Pressurized Thermal Shock

File: 86-056-026

- References: (1) 10 CFR 50.61 "Fracture Toughness Requirements for Protection Against Pressurized Thermal Shock Events".
(2) CEN-189, Appendix J, Evaluation of Pressurized Thermal Shock Effects for Palo Verde 1, 2, and 3, 1981

Dear Mr. Knighton:

This letter provides the response required by Reference (1) for Palo Verde Units 1, 2, and 3. Some of this information was previously submitted by Reference (2).

Since there are not yet any surveillance capsule evaluations or other direct measurements of vessel fluence rates for Palo Verde Units 1, 2, and 3, FSAR peak fluence predictions were used to calculate the required RT-PTS values. Calculations were also done with the FSAR fluence increased by a factor of two (2.0) to conservatively bound possible variations in fluence due to uncertainties in actual plant operations and fuel loading strategies. As a conservative simplification, the peak of the axial and azimuthal fluence profiles was used to calculate a conservative RT-PTS value.

The controlling material chemistry and initial (i.e., pre-irradiation) toughness properties of the reactor vessel beltline materials for each of the three Palo Verde units are provided in Table 1. In each case, the controlling materials are the base plate properties, not the welds. The highest copper-nickel combination is 0.07% Cu and 0.66% Ni in PVNGS Unit 1. Using the CESSAR-F maximum design fluence of 3.15×10^{19} n/cn² (E>1 MeV) at the inside surface of the reactor vessel and the RT-PTS prediction equation from 10 CFR 50.61 results in a projected shift of 54°F, and a projected RT-PTS of 132°F. If the actual fluence were a factor of two greater (i.e., 6.3×10^{19} n/cn²) then the projected shift and RT-PTS would be 65°F and 143°F, respectively. These results conservatively bound calculations for PVNGS Units 2 and 3.

Page 2

As can be seen above, the RT-PTS values for PVNGS 1, 2, and 3 are projected to remain well below the 10 CFR 50.61 screening criterion of 270°F, even for twice the maximum design fluence. In accordance with the requirements of paragraph (b)(1) of 10 CFR 50.61, we will inform you if future changes in core loadings, surveillance measurements or other information indicate a significant change in the projected values.

We believe this satisfies the requirements of 10 CFR 50.61 for PVNGS 1, 2, and 3.

Very truly yours,

E. E. Van Brunt, Jr.
Executive Vice President
Project Director
