- 20% of the cold leg TTS from 6 inches above to 3 inches below the TTS (SG C)

NOTE 1 - For those tube locations where the expansion transition is located deeper into the tubesheet, the inspection distance into the tubesheet was adjusted to 5 inches below the top of the tubesheet to ensure adequate inspection coverage of the F* distance.

Primary Side Visual Examinations

- Westinghouse Plug-in-Plug (PIP) - There are 9 hot leg and 9 cold leg tube locations (SG A - 4; SG B - 2; SG C - 3) which contain Alloy 600 plugs repaired with the Westinghouse PIP technique. These locations are visually examined each outage to assess the condition of the tack weld which holds the PIP in place. No degradation was observed in any of the tube plugs. All tube plugs were accounted for and all were verified to be in their proper location. No sign of cracking was reported in any of the eighteen PIP tack welds.
- Westinghouse Nuclear Safety Advisory Letter (NSAL) 12-1 - A remote visual inspection of the area around the channelhead drain line was performed in each hot and cold leg channelhead to meet the requirements of Westinghouse NSAL 12-1, "Steam Generator Channel Head Degradation". Included in this examination was (a) the divider plate to stub runner weld, (b) the tubesheet to stub runner weld, (c) the divider plate to channelhead weld and (d) channelhead to tubesheet weld. This inspection looked for evidence of gross defects such as indications in welds, missing weld filler material, a breach in the weld metal, and unusual discoloration of the weld metal and/or cladding imperfections. All inspections were determined to be acceptable. No sign of cladding breach, cracking, missing filler metal or discoloration was observed.
- Tube Plugs - 100% of the tube plugs are visually examined (as-found & as-left condition) each time the primary side is opened to document the condition of the hot and cold leg channelheads. This process also includes tube plug accountability. During 2R19, as well as in all prior outages, the examinations verified that the correct number of tube plugs were present and in the proper tube locations. All plugs were determined to be acceptable.

Secondary Side Visual Examinations:

- Foreign Object Search and Retrieval (FOSAR) - A visual inspection of the secondary side tubesheet face, annulus and tube lane was performed during 2R19 in all three steam generators. Three objects were identified (i.e. sludge rocks) for retrieval. One of the three sludge rocks was removed. The two sludge rocks that were not removed broke up during the retrieval effort. Sludge rocks are not considered foreign material as they are indigenous to the operation of the component.
- Possible Loose Part Indications - For those tube locations where possible loose part indications were reported during the 2R19 eddy current examinations and no visual inspection was performed at those particular tube locations, the Plus Point probe was used to verify that no degradation or tube wall wear was present. These tubes remained in service.

Unit 2 - 2R19 Steam Generator 180 Day Report

- SG A Steam Drum - A visual inspection of the SG A steam drum region was performed during 2R19 to assess the general conditions. In addition, ultrasonic (UT) thickness measurements were conducted on the feedwater header patch plate installed at 2R13. No adverse conditions were noted from any of these inspections. UT thickness measurements of select locations (e.g. high velocity flow areas) of the feedwater header and J-tubes did not indicate any regions of flow accelerated corrosion.

TS 5.6.6.2.1.b

Degradation mechanisms found:

The following degradation mechanisms were reported during 2R19:

- Axial ODSCC at non-dented TSP intersections
- Axial ODSCC in the hot leg sludge pile freespan regions and expansion transition regions
- Circumferential ODSCC at the hot leg TTS expansion transitions
- Axial PWSCC at the hot leg TTS expansion transitions

- Foreign object induced wear

TS 5.6.6.2.1.c

Nondestructive examination techniques utilized for each degradation mechanism:

- For the degradation mechanisms observed during 2R19, bobbin coil probes were used as the primary method of detection except at or below TTS and in Row 1 and 2 U-bends where bobbin probes are not qualified. In these areas, Plus Point probes were employed. Plus Point probes were also used to re-examine any ambiguous bobbin coil signals that were reported.
- The 2R19 examination techniques were qualified, for detection and sizing (as applicable) of the existing and potential degradation mechanisms listed in the 2R19 degradation assessment. This qualification was in accordance with Appendices H and I of the EPRI, "Steam Generator Management Program: Pressurized Water Reactor Steam Generator Examination Guidelines: Revision 7".
- Site-specific ETSS's are developed prior to each steam generator inspection for each existing and potential degradation mechanism identified in the 2R19 degradation assessment. The site-specific ETSS's are developed in accordance with Appendices H and I of the EPRI, "Steam Generator Management Program: Pressurized Water Reactor Steam Generator Examination Guidelines: Revision 7."
- The examination techniques utilized during 2R19 are considered "Site Validated" as defined in the EPRI, "Steam Generator Management Program: Pressurized Water Reactor Steam Generator Examination Guidelines: Revision 7," for each existing and potential degradation mechanism listed in the 2R19 degradation assessment.
- Axial ODSCC in the U-bend region is limited to Row 3 through Row 9 due to the bending technique used for those tube locations.

Location, orientation (if linear), and measured sizes (if available) of service-induced indications:

The 2R19 SG Examination Results section (Page 10) lists information that includes the location, orientation and measured sizes of service-induced indications. Further explanation of the information provided in the results section is given below:

- Bobbin probe indications reported as "I-codes" (i.e., DNI, DSI, DTI or NQI) were re-inspected with the Plus Point probe.
- Bobbin probe indications reported as PSI were re-inspected with the Plus Point probe. If the Plus Point probe indicated a possible TSP ligament breach existed (CSI), it was further evaluated by the original equipment manufacturer (OEM) engineering group. All ligament breach extents were found to be acceptable for continued plant operation.

Unit 2 - 2R19 Steam Generator 180 Day Report

- New AVB indications reported from the bobbin probe listed as PCT were inspected with the Plus Point probe. If the Plus Point probe indicated no crack-like flaws were present within the wear scar, a wear call (WAR) was assigned to the Plus Point report.
- Plus Point indications reported as "I-codes" (i.e., SAI, SCI, MAI or MCI) were either (a) removed from service via plugging, (b) left in service by installing sleeves or (c) left in service if the indications qualified under the requirements of GL 95-05.
- All hot leg top of tubesheet circumferential indications were stabilized prior to plug installation.

TS 5.6.6.2.1.e

Number of tubes plugged or repaired during the inspection outage for each degradation mechanism:

The following tables list the number of tubes plugged or repaired for each existing degradation mechanism reported during 2R19. This is the fourth consecutive outage where the alternate repair criteria of GL 95-05 was implemented.

The results of condition monitoring, including the results of tube pulls and in-situ testing:

Condition Monitoring

- All tubes were shown to satisfy the structural and leakage integrity performance criteria at 2R19. The relative severity levels of the degradation observed during 2R19 were judged to be consistent with or bounded by the levels associated with previous outage inspection results. Based on the indications observed during 2R19, the SG tubing is expected to meet all operational, structural and leakage integrity requirements at End-of Cycle 20. None of the indications reported during 2R19 represented a leakage potential at postulated main steam line break conditions.

Tube Pulls

- No tubes were pulled (removed) from the SG's during 2R19.

In-Situ Testing

- In SG A, two tubes (Row 8 Column 26 & Row 31 Column 63) were in-situ pressure tested during 2R19 due to circumferential ODSCC indications located at the hot leg top-of-tubesheet. Both tubes were successfully pressure tested up to 5150 psi with no reported leakage or burst.

2R19 SG Examination Results

Attachments A, B, and C provide the SG examination results for tubes in the Beaver Valley Power Station, Unit No. 2 with service-induced indications.

NOTE: The majority of the data contained in the Attachments comes from the production analysis process however, some data has been re-sized or re-profiled to address structural integrity concerns. Therefore, variations in the dimensions of a given indication (e.g., length, angular extent, voltage, etc.) may exist between this document and those documents previously submitted to the NRC in support of the spring 2017 outage (2R19). Regardless of the source of the data being provided, all tubes that exceeded the plugging or repair limit were properly dispositioned prior to returning the steam generators to service (MODE 4).
