceptable limits to ensure that the structure is seismically adequate, using the same analysis methodology as a Seismic Category I structure, considering associated loads as described in DCD Tier 1 ITAAC Table 2.16.10-1, Item 1. The SSI analysis uses site-specific foundation input response spectra (FIRS) developed using site-specific soil properties and FSAR Sections 2.5.2 and 3.7.1 methodology for Seismic Category I buildings.	Perform site-specific SSI analysis, following the methodology specified for Seismic Category I structures in FSAR Section 3.7.2, to address ground motion exceedances and site-specific effects of subgrade properties. If the Service Building structure seismic load demands exceed the standard design seismic loads, perform a structural design evaluation of the Service Building in the same manner as for a Seismic Category I structure, including the load combinations and the acceptance criteria, for the associated loads.	The Service Building structure seismic load demands obtained from the site-specific SSI analysis are acceptable if at least one of the following two criteria are satisfied: (1) the site-specific seismic loads are bounded by the standard design seismic loads used for the Service Building; or, (2) the results from the site-specific structural design evaluation demonstrate that the Service Building total stresses are bounded by Code allowable stress limits that are the same as for a Seismic Category I structure, for the associated loads. Site-specific foundation input response spectra (FIRS) developed using site-specific soil properties and FSAR Sections 2.5.2 and 3.7.1 methodology are used in the SSI analysis.
2. Seismic SSSI of the non-Seismic Category I Service Building will not impair the ability of the adjacent Seismic Category I Reactor Building, Control Building, Fuel Building, or FWSC to perform the safety functions	Perform site-specific SSSI analyses to evaluate seismic interaction between the Service Building and adjacent Seismic Category I Reactor Building, Control Building, Fuel Building, or FWSC, using methodology consistent with that used for the Seismic Category I structures.	Site-specific analyses conclude that there is no seismic SSSI of the non-Seismic Category I Service Building that impairs the ability of the adjacent Seismic Category I Reactor Building, Control Building, Fuel Building, or FWSC to perform the safety functions.

4.8 Ancillary Diesel Building ITAAC

Table 4-8 provides the site-specific ancillary diesel building (ADB) ITAAC. The licensee shall perform and satisfy the ITAAC defined in Table 4-8 (from North Anna 3 COL Application Part 10, Table 2.4.18-1).

Table 4-8
ITAAC for the Ancillary Diesel Building

Design Commitment	Inspections, Tests, Analyses	Acceptance Criteria
1 The site-specific seismic load demands for the Ancillary Diesel Building structure are within acceptable limits to ensure that the structure is seismically adequate, using the same analysis methodology as a Seismic Category I structure, considering associated loads as described in DCD Tier 1 ITAAC Table 2.16.11-1, Item 1.	Perform site-specific SSI analysis, following the methodology specified for Seismic Category I structures in FSAR Section 3.7.2, to address ground motion exceedances and site-specific effects of subgrade properties. If the Ancillary Diesel Building structure seismic load demands exceed the standard design seismic loads, perform a structural design evaluation of the Ancillary Diesel Building in the same manner as for a Seismic Category I structure, including the load combinations and the acceptance criteria, for the associated loads.	The Ancillary Diesel Building structure seismic load demands obtained from the site-specific SSI analysis are acceptable if at least one of the following two criteria are satisfied: (1) the site-specific seismic loads are bounded by the standard design seismic loads used for the Ancillary Diesel Building; or, (2) the results from the site-specific structural design evaluation demonstrate that the total stresses are bounded by Code allowable stress limits that are the same as for a Seismic Category I structure, for the associated oads.
The SSI analysis uses site-specific foundation input response spectra (FIRS) developed using site-specific soil properties and FSAR Sections 2.5.2 and 3.7.1 methodology for Seismic Category I buildings.		Site-specific foundation input response spectra (FIRS) developed using site-specific soil properties and FSAR Sections 2.5.2 and 3.7.1 methodology are used in the SSI analysis.
2. Seismic SSSI of the non-Seismic Category I Ancillary Diesel Building will not impair the ability of the adjacent Seismic Category I Fuel Building to perform its safety functions.	Perform site-specific SSSI analyses to evaluate seismic interaction between the Ancillary Diesel Building and adjacent Seismic Category I Fuel Building, using methodology consistent with that used for the Seismic Category I structures.	I Site-specific analyses conclude that there is no seismic SSSI of the non-Seismic Category I Ancillary Diesel Building that impairs the ability of the adjacent Seismic Category I Fuel Building to perform ts safety functions.

Appendix B

Chronology of the Combined License Application for North Anna 3

This appendix contains a chronological listing of routine licensing correspondence between the staff of the U.S. Nuclear Regulatory Commission (NRC) regarding the review of the North Anna 3 plant design under Docket No. 052-000017.

Appendix C Electronic Request for Additional Information Database

The following notes pertain to the table on the proceeding pages:

- The request for additional information (RAI) question numbers were assigned based on the section of the Standard Review Plan (SRP) that was associated with the question (e.g., question 02.01.02-1 was generated based on the staff's review of the application against Section 2.1.2 of the SRP).
- The NRC letter number is a unique number that was assigned to the letter that transmitted the RAIs to the applicant.
- The applicant's responses to security-related and sensitive information questions (e.g., physical security) are not publically available

UNITED STATES
NUCLEAR REGULATORY COMMISSION
ADVISORY COMMITTEE ON REACTOR SAFEGUARDS
WASHINGTON, DC 20555 - 0001

November 15, 2016

The Honorable Stephen G. Burns
Chairman
U.S. Nuclear Regulatory Commission
Washington, DC 20555-0001

SUBJECT: REPORT ON THE SAFETY ASPECTS OF DOMINION VIRGINIA POWER COMBINED LICENSE APPLICATION FOR NORTH ANNA UNIT 3

Dear Chairman Burns:

During the 638th meeting of the Advisory Committee on Reactor Safeguards (ACRS), November 3-5, 2016, we reviewed the NRC staff's advanced final safety evaluation report (SER) for the Dominion Virginia Power (Dominion or the applicant) combined license application (COLA) for North Anna Unit 3. Dominion proposes to construct and operate an Economic Simplified Boiling Water Reactor (ESBWR) on the site of their two operating nuclear units, North Anna Units 1 and 2. In October 2010, we completed our safety review of the General Electric-Hitachi (GEH) application for certification of its ESBWR passive nuclear power plant design and concurred with the staff's recommendation to certify that design. In April 2014, we found the revised analysis procedure for the structural and functional integrity of the ESBWR steam dryer to be acceptable.

Our ESBWR Subcommittee held an informational briefing on September 22, 2016, and a subcommittee meeting on October 20, 2016, to review the North Anna Unit 3 COLA and the staff's advanced final SER. During our meetings, we met with representatives of the staff, Dominion and its vendors, and the public. We also had the benefit of the documents referenced. This letter fulfills the requirement of 10 CFR 52.87 that the ACRS report on those portions of the application that concern safety.

CONCLUSIONS AND RECOMMENDATION

1 There is reasonable assurance that North Anna Unit 3 can be built and operated without undue risk to the health and safety of the public. The COLA for North Anna Unit 3 should be approved.

2 Site-specific departures and exemptions from the ESBWR design control document (DCD), including those in the areas of seismic design and analysis, electrical power distribution system, liquid effluent discharge, and design for hurricane wind generated missiles, are acceptable and should be approved.

3. There is reasonable assurance that the ESBWR design and the North Anna Unit 3 site satisfy the requirements resulting from the Fukushima Near-Term Task Force recommendations.

BACKGROUND

On November 26, 2007, Dominion submitted an application to the NRC for a combined license (COL) to construct and operate a GEH ESBWR at the North Anna site pursuant to 10 CFR Part 52, “Licenses, Certification, and Approvals for Nuclear Power Plants.” The application incorporated, by reference, the ESBWR DCD and an early site permit (ESP) for the North Anna site which was issued based on a site safety analysis report.

The ESBWR nuclear reactor design is a 4,500 megawatt thermal reactor that uses natural circulation flow within the vessel under normal operation and has passive safety features. This reactor is identified as North Anna Unit 3 and will be located on Dominion’s existing North Anna site in Louisa County, Virginia, approximately 40 miles north northwest of Richmond, Virginia. There are two existing Westinghouse pressurized water reactors, North Anna Units 1 and 2, in operation at the site, as well as an independent spent fuel storage installation. North Anna Unit 3 will be located adjacent to and generally west of the existing units.

In June 2010, Dominion revised its application to instead reference the United States Advanced Pressurized Water Reactor technology for North Anna Unit 3, but then reverted to the ESBWR reactor technology in April 2013.

On June 24, 2014, Dominion submitted a revised application that followed the design centered review approach (DCRA), based on the DTE Electric Company Fermi 3 COLA, which referenced the codified version of the ESBWR design certification rule contained in 10 CFR Part 52, Appendix E, “Design Certification Rule for the ESBWR Design.” The DCRA allows the staff to perform one technical review and reach a decision for a reference COLA (RCOLA) addressing issues outside the scope of the design certification, and to use that review and decision to support subsequent COLAs. The first COLA submitted for NRC staff review for a certified design is designated as the RCOLA, and subsequent applications are designated as subsequent COLAs (SCOLAs).

The final SER for the Fermi 3 COLA documents the staff’s review of both standard and site-specific information and is the first complete SER for a COLA in the ESBWR design center. To ensure that the staff’s findings on standard content documented in the final SER for the Fermi 3 COLA are equally applicable to the North Anna Unit 3 COLA, the staff undertook the following reviews:

- The staff compared the North Anna Unit 3 COL final safety analysis report (FSAR), Revision 8, to the Fermi 3 COL FSAR, Revision 8. In performing this comparison, the staff considered changes to the Fermi 3 COL FSAR (and other parts of the COLA, as applicable) resulting from requests for additional information (RAIs) and open and confirmatory items identified in the Fermi 3 SER with open items.

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation (the Fermi 3 final SER) were acceptable for North Anna Unit 3.

- The staff verified that the site-specific differences between Fermi 3 and North Anna Unit 3 sites are adequately addressed.

DISCUSSION

Site Characteristics

Site characteristics include potential hazards in proximity of the plant, as well as meteorology, hydrology, geology, seismology, and geotechnical parameters. An applicant must identify these characteristics and demonstrate that they, along with site-related design parameters specified in the ESP, are bounded by the site parameters for the certified design, or justify departures or exemptions where applicable. The staff reviewed the North Anna Unit 3 COLA, the referenced ESBWR DCD, and the North Anna Unit 3 ESP, to ensure that the combination of the information in these documents appropriately represents the complete scope of information relating to site characteristics. The staff concluded that the applicant has provided sufficient information and that, except as discussed under Departures and Exemptions below, the North Anna Unit 3 site characteristics are bounded by the requirements of the ESBWR DCD.

Departures and Exceptions from the ESBWR DCD

Ground Response Spectra for Seismic Structural Loads and Floor Response Spectra

The site-specific ground motion response spectra and foundation input response spectra for North Anna Unit 3 exceed the DCD certified seismic design response spectra. In the current application, Dominion revised its seismic hazard characterization using the methods prescribed in NUREG-2115. The updated North Anna Unit 3 probabilistic seismic hazard analysis using the Central and Eastern U.S. seismic source characterization model considers an updated catalog of earthquakes potentially affecting the site and incorporates the most recent ground motion model (Electric Power Research Institute, 2013) to develop uniform hazard response spectra; i.e. response spectra associated with specific annual exceedance frequencies).

The probabilistic seismic hazard analysis considered the magnitude 5.8 2011 Mineral, Virginia earthquake, which occurred approximately 11 miles southwest of the North Anna site and was one of the largest magnitude earthquakes instrumentally recorded in eastern North America. Despite its magnitude, the CEUS SSC model found the Mineral earthquake to have an insignificant effect on the resulting seismic source characterization for the site. Indeed, the resulting acceleration response spectra being used for the seismic design of North Anna Unit 3 demonstrates substantial margins relative to the accelerations measured at the North Anna site during the Mineral earthquake. The applicant also considered the potential for surface faulting, and the stability of surface materials and foundations at the site.

The uniform hazard response spectra at $1x10^{-4}$ and $1x10^{-5}$ per year exceedance frequencies were further analyzed to address transmission of the seismic waves through the site-specific geologic columns above hard rock, for determination of the ground motion response spectra and the foundation input response spectra for the seismic category I structures: reactor building/fuel building, control building and fire water support complex. These spectra were input to detailed structural models of each building to determine seismic load demands on the structures as well as in-structure response spectra (ISRS) for analysis of systems and components.

Since the updated seismic load demands exceed those based on the certified seismic design response spectra at some frequencies, the two spectra were bounded. Bounding spectra were then combined with standard design non-seismic loads in the same analysis models used for the standard design to determine their acceptability. The analyses confirmed the adequacy of the seismic category 1 structures. No changes were required to DCD concrete structures such as slab and wall thickness, although some minor structural modifications were required to some steel components to withstand the higher loads.

Interaction with non-seismic category I structures was also considered. Inspection, test, and analysis acceptance criteria are included for those buildings to verify that the as-built structures meet applicable acceptance standards under the higher, site-specific loads. Site-specific ISRS that exceed standard design ISRS will be used for seismic design and qualification of North Anna Unit 3 equipment and components.

The staff confirmed that the North Anna Unit 3 seismic design methodology for plant structures, systems, and components is acceptable. Their review included an independent geological assessment of the Mineral earthquake, which concluded that the applicant's assessment was sufficient. Staff experts, including geologists, also evaluated the behavior of a previously discovered fault, commonly referred to as fault "a", near the North Anna site. This is a geologically old structure, i.e., at least one million years old, and the staff determined it was not a potential seismic source. There was no evidence of rupture or deformation of fault "a" as a result of the Mineral earthquake. The staff performed an independent probabilistic seismic hazard analysis and confirmed the applicant's site amplification and ground motion response spectra calculations.

The review concluded that sufficient information has been provided to satisfy NRC regulations and guidance in the seismic area and, with identified changes, the ESBWR standard design is adequate to meet the site-specific seismic demand. Thus, the applicant resolved all COL items and license conditions in the seismic area.

Electrical Power Distribution System

The applicant has proposed two departures and an exemption to the certified design information.

One departure pertains to the use of Dominion transmission system standards for switchyard surge protection. Those standards are proposed in lieu of specific elements of an IEEE standard that is endorsed by Regulatory Guide 1.204, which is cited in Tier 2 of the DCD. The staff reviewed this departure and concluded that the applicant's measures provide equivalent protection.

The other departure and its associated DCD Tier 1 exemption pertain to a change in the configuration of the normal preferred power supply from the North Anna switchyard. The change introduces an intermediate switchyard that contains additional equipment not included in the certified design: three single-phase 500kV / 230kV transformers, a 500kV isolation circuit breaker, and three motor-operated disconnects. This configuration incorporates unit auxiliary transformers and reserve auxiliary transformers that have the same design specifications and voltage ratings. To better understand the potential risk significance of this change, we examined the relevant portions of the electric power system models and analyses in the design certification probabilistic risk assessment (PRA).

Failures of the additional equipment in the intermediate switchyard will increase the frequency for loss of normal preferred power to the unit auxiliary transformers, compared to the switchyard-related power failures that are evaluated in the design certification PRA. Depending on the specific failure modes, those failures may also functionally prevent recovery of normal preferred power from the 500kV switchyard during the nominal PRA mission time. It is not likely that equipment failures in the intermediate switchyard will directly affect availability of the 230kV alternate preferred power supply to the reserve auxiliary transformers. Nonetheless, the site-specific design will result in an increase in risk, compared to that evaluated for the certified design. The amount of that increase will be better understood when the final design is analyzed more completely in the North Anna Unit 3 site-specific PRA that will be performed prior to initial fuel load. Based on our comparative assessment, we have reasonable assurance that the increase will be small and that switchyard-related failures of normal preferred power will remain a small contribution to overall plant risk. Therefore, the proposed departure and exemption are acceptable.

Liquid Radioactive Waste Effluent Discharge Piping Flow Path

The North Anna Unit 3 COLA proposes an alternate flow path for routing of liquid radioactive waste effluent discharges to the environment that does not use the cooling tower blowdown line as specified in the DCD. This departure simplifies design and construction of the cooling tower blowdown line since it will not need to be designed with special features required for lines that contain liquid radioactive waste. Since the changes involve differences from both Tier 1 and Tier 2 portions of the DCD, they constitute both an exemption and a departure. The staff evaluated the radioactive waste discharge piping exemption/departure, and concluded that it is acceptable.

Design of Structures for Hurricane Wind Generated Missiles

The staff evaluated the exemption to the ESBWR DCD for the effects of hurricane-generated missiles. The staff requested that the applicant address site-specific hurricane missiles based on Regulatory Guide 1.221. In response, the applicant demonstrated that all seismic Category I structures are bounded by the DCD tornado missiles (330 mph wind speed). Some equipment subject to regulatory treatment of non-safety systems (RTNSS) is housed in non-seismic Category I structures, which are not designed for tornado-generated missiles. The DCD hurricane wind speed does not bound the Regulatory Guide 1.221 hurricane wind speeds at the North Anna site (140 mph). Therefore, this exemption modifies the DCD to specify that RTNSS structures will be designed to the most limiting hurricane-generated missile, either from the DCD or site-specific value calculated from Regulatory Guide 1.221. The staff finds that this exemption is acceptable.

Fukushima Requirements

In 2011, the Fukushima Near-Term Task Force issued a series of recommendations for improving nuclear power plant safety in the U.S. following the Fukushima earthquake and tsunami. Recommendations applicable to the North Anna Unit 3 COLA are: 4.2, Mitigation of Beyond-Design-Basis External Events, 7.1, Reliable Spent Fuel Pool Instrumentation, and 9.3, Emergency Preparedness Staffing and Communications.

Dominion incorporated information related to mitigating strategies for beyond-design-basis external events from the Fermi 3 RCOLA into the North Anna Unit 3 COLA. The staff reviewed this information and found the Fermi 3 COL standard content to be directly applicable to North Anna Unit 3. The staff provided a license condition with the same provisions as the comparable license condition for Fermi 3 that reflects the same mitigating strategies. This license condition requires the applicant to have developed an overall plan of mitigating strategies 180 days before the date scheduled for initial fuel load and to fully implement the strategies and guidance required in the license condition before fuel load.

The applicant addressed spent fuel pool instrumentation in the North Anna Unit 3 COLA. In subsequent RAI responses, Dominion described spent fuel pool level instrument design features that ensure reliable indication of the water level in the spent fuel pool and buffer pools. The staff reviewed the Dominion submittal on this topic and found that it is consistent with the Fermi 3 RCOLA final SER. Therefore, the North Anna Unit 3 supplemental information on reliable spent fuel pool level instrumentation is acceptable. A license condition was imposed which verifies that the programmatic aspects of the Fukushima-related reliable spent fuel pool instrumentation Order are completed and implemented prior to initial fuel loading.

The Fukushima accident highlighted the need to better determine the levels of plant and offsite staffing needed to respond to a multi-unit event. Additionally, there is a need to ensure that communication equipment has adequate power to coordinate the response to an event during an extended loss of AC power. The applicant proposed and the staff accepted a license condition related to communications and staffing for emergency planning actions identical to that imposed at Fermi 3. The proposed license condition ensures that communications and staffing will be adequate for emergency planning operations.

We concur that the applicant’s submittals and associated license conditions adequately address the applicable Fukushima Near-Term Task Force recommendations.

SUMMARY

There is reasonable assurance that North Anna Unit 3 can be built and operated without undue risk to the health and safety of the public. The North Anna Unit 3 COLA should be approved.

Sincerely,

/RA/

Dennis C. Bley
Chairman
