Docket ID NRC-2015-0225

Open letter to the Nuclear Regulatory Commission:

I'm sure you have received many thousands of letters of this type and at this juncture you are probably no longer reading this as you anticipate nothing positive.

Who writes the NRC with a positive letter? One out of 300 people?

What amazes me is that you still hold " Lessons Learned " meetings after each disaster ! Haven't you learned your lesson yet?

And you have the nerve to ask for commentary on modular reactors?!?

No ! We don't want any new nuclear anything !!!

Look at the waste. The spent fuel in the dry casks will outlast the dry casks and those spent fuel rods will still be "hot" generations from now. I still can't believe that nuclear reactors were built with no idea how to take them apart. Case in point: A new kind of robot had to be invented to saw apart reactor parts because they were too hot for humans to approach when they dismantled Yankee Rowe.

This is a sad industry with a sad heritage for future generations.

And look at the market! Shares in nuclear generating companies are tanking while costs for decommissioning are skyrocketing.

A nuclear accident has taken down one of America's oldest companies: Westinghouse which was started in 1886. The Japanese company that bought it went broke because of the financial responsibilities caused by Fukushima pulling Westinghouse down into bankruptcy. Ironically, Westinghouse is a nuclear reactor designer.

It is all about money. When Regan got elected government funding for renewables like the Solar Research Institute in Golden, Colorado were pulled. Regan was elected with the help of nuclear Industry money.

That money keeps people like you working to pay your mortgage, car payments, your kids education, and probably your condo in Aspen. So what do you care about another nuclear accident?
On with the madness!

Sincerely,

P. Van der Does
