Inspection Summary:

Inspection on July 14-18, 1980 (Combined Inspection Reports Nos. 50-272/80-17/50-311/80-13

Areas Inspected: Physical security inspection, of the approved physical security plan, security program audit, security organization, physical barriers (PA/VA), lighting, access control (search) (escorting), (vital areas), alarm station, detection aids, assessment aids, communications, testing and maintenance, compensatory measures, power supply, response, locks, keys and combinations and records and reports.

The inspection involved 39 inspector-hours onsite by a regional based inspector. The inspection was begun during regular hours.

Results: The licensee was found to be in noncompliance with the Physical Security Plan and NRC requirements within three (3) of the nineteen areas examined during the inspection, i.e., (a) failure to keep the isolation zone clear of structures or material, (b) failure to secure an opening in the wall of the control and auxiliary relay room, (c) failure to secure an opening above a partition that was part of a vital area barrier. Two unresolved items are: (a) bullet resistant requirements at the contractor access control point, and (b) recording exit times from normally unoccupied vital areas.
