

**FRWG**  
Fast Reactor Working Group

**NRC Standards Forum**

**September 26, 2017**

# Fast Reactor Working Group

- **Multiple developers working on multiple technologies**
  - 9 developers, 10 designs
- **Spans a variety of fast reactor technologies in development:**
  - Sodium, lead, salt, and gas coolants using metal, oxide, carbide, nitride, and salt fuels

<b>ARC</b>	<b>Westinghouse</b>	<b>Southern</b>
<b>GE</b>	<b>Columbia Basin</b>	<b>Exelon</b>
<b>TerraPower</b>	<b>Hydromine</b>	<b>Duke</b>
<b>Oklo</b>	<b>Elysium Industries</b>	<b>EPRI</b>
	<b>General Atomics</b>	

# Industry Engagement

- ⦿ Fast reactors offer a near limitless source of clean and affordable energy, which have attracted the participation of a diverse group of technology developers and other stakeholders
- ⦿ The FRWG works with developers and fast reactor stakeholders to further the state-of-the-art
  - > Technology development
  - > Regulatory
  - > International collaboration

# High Level Perspectives

- ⦿ Diverse technologies spanning a spectrum of technical readiness with varying needs
- ⦿ General consensus that standards need to be modernized as the industry grows, but are generally adequate to support initial deployment strategies
  - > Concerns about certain technology-specific gaps
  - > Concerns about standards development timeframes and delays

# High Level Perspectives

- ⦿ Standards are most effective when there are multiple industry stakeholders with significant technology maturity and overlap, who have a sophisticated understanding of what is needed in particular areas
- ⦿ Must consider industry needs in light of industry maturity
- ⦿ Standard modernization will become increasingly useful as the advanced reactor industry grows

# Paradigm Shifts from LWRs

	LWRs (PWR & BWR)	Non-LWRs
<b>Fuel</b>	UO <sub>2</sub>	Metals, oxides, carbides, nitrides, salts
<b>Cladding</b>	Zirconium alloys	Steels, ceramics, no cladding
<b>Coolant</b>	Water	Sodium, lead, other liquid metals, gas, salts
<b>Moderator</b>	Water	Graphite, hydrides, no moderator
<b>Spectrum</b>	Thermal	Fast, epithermal, thermal
<b>Temperature</b>	280°C to 320°C	300°C to >850°C
<b>Fuel cycle</b>	1 to 2 years	Up to 60 years, possibly more

# Standards of Interest

- ◎ NQA-1
  - > Useful to advanced reactor work currently
  - > Continue to modernize as appropriate and as needed

# Standards of Interest

- ◎ Materials
  - > Structural alloys, cladding materials, and coating materials for the temperature ranges and fluences of interest
    - BPV code for GFR
  - > Concrete considerations at high temperature and fluence
- ◎ I&C
  - > Spectral, material, temperature, and lifetime considerations
- ◎ Fuel and material handling variations

# Standards of Interest

- ◎ Decay heat
  - > Different from LWR standard due to fast spectrum, fuel management, and fuel configuration variations
- ◎ Risk-informed design and risk analysis
  - > Important to consider implications of inherent safety characteristics
- ◎ General reactor design standards
- ◎ Varying considerations for fire protection, operations, offsite/backup power, and seismic standards

# Standards Gaps

- ⦿ Standards gap analysis efforts for sodium fast reactors provides initial insights into future standards needs
- ⦿ This work benefits other technologies
  - > Similar investigations may be desired, but results must be kept in context to technology and industry maturity
