Ms. Elinor G. Adensam, Director
BWR Project Directorate No. 3
U.S. Nuclear Regulatory Commission
7920 Norfolk Avenue
Washington, DC 20555

Dear Ms. Adensam:

Re: Nine Mile Point Unit 2
Docket No. 50-410

Enclosed is the Preservice Inspection Plan for Nuclear Piping System and Component Supports, the third part of the Preservice Inspection Plan for Nine Mile Point Unit 2. The first part, the Preservice Inspection Plan for Nuclear Piping Systems and the Reactor Pressure Vessel, was submitted on October 15, 1985. The second part, the Inservice Testing Plan for Pumps and Valves, was submitted on November 27, 1985. This submittal completes the planned submittal for Safety Evaluation Report Open Item No. 3 concerning the Preservice Inspection Plan.

Very truly yours,

C. V. Mangan
Senior Vice President

INSERTION INSTRUCTIONS

The following instructions are for the insertion of material in the Nine Mile Point Unit 2 Preservice Inspection Plan.

Remove existing cover/spine and title page for Volume 4 of the Preservice and Inservice Inspection Plan and insert new cover/spine and title page entitled Preservice Inspection Plan for Nuclear Piping Systems and Component Supports.

Insert all new material for Section 1 and Appendix A. (Note: This new material has no volume number.)

SECTION 1

INTRODUCTION AND INSPECTION REQUIREMENTS

1.1 INTRODUCTION

The Preservice Inspection (PSI) Plan for Niagara Mohawk Power Corporation's (NMPC) Nine Mile Point Nuclear Station Unit 2 (Unit 2) consists of three separate documents, as follows:

1. Preservice Inspection Plan for Nuclear Piping Systems and the Reactor Pressure Vessel.

2. Inservice Testing Plan for Pumps and Valves.

3. Preservice Inspection Plan for Nuclear Piping System and Component Supports.

This document is the Preservice Inspection Plan for Nuclear Piping System and Component Supports. It supersedes all previous submittals issued and is considered the base document for preservice examination and testing of component supports.

This document shall be updated pending the completion of any modifications necessary to attain the plant as-built configuration. The status of this plan is considered up-to-date when:

1. The required examination and testing is completed and documented, including verification of manufacturers' documentation and functional test reports.

2. The Requests for Relief covered by the scope of this Plan are submitted for approval.

1.1.1 Plan Format

The Preservice Plan for component supports is organized into two sections, as follows:

Section 1 - Describes general requirements, scope, responsibilities, and the applicable code for examination and testing of component supports.

Appendix A - Preservice Testing - Component Supports. A description of the printout is provided in Section 1.1.1.1.

1.1.1.1 Preservice Testing - Component Supports

Appendix A contains the following information:

1. Support No. - Indicates the unique support number found on support drawings, i.e., 2MSSPSSH319A1, where:

   2 = Unit 2
   MSS = System code
   PSSH = Type of support
   319 = Support number
   A = Scope of design and analysis
   1 = ASME Code Class 1

   Types of supports are defined as:

   PSSP = Snubber
   PSSH = Spring hanger
   PSA = Anchor
   PSR = Restraint
   PSST = Strut

   Types of scopes of design and analysis are defined as:

   A - SWEC Headquarters engineered and stress analyzed
   B - ITTG engineered, SWEC analyzed
   C - SWEC Field engineered and stress analyzed

2. System Code - Piping system identification according to Table 1-1.

3. BZ Support Drawing - Unique support drawing.

4. ASME Code Class - Safety Class 1, 2, 3, or 4 (B31.1 upgrade).

5. Type of Support - An "X" indicates the type of support, i.e., pipe, snubber, intervening attachment, vessel, heat exchanger, valve, or pump. When identified with a component, the applicable equipment mark number is entered also.

6. Examination Code - ASME Section XI, 1980 Edition through Winter 1980 Addenda.

7. Examination Item - In accordance with ASME Section XI, Table IWF-2500-2 (F-1, F-2, F-3, or F-4).

8. Examination Category - In accordance with ASME Section XI, Table IWF-2500-1 (F-A, F-B, F-C).

9. Examination Method - Visual, VT-3, or VT-4, as applicable.

10. Examination Procedure - VT procedure used for examination.

11. ISO DWG - Applicable contractor's isometric piping drawing.

12. Welded Attachment - "Y" or "N," as required by Tables IWF-2500-1 and IWF-2500-2, Examination Categories F-A, F-B, or F-C.

13. Location Buildings

    PRI CONT - Primary containment

    SEC CONT - Secondary containment

    NAB - North auxiliary bay

    SAB - South auxiliary bay

    SDGB - Diesel generator building

    TBDG - Turbine building

    CBDG - Control building

    SCRNWELL - Screenwell building

    TUNN - Tunnel

    SGTB - Standby gas treatment building

14. Location Elevation - Building/tunnel elevation in ft.

15. Access/Inaccess. - "A" or "I" indicates accessibility status, i.e., in primary or physically inaccessible area.

16. High Rad Zone = "Y" or "N" remarks indicate the level of radiation:

    DR=1 = Less than 100 mRem/hr

    DR=2 = 100-500 mRem/hr

    DR=3 = Greater than 500 mRem/hr.

    With DR=2 or DR=3, as indicated in the "Remarks" field for snubbers, High Rad Zone equals "Y."

17. Remove for Exam - "Y" or "N" indicates the necessity of removing or not removing for testing.

18. Design Spec - Design Specification No. NMP2-P301N.

19. Install Spec - Installation Specification No. NMP2-P301J or NMP2-P301F (small bore only).

20. Relief Request - "Y" or "N" indicates the need for relief.

21. Remarks - Used to denote any other relevant information such as dose rate, etc.

1.2 SCOPE AND RESPONSIBILITIES

This Plan delineates the commitments and requirements for examination of the supports for pressure-containing piping systems and component supports of the reactor coolant system, portions of the associated auxiliary systems, and the emergency core cooling systems.

Title 10 of the Code of Federal Regulations, Part 50.55a(g), requires PSI to be performed in accordance with Section XI of the American Society of Mechanical Engineers (ASME), Boiler and Pressure Vessel Code, Rules for Inservice Inspection of Nuclear Power Plant Components, including applicable addenda.

Performance of the PSI is the responsibility of NMPC or its designated agents. This responsibility includes the requirements contained in IWA-1400(a) through (o) of the Code.

1.2.1 Applicable Code for Preservice Inspection

The PSI Plan for Unit 2 shall be in compliance with the rules and regulations of 10CFR50.55a and Section XI of the ASME Boiler and Pressure Vessel Code, 1980 Edition, including addenda through Winter 1980.

In addition to the previously referenced Code edition and addenda, the PSI Plan for supports has been prepared using appropriate guidance from the following industry standard:

- OM-4 - Examination and Performance Testing of Nuclear Power Plant Dynamic Restraints (Snubbers).

1.2.2 Later Codes

As permitted by paragraphs 10CFR50.55a(g)(2) and (g)(4), NMPC may elect, for certain components, to meet requirements set forth in later editions and addenda of the Code than those specified in the approved Plan. The later Codes selected shall have been incorporated by reference in 10CFR50.55(b)(2). Additionally, use of later Codes shall be subject to approval by the NRC.

1.2.3 Requests for Relief from Code Requirements

Under the provisions of 10CFR50.55a(g)(5)(iii), relief from Code examination and/or test requirements for components, supports, or support elements shall be requested in writing to the NRC. The request for relief shall become part of this Plan and the component examination and test records and shall contain the following information:

1. Identification of the component or support, including its name and number as given in the FSAR, its function, and the ASME III Code Class.

2. The Code requirement for which relief is being requested.

3. The basis for the request for relief.

4. The inspection periods and intervals for which the requested relief is needed.

5. Alternate tests or examinations being proposed.

6. The schedule for implementing the alternate tests or examinations.

7. The impact on the overall level of plant quality and safety if it is impossible to perform an alternate examination.

8. The preservice inspection results, if any, for the components for which the relief is being requested.

When the requests for relief are due to radiation considerations, the following additional information shall be included:

1. Total estimated man-rem exposure involved in the examination.

2. Radiation levels at the test area.

3. Flushing or shielding capabilities that might reduce radiation levels.

The components for which relief from examination has been granted by the NRC will be exempted from the Code examination for which relief was requested.

Relief requests are located after the tables in Section 1 of this plan. They are assigned sequential numbers as follows:

RR-IWF-1, etc.

1.2.4 Supports Requiring Examinations and Tests

Appendix A lists all ASME III, Class 1, 2, 3, and ANSI B31.1 upgrade supports that require visual examination and snubbers that require visual examination and functional testing. The component supports that require inspection are located within the ASME Section III boundary of those P&IDs listed in Table 1-1.

The examination and testing requirements of ASME Section XI, Subsection IWF, and this Plan shall be limited to the Class 1, 2, 3, and ANSI B31.1 upgrade component supports for which all of the requirements of the construction code have been met.

In accordance with Section XI-1980 and Winter 1980 Addenda, IWF-2510a states, "Component supports selected for examination shall be the supports of those components that are required to be examined under IWB, IWC and IWD during the first interval" and, since IWF-1230, "support exempt

from examination and test," is in the course of preparation, Code Interpretation X1-1-83-12R-2 was used to determine which component support will be examined and to establish the following exemption criteria.

Supports are exempt from the requirements of ASME Section XI, as follows:

1. ASME III, Class 1, Piping and Components

   a. Supports on piping and related components 1-in NPS and smaller.

   b. Supports on 2-in NPS and smaller reactor vessel head piping made inaccessible by control rod drive penetrations.

2. ASME III, Class 2, Piping and Components

   a. Supports on 4-in NPS and smaller piping and components.

   b. Supports for piping and components of any size that operate at a pressure equal to or less than 275 psig and a temperature equal to or less than 200°F in systems other than residual heat removal, emergency core cooling, and containment heat removal.

   c. Supports for piping and other components of any size beyond the last shutoff valve in open-ended portions of systems.

3. ASME III, Class 3, Piping and Components

   a. Supports on piping and components 4-in NPS and smaller.

   b. Supports for piping and components exceeding 4-in NPS, where:

      (1) Components and piping are located in systems whose function is not required to support reactor residual heat removal, containment heat removal, and emergency core cooling; and

      (2) Components and piping operate at a pressure of 275 psig or less and a temperature of 200°F or less.

The examination requirements shall be applied to plate and shell-type (F-A), linear-type (F-B), and component standard-type (F-C) supports within the support examination boundaries defined by ASME Section XI, IWF-1300. Supports may be composed of a combination of linear, plate and shell, and component standard types of support elements.

1.3 EXAMINATIONS

1.3.1 Application of Examination Methods

The VT-3 and VT-4 visual examination requirements of IWF-2000 and Tables 1-2 and 1-3 of this Plan shall apply to all piping supports, component supports, and support elements, including snubbers, identified in Appendix A.

Preservice examinations shall be performed following the initiation of system tests and shall be completed prior to commercial operation.

1.3.2 Visual Examination Requirements

A preservice examination shall be made on all snubbers. This examination shall be conducted after initiation of system test and completed prior to commercial operation. The initial examination shall verify, as a minimum:

1. There are no visible signs of damage or impaired operability as a result of storage, handling, or installation.

2. The snubber load rating, location, orientation, position setting, and configuration (attachments, extensions, etc) are in accordance with design drawings and specifications. Installation records (based on physical inspections) verifying that the snubbers were installed according to design drawings and specifications shall be acceptable in meeting this requirement.

3. Adequate swing clearance is provided to allow snubber movement.

4. Structural connections such as pins, bearings, studs, fasteners, and other connecting hardware such as lock nuts, tabs, wire, and cotter pins are installed correctly.

If the period between the preservice examination and initial system preoperational test exceeds 6 mo, Items 1 and 3 (above) shall be repeated.

Snubbers that are installed incorrectly or otherwise fail to meet any of the preservice examination requirements shall be properly dispositioned, repaired, or replaced. The corrected, repaired, and replacement snubbers shall be examined in accordance with the requirements of this paragraph. Additionally, replacement snubbers shall be operability tested in accordance with the requirements of Section 1.7.4.1.

1.4 STANDARDS FOR EXAMINATION EVALUATIONS

Evaluation of preservice examination results shall be performed in accordance with the requirements of Article IWF-3000 and this Plan.

The acceptance standards for support items, bolting, and alignment in Subarticle IWF-3400 are defined by site-approved and -administered procedures.

Acceptance standards for support items, including bolting and alignment, shall be in accordance with the requirements of the design specifications, engineering drawings, and construction code in the absence of Section XI requirements.

1.5 REPAIR PROCEDURES

The requirements in Article IWF-4000 for repair procedures are being defined by site-approved and -administered procedures.

Repairs to supports and replacement of supports shall be in accordance with the requirements of the design specifications and the construction code in the absence of Section XI requirements.

1.6 CORRECTIVE ACTION

Immediate corrective action shall be taken for all supports that do not meet Code or functional test requirements. Systems or components will not be put into service until corrective action has been completed. Systems or components will be evaluated and removed from service, if necessary, if a support is found inoperable, has lost structural integrity, or cannot be repaired or replaced within 72 hr. If a safety-related system or component is damaged, overstressed, or is likely to be damaged, the system or

components will be taken out of service immediately. Systems or components will not be put into service until corrective action has been completed.

1.7 TESTING OF SNUBBERS

1.7.1 Introduction

This section contains the requirements for testing of snubbers.

The purpose of this portion of the Plan is to demonstrate operational readiness of the snubbers by requiring the performance of tests and, when necessary, corrective action.

1.7.2 Terminology

The following list of definitions is provided to ensure a uniform understanding of selected terms used in this section.

1. Activation - The change in parameter that verifies restraining action.

2. Breakaway Force - The minimum applied force required to initiate extension or retraction of the snubber.

3. Drag Force - The force required to maintain the extension or retraction of the snubber at a constant velocity prior to activation.

4. Snubber - A device which provides restraint to a component or system during a sudden application of forces but allows essentially free motion during thermal movement.

5. Inaccessible Snubbers - Those snubbers that are in a high radiation area or other conditions that would render it impractical for the snubbers to be examined under normal plant operating conditions without exposing plant personnel to undue hazards.

6. Maintenance - Action taken to prevent or correct deficiencies in the function of a snubber.

7. Mechanical Snubbers - Devices in which load is transmitted entirely through mechanical components.

8. Normal Operating Conditions - Operating conditions during reactor startup, operating at power, hot standby, and reactor cooldown to cold shutdown.

9. Operability Testing - An element of inspection consisting of measurement of parameters that verify snubber performance.

10. Operating Temperature - The temperature of the environment surrounding a snubber at its installed plant location during the phase of plant operation for which the snubber function is required.

11. Release Rate - The velocity or acceleration of extension or retraction of the snubber under a specified load after activation of the snubber took place.

12. Activation Velocity - The maximum velocity of extension or retraction of the snubber prior to the onset of restraining action.

13. Threshold Acceleration - The maximum acceleration of extension or retraction of the snubber prior to the onset of restraining action.

14. Swing Clearance - The movement envelope within which the snubber must operate without restriction, from the cold-installed position to the hot-operating position.

15. Test Temperature - The temperature of the snubber at the time of the test.

1.7.3 Procedures and Equipment

1.7.3.1 Test Procedures

Tests shall be performed in accordance with written procedures.

As a minimum, these procedures shall include:

1. General description (method and objectives).

2. Scope of application.

3. References.

4. Prerequisites, precautions, and limitations.

5. Test equipment required.

6. Sequential actions to be followed.

7. Acceptance criteria.

8. Data sheets.

1.7.3.2 Test Results

As a minimum, the results of test data shall be documented and include:

1. Manufacturer's model number, serial number, type, and unique location identification of the snubber.

2. Pertinent test data.

3. Identification and disposition of nonconformances.

4. Information to identify the test performed, procedure used, and the test date.

5. Test equipment used and calibration dates.

6. Acceptability of test results.

7. Inspector's identification.

1.7.3.3 Instrumentation and Test Equipment

Instrumentation and test equipment used to verify snubber performance shall be capable of measuring the test parameters over their amplitude and frequency ranges with accuracy sufficient enough to obtain meaningful test results.

All instruments and test equipment used to perform the tests shall be calibrated and controlled in accordance with written procedures to ensure accuracy of measured data.

1.7.3.4 Snubber Maintenance Procedures

Maintenance activities that may affect the ability of the snubber to perform its intended function shall be completed in accordance with written procedures. Snubbers that undergo maintenance activities that may alter the snubber's intended function shall be examined and tested in accordance with the applicable requirements of Section 1.7.4.1 after maintenance is completed. The written maintenance

procedures shall specify the appropriate examinations and tests.

1.7.3.5 Snubber Repair, Modification, and Replacement Procedures

Repaired, modified, and/or replacement snubbers shall be tested in accordance with written procedures and the requirements of Section 1.7.5. The written procedures shall specify the appropriate tests.

1.7.4 Preservice Operability Testing

1.7.4.1 Operability Testing Requirements

Preservice operability tests shall be performed once on all snubbers prior to installation. Manufacturers' test data may be used in lieu of field testing. The testing shall verify that:

1. The force that will initiate motion (breakaway force) or maintain low velocity displacement (drag force), whichever is applicable, is within specified limits, both in tension and compression.

2. Activation is within the specified range of velocity or acceleration in both tension and compression.

3. Release rate, where applicable, is within the specified range in tension and compression. For units specifically required not to displace under continuous load, the ability of the snubber to withstand load without displacement shall be demonstrated.

All snubber functional test procedures shall meet the test requirements contained in Article IWF-5000. All test procedures shall be reviewed and approved by NMPC or its Agent.

Snubbers that fail any of the preservice operability tests shall be evaluated for the cause(s) of failure(s). If a design or manufacturing deficiency in the snubber is found, it shall be corrected. Modified, repaired, and replacement snubbers shall be tested in accordance with the preceding requirements.

1.7.4.2 Preservice Thermal Movement Examination Requirements

During initial system heatup and cooldown, the thermal movement of snubbers in systems whose design operating temperature exceeds 250°F shall be verified as follows:

1. During initial system heatup and cooldown at temperature plateaus, record the snubber setting. Verify, at each plateau, that the snubber setting is within acceptable design limits. All discrepancies or inconsistencies shall be evaluated and corrected, if necessary, prior to proceeding to the next specified plateau.

   The total thermal movement based on snubber settings from cold to hot at full operating temperature shall be recorded. This value may be either measured directly, if maximum operating temperature was attained, or extrapolated from lower temperature readings. The cold or hot position setting shall be evaluated and adjusted, if necessary, to ensure adequate snubber clearance from fully extended or retracted positions.

2. Verify that there is swing clearance at specified heatup and cooldown plateaus.

1.7.5 Acceptance Criteria

1.7.5.1 Examination Acceptance Criteria

To be acceptable, a snubber shall be capable of performing its design function as installed. There may be conditions present which are undesirable but do not render the installed snubber inoperable. These conditions and any unacceptable snubbers are subject to corrective action.

To be acceptable, the snubber installation must meet all of the following requirements. If it fails to meet any one of these requirements it shall be identified as unacceptable, unless an engineering evaluation or test establishes that the snubber installation was capable of performing its required function as found.

1. Snubbers shall be installed so that they will carry the specified load. Loose fasteners, deformed members, or detection of disconnected components are some of the conditions which can adversely affect the load-carrying capability of the

installation. Detection of these conditions requires identification of the installation as acceptable, unless an engineering evaluation determines that the snubber installation as found is capable of carrying the design load.

2. Snubbers shall be installed in such condition that they do not restrict the thermal movement of the pipe or other equipment that the installation is designed to protect or restrain. Misalignment, deformation, binding, and jamming are some of the conditions which can result in restricted thermal movement. If no indication of binding or misalignment is observed and the snubber is free to pivot at the pinned connections, the provisions of this requirement are considered to have been satisfied.

3. The visible design features required for actuation of the snubber shall be functional. Features that can be verified visually are to be observed.

1.8 PERSONNEL QUALIFICATIONS

Personnel who are required to witness, perform, and/or evaluate the examinations and tests shall be qualified in accordance with the Owner's procedures.

1.9 RECORDS AND RECORDKEEPING

1.9.1 Requirements

Record copies of acceptance tests, design specifications, operating and maintenance instructions, written inspection procedures, test equipment, calibration records, examination results, test results, maintenance records, replacement records, and schedules of inspection shall be maintained and controlled.

1.9.2 Preservice Records

Records necessary to verify the results of the preservice program shall be maintained and include, as a minimum:

1. Preservice test results.

2. Examination records.

3. Thermal movement inspection records.

4. Nonconformance and corrective action required to be completed during the preservice inspection.

TABLE 1-1 (Cont)

P&ID	System	System Designation	ASME/ANSI Class Designation
11***	Service Water	SWP	3
EM38**	Transversing Incore Probe	TIP	2
1	Turbine Gland Seal and Exhaust	TME	4*
37	Reactor Water Cleanup	WCS	1,2,3

*Based on Regulatory Guide 1.26, portions of Class 4 systems have been classified as Quality Group B and therefore are examined under the requirements of ASME Section XI, Class 2.

**No P&ID is provided for the TIP system. EM38 is used for inspection of the valves.

***Component supports listed in Appendix A have support designations starting 2SWP, 2SWQ, and 2SWR.
