

NUCLEAR ENERGY INSTITUTE

Dr. Thomas D. Ryan SENIOR VICE PRESIDENT, REGULATORY POLICY & REFORM

November 27, 1996

Mr. John C. Hoyle Secretary of the Commission **U.S. Nuclear Regulatory Commission** Washington, DC 20555-0001

**ATTENTION:** Chief, Docketing and Service Branch

SUBJECT: NRC Strategic Assessment and Rebaselining (61 Federal Register 195; October 7, 1996) **Request for Comments** 

Dear Mr. Hoyle:

The Nuclear Energy Institute (NEI),<sup>1</sup> on behalf of the nuclear energy industry, has reviewed the Direction Setting Issue (DSI) papers which form a part of the NRC Strategic Assessment and Rebaselining Initiative. The purpose of these papers is to discuss key issues affecting the future strategic direction of NRC and provide options for selection by the Commission. The NRC has requested comments from all "stakeholders" to be considered as part of the Commission's decision making process. Our comments on each DSI paper are organized in the following format:

- 1. What, if any important considerations have been omitted?
- 2. How accurate are the NRC's assumptions and projections for internal and external factors?

-

<sup>&</sup>lt;sup>1</sup> NEI is the organization responsible for establishing unified nuclear industry policy on matters affecting the nuclear energy industry, including the regulatory aspects of generic operational and technical issues. NEI's members include all utilities licensed to operate commercial nuclear power plants in the United States, nuclear plant designers, major architect/engineering firms, fuel fabrication facilities, materials licensees, and other organizations and individuals involved in the nuclear energy industry.

ALL OSIS,

- 3. Do the Commission's preliminary views respond to the current environment and challenge?
- 4. NEI Recommendations

The NRC is to be commended for undertaking this effort. It is important to periodically review the overall direction of the agency, particularly given the dynamic circumstances in the nuclear industry today. The DSIs identified through the early phases of this assessment are reasonably complete, highlighting the areas in which strategic decisions are needed. Many of our comments highlight areas where the staff analysis of the issues does not include viewpoints significantly different from the status quo.

We are concerned that insufficient review time will reduce the effectiveness of the stakeholder comment process. The stakeholders had a very limited time to solicit and compile comments from their constituencies. We recognize that the public comment period was extended, but the two week extension was announced too late in the process to affect the collection of comments from NEI's members. It is likely that other "stakeholders" representing large constituencies, including licensees with multiple internal organizational groups, were similarly constrained.

Of greater significance is the amount of time the NRC has indicated will be used to assess the comments. NRC staff indicated during the workshops that "Stakeholder Interaction Reports," compiling the comments, would be forwarded to the Commission for consideration within three weeks after the comment deadline. This schedule would make it very difficult for NRC management to consider the variety and volume of public comments that are likely to be received. It could restrict the ability to revise the thinking that went into the initial papers, to define and flesh out new options which may be suggested by the comments, or to provide analysis of such new options for the Commission's consideration. We encourage NRC to take the time necessary to derive full benefit from this important endeavor.

A significant omission from this strategic assessment is the current enforcement policy. That policy has a pervasive effect on the relationship between the NRC and its licensees and on the message the public perceives regarding the safety significance of problems. Other federal agencies with safety mandates, and many foreign nuclear regulatory authorities, have different approaches to enforcement. Some of these are structured differently specifically to encourage compliance, rather than punish non-compliance. NEI strongly encourages the NRC to subject the enforcement policy to the same type of review, examining options different from the

agency's historical practice, as has been applied to other programs in many of the DSIs.

In many of the DSI papers, past actions of the agency are summarized, but often not critically evaluated. Instead, it appears to be accepted that past regulatory actions were necessary and remain appropriate as continuing regulatory requirements. In fact, many of these actions were in response to specific events and issues, may not have been the most effective means of dealing with the issue, and are inappropriate as continuing burdensome requirements since the causes of the events have been dealt with. A more thorough assessment of previous NRC actions could produce lessons on how the agency could have been, and could be, more effective in addressing issues. Today, the regulatory problems at the Millstone station are the issue of the moment. References to these problems permeate the DSI papers. The papers could well have had a different tone had they been prepared a year earlier. While it is necessary to deal with compliance problems when they are found, it seems inappropriate for individual situations such as Millstone to color so completely the strategic picture for a regulatory agency.

There is agreement between the NRC and industry that safety performance has improved over the last several years. Performance indicators monitored by NRC and industry both demonstrate such improvement. Nevertheless, the total burden imposed by regulatory requirements continues to increase. There is danger that this increasing burden will make it economically infeasible for some nuclear power plants to continue operation, thus depriving the nation of a reliable, clean source of electric power. Such an outcome is not in the public interest if safety is not in question. An improved focus is needed in the nuclear regulatory process on safety significance. We note that Chairman Jackson has often expressed her support for the concept of risk-informed, performance-based regulation. We agree that this is an excellent mechanism for providing the needed focus. It would allow issues to be addressed in their appropriate context, considering both their individual significance and the overall level of safety performance in the industry. It would lead to more efficient means to address those issues that require action. It would appropriately allow for individual variation in the response to an issue, as it is seldom the case that a single specific action is the appropriate, effective response for all members of a class of NRC licensees. The regulatory process needs to recognize this, and allow problems to be addressed in the manner which will be most effective given the circumstances of individual licensees. We encourage the NRC to utilize fully this strategic planning process to further the transition to this more effective and efficient regulatory regime.

Several of the DSIs would benefit from a practical definition of an adequate level of protection of public health and safety. It is difficult to discuss how to (1) improve public communication, (2) improve the efficiency and effectiveness of the regulator, and (3) properly focus a regulatory oversight program without defining the baseline against which effectiveness can be measured. Without a more objective definition of adequate safety levels, one cannot determine when programs are successful or address a perception that more needs to be done. The NRC needs to develop means for applying the safety goals in a practical manner in order to provide a benchmark that is useful for determining when and how much additional action is required to assure safety.

Significant management attention will be required to implement any changes that result from this strategic planning process. The experience with risk-informed performance-based regulation is instructive in that regard. The Commissioners and senior staff management repeatedly have made comments supportive of such approaches to regulation. There appears to be an understanding, at the policy level, that it is appropriate to deal with issues in their particular safety context. This policy has not been effectively transferred to the working level of the staff. Inspectors and reviewers, whose actions impact NRC licensees on a daily basis, remain focused on detailed, prescriptive approaches. They continue to be concerned with how the "requirements" of NRC guidance documents are met, regardless of the safety objective and inherent flexibility of guidance. It will be very important for the Commission and staff management to devote considerable effort to translating any policy changes resulting from this rebaselining to changes in practice at the working level, so that they may indeed improve the effectiveness of the regulatory process.

We appreciate the opportunity to comment on these issues. We are willing to meet with the Commission or staff to discuss our comments or the related broader issues. Please contact me at (202) 739-8013 if there are any questions regarding our comments.

Sincerely,

Thomas D. Ryan

## NRC Strategic Assessment and Rebaselining Initiative

November: 27, 1996

## DSI 2 – Oversight of the Department of Energy

- 1. What, if any, important considerations may have been omitted?
  - The paper does not address the question of funding of the NRC's DOE oversight activities. NRC can not assume additional activities without funding to support those activities. Any funds presently supporting DOE oversight activities should be transferred to the NRC until the NRC can determine DOE oversight expenses. Licensees should not shoulder the financial burden.
  - The paper does not discuss the transition which will occur for DOE oversight activities. Without defining the methods to facilitate the transition this could be a significant obstacle to success and a drain on NRC resources. An example is the recent transition of the enrichment facilities from DOE regulation to NRC regulation. This has been and continues to be a major regulatory adjustment.
  - NRC oversight of DOE will likely take considerable NRC staff resources. Additional experienced and qualified staff would be needed to deal with the new challenges posed by DOE operations. Failure to adequately augment staffing could result in reduced oversight of operations of current licensees, but it is more likely to result in delays on important industry initiatives such as Cost-Beneficial Licensing Actions (CBLA) or relief requests. NRC oversight of DOE should not be allowed to impact adversely routine regulatory activities with existing licensees.
  - The openness of NRC licensing activities to the public, a key feature to ensure public credibility, will be constrained because of defense secrecy requirements. Defense secrecy is accepted broadly by the public to be in the interests of national security, but the difficulty of maintaining a clean line between defense and non-defense openness in licensing activities could result in growing public distrust.
- 2. How accurate are the NRC's assumptions and projections for internal and external factors?

The representation of the issue, assumptions and projections of internal and external factors appear to be accurate.

3. Do the Commission's preliminary views respond to the current environment and challenge?

The lack of consideration of transition and funding issues make it impossible for the Preliminary Views on the options to be fully responsive to the current environment and challenge.

4. NEI Recommendation

NEI takes no position regarding how the DOE nuclear facilities should be regulated. Our principal interest is in assuring minimal impact on regulatory activities for existing licensees, particularly their ability to obtain the regulatory approvals needed to continue to improve and optimize operations. The major factors that could produce undesirable impact are those enumerated above. NRC should assure that these factors are given careful consideration in any transition to increased involvement in regulation of DOE facilities.
