

UNITED STATES  
NUCLEAR REGULATORY COMMISSION  
WASHINGTON, D. C. 20555

MAR 17 1987

Mr. Frank Bergamo, Manager  
Nuclear Products, Customer Services  
Kaman Instrumentation Corporation  
P.O. Box 7463  
Colorado Springs, Colorado 80933

Dear Mr. Bergamo,

The Nuclear Regulatory Commission (NRC) has received a report under 10 CFR Part 21 from the Arizona Nuclear Power Project (ANPP) concerning deficiencies they noted in the particulate channel of the containment building radiation monitor (RU-1) at the Palo Verde Nuclear Station (PVNS). The RU-1 monitor was supplied by Kaman Instrumentation and is used for detecting reactor coolant leakage in accordance with NRC Regulatory Guide 1.45. In their report (see attached), ANPP states that erroneous documentation was supplied with the RU-1 monitor. This resulted in an incorrect detector efficiency being used in the RU-1 calibration. They also state that the erasable-programmable-read-only-memory (EPROMs), supplied by Kaman, had been programmed with an incorrect flow conversion factor. The RU-1 operability testing performed at PVNS was inadequate to detect the error in the EPROM programming.

As Mr. Roger Pedersen of my branch discussed with you, my branch's responsibility is to identify and resolve potentially generic industry problems. When appropriate, this responsibility includes notifying the industry via a notice or other document. Since Kaman Instrumentation supplies components to several of our licensees, the reported deficiencies, if verified, could have generic implications.

Assuming that you verify the facts reported, we would like to know:

(1) whether you have determined if these deficiencies could exist in components supplied to your other customers; (2) if so, what plans you have to inform them of the potential problems; and (3) steps you have taken (or planned) to prevent a reoccurrence. In cases such as this, when the vendor's resolution is reasonable, successful and thorough, we typically do not issue a notice to the industry, thus avoiding duplication of efforts.

A second potentially generic issue raised by the ANPP deficiency report is whether the RU-1 monitor, as operated at PVNS, is capable of detecting a one gallon per minute leak within one hour as specified in Regulatory Guide 1.45. Two relevant concerns are raised in the report. The first concerns the effect that short-lived radionuclides (predominantly Rb-88) have on the monitor's response and the long filter paper stepping time it dictates. The second concern relates to how the monitor's sensitivity is effected by the relatively low reactor coolant activity coupled with a relatively high background airborne radiation in the containment. Whether ANPP is meeting its licensing commitments is a question we intend to pose to our Office of Nuclear Reactor Regulation; however, any comment you have on this issue will be considered.

**KAMAN**

## PROBLEM

EVALUATE THE SENSITIVITY & TIME RESPONSE OF THE PARTICULATE MONITORING CHANNEL TO VARIATIONS IN:

- AMBIENT BACKGROUND
- NOBLE GAS CONTRIBUTION (BACKGROUND)
- SHORT-LIVED PARTICULATE ISOTOPE ACTIVITY, e.g., Rb-88 ( $\lambda_{1/2} \approx 18$  MIN)
- LONG-LIVED PARTICULATE ACTIVITY, e.g. Cs - 137

## METHOD OF SOLUTION

- ACTUAL EXPERIMENTAL VALIDATION IS NOT FEASIBLE
- MUST RELY ON COMPUTER SIMULATION OF MONITOR PERFORMANCE
- EXACT FUNCTIONAL EQUIVALENT OF PARTICULATE PROCESSING ALGORITHM USED IN MONITOR IS CODED IN PC PROGRAM
- SIMULATION PROGRAM "MFCALC" DETERMINES SENSITIVITIES OF ALGORITHM TO VARIOUS PROBLEM PARAMETERS

## MFCALC SIMULATION PROGRAM INPUTS

- ACTIVITY OF LONG-LIVED PARTICULATES (e.g., Cs-137)
- ACTIVITY OF SHORT-LIVED PARTICULATES (e.g., Rb-88)
- AMBIENT BACKGROUND, CPM (e.g., 100-300 cpm)
- SENSITIVITY OF PARTICULATE CHANNEL TO NOBLE GAS ACTIVITY (e.g.;  $10^6$  cpm/ $\mu$ Ci/cc)
- NOBLE GAS ACTIVITY
- FLOW RATE, CFM
- TIME STEP & TOTAL RUN TIME

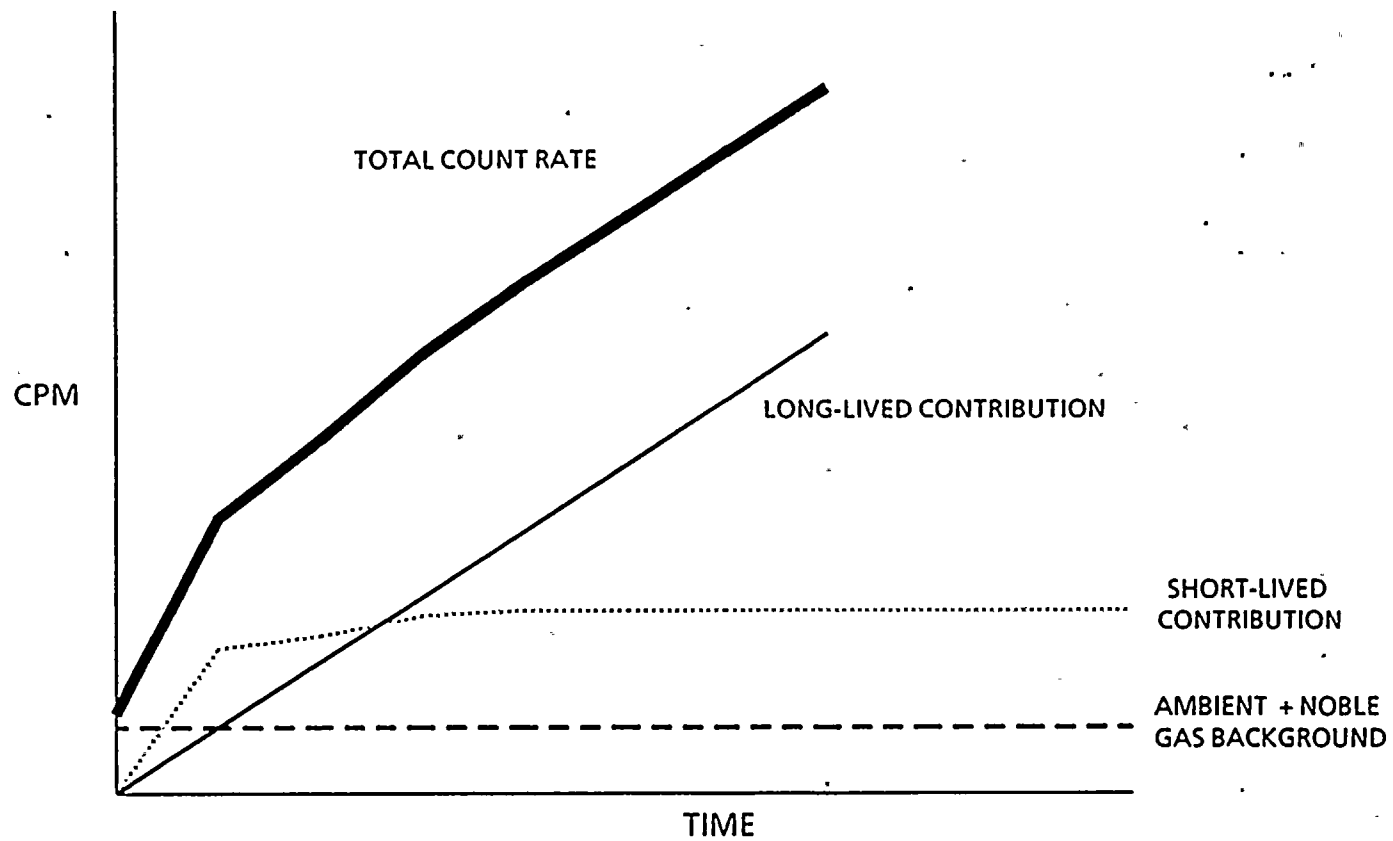

## MFCALC SIMULATION FEATURES

- CALCULATES GROSS DETECTOR CPM BASED ON BACKGROUND AND BUILDUP OF SHORT AND LONG-LIVED ISOTOPES ON FILTER
- DECAY OF SHORT-LIVED PARTICULATES IS ACCOUNTED FOR
- STATISTICAL FLUCTUATIONS IN COUNT RATE, BACKGROUNDS, AND FLOW RATE ARE ACCOUNTED FOR
- CALCULATED ACTIVITY CONCENTRATION OF PARTICULATES IS DETERMINED FROM COUNT RATE EXACTLY AS DONE IN MONITOR
- PERCENTAGE DIFFERENCE BETWEEN "CALCULATED" AND "ACTUAL" (I.E., INPUT) ACTIVITY IS COMPUTED AT EACH TIME STEP
- RESULTS ARE PLOTTED VS. TIME

### DIFFICULT CONDITIONS

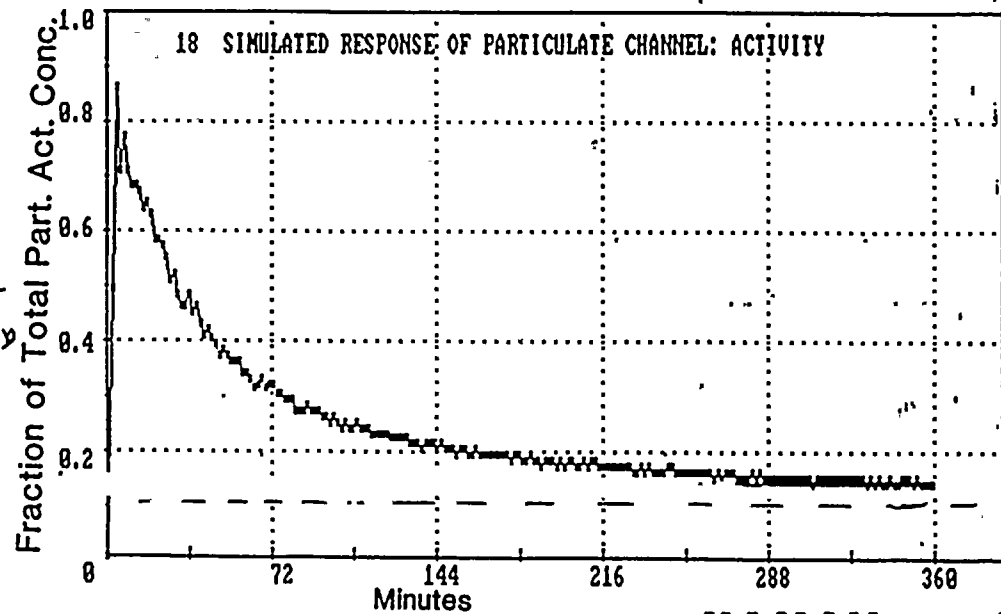

High Concentration of Short-Lived Isotopes

Large Noble Gas Activity

Slow Response

Converges to Long-Lived Component

- TOTAL ACTIVITY  $1 \times 10^{-9}$   $\mu\text{Ci/cc}$   
 10% Cs-137  $\lambda = \infty$   
 90% Rb-88  $\lambda = 18 \text{ MIN}$
- Noble GAS ACTIVITY  $5 \times 10^{-3}$   $\mu\text{Ci/cc}$   
 $\sim 7000$  CPM BACKGROUND
- STABILIZATION TIME  
 $> 6 \text{ HRS}$

**KAMAN**

## SOME GENERAL CONCLUSIONS

- ALGORITHM HAS BEEN VERIFIED FOR WIDE VARIETY OF INPUT CONDITIONS
- IDENTIFIED AREAS WHERE MONITOR RESPONSE WILL BE VERY SLOW
- IDENTIFIED PRIMARY FACTOR WHICH REDUCES EFFICIENCY OF ALGORITHM (I.E., FRACTION SHORT-LIVED ISOTOPE)
- NOBLE GAS ACTIVITY DOES NOT GREATLY AFFECT MONITOR RESPONSE
- AMBIENT BACKGROUND HAS LITTLE EFFECT ON RESPONSE
- RESPONSE TIME RELATIVELY CONSTANT OVER WIDE RANGE OF PARTICULATE ACTIVITIES ( $10^{-11}$  -  $10^{-7}$ )

**KAMAN**
