Background

Members of the NRC staff met with the licensee's representatives at Bethesda, Maryland, to discuss proposed revisions to specific sections of the Turkey Point Plant Units 3 and 4 Technical Specifications. The licensee is converting the existing custom plant Technical Specifications, which were issued in the early 1970's, to the format and content of the Standard Technical Specifications for Westinghouse Pressurized Water Reactors (NUREG-0452). A list of attendees is enclosed.

Summary

The meeting was held to perform a detailed review of the proposed Technical Specifications relating to Safety Limits and Instrumentation (Sections 2.0 and 3/4.3). Prior to reviewing these sections, the progress to date and the proposed schedule were discussed. Actions related to the Electrical Power Systems (3/4.8) were identified for follow-up in addition to other previously reviewed sections. It was determined that both the licensee and NRC staff should support the overall effort to assure a thorough and timely review. It is important to resolve the open items identified during each meeting to allow issuance of a second draft of the proposed Technical Specification reflecting the agreed-upon resolutions and an updated no significant hazards consideration evaluation addressing all of the changes.

The review of Sections 2.0 and 3/4.3 resulted in several open items which required followup, such as the allowable values for various setpoints. The licensee and staff will resolve these items prior to the next meeting.

The followup meetings will take place at the site, the Region II office and at Bethesda to assure interaction with all the participants. Physical systems

and components can be verified during the site meetings. The licensee identified some sections of the proposed Technical Specifications to be deleted or added which differ from the Standard Technical Specifications due to plant-specific design features.
