Attention: Document Control Desk

Subject: Dresden Nuclear Power Station Units 2 and 3 Supplemental
Response to NRC Bulletin 93-03, "Resolution of Issues
Related to Reactor Vessel Water Level Instrumentation in
BWRs."
NRC Docket Numbers 50-237 and 50-249

Reference: (a) L. DelGeorge letter to T. Murley, dated July 30, 1993
(b) J. Schrage letter to W. Russell, dated March 11, 1994

This letter provides the completion report for NRC Bulletin 93-03 for Dresden Units 2 and 3. The short term compensatory actions requested by the bulletin were reported complete by reference (a) and subsequently confirmed closed in an NRC inspection conducted May 6 through June 18, 1993 (NRC Inspection Report 237/93017, and 249/93017).

In response to the bulletin, hardware modifications have been installed at Dresden Station to ensure the Reactor Vessel Water Level Instrument systems (RVWLIS) are of high functional reliability for anticipated operational occurrences, and for accident scenarios as discussed in the Bulletin. Modifications on Unit 2 and Unit 3 were completed and operation authorized on May 24, 1995. These modifications provide degassed Control Rod Drive water to the RVWLIS reference leg piping and were described in detail in reference (b).

The Bulletin 93-03 required response was for these actions to be reported within 30 days of completion. Due to administrative error, this requirement was not met. Commonwealth Edison apologizes for any inconvenience this may have caused. Appropriate corrective actions will be implemented to minimize the possibility of similar future problems.
