Swift Fox Survey Protocol Marsland Expansion Area

Appendix O Swift Fox Survey Protocol

The following protocol is a modification of a swift fox protocol included in Mineral Exploration Permit Number NE0210824 (dated August 19, 2009) issued by the Department of Environmental Quality (NDEQ) to Crow Butte Resources, Inc (NDEQ 2009). This permit primarily addresses impacts associated with drilling of boreholes for purposes of mineral exploration. The primary modification of the Appendix 10 protocol is expanding the type of activities potentially impacting the swift fox to include, in addition to drilling of boreholes, uranium in situ satellite project development activities. Satellite "project development" includes construction of satellite facilities (process building and associated storage structures, evaporation ponds, wellfield development (surface preparation, monitor and injection/recovery wells, wellhouses, and trunklines/piping), well workover, boreholes outside of wellfields, and project roadways. Reference to "project development" in this protocol refers to these activities. Project development activities apply to initial construction/wellfield development, operations and decommissioning. Decommissioning includes decontaminating, dismantling, and removing satellite facilities and associated wellfield buildings/equipment/wells and, site reclamation and groundwater restoration.

Swift fox are typically found in topographically flat (slopes <20%) arid regions. In Nebraska, suitable habitat is in the short-grass prairie ecoregion where vegetation is less than 40 cm tall. They can be found in large expanses of prairie as well as prairie intermixed with agriculture. Dens are also found in anthropogenic areas such as near roads and trails, and in agricultural fields, culverts pipes and buildings (Tannerfeldt et al 2003). Swift fox are highly mobile and will use a variety of dens throughout the year. However, a female swift fox with young pups will typically be tied to one den until the pups are old enough to disperse from the den. Swift fox den entrances have a diameter of 17 to 23 cm.

Required Surveys:

CBR will avoid impacting the swift fox species by avoiding certain locations during specific times of the year. Surveys shall be conducted that are <u>consistent</u> with the Nebraska Game and Parks Commission (NG&PC) standard protocol included in CBR's Mineral Exploration Permit Number NE0210824 as Attachment 1.

The survey form to be used for swift fox surveys is attached to this protocol.

Project development activities will occur within a designated permit boundary. If project development activities within this permit boundary are such that specific protocol requirements (e.g., designated distances from swift fox dens) cannot be avoided as stated in this protocol, CBR will consult with the NDEQ and NG&PC as to the feasibility of

CROW BUTTE RESOURCES, INC.

alternate actions. No work will be conducted until any such issue has been resolved with the NDEQ and NG&PC.

Surveyors:

Surveys shall be conducted by a qualified individual who has experience working with the species or has been trained to identify swift fox burrows, dens and sign (scat, tracks, etc.).

Location:

Surveys shall be conducted at project development sites discussed above where suitable habitat is present within the range of the species.

Season:

Surveys shall be conducted year-around in areas of suitable habitat where project development activities are planned.

Timing:

Surveys shall be conducted within one week of initiating project development activities described above under Location.

Survey Technique:

The "denning season" is defined as the period of time when adult swift fox give birth and raise pups. In Nebraska, the swift fox denning season is from April 1 through August 31.

During the denning season, the area that must be surveyed for dens includes project development activities plus an additional 230 meters around the affected areas. When developing wellfields, numerous boreholes will initially be drilled. In this situation, the "affected area" will be the perimeter of the wellfield for the addition of 230 meters to the survey area, as opposed to each drill site. Under such conditions (i.e. work over multiple days or months), only one survey shall be submitted for that period indicating the duration of planned activities in the survey area. During other periods of time (e.g., operations), when individual boreholes are drilled at one time or a workover rig is used for well maintenance, then the additional 230 meters will be applied to the drill site. The above procedures will allow the operator the option of the most effective type of survey to use - wellfield boundary or individual drill site. The satellite facilities will be located within a 1.8-acre fenced-in site. The swift fox survey will be conducted prior to construction using an additional 230 meters around the fence boundary.

During the non-denning season (September 1 through March 31), the area that must be surveyed for dens includes the project development activities plus an additional 100 meters around the affected areas. When developing wellfields, numerous boreholes will initially be drilled. In this situation, the "affected area" will be the perimeter of the

CROW BUTTE RESOURCES, INC.

wellfield for the addition of 100 meters to the survey area, as opposed to each drill site. Under such conditions (i.e. work over multiple days or months), only one survey shall be submitted for that period indicating the duration of planned activities in the survey area. During other periods of time (e.g., operations), when individual boreholes are drilled at one time or a workover rig is used for well maintenance, then the additional 100 meters will be applied to the drill site. The above procedures will allow the operator the option of the most effective type of survey to use - wellfield boundary or individual drill site. The satellite facilities will be located within a 1.8-acre fenced-in site. The swift fox survey will be conducted using an additional 100 meters around the fence boundary.

The survey will consist of walking transects and searching for dens within the survey area. Transects will be no more that 50 meters apart in order to thoroughly cover the area.

An active den may have fresh digging at the entrance, although this is not always the case (Jackson and Choate 2000). Sign, such as scat or tracks, can also be indicate an active den. Swift fox tracks are approximately 2.54 cm wide and 3.8 cm long. Although this is the smallest canid species, tracks can be confused with other species, especially young coyotes. Inactive dens may be overgrown with vegetation, have spider webs over the entrance, or be caving in.

Conservative Measures:

If a potentially active swift fox den is identified, one of two conservation measures should be implemented:

- 1. The area of project development activities shall be done so activities are at least 230 meters from the den during the denning season, or 100 meters from the den during the non-denning season. For drilling sites, these can be moved to an appropriate distance from the den. A survey around any of these new activities must be conducted.
- 2. A track or scent station can be set up to determine if the den is being used by swift fox. If track or scent stations indicate swift fox are using the den, then project development activities within a minimum of 100 meters or 230 meters (whichever is appropriate for the season) of the den would be postponed until the den is abandoned. For drilling sites, they can be moved as outlined in #1 above. If track or scent stations indicate swift fox are not using the den, then drilling activities may proceed if there are not any other dens or swift fox within the survey area.

Track Station: Den use can be determined by clearing vegetation around the den and sifting a mixture of fine dry sand and unscented glycerin in a circular patter (~1 m in diameter) around the den hole, approximately 0.5 inches thick. Tracks of the animal using the den can then be identified the following morning as most animals using underground dens are nocturnal and will exit the den at night. Track stations are only

CROW BUTTE RESOURCES, INC.

Swift Fox Survey Protocol Marsland Expansion Area

good for one night. If the track station cannot be checked the following morning, a new sand and glycerin mixture should be applied to the area around the den hole and surveyed the next morning.

Scent Station: Swift fox scent station surveys can be conducted any time of the year, although tracks will not show on bare, frozen ground. However, snow can be used as a tracking medium in winter. Scent stations are created by clearing any vegetation in an area and sifting a mixture of fine dry sand and unscented glycerin in a circular patter (~1 m in diameter) approximately 0.5 inches thick. A plaster tablet soaked in cod/salmon oil mixture (or either) is placed in the center of the station. Scent stations are then placed at locations selected based on the suitability of the surrounding habitat and the presence of certain structures (fence rows, gates, intersections, trails, etc.) that facilitate movement. Weather permitting, they are reset for 3 consecutive days or until at least one station shows sign of swift fox visitation (tracks, feces). Scent stations should not be used within 300 meters of a known or suspected active den as these methods may attract predators.

Survey Reports

A monthly survey report shall be submitted to Nebraska Game and Parks Commission (NG&PC) and Nebraska Department of Environmental Quality (NDEQ) describing all surveys for the swift fox that were conducted during the previous month in connection with project development activities. The survey report shall include the names of the surveyors and their credentials, date and time of the survey, weather conditions, locations surveyed, methods, results, and a discussion of applicable conservation measures implemented. If the swift fox is not identified, the above information must be recorded and included in the report to be submitted at the end of the month. If a swift fox is identified within the survey area, NG&PC must be notified by telephone within twentyfour (24) hours of identification. Written documentation of identification and the survey report shall be submitted with five (5) days of species identification, along with indication of conservation measures. All survey reports shall be submitted no later than the 28th day of the month following the end of the reporting period, even if the species being surveyed are not detected at a particular site. Copies of the reports shall be kept on site for inspection by the NDEQ.

Crow Butte Resources Marsland Project Page 1 of 2

April 23, 2012

Rhonda Grantham Supervisor Radiation Safety & Regulatory Affairs/RSO 86 Crow Butte Rd Crawford, NE 69339

Subject: United States Nuclear Regulatory Commission (USNRC) Regulatory Guide 4.14 Lower Limits of Detection for the Marsland Baseline Samples.

Dear Rhonda:

As requested in conversation with David Blaida, Energy Laboratories, Inc. (ELI) Radiochemical Supervisor on April 20, 2012, the following is an explanation verifying the reported Minimum Detectable Concentrations/Lower Limits of Detection (MDC/LLD) values for the Marsland Baseline Project samples are in compliance with the USNRC regulatory guide 4.14, Section 5 "LLD" for the following requested analytes:

Analyte	MDC/LLD	MDC/LLD
Matrix	Water	Water
Radium 226	2E-10 uCi/ml	0.2 pCi/L
Thorium 230	2E-10 uCi/ml	0.2 pCi/L
Polonium 210	1E-9 uCi/ml	1.0 pCi/L
Lead 210	1E-9 uCi/ml	1.0 pCi/L
Uranium	2E-10 uCi/ml	0.2 pCi/L
Matrix	Soil/sediment (dry)	Soil/sediment (dry)
Radium 226	2E-7 uCi/g	0.2 pCi/g
Thorium 230	2E-7 uCi/g	0.2 pCi/g
Polonium 210	No guidance	No guidance
Lead 210	2E-7 uCi/g	0.2 pCi/g
Uranium	2E-7 uCi/g	0.2 pCi/g
Matrix	Vegetation, food & Fish (wet)	Vegetation, food & Fish (wet)
Radium 226	5E-8 uCi/kg	0.05 pCi/g
Thorium 230	2E-7 uCi/kg	0.2 pCi/g
Polonium 210	1E-6 uCi/kg	1.0 pCi/g
Lead 210	1E-6 uCi/kg	1.0 pCi/g
Uranium	2E-7 uCi/kg	0.2 pCi/g

ELI has met the criteria per the guidance suggested by the USNRC when reasonably achievable by available conventional laboratory methodology. If for some reason the MDC/LLD was not be met on the original analysis, the samples were recounted or re-analyzed until the 4.14 MDC/LLDs were achieved. If after

www.energylab.com Analytical Excellence Since 1952

Crow Butte Resources Marsland Project Page 2 of 2

reanalysis these criteria still could not be met, the laboratory report included a narrative explanation with respect to one or more of the following:

- 1. Matrix interferences
- 2. Matrix effects
- 3. Inadequate sample volumes
- 4. Radiochemical concentrations were reported above the MDC/LLD

In addition, some of the analytes were reported to two significant figures. Regulatory Guide, 4.14 lists the LLDs to only one significant figure, therefore, it is of ELI's opinion that these should be rounded to the nearest significant figure. For example, 1.3 pCi/L equals 1 pCi/L.

Also, as mutually agreed, the concept of MDC vs. LLD is effectively a "non-issue" in that each calculation is slightly different but clearly generates identical sets of results.

Hopefully this is an adequate explanation of the issues as it pertains to the Marsland Expansion Area. If you have any questions, please do not hesitate to contact Dave Blaida or me.
