

Westinghouse Lessons Learned Action Plan Items
June 13, 2017

On October 28, 2016, the NRC issued a charter to evaluate lessons learned from recent experiences with significant uranium accumulations in scrubber and ventilation systems at the Westinghouse Columbia Fuel Fabrication Facility (Westinghouse) (Agencywide Document and Management System (ADAMS) Accession Number ML16285A018). The charter directed the staff to seek and incorporate input from stakeholders on the following topics:

- License review process
- Inspection program
- Operating experience program
- Roles and responsibilities of the Division of Fuel Facility Inspection (DFFI) and the Division of Fuel Cycle Safety, Safeguards, and Environmental Review (FCSE)
- Knowledge management

On January 30, 2017, the staff issued a publicly available report on the lessons-learned from the Westinghouse event (ADAMS Accession Number ML16330A642). In the report, the staff identified recommendations for further evaluation within the topics listed above. The report focused on recommendations directly associated with the causes of the event. The recommendations were prioritized as high, medium, and low and an action plan was developed.

The attachment provides an overview of the actions to address the recommendations. At this time, the staff has begun work only on the high priority recommendations.
