RE: Docket No. 72-1050; NRC-2016-0231 Waste Control Specialists LLC's Consolidated Interim Spent Fuel Storage Facility Project

March 8, 2017

Dear Cindy Bladey and NRC,

Our group has been working diligently inside and outside the community gathering letters from people that oppose the storing of high level radiation waste in Andrews County. Enclosed are letters about what should be included in the scoping of the Environmental Impact Statement for Waste Control Specialists' application.

We are having overwhelming success in acquiring signatures, and would easily have more signatures with more time. People here are very concerned.

We have been talking to many people, and they all express a great concern about how this could affect the future of their children and all future generations. Through our involvement and talking to the public, we have also found that many of the people do not speak English fluently and are ignorant of the facts, and thus an ignorant public can be taken advantage of very easily.

I would also like to bring to your attention that the meeting held in Andrews, TX on the 15<sup>th</sup> of February 2017 from 7PM to 10PM was held on a Wednesday night, precisely at the same time that most of the people attend their Church services, so consequently they were unwilling to skip Church to attend the meeting.

We are not convinced that WCS has an overwhelming monopoly on helping our community. There are plenty of other companies and businesses that employ people. The throwing of "crumbs" by WCS in the form of a few scholarships and donations to our community do not justify putting us in danger. The long term potential dangers, proportionally, by far, outweigh the benefits.

We suggest that WCS should stay "low level" and continue to be a part of our community. We suggest that you take this and the other letters included in this package under careful consideration before granting WCS the license to store

**SUNSI Review Complete** Template = ADM - 013 E-RIDS= ADM-03

Add= J. park (JRP) J. Quinterd (Jmm 9)

high level radiation waste in Andrews County.

We understand the need to find a place to store the dry casks in a safe, permanent secure place, but we also believe that the proposed "temporary" storage in Andrews County will eventually turn into a permanent nightmare. We suspect that once the casks arrive in Andrews County, the pressure to move the waste any further would be off and they will be here "forever".

On a moral note, if you will, we also think that our four commissioners and one Judge that signed the resolution, represent a very small percentage of the population and therefore, considering the circumstances, should not have the power to determine the future of our community, given the long life span of the waste materials and the unjust involvement of our future generations that do not have a voice in this matter.

Sincerely,

Numberto Acrie

RE: Docket No. 72-1050; NRC-2016-0231 Waste Control Specialists LLC's Consolidated Interim Spent Fuel Storage Facility Project

5.0

Feb. 2, 2017

Dear Cindy Bladey and NRC,

Waste Control Specialists' (WCS) application to import tons of spent fuel, high-level radioactive waste, from nuclear reactors around the country and store it in Andrews County for 40 years (or longer) should be halted in order to protect public health and safety, including the health and safety of my constituents.

The Environmental Impact Statement (EIS) for Waste Control Specialists' license application should include a designation of transportation routes and the array of potential impacts of accidents or terrorism incidents that could occur along those routes. If the license gets approved, deadly waste would be transported through our region for 24 years. Even one small accident would be one too many. Despite assurances that accident damage would be minimal, real life disasters have been known to exceed the worst anticipated scenarios.

A 2014 Texas Commission on Environmental Quality report warns of potential sabotage of radioactive waste shipments, saying that such an incident would most likely occur in a large city rather than a rural area. Terrorist actions involving radioactive waste in the San Antonio region would be an unimaginable nightmare.

The EIS should look closely into the risk of groundwater contamination at the site, especially since the entire TCEQ Radioactive Materials Division recommended denying a license for "low-level" radioactive waste at the Waste Control Specialists site due to the proximity of groundwater.

The EIS should consider potential impacts from accidents or radioactive waste related terrorist actions along transport routes and at the site, including impacts to people, land and water. In-depth research should examine radiation monitoring and cumulative impacts of multiple facilities near the WCS site, site security, engineering adequacy of the storage pad and seismic stresses, the adequacy of the crane that would move radioactive waste.

The report should include exactly how radioactive waste from a cracked and leaking canister would be handled, as it appears there would be no wet pool or hot cell at the WCS site. It appears that no one knows yet how to transfer waste from dry cask to dry cask. WCS should have to explain how this would be accomplished and not just say they'll figure it out when the problem arises. Please know that we don't consent to becoming a national radioactive waste dumping ground. We should not have to risk contamination of our land, aquifers or air or the health of plants, wildlife and livestock. Human exposure to high-level radioactive waste can lead to immediate death.

Homeowners' insurance doesn't cover radioactive contamination. A single rail car could haul waste containing as much plutonium as the bomb dropped on Nagasaki. We've had serious train accidents in our region. Two trains have collided head-on in West Texas last year at 65 mph. I understand that cask testing has been conducted for accidents up to 60 mph, but this scenario has already been exceeded. The EIS should address these risks.

The EIS should address the impacts of "interim storage" becoming dangerous permanent de facto disposal, and the waste might never be disposed of in a scientifically viable geologic repository using a reliable isolation system. With political pressure gone, the waste would likely never move again.

Above-ground casks would be exposed to the weathering effects of temperature extremes, and potential wildfires, tornadoes and earthquakes. The EIS should address these issues and answer the following questions: At what point could the waste go critical? What interactions of these circumstances and contact with other radioactive waste and hazardous materials at the WCS site could occur? What are the cumulative impacts of waste at this site and nearby sites on workers, local people and the environment, and how could natural disasters impact add to impacts?

Please host a hearing on the WCS application so that those of us who would be put at risk can address the NRC on this important issue. I would appreciate a written response.

Sincerely, Arture De Les Ries JR

The EIS should consider potential impacts from accidents or radioactive waste related terrorist actions along transport routes and at the site, including impacts to people, land and water. Indepth research should examine radiation monitoring and cumulative impacts of multiple facilities near the WCS site, site security, engineering adequacy of the storage pad and seismic stresses, the adequacy of the crane that would move radioactive waste.

The report should include exactly how radioactive waste from a cracked and leaking canister would be handled, as it appears there would be no wet pool or hot cell at the WCS site. It appears that no one knows yet how to transfer waste from dry cask to dry cask. WCS should have to explain how this would be accomplished and not just say they'll figure it out when the problem arises.

The EIS should address the impacts of "interim storage" becoming dangerous permanent de facto disposal, and the waste might never be disposed of in a scientifically viable geologic repository using a reliable isolation system. With political pressure gone, the waste would likely never move again.

Above-ground casks would be exposed to the weathering effects of temperature extremes, and potential wildfires, tornadoes and earthquakes. The EIS should address these issues and answer the following questions: At what point could the waste go critical? What interactions of these circumstances and contact with other radioactive waste and hazardous materials at the WCS site could occur? What are the cumulative impacts of waste at this site and nearby sites on workers, local people and the environment, and how could natural disasters impact add to impacts?

Please host a hearing on the WCS application so that those of us who would be put at risk can address the NRC on this important issue. I would appreciate a written response.

Sincerely, diamantina. LOPEZ.

RE: Docket No. 72-1050; NRC-2016-0231 - Waste Control Specialists LLC's Consolidated Interim Spent Fuel Storage Facility Project

\_\_\_\_\_, 2017

Dear Cindy Bladey and NRC,

Waste Control Specialists' (WCS) application to import tons of spent fuel, high-level radioactive waste, from nuclear reactors around the country and store it in Andrews County for 40 years (or longer) should be halted in order to protect public health and safety, including the health and safety of my constituents.

The Environmental Impact Statement (EIS) for Waste Control Specialists' license application should include a designation of transportation routes and the array of potential impacts of accidents or terrorism incidents that could occur along those routes. If the license gets approved, deadly waste would be transported through our region for 24 years. Even one small accident would be one too many. Despite assurances that accident damage would be minimal, real life disasters have been known to exceed the worst anticipated scenarios.

A 2014 Texas Commission on Environmental Quality report warns of potential sabotage of radioactive waste shipments, saying that such an incident would most likely occur in a large city rather than a rural area. Terrorist actions involving radioactive waste in the San Antonio region would be an unimaginable nightmare.

The EIS should look closely into the risk of groundwater contamination at the site, especially since the entire TCEQ Radioactive Materials Division recommended denying a license for "low-level" radioactive waste at the Waste Control Specialists site due to the proximity of groundwater.

The EIS should consider potential impacts from accidents or radioactive waste related terrorist actions along transport routes and at the site, including impacts to people, land and water. Indepth research should examine radiation monitoring and cumulative impacts of multiple facilities near the WCS site, site security, engineering adequacy of the storage pad and seismic stresses, the adequacy of the crane that would move radioactive waste.

The report should include exactly how radioactive waste from a cracked and leaking canister would be handled, as it appears there would be no wet pool or hot cell at the WCS site. It appears that no one knows yet how to transfer waste from dry cask to dry cask. WCS should have to explain how this would be accomplished and not just say they'll figure it out when the problem arises.

The EIS should address the impacts of "interim storage" becoming dangerous permanent de facto disposal, and the waste might never be disposed of in a scientifically viable geologic repository using a reliable isolation system. With political pressure gone, the waste would likely never move again.

It appears that no one knows yet how to transfer waste from dry cask to dry cask. WCS should have to explain how this would be accomplished and not just say they'll figure it out when the problem arises.

Please know that we don't consent to becoming a national radioactive waste dumping ground. We should not have to risk contamination of our land, aquifers or air or the health of plants, wildlife and livestock. Human exposure to high-level radioactive waste can lead to immediate death. Homeowners' insurance doesn't cover radioactive contamination. A single rail car could haul waste containing as much plutonium as the bomb dropped on Nagasaki. We've had serious train accidents in our region. Two trains have collided head-on in West Texas last year at 65 mph. I understand that cask testing has been conducted for accidents up to 60 mph, but this scenario has already been exceeded. The EIS should address these risks.

The EIS should address the impacts of "interim storage" becoming dangerous permanent de facto disposal, and the waste might never be disposed of in a scientifically viable geologic repository using a reliable isolation system. With political pressure gone, the waste would likely never move again.

Above-ground casks would be exposed to the weathering effects of temperature extremes, and potential wildfires, tornadoes and earthquakes. RE: Docket No. 72-1050; NRC-2016-0231 Waste Control Specialists LLC's Consolidated Interim Spent Fuel Storage Facility Project

Feb. \_\_\_, 2017

Dear Cindy Bladey and NRC,

Waste Control Specialists' (WCS) application to import tons of spent fuel, high-level radioactive waste, from nuclear reactors around the country and store it in Andrews County for 40 years (or longer) should be halted in order to protect public health and safety, including the health and safety of my constituents.

The Environmental Impact Statement (EIS) for Waste Control Specialists' license application should include a designation of transportation routes and the array of potential impacts of accidents or terrorism incidents that could occur along those routes. If the license gets approved, deadly waste would be transported through our region for 24 years. Even one small accident would be one too many. Despite assurances that accident damage would be minimal, real life disasters have been known to exceed the worst anticipated scenarios.

A 2014 Texas Commission on Environmental Quality report warns of potential sabotage of radioactive waste shipments, saying that such an incident would most likely occur in a large city rather than a rural area. Terrorist actions involving radioactive waste in the San Antonio region would be an unimaginable nightmare.

The EIS should look closely into the risk of groundwater contamination at the site, especially since the entire TCEQ Radioactive Materials Division recommended denying a license for "low-level" radioactive waste at the Waste Control Specialists site due to the proximity of groundwater.

The EIS should consider potential impacts from accidents or radioactive waste related terrorist actions along transport routes and at the site, including impacts to people, land and water. In-depth research should examine radiation monitoring and cumulative impacts of multiple facilities near the WCS site, site security, engineering adequacy of the storage pad and seismic stresses, the adequacy of the crane that would move radioactive waste.

Homeowners' insurance doesn't cover radioactive contamination. A single rail car could haul waste containing as much plutonium as the bomb dropped on Nagasaki. We've had serious train accidents in our region. Two trains have collided head-on in West Texas last year at 65 mph. I understand that cask testing has been conducted for accidents up to 60 mph, but this scenario has already been exceeded. The EIS should address these risks.

The EIS should address the impacts of "interim storage" becoming dangerous permanent de facto disposal, and the waste might never be disposed of in a scientifically viable geologic repository using a reliable isolation system. With political pressure gone, the waste would likely never move again.

Above-ground casks would be exposed to the weathering effects of temperature extremes, and potential wildfires, tornadoes and earthquakes. The EIS should address these issues and answer the following questions: At what point could the waste go critical? What interactions of these circumstances and contact with other radioactive waste and hazardous materials at the WCS site could occur? What are the cumulative impacts of waste at this site and nearby sites on workers, local people and the environment, and how could natural disasters impact add to impacts?

Please host a hearing on the WCS application so that those of us who would be put at risk can address the NRC on this important issue. I would appreciate a written response.

Sincerely,

NIW

RE: Docket No. 72-1050; NRC-2016-0231 - Waste Control Specialists LLC's Consolidated Interim Spent Fuel Storage Facility Project

\_\_\_\_\_.2017

Dear Cindy Bladey and NRC,

Waste Control Specialists' (WCS) application to import tons of spent fuel, high-level radioactive waste, from nuclear reactors around the country and store it in Andrews County for 40 years (or longer) should be halted in order to protect public health and safety, including the health and safety of my constituents.

The Environmental Impact Statement (EIS) for Waste Control Specialists' license application should include a designation of transportation routes and the array of potential impacts of accidents or terrorism incidents that could occur along those routes. If the license gets approved, deadly waste would be transported through our region for 24 years. Even one small accident would be one too many. Despite assurances that accident damage would be minimal, real life disasters have been known to exceed the worst anticipated scenarios.

A 2014 Texas Commission on Environmental Quality report warns of potential sabotage of radioactive waste shipments, saying that such an incident would most likely occur in a large city rather than a rural area. Terrorist actions involving radioactive waste in the San Antonio region would be an unimaginable nightmare.

The EIS should look closely into the risk of groundwater contamination at the site, especially since the entire TCEQ Radioactive Materials Division recommended denying a license for "low-level" radioactive waste at the Waste Control Specialists site due to the proximity of groundwater.

The EIS should consider potential impacts from accidents or radioactive waste related terrorist actions along transport routes and at the site, including impacts to people, land and water. Indepth research should examine radiation monitoring and cumulative impacts of multiple facilities near the WCS site, site security, engineering adequacy of the storage pad and seismic stresses, the adequacy of the crane that would move radioactive waste.

The report should include exactly how radioactive waste from a cracked and leaking canister would be handled, as it appears there would be no wet pool or hot cell at the WCS site. It appears that no one knows yet how to transfer waste from dry cask to dry cask. WCS should have to explain how this would be accomplished and not just say they'll figure it out when the problem arises.

Please know that we don't consent to becoming a national radioactive waste dumping ground. We should not have to risk contamination of our land, aquifers or air or the health of plants, wildlife and livestock. Human exposure to high-level radioactive waste can lead to immediate death. Homeowners' insurance doesn't cover radioactive contamination. A single rail car could haul waste containing as much plutonium as the bomb dropped on Nagasaki. We've had serious train accidents in our region. Two trains have collided head-on in West Texas last year at 65 mph. I understand that cask testing has been conducted for accidents up to 60 mph, but this scenario has already been exceeded. The EIS should address these risks.

The EIS should address the impacts of "interim storage" becoming dangerous permanent de facto disposal, and the waste might never be disposed of in a scientifically viable geologic repository using a reliable isolation system. With political pressure gone, the waste would likely never move again.

Above-ground casks would be exposed to the weathering effects of temperature extremes, and potential wildfires, tornadoes and earthquakes. The EIS should address these issues and answer the following questions: At what point could the waste go critical? What interactions of these circumstances and contact with other radioactive waste and hazardous materials at the WCS site could occur? What are the cumulative impacts of waste at this site and nearby sites on workers, local people and the environment, and how could natural disasters impact add to impacts?

Please host a hearing on the WCS application so that those of us who would be put at risk can address the NRC on this important issue. I would appreciate a written response.

A 2014 Texas Commission on Environmental Quality report warns of potential sabotage of radioactive waste shipments, saying that such an incident would most likely occur in a large city rather than a rural area. Terrorist actions involving radioactive waste in the San Antonio region would be an unimaginable nightmare.

The EIS should look closely into the risk of groundwater contamination at the site, especially since the entire TCEQ Radioactive Materials Division recommended denying a license for "low-level" radioactive waste at the Waste Control Specialists site due to the proximity of groundwater.

The EIS should consider potential impacts from accidents or radioactive waste related terrorist actions along transport routes and at the site, including impacts to people, land and water. In-depth research should examine radiation monitoring and cumulative impacts of multiple facilities near the WCS site, site security, engineering adequacy of the storage pad and seismic stresses, the adequacy of the crane that would move radioactive waste.

Homeowners' insurance doesn't cover radioactive contamination. A single rail car could haul waste containing as much plutonium as the bomb dropped on Nagasaki. We've had serious train accidents in our region. Two trains have collided head-on in West Texas last year at 65 mph. I understand that cask testing has been conducted for accidents up to 60 mph, but this scenario has already been exceeded. The EIS should address these risks.

The EIS should address the impacts of "interim storage" becoming dangerous permanent de facto disposal, and the waste might never be disposed of in a scientifically viable geologic repository using a reliable isolation system. With political pressure gone, the waste would likely never move again.

Above-ground casks would be exposed to the weathering effects of temperature extremes, and potential wildfires, tornadoes and earthquakes. The EIS should address these issues and answer the following questions: At what point could the waste go critical? What interactions of these circumstances and contact with other radioactive waste and hazardous materials at the WCS site could occur? What are the cumulative impacts of waste at this site and nearby sites on workers, local people and the environment, and how could natural disasters impact add to impacts?

Please host a hearing on the WCS application so that those of us who would be put at risk can address the NRC on this important issue. I would appreciate a written response.

RE: Docket No. 72-1050; NRC-2016-0231 Waste Control Specialists LLC's Consolidated Interim Spent Fuel Storage Facility Project

Feb. \_\_\_, 2017

Dear Cindy Bladey and NRC,

Waste Control Specialists' (WCS) application to import tons of spent fuel, high-level radioactive waste, from nuclear reactors around the country and store it in Andrews County for 40 years (or longer) should be halted in order to protect public health and safety, including the health and safety of my constituents.

The Environmental Impact Statement (EIS) for Waste Control Specialists' license application should include a designation of transportation routes and the array of potential impacts of accidents or terrorism incidents that could occur along those routes. If the license gets approved, deadly waste would be transported through our region for 24 years. Even one small accident would be one too many. Despite assurances that accident damage would be minimal, real life disasters have been known to exceed the worst anticipated scenarios.

A 2014 Texas Commission on Environmental Quality report warns of potential sabotage of radioactive waste shipments, saying that such an incident would most likely occur in a large city rather than a rural area. Terrorist actions involving radioactive waste in the San Antonio region would be an unimaginable nightmare.

The EIS should look closely into the risk of groundwater contamination at the site, especially since the entire TCEQ Radioactive Materials Division recommended denying a license for "low-level" radioactive waste at the Waste Control Specialists site due to the proximity of groundwater.

In-depth research should examine radiation monitoring and cumulative impacts of multiple facilities near the WCS site, site security, engineering adequacy of the storage pad and seismic stresses, the adequacy of the crane that would move radioactive waste.

The report should include exactly how radioactive waste from a cracked and leaking canister would be handled, as it appears there would be no wet pool or hot cell at the WCS site. It appears that no one knows yet how to transfer waste from dry cask to dry cask. WCS should have to explain how this would be accomplished and not just say they'll figure it out when the problem arises. Please know that we don't consent to becoming a national radioactive waste dumping ground. We should not have to risk contamination of our land, aquifers or air or the health of plants, wildlife and livestock. Human exposure to high-level radioactive waste can lead to immediate death.

The EIS should look closely into the risk of groundwater contamination at the site, especially since the entire TCEQ Radioactive Materials Division recommended denying a license for "low-level" radioactive waste at the Waste Control Specialists site due to the proximity of groundwater.

The EIS should consider potential impacts from accidents or radioactive waste related terrorist actions along transport routes and at the site, including impacts to people, land and water. Indepth research should examine radiation monitoring and cumulative impacts of multiple facilities near the WCS site, site security, engineering adequacy of the storage pad and seismic stresses, the adequacy of the crane that would move radioactive waste.

The report should include exactly how radioactive waste from a cracked and leaking canister would be handled, as it appears there would be no wet pool or hot cell at the WCS site. It appears that no one knows yet how to transfer waste from dry cask to dry cask. WCS should have to explain how this would be accomplished and not just say they'll figure it out when the problem arises.

The EIS should address the impacts of "interim storage" becoming dangerous permanent de facto disposal, and the waste might never be disposed of in a scientifically viable geologic repository using a reliable isolation system. With political pressure gone, the waste would likely never move again.

Above-ground casks would be exposed to the weathering effects of temperature extremes, and potential wildfires, tornadoes and earthquakes. The EIS should address these issues and answer the following questions: At what point could the waste go critical? What interactions of these circumstances and contact with other radioactive waste and hazardous materials at the WCS site could occur? What are the cumulative impacts of waste at this site and nearby sites on workers, local people and the environment, and how could natural disasters impact add to impacts?

Please host a hearing on the WCS application so that those of us who would be put at risk can address the NRC on this important issue. I would appreciate a written response.

ncerely, Elizabeth Mendozzi

RE: Docket No. 72-1050; NRC-2016-0231 - Waste Control Specialists LLC's Consolidated Interim Spent Fuel Storage Facility Project

teb 25 2017

Dear Cindy Bladey and NRC,

Waste Control Specialists' (WCS) application to import tons of spent fuel, high-level radioactive waste, from nuclear reactors around the country and store it in Andrews County for 40 years (or longer) should be halted in order to protect public health and safety, including the health and safety of my constituents.

The Environmental Impact Statement (EIS) for Waste Control Specialists' license application should include a designation of transportation routes and the array of potential impacts of accidents or terrorism incidents that could occur along those routes. If the license gets approved, deadly waste would be transported through our region for 24 years. Even one small accident would be one too many. Despite assurances that accident damage would be minimal, real life disasters have been known to exceed the worst anticipated scenarios.

A 2014 Texas Commission on Environmental Quality report warns of potential sabotage of radioactive waste shipments, saying that such an incident would most likely occur in a large city rather than a rural area. Terrorist actions involving radioactive waste in the San Antonio region would be an unimaginable nightmare.

The EIS should look closely into the risk of groundwater contamination at the site, especially since the entire TCEQ Radioactive Materials Division recommended denying a license for "low-level" radioactive waste at the Waste Control Specialists site due to the proximity of groundwater.

The EIS should consider potential impacts from accidents or radioactive waste related terrorist actions along transport routes and at the site, including impacts to people, land and water. Indepth research should examine radiation monitoring and cumulative impacts of multiple facilities near the WCS site, site security, engineering adequacy of the storage pad and seismic stresses, the adequacy of the crane that would move radioactive waste.

The report should include exactly how radioactive waste from a cracked and leaking canister would be handled, as it appears there would be no wet pool or hot cell at the WCS site. It appears that no one knows yet how to transfer waste from dry cask to dry cask. WCS should have to explain how this would be accomplished and not just say they'll figure it out when the problem arises.

The EIS should address the impacts of "interim storage" becoming dangerous permanent de facto disposal, and the waste might never be disposed of in a scientifically viable geologic repository using a reliable isolation system. With political pressure gone, the waste would likely never move again.

<sup>,</sup> <del>· Feb</del>. \_\_\_, 2017

Dear Cindy Bladey and NRC,

Waste Control Specialists' (WCS) application to import tons of spent fuel, high-level radioactive waste, from nuclear reactors around the country and store it in Andrews County for 40 years (or longer) should be halted in order to protect public health and safety, including the health and safety of my constituents.

The Environmental Impact Statement (EIS) for Waste Control Specialists' license application should include a designation of transportation routes and the array of potential impacts of accidents or terrorism incidents that could occur along those routes. If the license gets approved, deadly waste would be transported through our region for 24 years. Even one small accident would be one too many. Despite assurances that accident damage would be minimal, real life disasters have been known to exceed the worst anticipated scenarios.

A 2014 Texas Commission on Environmental Quality report warns of potential sabotage of radioactive waste shipments, saying that such an incident would most likely occur in a large city rather than a rural area. Terrorist actions involving radioactive waste in the San Antonio region would be an unimaginable nightmare.

The EIS should look closely into the risk of groundwater contamination at the site, especially since the entire TCEQ Radioactive Materials Division recommended denying a license for "low-level" radioactive waste at the Waste Control Specialists site due to the proximity of groundwater.

The EIS should consider potential impacts from accidents or radioactive waste related terrorist actions along transport routes and at the site, including impacts to people, land and water. In-depth research should examine radiation monitoring and cumulative impacts of multiple facilities near the WCS site, site security, engineering adequacy of the storage pad and seismic stresses, the adequacy of the crane that would move radioactive waste.

The report should include exactly how radioactive waste from a cracked and leaking canister would be handled, as it appears there would be no wet pool or hot cell at the WCS site. It appears that no one knows yet how to transfer waste from dry cask to dry cask. WCS should have to explain how this would be accomplished and not just say they'll figure it out when the problem arises.

Please know that we don't consent to becoming a national radioactive waste dumping ground. We should not have to risk contamination of our land, aquifers or air or the health of plants, wildlife and livestock. Human exposure to high-level radioactive waste can lead to immediate death.

Homeowners' insurance doesn't cover radioactive contamination. A single rail car could haul waste containing as much plutonium as the bomb dropped on Nagasaki. We've had serious train accidents in our region. Two trains have collided head-on in West Texas last year at 65 mph. I understand that cask testing has been conducted for accidents up to 60 mph, but this scenario has already been exceeded. The EIS should address these risks.

The EIS should address the impacts of "interim storage" becoming dangerous permanent de facto disposal, and the waste might never be disposed of in a scientifically viable geologic repository using a reliable isolation system. With political pressure gone, the waste would likely never move again.

Above-ground casks would be exposed to the weathering effects of temperature extremes, and potential wildfires, tornadoes and earthquakes. Waste Control Specialists' (WCS) application to import tons of spent fuel, high-level radioactive waste, from nuclear reactors around the country and store it in Andrews County for 40 years (or longer) should be halted in order to protect public health and safety, including the health and safety of my constituents.

The Environmental Impact Statement (EIS) for Waste Control Specialists' license application should include a designation of transportation routes and the array of potential impacts of accidents or terrorism incidents that could occur along those routes. If the license gets approved, deadly waste would be transported through our region for 24 years. Even one small accident would be one too many. Despite assurances that accident damage would be minimal, real life disasters have been known to exceed the worst anticipated scenarios.

A 2014 Texas Commission on Environmental Quality report warns of potential sabotage of radioactive waste shipments, saying that such an incident would most likely occur in a large city rather than a rural area. Terrorist actions involving radioactive waste in the San Antonio region would be an unimaginable nightmare.

The EIS should look closely into the risk of groundwater contamination at the site, especially since the entire TCEQ Radioactive Materials Division recommended denying a license for "low-level" radioactive waste at the Waste Control Specialists site due to the proximity of groundwater.

The EYS should consider potential impacts from accidents or radioactive waste related terrorist actions along transport routes and at the site, including impacts to people, land and water. Indepth research should examine radiation monitoring and cumulative impacts of multiple facilities hear the WCS site, site security, engineering adequacy of the storage pad and seismic stresses, the adequacy of the crane that would move radioactive waste.

The report should include exactly how radioactive waste from a cracked and leaking canister would be handled, as it appears there would be no wet pool or hot cell at the WCS site. It appears that no one knows yet how to transfer waste from dry cask to dry cask. WCS should have to explain how this would be accomplished and not just say they'll figure it out when the problem arises.

Please know that we don't consent to becoming a national radioactive waste dumping ground. We should not have to risk contamination of our land, aquifers or air or the health of plants, wildlife and livestock. Human exposure to high-level radioactive waste can lead to immediate death.

- 1 A

The EIS should address the impacts of "interim storage" becoming dangerous permanent de facto disposal, and the waste might never be disposed of in a scientifically viable geologic repository using a reliable isolation system. With political pressure gone, the waste would likely never move again.

Above-ground casks would be exposed to the weathering effects of temperature extremes, and potential wildfires, tornadoes and earthquakes. The EIS should address these issues and answer the following questions: At what point could the waste go critical? What interactions of these circumstances and contact with other radioactive waste and hazardous materials at the WCS site could occur? What are the cumulative impacts of waste at this site and nearby sites on workers, local people and the environment, and how could natural disasters impact add to impacts?

Please host a hearing on the WCS application so that those of us who would be put at risk can address the NRC on this important issue. I would appreciate a written response.

Sincerely,

The Environmental Impact Statement (EIS) for Waste Control Specialists' license application should include a designation of transportation routes and the array of potential impacts of accidents or terrorism incidents that could occur along those routes. If the license gets approved, deadly waste would be transported through our region for 24 years. Even one small accident would be one too many. Despite assurances that accident damage would be minimal, real life disasters have been known to exceed the worst anticipated scenarios.

A 2014 Texas Commission on Environmental Quality report warns of potential sabotage of radioactive waste shipments, saying that such an incident would most likely occur in a large city rather than a rural area. Terrorist actions involving radioactive waste in the San Antonio region would be an unimaginable nightmare.

The EIS should look closely into the risk of groundwater contamination at the site, especially since the entire TCEQ Radioactive Materials Division recommended denying a license for "low-level" radioactive waste at the Waste Control Specialists site due to the proximity of groundwater.

The EJS should consider potential impacts from accidents or radioactive waste related terrorist actions along transport routes and at the site, including impacts to people, land and water. In-depth research should examine radiation monitoring and cumulative impacts of multiple facilities near the WCS site, site security, engineering adequacy of the storage pad and seismic stresses, the adequacy of the crane that would move radioactive waste.

12.0

Homeowners' insurance doesn't cover radioactive contamination. A single rail car could haul waste containing as much plutonium as the bomb dropped on Nagasaki. We've had serious train accidents in our region. Two trains have collided head-on in West Texas last year at 65 mph. I understand that cask testing has been conducted for accidents up ' to 60 mph, but this scenario has already been exceeded. The EIS should address these risks.

The EIS should address the impacts of "interim storage" becoming dangerous permanent de facto disposal, and the waste might never be disposed of in a scientifically viable geologic repository using a reliable isolation system. With political pressure gone, the waste would likely never move again.

Above-ground casks would be exposed to the weathering effects of temperature extremes, and potential wildfires, tornadoes and earthquakes. The EIS should address these issues and answer the following questions: At what point could the waste go critical? What interactions of these circumstances and contact with other radioactive waste and hazardous materials at the WCS site could occur? What are the cumulative impacts of waste at this site and nearby sites on workers, local people and the environment, and how could natural disasters impact add to impacts?

Please host a hearing on the WCS application so that those of us who would be put at risk can address the NRC on this important issue. I would appreciate a written response.

\_\_\_\_\_, 2017

Dear Cindy Bladey and NRC,

Waste Control Specialists' (WCS) application to import tons of spent fuel, high-level radioactive waste, from nuclear reactors around the country and store it in Andrews County for 40 years (or longer) should be halted in order to protect public health and safety, including the health and safety of my constituents.

The Environmental Impact Statement (EIS) for Waste Control Specialists' license application should include a designation of transportation routes and the array of potential impacts of accidents or terrorism incidents that could occur along those routes. If the license gets approved, deadly waste would be transported through our region for 24 years. Even one small accident would be one too many. Despite assurances that accident damage would be minimal, real life disasters have been known to exceed the worst anticipated scenarios.

A 2014 Texas Commission on Environmental Quality report warns of potential sabotage of radioactive waste shipments, saying that such an incident would most likely occur in a large city rather than a rural area. Terrorist actions involving radioactive waste in the San Antonio region would be an unimaginable nightmare.

The EIS should look closely into the risk of groundwater contamination at the site, especially since the entire TCEQ Radioactive Materials Division recommended denying a license for "low-level" radioactive waste at the Waste Control Specialists site due to the proximity of groundwater.

The EIS should consider potential impacts from accidents or radioactive waste related terrorist actions along transport routes and at the site, including impacts to people, land and water. Indepth research should examine radiation monitoring and cumulative impacts of multiple facilities hear the WCS site, site security, engineering adequacy of the storage pad and seismic stresses, the adequacy of the crane that would move radioactive waste.

The report should include exactly how radioactive waste from a cracked and leaking canister would be handled, as it appears there would be no wet pool or hot cell at the WCS site. It appears that no one knows yet how to transfer waste from dry cask to dry cask. WCS should have to explain how this would be accomplished and not just say they'll figure it out when the problem arises.

Please know that we don't consent to becoming a national radioactive waste dumping ground. We should not have to risk contamination of our land, aquifers or air or the health of plants, wildlife and livestock. Human exposure to high-level radioactive waste can lead to immediate death. Homeowners' insurance doesn't cover radioactive contamination. A single rail car could haul waste containing as much plutonium as the bomb dropped on Nagasaki. We've had serious train accidents in our region. Two trains have collided head-on in West Texas last year at 65 mph. I understand that cask testing has been conducted for accidents up to 60 mph, but this scenario has already been exceeded. The EIS should address these risks.

The EIS should address the impacts of "interim storage" becoming dangerous permanent de facto disposal, and the waste might never be disposed of in a scientifically viable geologic repository using a reliable isolation system. With political pressure gone, the waste would likely never move again.

Above-ground casks would be exposed to the weathering effects of temperature extremes, and potential wildfires, tornadoes and earthquakes. The EIS should address these issues and answer the following questions: At what point could the waste go critical? What interactions of these circumstances and contact with other radioactive waste and hazardous materials at the WCS site could occur? What are the cumulative impacts of waste at this site and nearby sites on workers, local people and the environment, and how could natural disasters impact add to impacts?

Please host a hearing on the WCS application so that those of us who would be put at risk can address the NRC on this important issue. I would appreciate a written response.

Homeowners' insurance doesn't cover radioactive contamination. A single rail car could haul waste containing as much plutonium as the bomb dropped on Nagasaki. We've had serious train accidents in our region. Two trains have collided head-on in West Texas last year at 65 mph. I understand that cask testing has been conducted for accidents up to 60 mph, but this scenario has already been exceeded. The EIS should address these risks.

The EIS should address the impacts of "interim storage" becoming dangerous permanent de facto disposal, and the waste might never be disposed of in a scientifically viable geologic repository using a reliable isolation system. With political pressure gone, the waste would likely never move again.

Above-ground casks would be exposed to the weathering effects of temperature extremes, and potential wildfires, tornadoes and earthquakes. The EIS should address these issues and answer the following questions: At what point could the waste go critical? What interactions of these circumstances and contact with other radioactive waste and hazardous materials at the WCS site could occur? What are the cumulative impacts of waste at this site and nearby sites on workers, local people and the environment, and how could natural disasters impact add to impacts?

Please host a hearing on the WCS application so that those of us who would be put at risk can address the NRC on this important issue. I would appreciate a written response.

aura Sincerely Atholas. TX 79714 ഹാറ

RE: Docket No. 72-1050; NRC-2016-0231 Waste Control Specialists LLC's Consolidated Interim Spent Fuel Storage Facility Project

Feb. 2, 2017

Dear Cindy Bladey and NRC,

Waste Control Specialists' (WCS) application to import tons of spent fuel, high-level radioactive waste, from nuclear reactors around the country and store it in Andrews County for 40 years (or longer) should be halted in order to protect public health and safety, including the health and safety of my constituents.

The Environmental Impact Statement (EIS) for Waste Control Specialists' license application should include a designation of transportation routes and the array of potential impacts of accidents or terrorism incidents that could occur along those routes. If the license gets approved, deadly waste would be transported through our region for 24 years. Even one small accident would be one too many. Despite assurances that accident damage would be minimal, real life disasters have been known to exceed the worst anticipated scenarios.

A 2014 Texas Commission on Environmental Quality report warns of potential sabotage of radioactive waste shipments, saying that such an incident would most likely occur in a large city rather than a rural area. Terrorist actions involving radioactive waste in the San Antonio region would be an unimaginable nightmare.

The EIS should look closely into the risk of groundwater contamination at the site, especially since the entire TCEQ Radioactive Materials Division recommended denying a license for "low-level" radioactive waste at the Waste Control Specialists site due to the proximity of groundwater.

The EIS should consider potential impacts from accidents or radioactive waste related terrorist actions along transport routes and at the site, including impacts to people, land and water. In-depth research should examine radiation monitoring and cumulative impacts of multiple facilities near the WCS site, site security, engineering adequacy of the storage pad and seismic stresses, the adequacy of the crane that would move radioactive waste.

Homeowners' insurance doesn't cover radioactive contamination. A single rail car could haul waste containing as much plutonium as the bomb dropped on Nagasaki. We've had serious train accidents in our region. Two trains have collided head-on in West Texas last year at 65 mph. I understand that cask testing has been conducted for accidents up to 60 mph, but this scenario has already been exceeded. The EIS should address these risks.

RE: Docket No. 72-1050; NRC-2016-0231 - Waste Control Specialists LLC's Consolidated Interim Spent Fuel Storage Facility Project

2/2(11.7, 2017

Dear Cindy Bladey and NRC,

Waste Control Specialists' (WCS) application to import tons of spent fuel, high-level radioactive waste, from nuclear reactors around the country and store it in Andrews County for 40 years (or longer) should be halted in order to protect public health and safety, including the health and safety of my constituents.

The Environmental Impact Statement (EIS) for Waste Control Specialists' license application should include a designation of transportation routes and the array of potential impacts of accidents or terrorism incidents that could occur along those routes. If the license gets approved, deadly waste would be transported through our region for 24 years. Even one small accident would be one too many. Despite assurances that accident damage would be minimal, real life disasters have been known to exceed the worst anticipated scenarios.

A 2014 Texas Commission on Environmental Quality report warns of potential sabotage of radioactive waste shipments, saying that such an incident would most likely occur in a large city rather than a rural area. Terrorist actions involving radioactive waste in the San Antonio region would be an unimaginable nightmare.

The EIS should look closely into the risk of groundwater contamination at the site, especially since the entire TCEQ Radioactive Materials Division recommended denying a license for "low-level" radioactive waste at the Waste Control Specialists site due to the proximity of groundwater.

The EIS should consider potential impacts from accidents or radioactive waste related terrorist actions along transport routes and at the site, including impacts to people, land and water. Indepth research should examine radiation monitoring and cumulative impacts of multiple facilities near the WCS site, site security, engineering adequacy of the storage pad and seismic stresses, the adequacy of the crane that would move radioactive waste.

The report should include exactly how radioactive waste from a cracked and leaking canister would be handled, as it appears there would be no wet pool or hot cell at the WCS site. It appears that no one knows yet how to transfer waste from dry cask to dry cask. WCS should have to explain how this would be accomplished and not just say they'll figure it out when the problem arises.

Please know that we don't consent to becoming a national radioactive waste dumping ground. We should not have to risk contamination of our land, aquifers or air or the health of plants, wildlife and livestock. Human exposure to high-level radioactive waste can lead to immediate death. Homeowners' insurance doesn't cover radioactive contamination. A single rail car could haul waste containing as much plutonium as the bomb dropped on Nagasaki. We've had serious train accidents in our region. Two trains have collided head-on in West Texas last year at 65 mph. I understand that cask testing has been conducted for accidents up to 60 mph, but this scenario has already been exceeded. The EIS should address these risks.

The EIS should address the impacts of "interim storage" becoming dangerous permanent de facto disposal, and the waste might never be disposed of in a scientifically viable geologic repository using a reliable isolation system. With political pressure gone, the waste would likely never move again.

Above-ground casks would be exposed to the weathering effects of temperature extremes, and potential wildfires, tornadoes and earthquakes. The EIS should address these issues and answer the following questions: At what point could the waste go critical? We've had serious train accidents in our region. Two trains have collided head-on in West Texas last year at 65 mph. I understand that cask testing has been conducted for accidents up to 60 mph, but this scenario has already been exceeded. The EIS should address these risks.

The EIS should address the impacts of "interim storage" becoming dangerous permanent de facto disposal, and the waste might never be disposed of in a scientifically viable geologic repository using a reliable isolation system. With political pressure gone, the waste would likely never move again.

Above-ground casks would be exposed to the weathering effects of temperature extremes, and potential wildfires, tornadoes and earthquakes. The EIS should address these issues and answer the following questions: At what point could the waste go critical? What interactions of these circumstances and contact with other radioactive waste and hazardous materials at the WCS site could occur? What are the cumulative impacts of waste at this site and nearby sites on workers, local people and the environment, and how could natural disasters impact add to impacts?

Please host a hearing on the WCS application so that those of us who would be put at risk can address the NRC on this important issue. I would appreciate a written response.

Sincerely.

RE: Docket No. 72-1050; NRC-2016-0231 Waste Control Specialists LLC's Consolidated Interim Spent Fuel Storage Facility Project

Feb. <u>, 2017</u>

Dear Cindy Bladey and NRC,

Waste Control Specialists' (WCS) application to import tons of spent fuel, high-level radioactive waste, from nuclear reactors around the country and store it in Andrews County for 40 years (or longer) should be halted in order to protect public health and safety, including the health and safety of my constituents.

The Environmental Impact Statement (EIS) for Waste Control Specialists' license application should include a designation of transportation routes and the array of potential impacts of accidents or terrorism incidents that could occur along those routes. If the license gets approved, deadly waste would be transported through our region for 24 years. Even one small accident would be one too many. Despite assurances that accident damage would be minimal, real life disasters have been known to exceed the worst anticipated scenarios.

A 2014 Texas Commission on Environmental Quality report warns of potential sabotage of radioactive waste shipments, saying that such an incident would most likely occur in a large city rather than a rural area. Terrorist actions involving radioactive waste in the San Antonio region would be an unimaginable nightmare.

The EIS should look closely into the risk of groundwater contamination at the site, especially since the entire TCEQ Radioactive Materials Division recommended denying a license for "low-level" radioactive waste at the Waste Control Specialists site due to the proximity of groundwater.

The EIS should consider potential impacts from accidents or radioactive waste related terrorist actions along transport routes and at the site, including impacts to people, land and water. In-depth research should examine radiation monitoring and cumulative impacts of multiple facilities near the WCS site, site security, engineering adequacy of the storage pad and seismic stresses, the adequacy of the crane that would move radioactive waste.

Homeowners' insurance doesn't cover radioactive contamination. A single rail car could haul waste containing as much plutonium as the bomb dropped on Nagasaki. We've had serious train accidents in our region. Two trains have collided head-on in West Texas last year at 65 mph. I understand that cask testing has been conducted for accidents up to 60 mph, but this scenario has already been exceeded. The EIS should address these risks.

The EIS should address the impacts of "interim storage" becoming dangerous permanent de facto disposal, and the waste might never be disposed of in a scientifically viable geologic repository using a reliable isolation system. With political pressure gone, the waste would likely never move again.

Above-ground casks would be exposed to the weathering effects of temperature extremes, and potential wildfires, tornadoes and earthquakes. RE: Docket No. 72-1050; NRC-2016-0231 - Waste Control Specialists LLC's Consolidated Interim Spent Fuel Storage Facility Project

February 28, 2017

Dear Cindy Bladey and NRC,

Waste Control Specialists' (WCS) application to import tons of spent fuel, high-level radioactive waste, from nuclear reactors around the country and store it in Andrews County for 40 years (or longer) should be halted in order to protect public health and safety, including the health and safety of my constituents.

The Environmental Impact Statement (EIS) for Waste Control Specialists' license application should include a designation of transportation routes and the array of potential impacts of accidents or terrorism incidents that could occur along those routes. If the license gets approved, deadly waste would be transported through our region for 24 years. Even one small accident would be one too many. Despite assurances that accident damage would be minimal, real life disasters have been known to exceed the worst anticipated scenarios.

A 2014 Texas Commission on Environmental Quality report warns of potential sabotage of radioactive waste shipments, saying that such an incident would most likely occur in a large city rather than a rural area. Terrorist actions involving radioactive waste in the San Antonio region would be an unimaginable nightmare.

The EIS should look closely into the risk of groundwater contamination at the site, especially since the entire TCEQ Radioactive Materials Division recommended denying a license for "low-level" radioactive waste at the Waste Control Specialists site due to the proximity of groundwater.

The EIS should consider potential impacts from accidents or radioactive waste related terrorist actions along transport routes and at the site, including impacts to people, land and water. Indepth research should examine radiation monitoring and cumulative impacts of multiple facilities near the WCS site, site security, engineering adequacy of the storage pad and seismic stresses, the adequacy of the crane that would move radioactive waste.

The report should include exactly how radioactive waste from a cracked and leaking canister would be handled, as it appears there would be no wet pool or hot cell at the WCS site. It appears that no one knows yet how to transfer waste from dry cask to dry cask. WCS should have to explain how this would be accomplished and not just say they'll figure it out when the problem arises.

Please know that we don't consent to becoming a national radioactive waste dumping ground. We should not have to risk contamination of our land, aquifers or air or the health of plants, wildlife and livestock. Human exposure to high-level radioactive waste can lead to immediate death.

Homeowners' insurance doesn't cover radioactive contamination. A single rail car could haul waste containing as much plutonium as the bomb dropped on Nagasaki. We've had serious train accidents in our region. Two trains have collided head-on in West Texas last year at 65 mph. I understand that cask testing has been conducted for accidents up to 60 mph, but this scenario has already been exceeded. The EIS should address these risks.

The EIS should address the impacts of "interim storage" becoming dangerous permanent de facto disposal, and the waste might never be disposed of in a scientifically viable geologic repository using a reliable isolation system. With political pressure gone, the waste would likely never move again.

Above-ground casks would be exposed to the weathering effects of temperature extremes, and potential wildfires, tornadoes and earthquakes. The EIS should address these issues and answer the following questions: At what point could the waste go critical? What interactions of these circumstances and contact with other radioactive waste and hazardous materials at the WCS site could occur? What are the cumulative impacts of waste at this site and nearby sites on workers, local people and the environment, and how could natural disasters impact add to impacts?

Please host a hearing on the WCS application so that those of us who would be put at risk can address the NRC on this important issue. I would appreciate a written response.

A 2014 Texas Commission on Environmental Quality report warns of potential sabotage of radioactive waste shipments, saying that such an incident would most likely occur in a large city rather than a rural area. Terrorist actions involving radioactive waste in the San Antonio region would be an unimaginable nightmare.

The EIS should look closely into the risk of groundwater contamination at the site, especially since the entire TCEQ Radioactive Materials Division recommended denying a license for "low-level" radioactive waste at the Waste Control Specialists site due to the proximity of groundwater.

The EIS should consider potential impacts from accidents or radioactive waste related terrorist actions along transport routes and at the site, including impacts to people, land and water. In-depth research should examine radiation monitoring and cumulative impacts of multiple facilities near the WCS site, site security, engineering adequacy of the storage pad and seismic stresses, the adequacy of the crane that would move radioactive waste.

Homeowners' insurance doesn't cover radioactive contamination. A single rail car could haul waste containing as much plutonium as the bomb dropped on Nagasaki. We've had serious train accidents in our region. Two trains have collided head-on in West Texas last year at 65 mph. I understand that cask testing has been conducted for accidents up to 60 mph, but this scenario has already been exceeded. The EIS should address these risks.

The EIS should address the impacts of "interim storage" becoming dangerous permanent de facto disposal, and the waste might never be disposed of in a scientifically viable geologic repository using a reliable isolation system. With political pressure gone, the waste would likely never move again.

Above-ground casks would be exposed to the weathering effects of temperature extremes, and potential wildfires, tornadoes and earthquakes. The EIS should address these issues and answer the following questions: At what point could the waste go critical? What interactions of these circumstances and contact with other radioactive waste and hazardous materials at the WCS site could occur? What are the cumulative impacts of waste at this site and nearby sites on workers, local people and the environment, and how could natural disasters impact add to impacts?

Please host a hearing on the WCS application so that those of us who would be put at risk can address the NRC on this important issue. I would appreciate a written response.

Sincerely.

RE: Docket No. 72-1050; NRC-2016-0231 Waste Control Specialists LLC's Consolidated Interim Spent Fuel Storage Facility Project March - Feb. \_\_\_, 2017

-----

Dear Cindy Bladey and NRC,

Waste Control Specialists' (WCS) application to import tons of spent fuel, high-level radioactive waste, from nuclear reactors around the country and store it in Andrews County for 40 years (or longer) should be halted in order to protect public health and safety, including the health and safety of my constituents.

The Environmental Impact Statement (EIS) for Waste Control Specialists' license application should include a designation of transportation routes and the array of potential impacts of accidents or terrorism incidents that could occur along those routes. If the license gets approved, deadly waste would be transported through our region for 24 years. Even one small accident would be one too many. Despite assurances that accident damage would be minimal, real life disasters have been known to exceed the worst anticipated scenarios.

A 2014 Texas Commission on Environmental Quality report warns of potential sabotage of radioactive waste shipments, saying that such an incident would most likely occur in a large city rather than a rural area. Terrorist actions involving radioactive waste in the San Antonio region would be an unimaginable nightmare.

The EIS should look closely into the risk of groundwater contamination at the site, especially since the entire TCEQ Radioactive Materials Division recommended denying a license for "low-level" radioactive waste at the Waste Control Specialists site due to the proximity of groundwater.
