High level waste is best keep above ground encapsulated in glass. Leaks can be readily observed and prevented from entering ground water. Do not approve deep burial of high level waste. Also I remember reading that there was a suggestion to relaxed the criterion of low level waste. I do not approve of that. Significaant contamination of soil by waste can be prevented by keeping only low level was underground and not relaxing the definition to raise the level considered low. Let's keep the soil clean.
