| 3.6 LIMITING CONDITION FOR OPERATION   | 4.6 SURVEILLANCE REQUIREMENTS  |
|--|--|
| I. Snubbers (Shock Suppressors)  | I. Snubbers (Shock Suppressors)  |
| <ol> <li>During all modes of operation except cold shut-<br/>down and refuel, all safety-related snubbers<br/>listed in Table 3.6.1 shall be operable except<br/>as noted in Specification 3.6.I.2 through<br/>3.6.I.4.</li> </ol>           | The following surveillance requirements apply to<br>safety-related snubbers listed in Table 3.6.1.<br>1. Visual Inspection<br>An independent visual inspection shall be performed  |
| <ol> <li>From and after the time a snubber is determined<br/>to be inoperable, continued reactor operation<br/>is permissible only during the succeeding 72<br/>hours unless the snubber is sooner made<br/>operable or replaced.</li> </ol> | on the safety-related hydraulic and mechanical<br>snubbers contained in Table 3.6.1 in accordance with<br>the schedule below:<br>a. All hydraulic snubbers whose seal material has   |
| <ol> <li>If the requirements of 3.6.I.l and 3.6.I.2<br/>cannot be met, an orderly shutdown shall be<br/>initiated and the reactor shall be in cold<br/>shutdown or refuel condition within 36 hours.</li> </ol>                              | been demonstrated by operating experience, lab<br>testing or analysis to be compatible with the<br>operating environment shall be visually<br>inspected. This inspection shall include, but<br>not necessarily be limited to, inspection of the<br>hydraulic fluid reservoir, fluid connections, |
| <ul> <li>4. If a snubber is determined to be inoperable<br/>while the reactor is in the cold shutdown or<br/>refuel mode, the snubber shall be made operable<br/>or replaced prior to refuel startup.</li> </ul>                             | and linkage connection to the piping and anchor<br>to verify snubber operability.<br>b. All mechanical snubbers shall be visually  |
| 5. Snubbers may be added to safety-related systems<br>without prior license amendment to Table 3.6.1<br>provided that a revision to Table 3.6.1 is<br>included with the next license amendment<br>request.                                   | inspected. This inspection shall consist of,<br>but not necessarily be limited to, inspection of<br>the snubber and attachments to the piping and<br>anchor for indications of damage or impaired<br>operability.  |

more than one step at a time.

Snubbers may be categorized in two groups, "accessible" or "inaccessible," based on their accessibility for inspection during reactor operation. These two groups may be inspected independently according to the above schedule.

- 2. Functional Testing
  - a. Once each refueling cycle, a representative sample of approximately 10% of the hydraulic snubbers contained in Table 3.6.1 shall be functionally tested for operability, including:
    - (i) Activation (restraining action) is achieved within the specified range of velocity

in both tension and compression.

(ii) Snubber bleed, or release rate, where required is within the specified range in compression or tension.

For each unit and subsequent unit found inoperable, an additional 10% of the hydraulic snubbers shall be tested until no more failures are found or all units have been tested.

- b. Once each refueling cycle, a representative sample of approximately 10% of the mechanical snubbers contained in Table 3.6.1 shall be functionally tested for operability. The test shall consist of two parts:
- (i) Verification that the force that initiates free movement of the snubber in either tension or compression is less than the specified maximum breakaway friction force.
- (ii) Verify that the activation (restraining action) is achieved within the specified range of acceleration or velocity, as applicable based on snubber design in both tension and compression.

Amendment No.

91e-4

and the second second

The inspection frequency is based upon maintaining a constant level of snubber protection. Thus, the required inspection interval varies inversely with the observed snubber failures. The number of inoperable snubbers found during a required inspection determines the time interval for the next required inspection. Inspections performed before that interval has elapsed may be used as a new reference point to determine the next inspection. However, the results of such early inspections performed before the original require time interval has elapsed (nominal time less 25%) may not be used to lengthen the required inspection interval. Any inspection whose results require a shorter inspection interval will override the previous schedule.

To further increase the assurance of snubber reliability, functional tests will be performed once each refueling cycle. A representative sample of 10% of the safety-related snubbers will be functionally tested. Observed failures on these samples will require testing of additional unit.

Hydraulic snubbers and mechanical snubbers may each be treated as different entities for the above surveillance programs.

Hydraulic snubber testing will include stroking of the snubbers to verify piston movement, lock-up, and bleed. Functional testing of the mechanical snubbers will consist of verification that the force that initiates free movement of the snubber in either tension or compression is less than the maximum breakaway friction force and verification that the activation (restraining action) is achieved within the specified range of acceleration or velocity, as applicable based on snubber design, in both tension and compression. When the cause of rejection of the snubber is clearly established and remedied for that snubber and for any other snubbers that may be generically susceptible, and verified by inservice functional testing, that snubber may be exempted from being counted as inoperable. Generically susceptible snubbers are those which are of a specific make or model and have the same design features directly related to rejection of the snubber by visual inspection or are similarly located or exposed to the same environmental conditions such as temperature, radiation, and vibration.

Monitoring of snubber service life shall consist of the existing station record systems, including the central filing system, maintenance files, safety-related work packages, and snubber inspection records. The record retention programs employed at the station shall allow station personnel to maintain snubber integrity. The service life for hydraulic snubbers is 10 years. The hydraulic snubbers existing locations do not impose undue safety implications on the piping and components because they are not exposed to excesses in environmental conditions. The service life for mechanical snubbers is 40 years. lifetime of the plant. The mechanical snubbers are installed in areas of harsh environmental conditions because of their dependability over hydraulic snubbers in these areas. All snubber installations have been thoroughly engineered providing the necessary safety requirements. Evaluations of all snubber locations and environmental conditions justify the above conservative snubber service lives.

Amendment No. 70, 76

| 3.6 LIMITING CONDITION FOR OPERATION   | 4.6 SURVEILLANCE REQUIREMENTS   |
| 1. Snubbers (Shock Suppressors)  | I. Snubbers (Shock Suppressors)   |
| <ol> <li>During all modes of operation except cold shut-<br/>down and refuel, all safety-related snubbers<br/>listed in Table 3.6.1 shall be operable except<br/>as noted in Specification 3.6.I.2 through<br/>3.6.I.4.</li> </ol> | The following surveillance requirements apply to<br>safety-related snubbers listed in Table 3.6.1.<br>1. Visual Inspection<br>An independent visual inspection shall be performed   |
| <ol> <li>From and after the time a snubber is determined<br/>to be inoperable, continued reactor operation<br/>is permissible only during the succeeding 72<br/>hours unless the snubber is sooner made</li> </ol>                 | on the safety-related hydraulic and mechanical<br>snubbers contained in Table 3.6.1 in accordance witten<br>the schedule below:   |
| operable or replaced.<br>3. If the requirements of 3.6.1.1 and 3.6.1.2<br>cannot be met, an orderly shutdown shall be<br>initiated and the reactor shall be in cold<br>shutdown or refuel condition within 36 hours.               | a. All hydraulic snubbers whose seal material has<br>been demonstrated by operating experience, lab<br>testing or analysis to be compatible with the<br>operating environment shall be visually<br>inspected. This inspection shall include, but<br>not necessarily be limited to, inspection of the<br>hydraulic fluid reservoir, fluid connections, |
| <ol> <li>If a snubber is determined to be inoperable<br/>while the reactor is in the cold shutdown or<br/>refuel mode, the snubber shall be made operable<br/>or replaced prior to refuel startup.</li> </ol>                      | and linkage connection to the piping and anchor<br>to verify snubber operability.<br>b. All mechanical snubbers shall be visually   |
| 5. Snubbers may be added to safety-related systems<br>without prior license amendment to Table 3.6.1<br>provided that a revision to Table 3.6.1 is<br>included with the next license amendment<br>request.                         | inspected. This inspection shall consist of,<br>but not necessarily be limited to, inspection of<br>the snubber and attachments to the piping and<br>anchor for indications of damage or impaired<br>operability.   |
|  | No. of Snubbers Found<br>Inoperable During Next Required<br>Inspection Interval Inspection Interval   |
| Unit 3 Amendment Nos.41,62,67  | $\begin{array}{cccccccccccccccccccccccccccccccccccc$  |

• •

<u>9</u>1b

1.6 JUMITING CONDITION FOR OPERATION

ie required inspection interval shall not be lenginened more than one step at a time.

Snubbers may be categorized in two groups, "accessible" or "inaccessible," based on their accessibility for inspection during reactor operation. These two groups may be inspected independently according to the above schedule.

2. Functional Testing

a. Once each refueling cycle, a representative sample of approximately 10% of the hydraulic snubbers contained in Table 3.6.1 shall be functionally tested for operability, including:

(i) Activation (restraining action) is achieved within the specified range of velocity in both tension and compression.

(ii) Snubber bleed, or release rate, where require is within the specified range in compression or tension.

For each unit and subsequent unit found inoperable, an additional 10% of the hydraulic snubbers shall be tested until no more failures are found or all units have been tested.

- b. Once each refueling cycle, a representative sample of approximately 10% of the mechanical snubbers contained in Table 3.6.1 shall be functionally tested for operability. The test shall consist of two parts:
- (i) Verification that the force that initiates free movement of the snubber in either tension or compression is less than the specified maximum breakaway friction force.
- (ii) Verify that the activation (restraining action) is achieved within the specified range of acceleration or velocity, as applicable based on snubber design in both tension and compression.

The inspection frequency is based upon maintaining a constant level of snubber protection. Thus, the required inspection interval varies inversely with the observed snubber failures. The number of inoperable snubbers found during a required inspection determines the time interval for the next required inspection. Inspections performed before that interval has elapsed may be used as a new reference point to determine the next inspection. However, the results of such early inspections performed before the original require time interval has elapsed (nominal time less 25%) may not be used to lengthen the required inspection interval. Any inspection whose results require a shorter inspection interval will override the previous schedule.

To further increase the assurance of snubber reliability, functional tests will be performed once each refueling cycle. A representative sample of 10% of the safety-related snubbers will be functionally tested. Observed failures on these samples will require testing of additional unit.

Hydraulic snubbers and mechanical snubbers may each be treated as different entities for the above surveillance programs.

Hydraulic snubber testing will include stroking of the snubbers to verify piston movement, lock-up, and bleed. Functional testing of the mechanical snubbers will consist of verification that the force that initiates free movement of the snubber in either tension or compression is less than the maximum breakaway friction force and verification that the activation (restraining action) is achieved within the specified range of acceleration or velocity, as applicable based on snubber design, in both tension and compression. When the cause of rejection of the snubber is clearly established and remedied for that snubber and for any other snubbers that may be generically susceptible, and verified by inservice functional testing, that snubber may be exempted from being counted as inoperable. Generically susceptible snubbers are those which are of a specific make or model and have the same design features directly related to rejection of the snubber by visual inspection or are similarly located or exposed to the same environmental conditions such as temperature, radiation, and vibration.

Monitoring of snubber service life shall consist of the existing station record systems, including the central filing system, maintenance files, safety-related work packages, and snubber inspection records. The record retention programs employed at the station shall allow station personnel to maintain snubber integrity. The service life for hydraulic snubbers is 10 years. The hydraulic snubbers existing locations do not impose undue safety implications on the piping and components because they are not exposed to excesses in environmental conditions. The service life for mechanical snubbers is 40 years, lifetime of the plant. The mechanical snubbers are installed in areas of harsh environmental conditions because of their dependability over hydraulic snubbers in these areas. All snubber installations have been thoroughly engineered providing the necessary safety requirements. Evaluations of all snubber locations and environmental conditions justify the above conservative snubber service lives.

Unit 3 Amendment Nos. 22, 52, 51

#### ATTACHMENT C

#### Evaluation of Significant Hazards Consideration

#### Description of Amendment Request

This proposed amendment request adds and deletes snubbers from the table of snubbers that require a routine surveillance. Also clarification was added that allows a testing mode for mechanical snubbers not currently in the Technical Specifications and removes reference to out-of-date LCOs concerning the Torus Ring Header Snubbers.

#### Basis for Proposed No Significant Hazards Consideration Determination

The Commission has provided guidance concering application of No Significant Hazards Consideration by citing examples (48 FR 14871). One such example, (ii), relates to a change that constitutes an additional limitation, restriction or control not presently including in the technical specification. Clearly the addition of snubbers to the Technical Specification, subjecting these snubbers to those surveillance requirements, falls within the domain of the example as does the inclusion of velocity testing for certain types of mechanical snubbers. Deletion of snubbers does not clearly fall with many of the examples, cited by the Commission, except perhaps example (vi). However all deletions were based on analysis which demonstrated that the piping stress remained within allowable design limits and removal of these snubbers does not enroach upon margins provided by the design cycles.

Therefore, since the application for amendment involves a proposed change that is similar to an examples for which no significant hazards consideration exists; or where no specific example is available the change does not increase the probability or consequences of an accident previously evaluated; does not create the possibility of a new or different kind of accident from any previously evaluated; or does not involve a significant reduction in a margin of safety, Commonwealth Edison has made a proposed determination that the application involves no significant hazards consideration.
