															Heat Rem						
															ift setpoint						
System (RCS) Low Temperature Overpressurization Protection (LTOP). Technical Specification (TS) 3.4.9.3 requires the																					
RHR safety valves to have a lift setting of less than or equal to 450 pounds per square inch gage (psig). A preliminary review of recent In-Service Testing data identified that the as-found lift setpoints for the 1- and 2-SV-103 were 455 and 452																					
psig, respectively. These values are greater than the TS limit of 450 psig, and as a result, the values were declared																					
inoperable on March 10, 1999. On March 11, 1999 it was determined that 1-SV-103 had been taken credit for in October

Prelimi	narv in	vestigat	ion indic	ates t	he cau	ise v	vas in	icom	ect in	nolem	nenta	atior	n of TS	sur	veillance r	eauireme	nts.	The	ASME		
Preliminary investigation indicates the cause was incorrect implementation of TS surveillance requirements. The ASME Operations and Maintenance Standards Code-1995 allows the application of a 3 percent setpoint tolerance to valve lift																					
settings during valve testing and requires a temperature correction factor to be incorporated into the lift setting. However,																					
the TS limit is a strict value that does not take into account allowable Code tolerances or the use of a temperature																					
correcti	on fact	or wher	i deterrr	nining t	the set	poin	it. As	; imn	nedia	te co	rrecti	ive a	action t	ooth	unit's safe	ety valves	wei	re de	clared		
inopera	ble. Er	igineerii	ng evalu	ation	results	indi	icate f	that	the re	eactor	r ves	sel	and the	e Rł	HR system	i piping w	ere a	alway	s		
	inoperable. Engineering evaluation results indicate that the reactor vessel and the RHR system piping were always adequately protected against overpressure, and there was no safety significance associated with the inoperable valves.
